RE: Tier 2 Pathway Application Nos. B0489; Response to Association of Irrigated Residents, Leadership Counsel for Justice & Accountability, Central Valley Defenders of Clean Water & Air, Animal Legal Defense Fund, and Food & Water Watch and individual commenters - Claude Duss, Craig Barry, and Joshua Kehoe.

Dear Dr. Cliff,

Brightmark RNG Holdings LLC ("Pathway Applicant") is responding within the scope of the Low Carbon Fuel Standard ("LCFS") program §95488.7(d)(5)(A) to the commenters, Association of Irrigated Residents, Leadership Counsel for Justice & Accountability, Central Valley Defenders of Clean Water & Air, Animal Legal Defense Fund, and Food & Water Watch (collectively "Commenters"), in a letter submitted March 15, 2024 regarding the Tier 2 Pathway Application (B0489) (the "Application").

Section §95488.7(d)(5)(A) of the LCFS states "only comments related to potential factual or methodological errors will require responses from the fuel pathway applicant." We don't believe the public comments received on the Application are related to factual or methodological errors and believe that the comments incorrectly claim adverse environmental damage results from the dairy manure project. Dairy manure projects result in significant long-term air quality improvements and greenhouse gas emission reductions through the use of RNG in transportation that displaces diesel trucking and the reduction of methane and other fugitive emissions from improved dairy manure management. Pathway Applicant will address the Commenters' letter, identified by sections in *italics*, and respond to all comments raised by the Commenters. We believe that no revisions to our pending Application are needed following sufficient review and approval of our response by California Air Resource Board ("CARB").

First, the application incorporates an unlawfully truncated system boundary that ignores feedstock production at the source factory farm—Lawnhurst Farms in Stanley, New York—which confines a total of 1,900 cows—and other emissions such as those from storage and disposal of digestate, resulting in artificially low Carbon Intensity (CI) values and inflated credit generation. A fuel pathway life cycle analysis must take into account "feedstock production" and "waste generation, treatment and disposal." In addition to the evidence provided in Exhibits A and B, more recent research indicates that emissions from factory farm gas production are significantly higher than currently appreciated, with especially high emissions from digestate storage. This recent study did not consider additional emissions from digestate handling and application, which is another potentially large source of emissions resulting from factory farm gas production that must be included in the pathway life cycle analysis. Yet, CARB and the pathway applicant ignore these and other emissions. In other words, this application dramatically undercounts the greenhouse gas emissions associated with this fuel by failing to apply the required "well-to-wheel" analysis.

Concurrently, this application overcounts environmental benefits by ignoring that this is, in one factory farm owner's words, "lucrative" feedstock production. Liquified manure rotting anaerobically in massive waste "lagoons" is not an unavoidable and natural consequence of animal agriculture operations. This system and the methane emissions that it causes are the result of Lawnhurst Farm's intentional management decisions designed to maximize profits and externalize pollution costs. CARB cannot ignore that the emissions the pathway applicant claims as captured from these factory farms' lagoons are intentionally created in the first place. The manure handling practices at this facility is an integrated part of generating and using factory farm gas. Thus, the gas generated at this facility is an intentionally produced product and cannot now be claimed as "captured" to secure a lucrative negative CI value.

The carbon intensities quantified in the pathway application process utilize a lifecycle analysis methodology which accounts for all emissions within the designated boundary based on the existing LCFS regulations. The CI score of the project incorporates baseline manure management practices and follows the life cycle analysis according to the guidance laid out in the 2014 California Livestock Projects Compliance Offset Protocol which includes project emissions from the storage and disposal of digestate. As a result of this process, the project shows avoided methane emissions from the baseline, resulting in the generation of credits by diverting methane from the farm. An approved third-party verifier confirmed the inputs, project boundary, and CA-GREET3.0 model for the project's CI score through a desktop analysis and site visit to ensure all emissions were accounted for.

Second, CARB has failed to ensure that the additionality requirements of Health and Safety Code section 38562 are met. If CARB had done so, it would have concluded that the methane capture at issue is patently not additional. The applicant acknowledges that the digester system (and associated emission reductions) has existed since 2013 and would continue to exist without the LCFS. Further, the project has participated in the federal RFS program and the California Cap-and-Trade Offset Program. Accordingly, any purported emission reductions associated with this digester has already been occurring and presumably will continue to occur with or without being subsidized by the LCFS program. Stated differently, these are emission reductions that "otherwise would occur." Thus, certification of this pathway with this proposed CI value would openly violate section 38562 by crediting nonadditional reductions.

The LCFS is a GHG reduction program that is not meant to punish those entities that were early adopters in implementing emission reduction projects. The LCFS program has provided the incentives necessary for the continued operation (and thus emission reductions) of this and other similar projects. The assumption that this project would operate without the LCFS is false. The capital and operating costs of digester system are significant and ongoing throughout the life of the project. Without these financial incentives, it is more likely that these projects would cease to operate, and the dairies would begin using their previous manure management practices including significant methane emissions.

Third, this application is a good example of how CARB's flawed approach is rewarding the biggest factory farm polluters and incentivizing further expansion and herd consolidation, which does more climate harm than good. Lawnhurst Farms is not a sustainable family farm—it is a large industrial operation that confines 1,900 cows. CARB should not allow this factory farm—or the applicant—to profit from the LCFS.

The above comment is not related to potential factual or methodological errors and therefore does not require a response from the fuel pathway applicant. The Pathway Applicant provided all the required information and supporting documentation necessary to certify the Tier 2 fuel pathway application to both CARB staff and an approved third-party verifier.

It should be noted that Lawnhurst Farms is a fourth-generation family owned and operated farm that was established in 1925. Their main production output is milk, and dairy manure is a waste. The LCFS has not incentivized them to increase their herd size.

Fourth, this application is so opaque that it is impossible for Commenters or other stakeholders to meaningfully evaluate it. The lifecycle analysis redacts information critical to understanding the CI calculation.

The Pathway Applicant met all of the pathway application requirements laid out in the regulation. This application was reviewed by CARB staff and validated by the third-party verifier. The Pathway Applicants redactions were within CARB's guidance, approved by CARB, and minimal.

Finally, the inflated CI values CARB proposes here work an additional environmental injustice on California citizens who will be exposed to higher levels of pollution from fossil transportation fuel and dirty vehicles made possible by excessive credit generation at factory farms. CARB has acknowledged that pollution from transportation fuels inflicts a racially disparate impact, so this continued certification of fuel pathways with extreme negative CI values to allow more pollution from deficit holders contributes to this injustice.

The above comment is not related to potential factual or methodological errors and therefore does not require a response from the fuel pathway applicant. It should be noted all CARB guidance was followed to quantify the lifecycle emissions which includes the transport of the finished fuels. For CARB to achieve the emission reduction goals of a 90% CI reduction by 2045, it will be necessary for the transportation fuel mix to not only include zero emission fuels, but also carbon negative fuels.

As this application highlights, CARB's unlawful and unjust administration of the LCFS program is causing environmental and public health harms not just in California, but to communities and ecosystems across the United States—in this case New York—by incentivizing and rewarding some of the worst factory farm practices by making them more "lucrative." If California is serious about being a climate leader, this is not the example to set.

The LCFS program is a transportation GHG reduction policy that has resulted in significant decreases in convention fuel consumption and GHG emissions from the transportation sector in California. Where the dairy farms are located, there are reduced methane and fugitive emissions from the use of digesters instead of uncovered anaerobic lagoons. Reductions of fugitive methane emissions is necessary to meet California, New York, and overall United States climate goals.

In response to the individual commenters - Claude Duss, Craig Barry, and Joshua Kehoe, we believe these comments do not require responses because they do not meet the standard of §95488.7(d)(5)(A). Dairy manure methane

Brightmark.com

projects like this one are eligible under the LCFS program, and the comments are irrelevant to the project and do not include project-specific factual or methodological errors.

In summary, Brightmark RNG Holdings LLC believes that no changes to the pending application under CARB review are required and sees no reason to deny or stay a certification decision on this pathway.

Sincerely,

Gerrud Wallaert
