## List of Acronyms and Abbreviations

Acronym	Term
ACF	Advanced Clean Truck Fleets Regulation
ACT	Advanced Clean Trucks Regulation
bhp-hr	Brake horsepower hour
CARB	California Air Resources Board or Board
GTM	Gross-ton-miles
HD I/M	Heavy-Duty Inspection and Maintenance
Low NO <sub>x</sub>	Heavy-Duty Engine and Vehicle Omnibus Regulation
META Tool	August 24, 2020 version of draft On-Road Heavy-Duty Beta META Tool v2
NO <sub>x</sub>	Oxides of nitrogen
PM <sub>10</sub>	Particulate matter 10 micrometers or smaller in diameter
PM <sub>2.5</sub>	Particulate matter 2.5 micrometers or smaller in diameter
POLA	Port of Los Angeles
Ports or San Pedro Bay Ports	Port of Los Angeles and Port of Long Beach
STB	Surface Transportation Board
U.S. EPA	United States Environmental Protection Agency
VMT	Vehicle miles traveled

## List of Definitions

Term	Definition
Cargo Handling Equipment	Any off-road, self-propelled vehicle or equipment used at a port or intermodal railyard to lift or move container, bulk, or liquid cargo carried by ship, train, or another vehicle, or used to perform maintenance and repair activities that are routinely scheduled or that are due to predictable process upsets. Equipment includes, but is not limited to, rubber-tired gantry cranes, yard trucks, top handlers, side handlers, reach stackers, forklifts, loaders, aerial lifts, excavators, and dozers.
Class I Railroad	Railroads with 2018 revenue of at least \$490 million.
Class 8 Truck	Any truck with a gross vehicle weight rating greater than 33,000 pounds.
Drayage Truck	A class 8 truck that is used for transporting containers, originating from a port or railyard to an intermediate destination, such as a warehouse.
EMFAC2017	The California Air Resources Board on-road mobile source emissions inventory. Contains emission factors from mobile sources, such as drayage and long haul trucks.
First-Mile/Last-Mile Emissions	Emissions associated with the first- and last-mile operations, such as from trucks and trains idling while waiting to be loaded and cargo handling equipment moving containers to be loaded.
Flat Car	Railcar with an open, flat deck designed to carry containers or trailers.
Gross Ton	Weight of all locomotive units, railcars, and contents.
Gross-Ton-Miles	Weight of all locomotive units, railcars, and contents moved one mile in transportation trains.
Gross Vehicle Weight Rating	The maximum amount of weight a vehicle is rated for, as specified by the manufacturer. Includes the weight of the vehicle, fuel, passengers, miscellaneous items, and trailer.
Idle Emissions	Truck emissions while the truck engine is idling.

Term	Definition
Line Haul Locomotive	United States Environmental Protection Agency defines line haul locomotives to be or greater than 2,300 horsepower. The California Air Resources Board categorizes line haul locomotives as greater than 4,000 horsepower.
Locomotive	A self-propelled piece of on-track equipment designed for moving or propelling cars that are designed to carry freight, passengers or other equipment, but which itself is not designed or intended to carry freight, passengers (other than those operating the locomotive) or other equipment.
Long Haul Truck	A class 8 truck that is used for transporting trailers containing cargo originally transported by a drayage truck to a destination, such as a distribution center.
Model Year	The annual production period of a truck manufacturer, which includes January 1st of a calendar year, or if the manufacturer has no annual production period, the calendar year.
On-Dock Rail	Rail tracks located inside ports where containers or other cargos are loaded onto railcars.
Railcar	A vehicle used for the carrying of cargo or passengers on rail tracks.
Running Exhaust Emissions	Truck emissions while the truck is in motion.
Start Emissions	Truck emissions during the brief period following engine start.
Tare Weight	Weight of an empty railcar.
Train	Connected locomotives and railcars moving as a unit.
Transloading	The act of repackaging cargo from one type of container in to another. For the purposes of this document, transloading refers to repackaging from a 40-foot container to a 53-foot trailer.
T7	An on-road heavy-duty inventory category. T7 refers to class 8 trucks with a gross vehicle weight rating greater than 33,000 pounds.

## Section A. Introduction

Though moving cargo by trains may have produced fewer emissions than trucks in the past, trucks in California have become much cleaner over the last decade and are moving towards zero emission technology. The analysis used truck and train emissions inventories to compare particulate matter 2.5 micrometers in diameter or smaller (PM<sub>2.5</sub>) and oxides of nitrogen (NO<sub>x</sub>) exhaust emissions projections from trucks and trains transporting containers originating from the Port of Los Angeles and the Port of Long Beach (Ports) from 2010 through 2050. The analysis did not consider greenhouse gases. Based on these emissions projections and this analysis, trucks will be the cleaner mode to move cargo by 2023.

## Section B. Detailed Methodology

### 1. Scenarios and Assumptions

The analysis modeled trucks and trains transporting containers originating from the Ports to a destination 300 miles away. For trucks, the analysis modeled a trip with drayage trucks transporting the containers the first 20 miles<sup>1</sup> and in-state long haul trucks transporting them the remaining 280 miles. For trains, the analysis modeled a trip with each train consisting of 4 line haul locomotives and 130 double-stacked railcars, based on samples of trains originating and terminating in the Ports, and the San Pedro Bay Ports Emissions Inventory.<sup>3</sup> The analysis estimated empty railcars at 26 tons,<sup>2</sup> and assumed the weight of a locomotive is 210 tons.<sup>3</sup>

The analysis assumed first- and last-mile emissions (such as from cargo handling equipment) are similar for trucks and trains, so those emissions are omitted from the analysis. The analysis assumed each of the 260 containers weighs 19 tons – a value consistent with the United States Environmental Protection Agency (U.S. EPA) Greenhouse Gas Emissions and Fuel Efficiency Standards.<sup>4</sup>

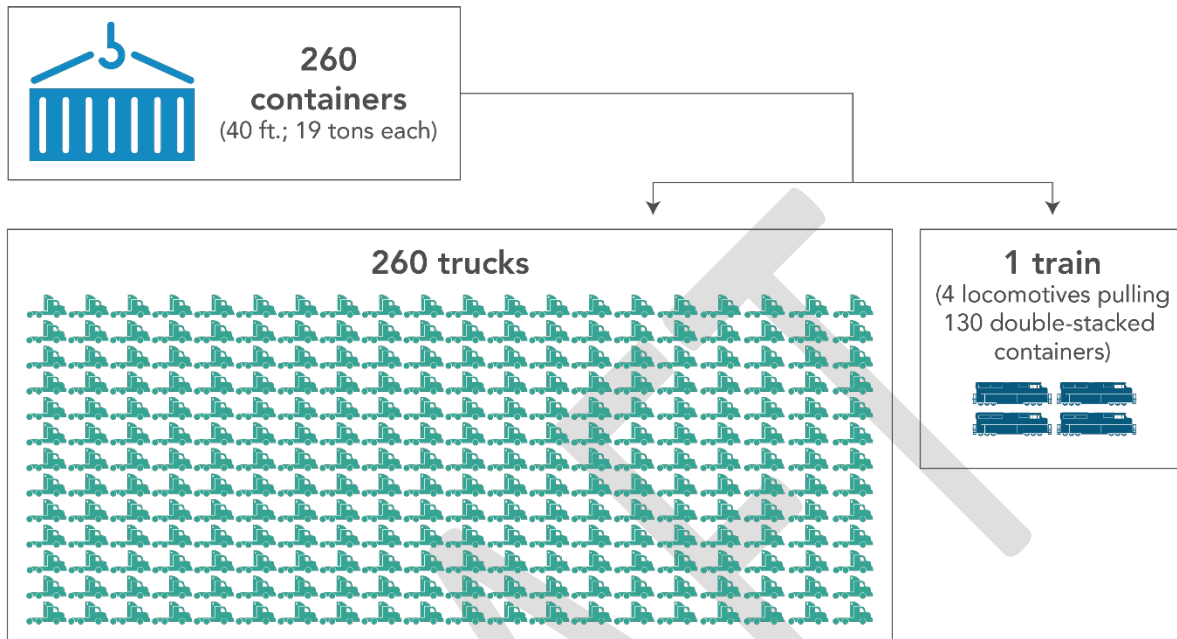

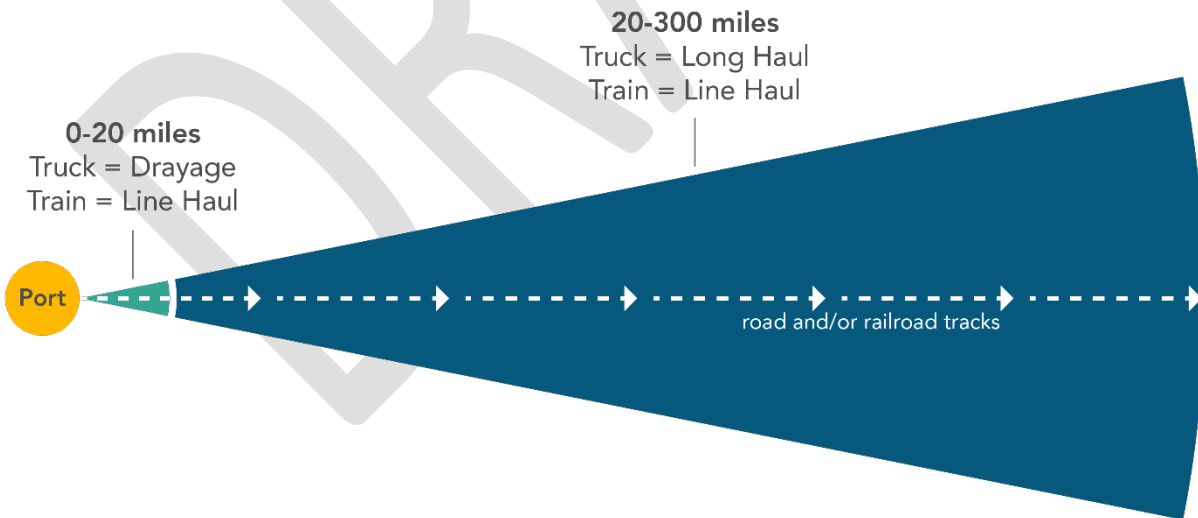

Figure 2. Communities within 20 miles of the Ports and communities 20-300 miles from the Ports

The analysis analyzed baseline scenarios and alternate scenarios. The truck baseline scenario includes Advanced Clean Trucks (adopted June 2020),<sup>5</sup> Heavy-Duty Engine

<sup>5</sup> CARB. June 25, 2020. Advanced Clean Trucks. <https://ww2.arb.ca.gov/our-work/programs/advanced-clean-trucks>.

and Vehicle Omnibus (adopted August 2020),<sup>6</sup> and Heavy-Duty Inspection and Maintenance (proposed Board date December 2021).<sup>7</sup> The train baseline scenario is based on projected natural turnover. The truck alternate scenario adds the Advanced Clean Fleets Regulation<sup>8</sup> to the baseline scenario, and the train alternate scenario assumes using 100 percent Tier 4 locomotives from 2020 to 2034 and 100 percent Tier 5 from 2035 to 2050.

## 2. Truck Methodology

The analysis used a combination of EMFAC2017<sup>9</sup> and an updated version of the draft On-Road Heavy-Duty Beta META Tool v2 (META Tool)<sup>10</sup> as the truck emissions inventory (see Appendix A for the relevant META Tool inventory data). The parameters used are shown in Table 1 and Table 2. The T7 POLA category represents drayage trucks operating near the Ports, and the T7 Tractor category represents in-state long haul trucks.

**Table 1. EMFAC2017 parameters**

Scenario	Midterm Goals
Fuel Consumption Options	Diesel
Federal or California Only Low NOX Regulation	California Only
Current Advanced Clean Trucks Regulation	TRUE

The analysis used EMFAC2017 to supplement the META Tool inventory, as the META Tool does not contain calendar years prior to 2017. The META Tool included the following regulations not present in EMFAC2017:

- Advanced Clean Trucks (adopted June 2020)<sup>11</sup>
- Heavy-Duty Engine and Vehicle Omnibus (adopted August 2020)<sup>12</sup>
- Heavy-Duty Inspection and Maintenance (proposed Board date December 2021)<sup>13</sup>

The analysis omitted emissions from transloading activities at intermediate facilities 20 miles from the Ports. These facilities repackage the cargo within the containers transported by the drayage trucks in to trailers pulled by long haul trucks, typically at a ratio of three containers to two trailers. In practice, there would be some cargo handling equipment emissions and truck idling emissions at these facilities.

Both the drayage truck and long haul truck categories in the analysis use the same baseline emission rates in EMFAC2017 and the META Tool. The baseline rates are based on class 8 trucks tested under the same conditions, with the same simulated trailer weights. Because of this, the analysis did not account for the reduction in the number of trucks from repackaging. The analysis assumed the same number of drayage trucks and long haul trucks, each carrying a container or trailer weighing 19 tons. If the emissions rates could account for the increase in trailer weight, truck emissions 20-300 miles from the Ports would likely be lower than the analysis shows.

<sup>11</sup> CARB. June 25, 2020. Advanced Clean Trucks. <https://ww2.arb.ca.gov/our-work/programs/advanced-clean-trucks>.

<sup>12</sup> CARB. August 27, 2020. Heavy-Duty Engine and Vehicle Omnibus Regulation. <https://ww2.arb.ca.gov/our-work/programs/heavy-duty-low-nox>.

<sup>13</sup> CARB. Heavy-Duty Inspection and Maintenance Program. <https://ww2.arb.ca.gov/our-work/programs/heavy-duty-inspection-and-maintenance-program>.

The analysis calculated emissions from EMFAC2017 for calendar years 2010 through 2016 using Equation 1.

**Equation 1: Calendar years 2010 – 2016 truck emissions from EMFAC2017**

$emissions = distance \times trucks \times \left( \frac{total\ exhaust\ emissions}{VMT} \right)_{category}$		
Where,		<u>Units</u>
<i>Emissions</i>	= Total exhaust emissions from trucks	<i>tons</i>
<i>Distance</i>	= Total distance traveled	<i>miles</i>
<i>Trucks</i>	= Total number of trucks	-
<i>Total exhaust emissions</i>	= Exhaust emissions from EMFAC2017	<i>tons/day</i>
<i>VMT</i>	= Vehicle miles traveled from EMFAC2017	<i>miles/day</i>
<i>Category</i>	= T7 POLA or T7 Tractor	-

The analysis used 20 miles for drayage trucks and 280 miles for long haul trucks. The total exhaust emissions included running exhaust, idle, and start emissions. The analysis divided these emissions by VMT to produce an approximate emissions rate in tons per mile.

The analysis calculated emissions for 2017 and newer trucks similarly, but because the META Tool did not aggregate truck model years, the analysis first summed the total exhaust emissions and VMT before dividing using Equation 2.

**Equation 2: Calendar years 2017 and newer truck emissions from META Tool**

$emissions = distance \times trucks \times \left( \frac{\sum total\ exhaust\ emissions}{\sum VMT} \right)_{category}$		
Where,		Units
<i>Emissions</i>	= Total exhaust emissions from trucks	<i>tons</i>
<i>Distance</i>	= Total distance traveled	<i>miles</i>
<i>Trucks</i>	= Total number of trucks	-
<i>Total exhaust emissions</i>	= Exhaust emissions from META Tool	<i>tons/day</i>
<i>VMT</i>	= Vehicle miles traveled from META Tool	<i>miles/day</i>
<i>Category</i>	= T7 POLA or T7 Tractor	-

For the total exhaust emissions, the analysis used the No Accelerated Turnover scenario in the META Tool, which only accounts for truck turnover from regulations and not additional turnover from incentives programs.

The analysis accounted for the Advanced Clean Fleets Regulation,<sup>14</sup> even though it is not present in the META Tool, by adding an alternate scenario in which drayage truck emissions are set to zero, starting in 2035 and all truck emissions are set to zero,

<sup>14</sup> CARB. February 12, 2020. Zero-Emission Fleet Rule Workshop Advanced Clean Truck Fleets.

starting in 2045. The Advanced Clean Fleets Regulation is expected to be presented to the Board in 2021/2022.

### 3. Train Methodology

The analysis calculated fuel consumption using gross-ton-miles (GTM), and then converted to brake horsepower-hour (bhp-hr)<sup>15</sup> to calculate the total PM<sub>2.5</sub> and NO<sub>x</sub> emissions.

Gross-tons include the weight of the freight, the empty railcars, and the locomotives. The analysis calculated gross-tons by adding these weights together. The analysis then calculated GTM by multiplying the gross-tons by the distance. GTM is calculated using Equation 3 through Equation 7.

The analysis calculated the number of trains required to transport the number of containers using Equation 3.

#### Equation 3: Number of trains

$$\begin{aligned} & \text{(number of trains)} \\ & = \frac{\text{(total number of containers)}}{\text{(number of railcars per train)} \times \text{(number of containers per railcar)}} \end{aligned}$$

Where,

<i>total number of containers</i>	= 260
<i>number of railcars per train</i>	= 130
<i>number of containers per railcar</i>	= 2

The analysis calculated total weight of freight on all trains using Equation 4.

#### Equation 4: Total weight of freight on all trains

$$\begin{aligned} & \text{freight weight} \\ & = (\text{weight of a container}) \times (\text{number of railcars per train}) \\ & \quad \times (\text{number of containers per railcar}) \times (\text{number of trains}) \end{aligned}$$

Where,

<i>weight of a container</i>	= 19 tons
<i>number of railcars per train</i>	= 130
<i>number of containers per railcar</i>	= 2
<i>number of trains</i>	= Number of trains, from Equation 3

The analysis calculated the total weight of the empty railcars on all trains using Equation 5.

<sup>15</sup> U.S. EPA Office of Transportation and Air Quality. April 2009. Emission Factors for Locomotives, EPA-420-F-09-025.

**Equation 5: Total weight of empty railcars on all trains**

$$\begin{aligned} \text{empty railcar weight [tons]} \\ &= (\text{weight of an empty railcar [tons]}) \\ &\times (\text{number of railcars per train}) \times (\text{number of trains}) \end{aligned}$$

Where,

<i>weight of an empty railcar</i>	= 26 tons
<i>number of railcars per train</i>	= 130
<i>number of trains</i>	= Number of trains, from Equation 3

The analysis calculated total weight of locomotives on all trains using Equation 6.

**Equation 6: Total weight of locomotives on all trains**

$$\begin{aligned} \text{locomotive weight} \\ &= (\text{weight of a single locomotive}) \\ &\times (\text{number of locomotives per train}) \times (\text{number of trains}) \end{aligned}$$

Where,

<i>weight of a single locomotive</i>	= 210 tons
<i>number of locomotives per train</i>	= 4
<i>number of trains</i>	= Number of trains, from Equation 3

The analysis calculated GTM by multiplying the total weight of the trains and the distance using Equation 7.

**Equation 7: GTM**

$$\begin{aligned} \text{GTM} = \{ &(\text{freight weight}) + (\text{empty railcar weight}) + (\text{locomotive weight}) \} \\ &\times (\text{distance}) \end{aligned}$$

Where,

		<u>Units</u>
<i>Freight weight</i>	= Total weight of freight on all trains, from Equation 4	<i>tons</i>
<i>Empty railcar weight</i>	= Total weight of railcars on all trains, from Equation 5	<i>tons</i>
<i>Locomotive weight</i>	= Total weight of locomotives on all trains, from Equation 6	<i>tons</i>
<i>Distance</i>	= Total distance traveled	<i>miles</i>

To calculate fuel consumption from GTM, the analysis calculated fuel efficiency in GTM per gallon of diesel consumed.

Class I Railroads report their annual GTM in the Class I Railroad Annual Report ("R-1" report), published on the Surface Transportation Board (STB) website.<sup>16</sup> The analysis

<sup>16</sup> STB. Annual Report Financial Data. <https://prod.stb.gov/reports-data/economic-data/annual-report-financial-data/>. Accessed August 11, 2020.

used the total annual GTM from Union Pacific and BNSF R-1 reports for 2019 for both revenue and non-revenue services.<sup>17</sup>

The analysis used annual fuel consumption for the “Freight” category from the Union Pacific and BNSF R-1 reports for 2019 to estimate annual fuel consumption.

The analysis calculated GTM per gallon of diesel consumed using Equation 8.

**Equation 8: GTM per gallon of diesel consumed by locomotives**

$GTM\ per\ gallon = \frac{annual\ GTM\ [gross-ton-miles]}{annual\ fuel\ consumption\ [gallons]}$		
Where,		<u>Units</u>
<i>GTM per gallon</i>	= Gross-ton-miles from locomotives per gallon of diesel consumed	<i>GTM/gallon</i>
<i>Annual GTM</i>	= Annual gross-ton-miles reported in R-1 reports	<i>GTM</i>
<i>Annual fuel consumption</i>	= Annual diesel consumption reported in R-1 reports Freight category	<i>gallons</i>

The analysis used 1,004 GTM per gallon for the analysis calculated from the 2019 Union Pacific and BNSF R-1 report values.

The analysis calculated locomotive fuel consumption from GTM and GTM per gallon using Equation 9.

**Equation 9: Locomotive fuel consumption**

$fuel\ usage = \frac{GTM}{GTM\ per\ gallon}$		
Where,		<u>Units</u>
<i>Fuel usage</i>	= Diesel consumed by locomotives	<i>gallon</i>
<i>GTM</i>	= GTM from Equation 7	<i>GTM</i>
<i>GTM per gallon</i>	= GTM per gallon of diesel consumed, from Equation 8	<i>GTM/gallon</i>

Once the amount of fuel usage was determined, the analysis calculated the associated emissions by applying emission factors weighted by the locomotive tier distribution. The analysis calculated total emissions from locomotives using Equation 10.

---

<sup>17</sup> Non-revenue service accounts for about 1% of the total GTM.

**Equation 10: Emissions from locomotives**

$$\begin{aligned}
 & \text{total emissions} \\
 &= (\text{fuel usage}) \times CF \\
 & \times \left\{ \begin{aligned} & (\text{emission factor}_{\text{pre-Tier 0}}) \times (\text{Distribution}_{\text{pre-Tier 0}}) \\ & + (\text{emission factor}_{\text{Tier 0}}) \times (\text{Distribution}_{\text{Tier 0}}) \\ & + (\text{emission factor}_{\text{Tier 1}}) \times (\text{Distribution}_{\text{Tier 1}}) \\ & + \dots \\ & + (\text{emission factor}_{\text{Tier 4}}) \times (\text{Distribution}_{\text{Tier 4}}) \end{aligned} \right\}
 \end{aligned}$$

Where,

<i>Total Emissions</i>	= Total emissions from trains	<u>Units</u> <i>pounds</i>
<i>Fuel usage</i>	= Total diesel consumption	<i>gallons</i>
<i>CF</i>	= Conversion factor <sup>15</sup>	
	$CF = \frac{20.8 \text{ [bhp-hr/gallon]}}{453.6 \text{ [g/pounds]}}$	
<i>emission factor<sub>Tier N</sub></i>	= Emission factor of Tier N locomotives	<i>g/bhp-hr</i>
<i>Distribution<sub>Tier N</sub></i>	= MWhr or bhp-hr Tier distribution of Tier N locomotives	-

The analysis used particulate matter 10 micrometers in diameter or smaller (PM<sub>10</sub>) and NO<sub>x</sub> emission factors from the U.S. EPA publication Emission Factors for Locomotives, EPA-420-F-09-025<sup>15</sup> for Tier 4 and older locomotives, and CARB Locomotive Technology Assessment<sup>18</sup> for proposed Tier 5 locomotives, as shown in Table 3. The analysis estimated PM<sub>2.5</sub> emission factors to be 0.96 times the PM<sub>10</sub> emission factors consistent with the conversion factor from PM<sub>10</sub> to PM<sub>2.5</sub> in the EMFAC2017 data.<sup>19</sup>

**Table 3. Line haul emission factors [grams/bhp-hr]**

	PM <sub>10</sub>	NO <sub>x</sub>
<b>Uncontrolled</b>	0.32	13.00
<b>Tier 0</b>	0.32	8.60
<b>Tier 0+</b>	0.20	7.20
<b>Tier 1</b>	0.32	6.70
<b>Tier 1+</b>	0.20	6.70
<b>Tier2</b>	0.18	4.95
<b>Tier 2+ and Tier 3</b>	0.08	4.95
<b>Tier 4</b>	0.015	1.00
<b>Tier 5</b>	0.006	0.15

For the baseline scenario, the analysis used tier distribution data from the unpublished draft locomotive line haul emissions inventory dated August 2020 (Appendix B). The baseline scenario only includes projected natural turnover. There is an alternative

<sup>18</sup> CARB. November 2016. Technology Assessment: Freight Locomotives.

<sup>19</sup> U.S. EPA publication Emission Factors for Locomotives, EPA-420-F-09-025 suggests using 0.97 to convert PM<sub>10</sub> to PM<sub>2.5</sub>.

scenario in which trains are 100 percent Tier 4 until 2034, and 100 percent Tier 5 from 2035 and beyond; the purpose of this scenario is to show that shifting freight from truck to train only reduces emissions when Tier 4 or cleaner locomotives are used.

## Section C. Results

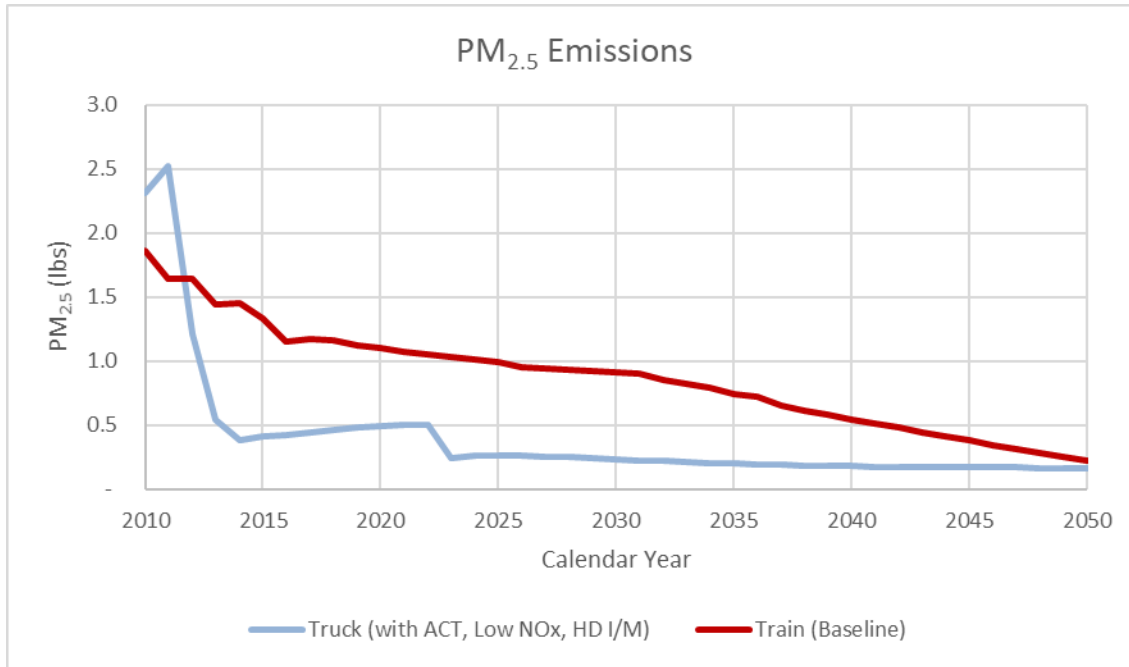

Drayage trucks have been able to move containers with lower PM<sub>2.5</sub> emissions than trains in communities within 20 miles of the Ports since 2012, due to the implementation of the 2007 Drayage Truck Regulation. As the 2010 Truck and Bus Regulation moves towards full implementation in 2023, trucks become cleaner than trains in all scenarios – long haul PM<sub>2.5</sub> emissions in communities 20-300 miles from the Ports become lower in 2020, long haul NO<sub>x</sub> emissions become lower in 2022, and drayage NO<sub>x</sub> emissions become lower in 2023.

Tier 4 and 5 locomotives can move containers with lower emissions than trucks in communities within 20 miles of the Ports through 2035, until the Advanced Clean Fleets Regulation<sup>14</sup> goal of 100 percent zero emission drayage trucks is achieved. The analysis also shows Tier 4 and 5 locomotives can move containers cleaner than long haul trucks until the Advanced Clean Truck Fleets Regulation (ACF)<sup>9</sup> brings all trucks to zero emissions in 2045. Figures 1 through 8 below show the results of the analysis.

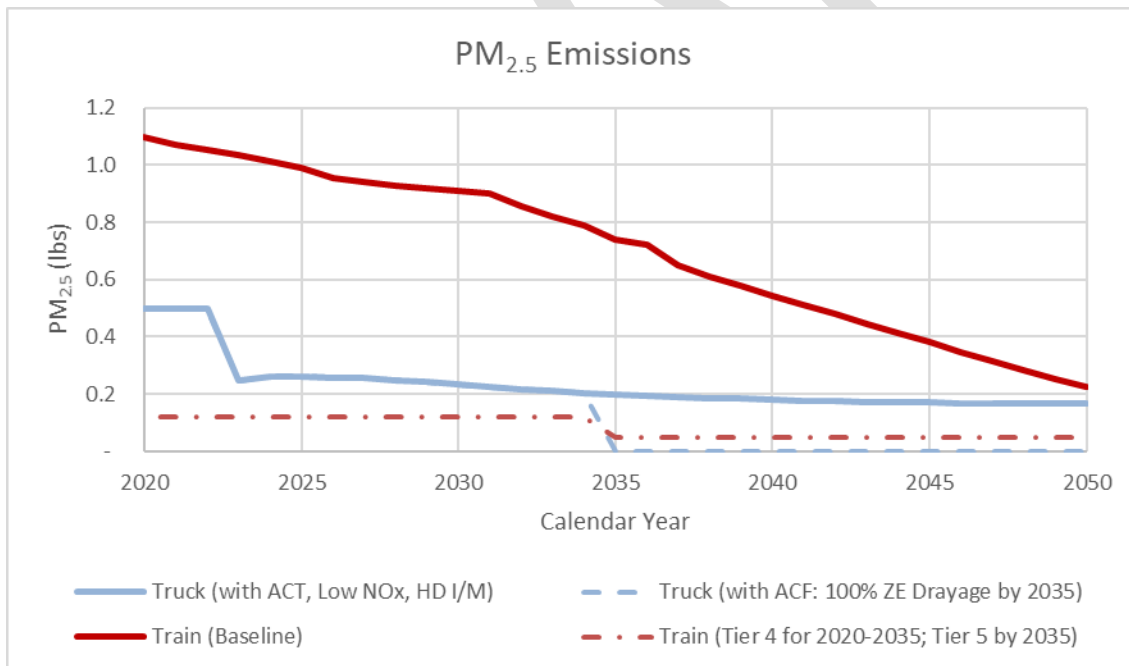

The analysis focused on PM<sub>2.5</sub> and NO<sub>x</sub> exhaust emissions; it did not consider greenhouse gases.

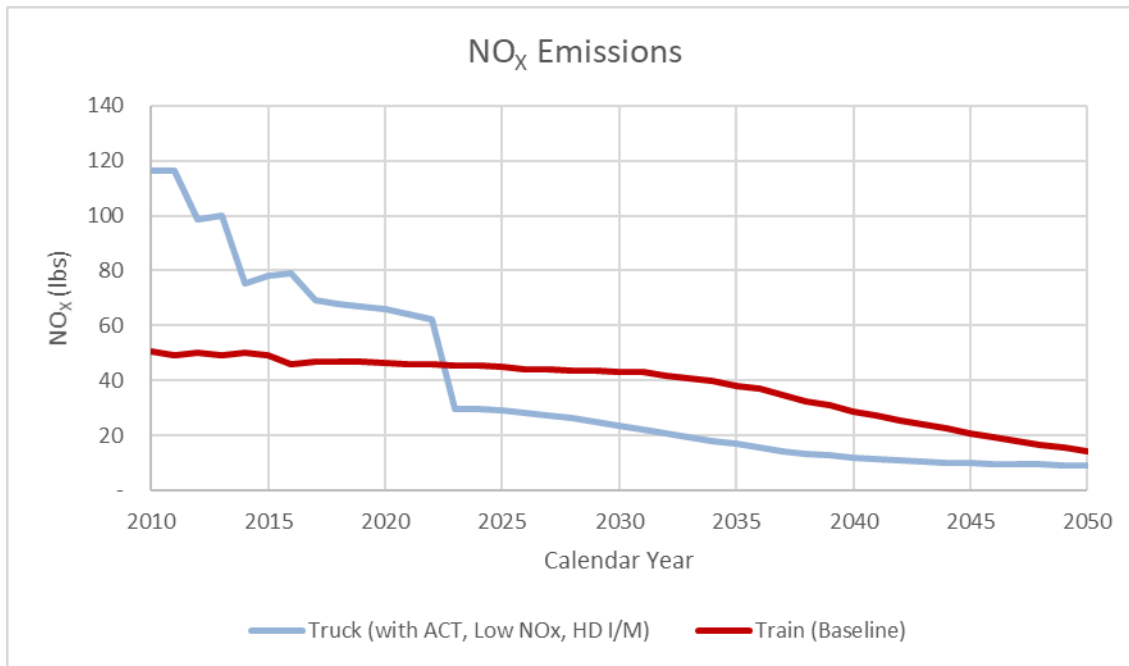

**Figure 3. PM<sub>2.5</sub> emissions in communities within 20 miles of the Ports 2010 – 2050**

## Appendix A. META Tool Inventory Values

VMT and total emissions from the August 24, 2020 version of the META Tool<sup>20</sup> used in the analysis are shown in Table 4. Values shown are through 2050, as used in the baseline scenario in the analysis. The alternative ACF scenario sets T7 POLA to zero in 2035 and T7 Tractor to zero in 2045.

**Table 4. Truck regulations, as reflected in the META Tool and the analysis**

Scenario	Regulation	Implementation
<b>Baseline (with ACT, Low NO<sub>x</sub>, HD I/M)</b>	Advanced Clean Trucks	Zero emission sales requirement: 5% in 2024 to 40% in 2032
	Heavy-Duty Engine and Vehicle Omnibus	From engine Model Year 2024
	Heavy-Duty Inspection and Maintenance	Deterioration rate reduction begins 2023
<b>Alternative (with ACF)</b>	Baseline + Advanced Clean Truck Fleets	<ul style="list-style-type: none"> <li>• Drayage: 100% zero emission by 2035</li> <li>• Long Haul: 100% zero emission by 2045</li> </ul>

<sup>20</sup> CARB. August 24, 2020. Draft On-Road Heavy-Duty Beta META Tool v2 for 2020 Mobile Source Strategy.

## Appendix B. Locomotive Inventory Values

The tier distribution in percentage of megawatt hours used for the baseline train scenario in the analysis is shown in Table 6. This data is from the unpublished draft locomotive line haul emissions inventory dated August 2020. Once the locomotive line haul emissions inventory is published, a link will be posted on the CARB Truck vs. Train website.

DRAFT
