Pensando en el Monitoreo de Aire

Algunos posibles objetivos de la monitorización del aire:

- Para determinar dónde y cuándo se producen las emisiones.
- Determinar qué fuentes son las principales responsables de la contaminación del aire.
- Para seguir el progreso de los Programas Comunitarios de Reducción de Emisiones.
- Para apoyar la investigación en salud pública.
- Proporcionar información en tiempo real sobre la calidad del aire para que los miembros de la comunidad puedan tomar decisiones informadas y cambiar su comportamiento para reducir la exposición.
- Lanzar campañas de información a la comunidad.
- Crear un nuevo sistema regulador de monitores de aire (es decir, para producir datos que puedan ser utilizados por agencias locales, estatales y federales para hacer cumplir las regulaciones).
- Otras preguntas?

Algunas preguntas críticas que se deben hacer con respecto a los sistemas de monitoreo de aire y monitoreo de aire:

- ¿Cuál será la duración del monitoreo del aire? ¿Cuánto tiempo estará el monitor en funcionamiento? ¿Qué metas o propósitos apoya esta decisión?
- Cuáles son los períodos de tiempo específicos que deben ser monitoreados (por ejemplo, estaciones específicas, día vs. noche, después de que ocurran ciertos eventos o escenarios, etc.).
- ¿Qué datos ya existen y cómo se utilizan?
- ¿Dónde debe tener lugar el monitoreo? ¿Qué áreas han sido verificadas en persona? ¿Cuáles son las áreas de mayor preocupación?
- ¿Dónde se encuentran las poblaciones sensibles? ¿Cómo debería informar eso al monitoreo del aire?
- ¿Para qué deben utilizarse los datos producidos por el sistema de monitoreo? ¿Y cómo debe compartirse con el público?
- ¿Cómo se involucrará la comunidad en la implementación del monitoreo del aire?
- Otras preguntas?

Contaminantes	Fuentes de Ejemplo	Plataforma			
		Remolque	Furgoneta	Sistema Compacto	PM2.5 Independiente
PM2.5	Móvil, industria, residencial	x	x	x	x
Negro de Carbón	Móvil, industria, residencial	x	x	x	
NO, NO2, NOx	Móvil, industria	x	x	x	
CO	Móvil	x	x	x	
Ozono	Regional, formado por VOC y NOx	x	x	x	
SO2, H2S	Industria	x	x	x	
VOC (BTEX)	Distribución y Comercialización de Gasolina	x	x	x	
VOC Auto GC/MS	Industria, móvil	x	x		
Tóxicos	Industria, móvil	x	x		
Meteorología		x	x	x	

Glosario

PM2.5	Partículas de 2.5 micrones o menos
Negro de Carbón	Principalmente de partículas de diesel
NO, NO2, NOx	Óxidos of Nitrógeno (precursor de PM2.5, Ozono)
CO	Monóxido de Carbono
Ozono	Regional, formado por VOC y NOx
SO2, H2S	Dióxido de Azufre, Sulfuro de Hidrógeno
VOC (BTEX)	Compuestos Orgánicos Volátiles (Benceno, Tolueno, Etileno, Xileno)
VOC Auto GC/MS	Otros Compuestos Orgánicos Volátiles no BTEX
Tóxicos	Muchos compuestos diferentes que pueden causar efectos dañinos a la salud
Meteorología	Velocidad del viento, dirección del viento, temperatura, humedad

Hoja de Trabajo del Diseño de la Red de Monitoreo del Aire de la Comunidad

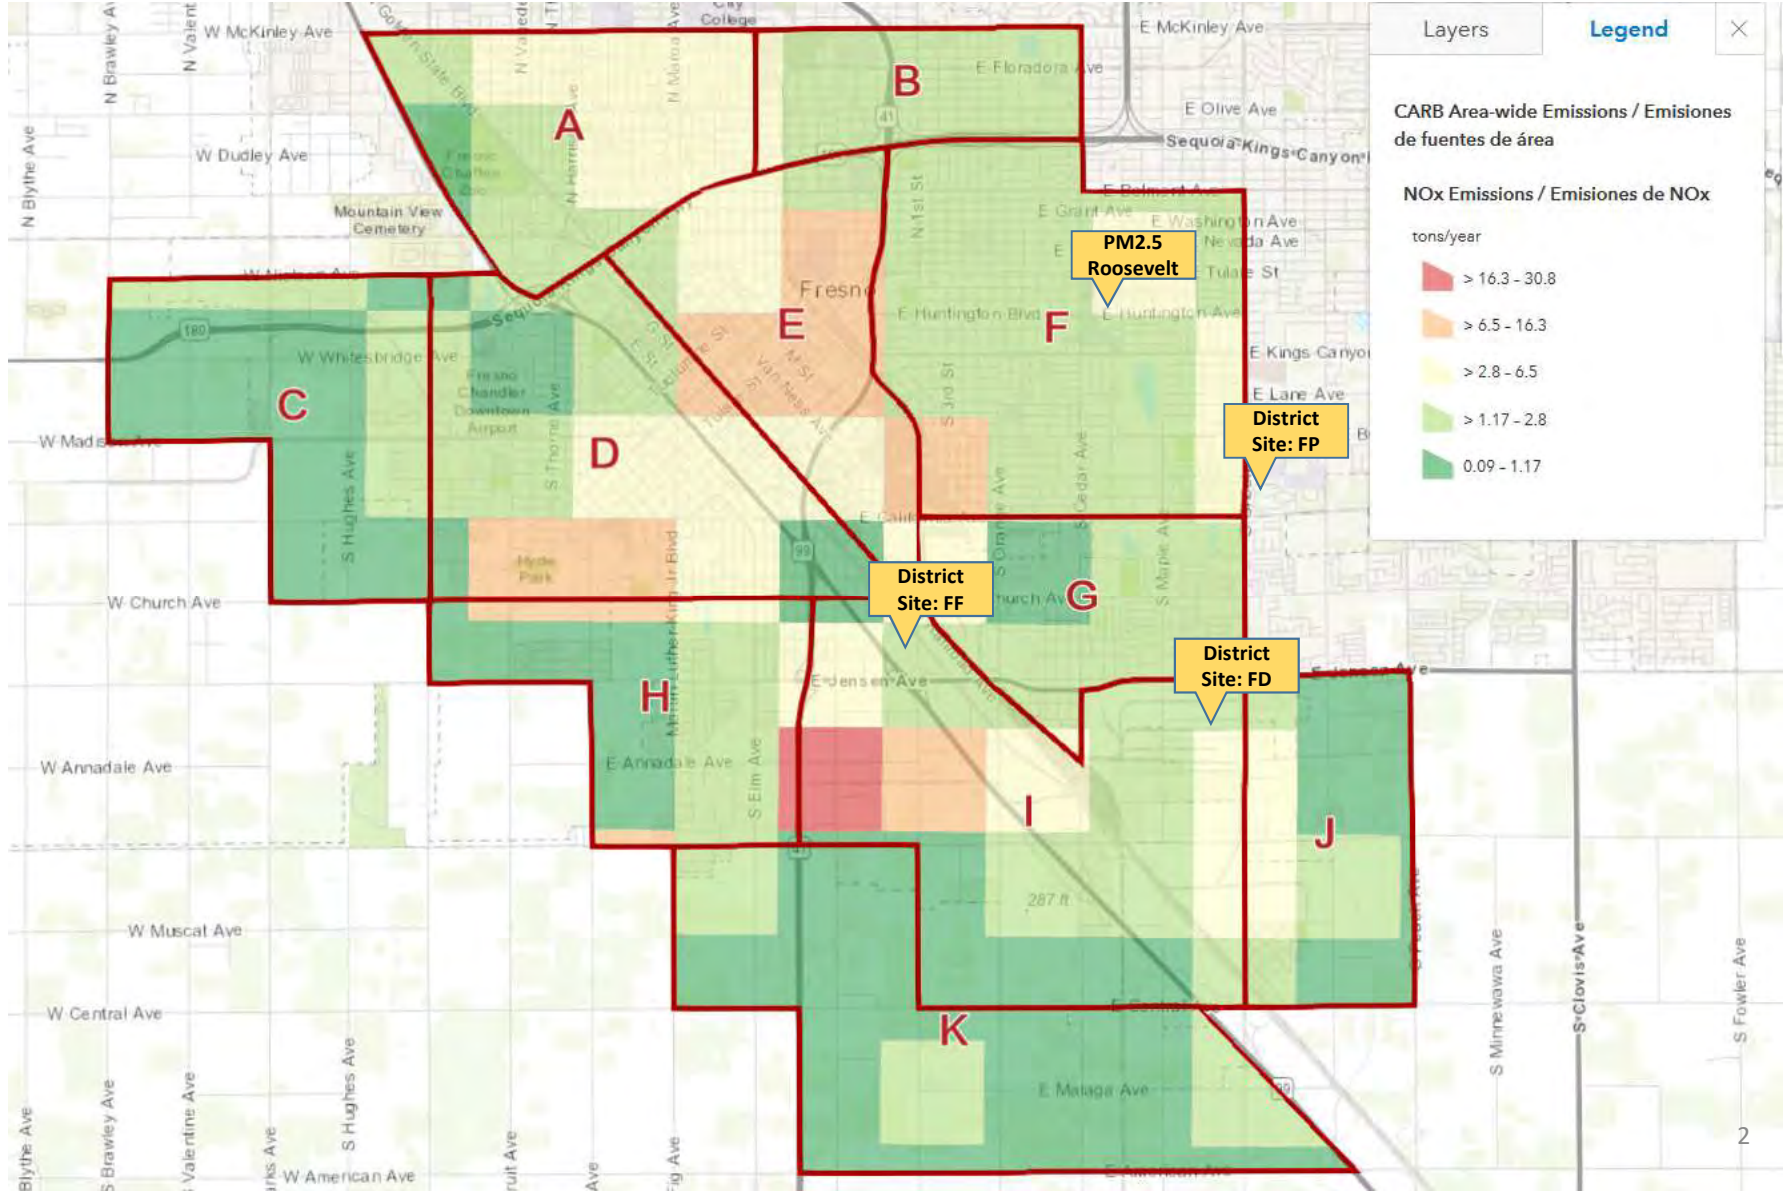

Remolque de Tamaño-completo = seleccione las 2 zonas de monitoreo del aire principales como sus áreas c
 Sistema Compacto = seleccione las 3 zonas de monitoreo del aire principales como sus áreas de mayor prio
 PM2.5 Independiente = seleccione 4 zonas de monitoreo del aire como sus áreas de mayor prioridad

Zona de Monitoreo del Aire de la Comunidad	Prioridad de Remolque de Tamaño-Completo (seleccione 2)	Sistema Compacto (seleccione 3)	PM2.5 Independiente (seleccione 4)	Otro (expliqué contaminante, tipo de monitor, razón)

GLOSARIO

El glosario de la Tabla I-1 tiene el objetivo de aclarar los términos usados en este documento; no contiene definiciones oficiales que se usen para otros fines. La página web donde se encuentra el glosario del Consejo de Recursos del Aire de California¹ (*California Air Resources Board, CARB*) también proporciona los términos comúnmente utilizados en todas nuestras páginas web y documentos, y puede utilizarse para consultar términos adicionales que no estén incluidos en la lista a continuación.

Tabla I-1 Glosario de Términos para el Programa de Protección del Aire en la Comunidad

TÉRMINO (SIGLA)	DESCRIPCIÓN
Año fiscal (<i>Fiscal Year, FY</i>)	Un período de 12 meses durante el cual se generan ganancias, se incurre en obligaciones, se realizan gravámenes, se gastan las asignaciones y para el cual se reconocen transacciones fiscales. En el gobierno del Estado de California, el año fiscal comienza el 1 de julio y finaliza el 30 de junio. Por ejemplo, si se hace una referencia al año fiscal estatal 2017-2018, este es el período que comienza el 1 de julio de 2017 y termina el 30 de junio de 2018. http://www.ebudget.ca.gov/reference/GlossaryOfTerms.pdf
Área de obtención	Un área geográfica con una calidad de aire igual o mejor, que los estándares de calidad del aire ambiental nacionales o de California. Un área puede ser un área de obtención con respecto a un contaminante y un área sin obtención para otros contaminantes.
Área sin obtención	Un área geográfica que la Agencia de Protección Ambiental de los Estados Unidos o el Consejo de Recursos del Aire de California identifica como un área que no cumple con los Estándares Nacionales de la Calidad del Aire Ambiental ni con los Estándares de California de la Calidad del Aire Ambiental para un agente contaminante determinado.
Aseguramiento de calidad	Un programa integrado utilizado para documentar el cumplimiento de los requisitos de calidad y generar confianza en que se cumplirán.

¹ Página web donde se encuentra el glosario del Consejo de Recursos del Aire de California:
<https://ww2.arb.ca.gov/about/glossary>.

APÉNDICE I – GLOSARIO

TÉRMINO (SIGLA)	DESCRIPCIÓN
Asociación de Funcionarios de Control de la Calidad del Aire (<i>California Air Pollution Control Officers Association, CAPCOA</i>)	CAPCOA es una asociación de funcionarios de control de la contaminación del aire que representa a las 35 agencias locales de calidad del aire de California.
Atribución de las fuentes	Una evaluación para identificar las fuentes o las categorías de las fuentes que contribuyen, incluidas, entre otras, fuentes fijas y móviles, y una estimación de su contribución relativa a la alta exposición a la contaminación del aire en las comunidades afectadas.
CalEnviroScreen	Desarrollado por la Agencia de Protección Ambiental de California y la Oficina de Evaluación de Riesgos a la Salud Ambiental (<i>Office of Environmental Health Hazard Assessment, OEHHA</i>), CalEnviroScreen es una herramienta de evaluación que se utiliza para identificar las comunidades que tienen una carga desproporcionada de fuentes de contaminación múltiples y con características poblacionales que las vuelven más susceptibles a la contaminación. https://oehha.ca.gov/calenviroscreen
Centro de Recursos	El Consejo de Recursos del Aire de California cuenta con un repositorio en línea que almacena las herramientas que los miembros de la comunidad, los distritos de aire y demás partes interesadas pueden utilizar cuando desarrollan e implementan el Programa de Protección del Aire en la Comunidad. https://ww2.arb.ca.gov/our-work/programs/Community-Air-Protection-Program-AB617
Comunidades en desventaja	Estas comunidades se identifican según criterios geográficos, socioeconómicos, de salud pública y de peligro medioambiental y pueden incluir, entre otros, lo siguiente: (1) áreas afectadas de manera desproporcionada por la contaminación ambiental y por otros peligros que pueden generar efectos negativos en la salud pública, exposición o degradación ambiental o (2) áreas con concentraciones de personas con bajos ingresos, alto desempleo, pocos propietarios de viviendas, cargas de renta elevadas, poblaciones vulnerables o niveles educativos bajos. Código de Salud y Seguridad de California §39711(a)

APÉNDICE I – GLOSARIO

TÉRMINO (SIGLA)	DESCRIPCIÓN
Consejo Gobernante del Consejo de Recursos del Aire de California (Consejo Gobernante de CARB)	El Consejo Gobernante del Consejo de Recursos del Aire de California está compuesta por 16 miembros, de los cuales 12 son designados por el gobernador y confirmados por el Senado del Estado. Los 12 incluyen 5 que trabajan en los distritos de aire locales, 4 expertos en campos que desarrollan las normas de calidad del aire, 2 miembros del público y 1, el presidente, que es el único miembro de tiempo completo. Los otros 4 miembros incluyen 2 que representan a las comunidades de justicia ambiental (1 designado por el Senado y otro, por la Asamblea) y 2 miembros sin derecho a voto designados para la supervisión legislativa, 1 del Senado y otro de la Asamblea.
Contaminantes del aire de criterio	Contaminantes del aire para los que se pueden determinar niveles aceptables y para los que se debe establecer un estándar de calidad del aire ambiental. Los ejemplos incluyen lo siguiente: ozono, monóxido de carbono, dióxido de nitrógeno, dióxido de azufre, materia particulada 10 y materia particulada 2.5.
Contaminantes tóxicos del aire	Un contaminante del aire, que se identifica según las regulaciones de CARB, que puede provocar o contribuir al aumento de muertes o enfermedades graves, o que puede generar un peligro en la actualidad o a futuro para la salud de los seres humanos. Los efectos en la salud de los contaminantes tóxicos del aire pueden ocurrir a niveles extremadamente bajos y, por lo general, es difícil identificar niveles de exposición que no produzcan efectos adversos para la salud.
Control de calidad	El control de calidad es un conjunto de procedimientos de rutina para verificar la calidad de los datos y garantizar que los objetivos de calidad de estos se cumplan, al mismo tiempo que se lleva a cabo el monitoreo.
Detección remota	El uso de instrumentos que se pueden implementar en plataformas terrestres, aéreas o espaciales, que miden la radiación emitida o reflejada a fin de recopilar información acerca de las concentraciones de contaminantes en el aire y de las condiciones meteorológicas.
Distrito de aire	Un distrito de control de la contaminación del aire, de gestión de la calidad del aire o de recursos del aire ubicado en California.
Efecto crónico en la salud	Un efecto en la salud que se produce en un período relativamente largo (p. ej., en meses o años).

APÉNDICE I – GLOSARIO

TÉRMINO (SIGLA)	DESCRIPCIÓN
Efecto grave en la salud	Un efecto en la salud que se produce en un período relativamente corto (p. ej., en minutos u horas). El término se utiliza para describir exposiciones y efectos breves que aparecen de inmediato luego de la exposición.
Estándar de calidad del aire	El nivel establecido de un contaminante en el aire exterior que no se debe superar en un período específico, a fin de proteger la salud pública. Es establecido por el gobierno estatal y el gobierno federal.
Evaluación estatal	Un documento desarrollado por el personal del Consejo de Recursos del Aire de California (<i>California Air Resources Board</i> , CARB) con el fin de resumir la información de la comunidad, como también los resultados de las evaluaciones de los distritos de aire o de la evaluación estatal de CARB para cada comunidad recomendada al Consejo Gobernante de CARB para consideración para el despliegue del monitoreo del aire en la comunidad y/o el desarrollo de programas de reducción de emisiones en la comunidad. La evaluación estatal proporciona una descripción general de la información utilizada para presentarle las recomendaciones del personal a el Consejo Gobernante de CARB.
Fuentes de áreas extendidas	Fuentes de contaminación en las cuales las emisiones se esparcen en un área amplia como, por ejemplo, productos del consumidor, chimeneas, polvo en la carretera y trabajos agrícolas. Las fuentes de áreas extendidas no incluyen las fuentes móviles ni las fuentes fijas.
Fuentes estacionarias	Fuentes que no son móviles, como plantas de energía, refinerías y fábricas, que emiten contaminantes del aire.
Fuentes móviles	Fuentes de contaminación del aire como automóviles, motocicletas, camiones, vehículos todoterreno, embarcaciones y aviones.
Gases de efecto invernadero (<i>Greenhouse gases</i> , GHG)	Los gases atmosféricos, como dióxido de carbono, metano, clorofluorocarbonos, óxido nitroso, ozono y vapor de agua, que demoran el paso del calor que se vuelve a irradiar a través de la atmósfera terrestre.

APÉNDICE I – GLOSARIO

TÉRMINO (SIGLA)	DESCRIPCIÓN
Impactos acumulativos	<p>Las exposiciones o los efectos ambientales o de salud pública de las emisiones y las descargas combinadas, en un área geográfica, que incluyen la contaminación ambiental de todas las fuentes, ya sea única o múltiple, rutinaria, accidental o emitida de algún otro modo. En los impactos se tendrán en cuenta las poblaciones vulnerables y los factores socioeconómicos, según sea necesario y en la medida en la que los datos estén disponibles. Los altos efectos acumulativos que aborda el programa de protección del aire de la comunidad son aquellos relacionados con las emisiones de contaminantes del aire de criterio y contaminantes del aire tóxicos.</p> <p>https://oehha.ca.gov/calenviroscreen/report/cumulative-impacts-building-scientific-foundation-report</p>
Indicadores de calidad de los datos	<p>Los indicadores de calidad de los datos incluyen una serie de métricas utilizadas para asegurarse de que los datos cumplan con los estándares de calidad definidos en el nivel establecido de seguridad que sea adecuado para alcanzar los objetivos de monitoreo del aire. Los ejemplos están enumerados en la Tabla E-1.</p>
Inventario de emisiones	<p>Un cálculo de la cantidad de contaminantes liberados a la atmósfera a partir de categorías de fuentes móviles, de áreas extendidas y fijas provocadas por la actividad humana y de fuentes naturales. Las fuentes naturales de emisiones incluyen hidrocarburos biogénicos y geogénicos, polvo natural transportado por el viento y emisiones de incendios forestales. Las emisiones de una fuente en particular se calculan como una masa de contaminante emitido durante un período específico, como en toneladas por día o por año.</p>
Justicia ambiental	<p>El tratamiento justo de las personas de todas las razas e ingresos con respecto al desarrollo, la implementación y la aplicación de las leyes, reglamentaciones y políticas ambientales.</p>
Ley de Calidad Ambiental de California (<i>California Environmental Quality Act</i> , CEQA)	<p>Una ley de California que establece un proceso para que las agencias públicas tomen decisiones informadas sobre las aprobaciones discrecionales de proyectos. El proceso ayuda a las personas encargadas de tomar decisiones a determinar si existe algún impacto ambiental relacionado con un proyecto propuesto. Exige que se eliminen o reduzcan los impactos ambientales relacionados con un proyecto propuesto y que se implementen medidas de mitigación de la calidad del aire.</p>

APÉNDICE I – GLOSARIO

TÉRMINO (SIGLA)	DESCRIPCIÓN
Materia particulada	Cualquier material, excepto agua pura, que existe en estado sólido o líquido en la atmósfera. El tamaño de las partículas puede variar, desde partículas gruesas transportadas por el viento hasta partículas finas de la combustión de productos.
Materia particulada 2.5 (<i>particulate matter 2.5</i> , PM2.5)	Materia particulada que tiene un diámetro aerodinámico de 2.5 micrones o menos. Esta fracción de partículas penetra más profundamente en los pulmones.
Materia particulada 10 (<i>particulate matter 10</i> , PM10)	Materia particulada que tiene un diámetro aerodinámico de 10 micrones o inferior (alrededor de 1/7 del diámetro de un cabello humano). El tamaño pequeño les permite ingresar en los sacos de aire que se encuentran en las profundidades de los pulmones, donde pueden quedar depositados y producir efectos negativos para la salud. Las PM10 también causan reducción de la visibilidad.
Materia particulada de diésel	El material sólido en el escape diésel. Por lo general, las partículas de diésel están compuestas de partículas de carbono (“hollín”, también llamado carbono negro) y varios compuestos orgánicos, incluidas más de 40 sustancias orgánicas cancerígenas. Más del 90 por ciento de las partículas de diésel tiene un diámetro inferior a 1 micrón; por lo tanto, es un subconjunto de partículas con un diámetro inferior a menos de 2.5 micrones. https://www.arb.ca.gov/research/diesel/diesel-health.htm
Medida de Control de Contaminantes Tóxicos Transmitidos en el Aire (<i>Airborne Toxic Control Measures</i> , ATCM).	Es una medida de control que adoptó el Consejo de Recursos del Aire de California, que reduce las emisiones de los contaminantes tóxicos del aire. Código de Salud y Seguridad de California §39666 y siguientes.
Mejor tecnología de control disponible para contaminantes tóxicos del aire (<i>best available control technology for toxic air contaminants</i> , T-BACT).	La técnica más efectiva para limitar o controlar las emisiones que se logró en la práctica o cualquier otra técnica para limitar o controlar las emisiones, incluyendo cambios en el proceso y equipo, que resultó ser tecnológicamente viable para una clase o categoría de fuente por el Director Ejecutivo del Consejo de Recursos del Aire de California o para el Funcionario de Control de la Contaminación del Aire de los distritos de aire.

APÉNDICE I – GLOSARIO

TÉRMINO (SIGLA)	DESCRIPCIÓN
Mejor tecnología de readaptación disponible para el control de emisiones (<i>best available retrofit control technology</i> , BARCT)	Un límite de la emisión de aire que se aplica a las fuentes existentes y que se basa en el grado máximo de reducción que se puede lograr, teniendo en cuenta los impactos ambientales, energéticos y económicos según cada clase o categoría de fuente.
Mejor tecnología disponible para el control de emisiones (<i>best available control technology</i> , BACT).	Un estándar de tecnología de control utilizado en los programas de permisos previos a la construcción. El término se utiliza en el programa federal de permisos para la prevención del deterioro significativo, y su definición puede encontrarse en la Ley de Aire Limpio (<i>Clean Air Act</i>) y el Código de Reglamentos Federales (<i>Code of Federal Regulations</i>). Sin embargo, en California, con frecuencia se utiliza para describir los requisitos de tecnología de control en las reglas de revisión de fuentes nuevas. Por lo general, las definiciones utilizadas por los distritos de control de la contaminación del aire de California son equivalentes al requisito de revisión de fuentes nuevas federal para la tecnología de control, o bien más estrictas, y más parecidas a la definición de tasa de emisión mínima alcanzable utilizada en la Ley de Aire Limpio federal.
Monitoreo móvil	Una plataforma de medición equipada con instrumentos que pueden medir rápidamente las concentraciones de contaminantes en el aire mientras están en movimiento.
Objetivo basado en la proximidad	Objetivos mensurables incluidos en los programas de reducción de emisiones en la comunidad para reducir la exposición en ubicaciones de receptores sensibles que están expuestos a niveles elevados debido a su proximidad a las fuentes de emisiones.
Objetivos de calidad de los datos	Criterios de rendimiento y aceptación para monitorear los datos necesarios y, de esta manera, respaldar medidas y decisiones específicas.
Ozono	Un producto del proceso fotoquímico que incluye energía solar y precursores de ozono, como, por ejemplo, hidrocarburos y óxidos de nitrógeno. El ozono existe en la capa de ozono superior de la atmósfera (ozono estratosférico) y en la superficie terrestre de la tropósfera (ozono). El ozono en la tropósfera provoca muchos efectos adversos en la salud y es un contaminante del aire de criterio. Es un componente importante del esmog.

APÉNDICE I – GLOSARIO

TÉRMINO (SIGLA)	DESCRIPCIÓN
Plan Marco para la Protección del Aire en la Comunidad (Plan Marco)	Un conjunto de elementos que están diseñados para cumplir con los requisitos del Proyecto de Ley de la Asamblea 617 para desarrollar una estrategia y un plan de monitoreo de aire estatales con el propósito de que sean evaluados por el Consejo de Recursos del Aire de California. Estos elementos incluyen el proceso para identificar a las comunidades afectadas, las estrategias estatales para reducir las emisiones de los contaminantes del aire de criterio y los contaminantes del aire tóxicos, como también los criterios propuestos para la implementación del monitoreo del aire en las comunidades, y el desarrollo y la implementación de los programas comunitarios de reducción de emisiones.
Programa de Protección del Aire en la Comunidad (Programa)	El programa establecido por el Consejo de Recursos del Aire de California para implementar los requisitos definidos en el Proyecto de Ley de la Asamblea 617.
Proyecto de Ley de la Asamblea 617	<p>El Proyecto de Ley de la Asamblea 617 se promulgó para reducir la exposición en las comunidades más afectadas por la contaminación del aire. Esta primera iniciativa estatal, única en su tipo, incluye el monitoreo del aire de la comunidad; programas de reducción de emisiones de la comunidad; nuevos requisitos para la adaptación acelerada de los controles de contaminación en fuentes industriales, mayores multas y mayor transparencia y disponibilidad de datos sobre la calidad y las emisiones del aire.</p> <p>El Proyecto de Ley de la Asamblea 617, Garcia, C., Capítulo 136, Estatutos de 2017, modificó el Código de Salud y Seguridad de California; enmendó § 40920.6, § 42400 y § 42402, y agregó §39607.1, § 40920.8, § 42411, § 42705.5 y § 44391.2.</p>
Proyectos ambientales suplementarios	<p>Proyectos comunitarios para mejorar la salud pública, reducir la contaminación, mejorar el cumplimiento ambiental y generar conciencia pública en los vecindarios más perjudicados por los daños ambientales, que se financian con una parte del pago de las sanciones recibidas durante la resolución de medidas de cumplimiento.</p> <p>https://www.arb.ca.gov/enf/seppolicy.htm</p>

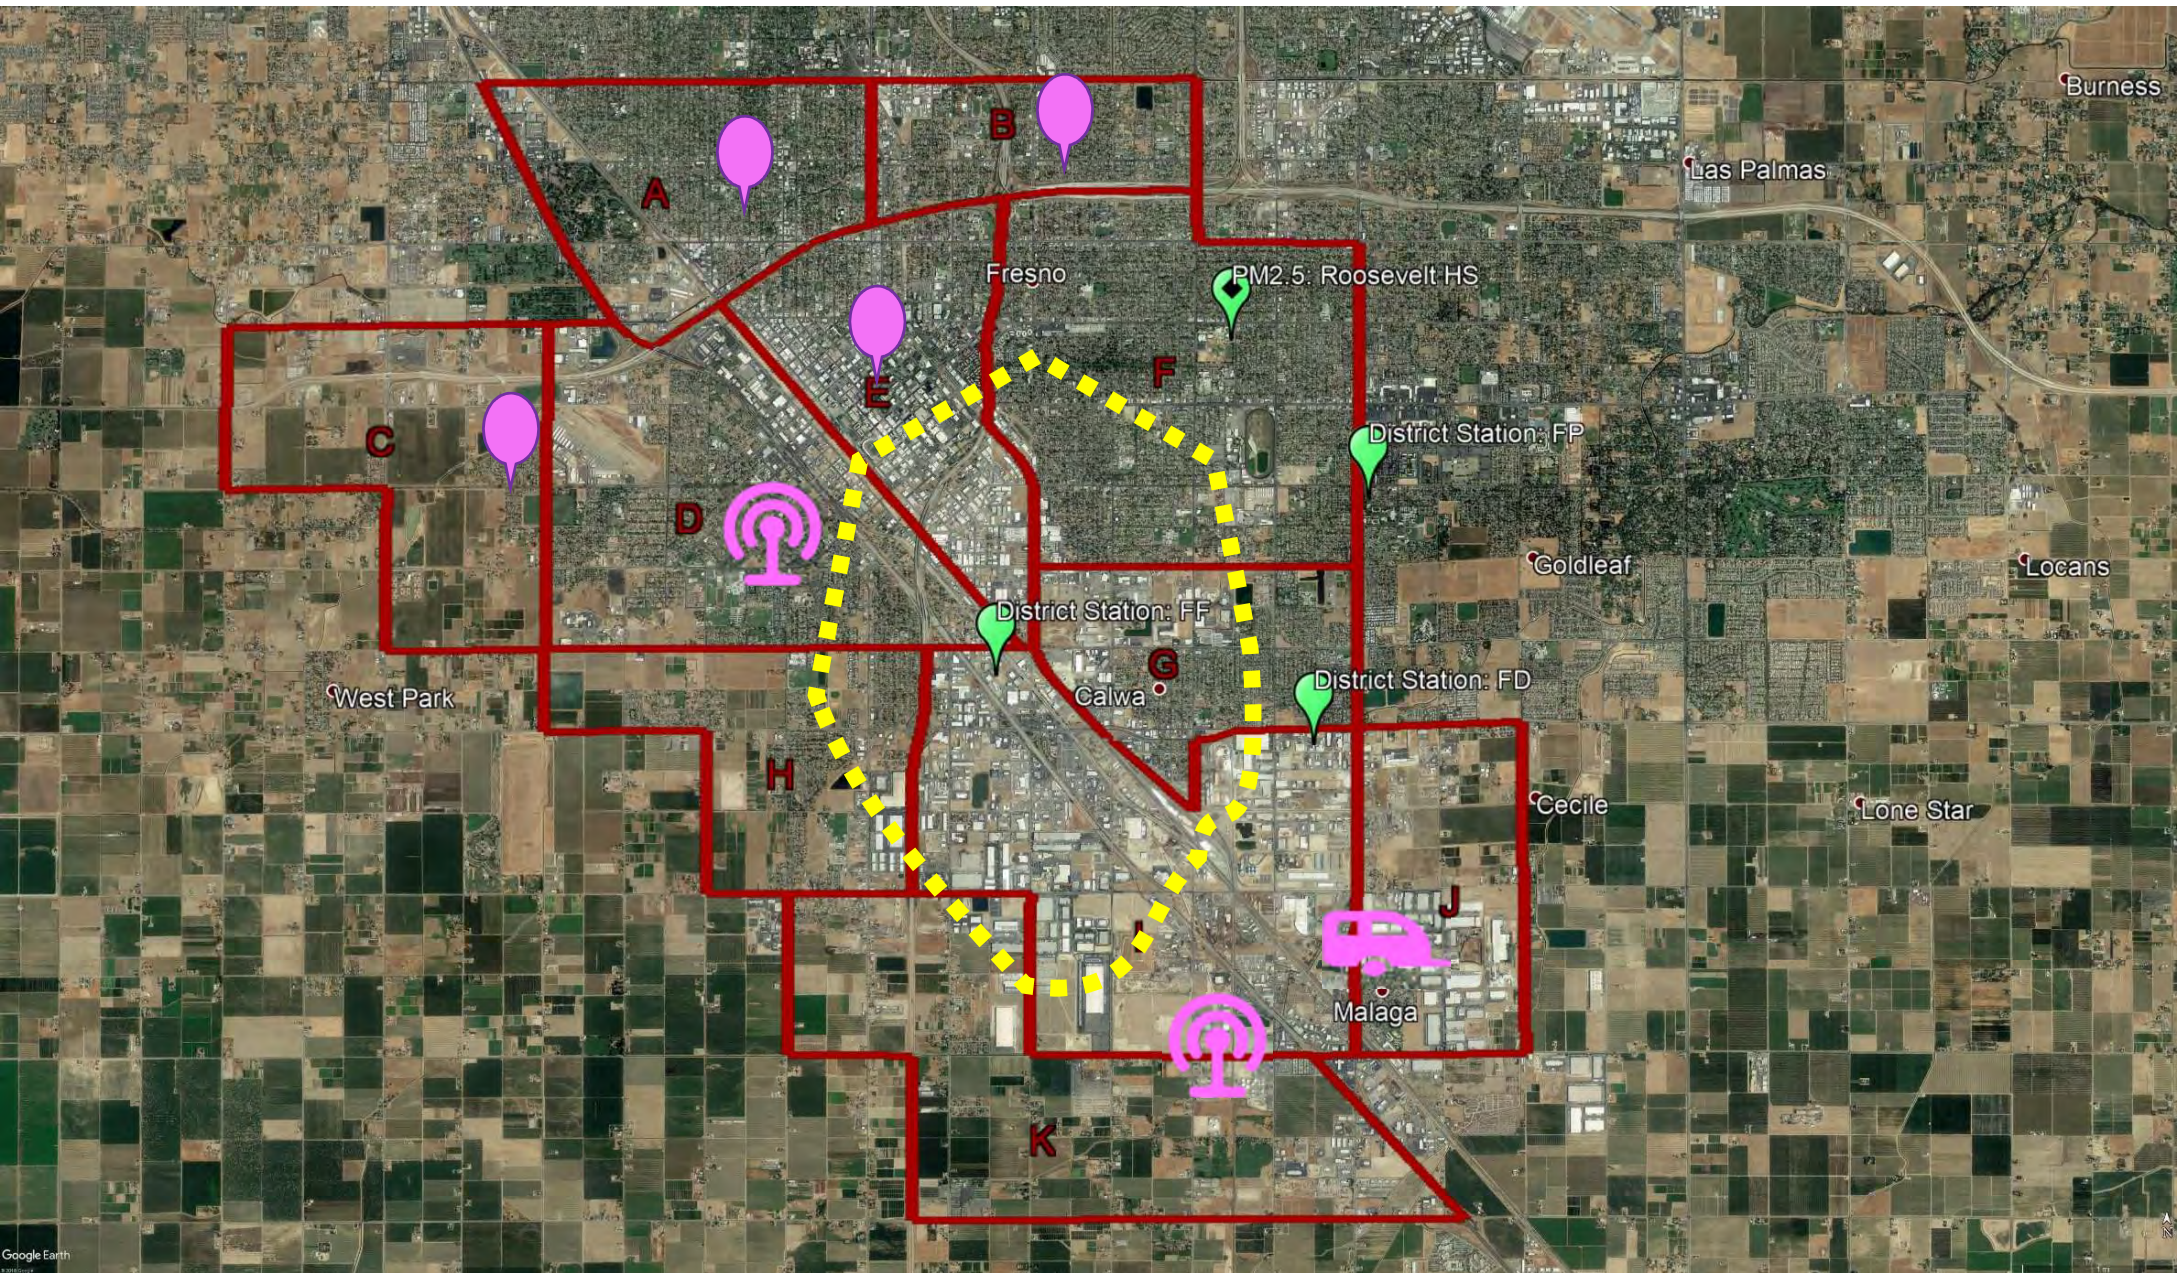

APÉNDICE I – GLOSARIO

TÉRMINO (SIGLA)	DESCRIPCIÓN
Receptores sensibles	Incluye hospitales, escuelas, guarderías y demás instituciones similares que el consejo del distrito de aire o el Consejo de Recursos del Aire de California puedan determinar. Código de Salud y Seguridad de California §42705.5(a)(5)
Sensor de aire	Un dispositivo que mide los contaminantes del aire en tiempo real o casi tiempo real. Por lo general, es un dispositivo portátil, de bajo costo y que necesita menos energía para funcionar en comparación con otros métodos para el monitoreo del aire. https://www.epa.gov/air-sensor-toolbox
Sistema de monitoreo perimetral	Un equipo de monitoreo del aire que mide y registra las concentraciones de contaminantes en el aire, en una fuente fija o cerca de ella, que puede ser útil para detectar o calcular las emisiones de contaminantes de la fuente, incluida la cantidad de emisiones fugitivas, y para respaldar las iniciativas de cumplimiento. Código de Salud y Seguridad de California §42705.5(a)(3)
Tóxicos del aire	Un término genérico que hace referencia a un químico o a un grupo de químicos dañinos que existe en el aire. Las sustancias que son especialmente dañinas para la salud, como las que figuran en el programa de contaminantes peligrosos del aire de la Agencia de Protección Ambiental de los Estados Unidos o en los programas de agentes tóxicos del aire del Proyecto de Ley de la Asamblea 1807 o del Proyecto de Ley de la Asamblea 2588 de California, se consideran agentes tóxicos del aire. Técnicamente, cualquier compuesto que se encuentre en el aire y que tenga el potencial de producir efectos adversos en la salud es un agente tóxico del aire.

Platform Capabilities for Initial Community Air Monitoring Network

Pollutants	Example Sources	Platform			
		Trailer (x1)	Van (x1)	Compact System (x2)	Stand Alone PM2.5 (x4)
PM2.5	Mobile, industry, residential	x	x	x	x
Black Carbon	Mobile, industry, residential	x	x	x	
NO, NO2, NOx	Mobile, industry	x	x	x	
CO	Mobile	x	x	x	
Ozone	Regional, formed from VOC and NOx	x	x	x	
SO2, H2S	Industry	x	x	x	
VOC (BTEX)	Gasoline distribution and marketing	x	x	x	
VOC Auto GC/MS	Industry, mobile	x			
Toxics	Industry, mobile	x	x		
Meteorology		x	x	x

10 Potential Network Design

A General Framework for Thinking about Air Monitoring

Some possible objectives of air monitoring:

- To determine where and when emissions are occurring.
- To determine which sources are primarily responsible for the air pollution.
- To track the progress of the Community Emissions Reduction Programs.
- To support public health research.
- To provide real-time air quality information so that community members can make informed choices and change their behavior to reduce exposure.
- To launch community awareness campaigns.
- To create a new regulatory system of air monitors (i.e. to produce data that could be used by local, state, and federal agencies to enforce regulations).
- *Other key objectives?*

Some critical questions to ask regarding air monitoring and air monitoring systems:

- What will be the duration of air monitoring? How long will the monitor be up and running? What goals or purpose does this decision support?
- What are the specific time periods that should be monitored (i.e. specific seasons, day vs. night, after certain events or scenarios occur, etc.).
- What data already exists and how is it being used?
- Where should monitoring take place? What areas have been ground-truthed? What are the areas of greatest concern?
- Where are sensitive populations located? How should that inform the air monitoring?
- What should the data produced by the monitoring system be used for? And how should it be shared with the public?
- How will the community be involved in the actual implementation of air monitoring?
- *Other key questions?*

Pensando en el Monitoreo de Aire

Algunos posibles objetivos de la monitorización del aire:

- Para determinar dónde y cuándo se producen las emisiones.
- Determinar qué fuentes son las principales responsables de la contaminación del aire.
- Para seguir el progreso de los Programas Comunitarios de Reducción de Emisiones.
- Para apoyar la investigación en salud pública.
- Proporcionar información en tiempo real sobre la calidad del aire para que los miembros de la comunidad puedan tomar decisiones informadas y cambiar su comportamiento para reducir la exposición.
- Lanzar campañas de información a la comunidad.
- Crear un nuevo sistema regulador de monitores de aire (es decir, para producir datos que puedan ser utilizados por agencias locales, estatales y federales para hacer cumplir las regulaciones).
- Otras preguntas?

Algunas preguntas críticas que se deben hacer con respecto a los sistemas de monitoreo de aire y monitoreo de aire:

- ¿Cuál será la duración del monitoreo del aire? ¿Cuánto tiempo estará el monitor en funcionamiento? ¿Qué metas o propósitos apoya esta decisión?
- Cuáles son los períodos de tiempo específicos que deben ser monitoreados (por ejemplo, estaciones específicas, día vs. noche, después de que ocurran ciertos eventos o escenarios, etc.).
- ¿Qué datos ya existen y cómo se utilizan?
- ¿Dónde debe tener lugar el monitoreo? ¿Qué áreas han sido verificadas en persona? ¿Cuáles son las áreas de mayor preocupación?
- ¿Dónde se encuentran las poblaciones sensibles? ¿Cómo debería informar eso al monitoreo del aire?
- ¿Para qué deben utilizarse los datos producidos por el sistema de monitoreo? ¿Y cómo debe compartirse con el público?
- ¿Cómo se involucrará la comunidad en la implementación del monitoreo del aire?
- Otras preguntas?

APPENDIX I. GLOSSARY

The glossary in Table I-1 is intended to clarify the terms used in this document; it does not contain official definitions to be used for other purposes. The California Air Resources Board’s Glossary webpage¹ also provides commonly used terms throughout our webpages and documents and may be used for additional terms not included in the list below.

Table I-1 Glossary of Terms for the Community Air Protection Program

TERM (ACRONYM)	DESCRIPTION
Acute health effect	A health effect that occurs over a relatively short period of time (e.g., minutes, hours). The term is used to describe brief exposures and effects which appear promptly after exposure.
Air district	An air pollution control district, air quality management district, or air resources district, located in California.
Air quality standard	The prescribed level of a pollutant in the outside air that should not be exceeded during a specific time period to protect public health. Established by both federal and State governments.
Air sensor	Device that measures air pollutants on a real-time or near real-time basis that is generally portable, low in cost, and can require less power than other air monitoring methods. https://www.epa.gov/air-sensor-toolbox
Air toxics	A generic term referring to a harmful chemical or group of chemicals in the air. Substances that are especially harmful to health, such as those considered under U.S. Environmental Protection Agency’s hazardous air pollutant program or California’s Assembly Bill 1807 and/or Assembly Bill 2588 air toxics programs, are considered to be air toxics. Technically, any compound that is in the air and has the potential to produce adverse health effects is an air toxic.
Airborne Toxic Control Measure (ATCM)	A control measure adopted by the California Air Resources Board that reduces emissions of toxic air contaminants. California Health and Safety Code § 39666 et seq.

¹ California Air Resources Board’s Glossary webpage: <https://ww2.arb.ca.gov/about/glossary>.

APPENDIX I – GLOSSARY

TERM (ACRONYM)	DESCRIPTION
Area-wide sources	Sources of pollution where the emissions are spread over a wide area, such as consumer products, fireplaces, road dust, and farming operations. Area-wide sources do not include mobile sources or stationary sources.
Assembly Bill 617	<p>Assembly Bill 617 was enacted to reduce exposure in communities most impacted by air pollution. This first-of-its-kind statewide effort includes: community air monitoring; community emissions reduction programs; new requirements for accelerated retrofit of pollution controls on industrial sources; increased penalty fees; and greater transparency and availability of air quality and emissions data.</p> <p>Assembly Bill 617, Garcia, C., Chapter 136, Statutes of 2017, modified the California Health and Safety Code, amending § 40920.6, § 42400, and § 42402, and adding § 39607.1, § 40920.8, § 42411, § 42705.5, and § 44391.2</p>
Attainment area	A geographical area identified to have air quality as good as, or better than, the national and/or California ambient air quality standards. An area may be an attainment area for one pollutant and a nonattainment area for others.
Best available control technology (BACT)	A control technology standard used in preconstruction permit programs. The term is used in the federal prevention of significant deterioration permitting program with a definition found in the federal Clean Air Act and the Code of Federal Regulations. In California, however, it is often used to describe control technology requirements in new source review rules. Usually, definitions used by California air pollution control districts are equivalent to or even more stringent than the federal new source review requirement for control technology and more akin to the lowest achievable emission rate definition used in the federal Clean Air Act.
Best available control technology for toxic air contaminants (T-BACT)	The most effective emissions limitation or control technique which has been achieved in practice or any other emissions limitation or control technique, including process and equipment changes, found by the California Air Resources Board Executive Officer or Air Pollution Control Officer of the air districts to be technologically feasible for a class or category of source.
Best available retrofit control technology (BARCT)	An air emission limitation that applies to existing sources and is based on the maximum degree of reduction achievable, taking into account environmental, energy, and economic impacts by each class or category of source.

APPENDIX I – GLOSSARY

TERM (ACRONYM)	DESCRIPTION
CalEnviroScreen	Developed by the California Environmental Protection Agency and the Office of Environmental Health Hazard Assessment, CalEnviroScreen is a screening tool that is used to help identify communities disproportionately burdened by multiple sources of pollution and with population characteristics that make them more sensitive to pollution. https://oehha.ca.gov/calenviroscreen
California Air Pollution Control Officers Association (CAPCOA)	CAPCOA is an association of Air Pollution Control Officers representing all 35 local air quality agencies throughout California.
California Air Resources Board Governing Board (CARB Governing Board)	The Governing Board for the California Air Resources Board consists of 16 members, of which 12 members are appointed by the Governor and confirmed by the State Senate. The 12 members include 5 who serve on air districts, 4 experts in fields that shape air quality rules, 2 public members, and the Chair, who serves as the only full-time member. The other 4 members include 2 who represent environmental justice communities (1 appointed by the Senate and the other by the Assembly) and 2 non-voting members appointed for Legislative oversight, 1 each from the Senate and Assembly.
California Environmental Quality Act (CEQA)	A California law that sets forth a process for public agencies to make informed decisions on discretionary project approvals. The process aids decision-makers to determine whether any environmental impacts are associated with a proposed project. It requires environmental impacts associated with a proposed project to be eliminated or reduced and that air quality mitigation measures are implemented.
Chronic health effect	A health effect that occurs over a relatively long period of time (e.g., months, years).
Community Air Protection Program (Program)	The program established by the California Air Resources Board to implement the requirements set forth in Assembly Bill 617.
Community Air Protection Blueprint (Blueprint)	A set of elements designed to meet Assembly Bill 617's requirements to develop a statewide strategy and statewide air monitoring plan for the California Air Resources Board consideration. These elements include the process for identifying impacted communities, statewide strategies to reduce emissions of criteria air pollutants and toxic air contaminants, as well as proposed criteria for deployment of community air monitoring and development and implementation of community emissions reduction programs.

APPENDIX I – GLOSSARY

TERM (ACRONYM)	DESCRIPTION
Criteria air pollutants	Air pollutants for which acceptable levels of exposure can be determined and for which an ambient air quality standard has been set. Examples include: ozone, carbon monoxide, nitrogen dioxide, sulfur dioxide, particulate matter 10 and particulate matter 2.5.
Cumulative impacts	The exposures, public health, or environmental effects from the combined emissions and discharges, in a geographic area, including environmental pollution from all sources, whether single or multi-media, routinely, accidentally, or otherwise released. Impacts will take into account sensitive populations and socio-economic factors, where applicable and to the extent data are available. The high cumulative impacts the Community Air Protection Program addresses are those related to emissions of criteria air pollutants and toxic air contaminants. https://oehha.ca.gov/calenviroscreen/report/cumulative-impacts-building-scientific-foundation-report
Data quality indicators	Data quality indicators include a variety of metrics used to ensure data will meet defined standards of quality at stated level of confidence appropriate to satisfy air monitoring objective(s). Examples are listed in Table E-1.
Data quality objectives	Performance and acceptance criteria of monitoring data needed to support specific actions or decisions.
Diesel particulate matter	The solid material in diesel exhaust. Diesel particulate matter is typically composed of carbon particles (“soot”, also called black carbon) and numerous organic compounds, including over 40 known cancer-causing organic substances. More than 90 percent of diesel particulate matter is less than 1 micron in diameter, and thus is a subset of particulate matter less than 2.5 microns in diameter. https://www.arb.ca.gov/research/diesel/diesel-health.htm
Disadvantaged communities	These communities are identified based on geographic, socioeconomic, public health, and environmental hazard criteria, and may include, but are not limited to, either of the following: (1) areas disproportionately affected by environmental pollution and other hazards that can lead to negative public health effects, exposure, or environmental degradation or (2) areas with concentrations of people that are of low-income, high unemployment, low levels of homeownership, high rent burden, sensitive populations, or low levels of educational attainment. California Health and Safety Code § 39711(a)

APPENDIX I – GLOSSARY

TERM (ACRONYM)	DESCRIPTION
Emissions inventory	An estimate of the amount of pollutants emitted into the atmosphere from categories of mobile, area-wide, and stationary sources caused by human activity as well as from natural sources. Natural source emissions include biogenic hydrocarbons, geogenic hydrocarbons, natural wind-blown dust, and wildfire emissions. Emissions from a particular source are estimated as mass of a pollutant emitted over a specific period of time, such as a tons per day or tons per year.
Environmental justice	The fair treatment of people of all races and incomes with respect to development, implementation and enforcement of environmental laws, regulations, and policies.
Fence-line monitoring system	Air monitoring equipment that measures and records air pollutant concentrations at or adjacent to a stationary source that may be useful for detecting or estimating emissions of pollutants from the source, including the quantity of fugitive emissions, and in supporting enforcement efforts. California Health and Safety Code § 42705.5(a)(3)
Fiscal Year (FY)	A 12-month period during which revenue is earned and received, obligations are incurred, encumbrances are made, appropriations are expended, and for which other fiscal transactions are recognized. In California State government, the fiscal year begins July 1 and ends the following June 30. For example, if reference is made to the State's Fiscal Year 2017-2018, this is the time period beginning July 1, 2017 and ending June 30, 2018. http://www.ebudget.ca.gov/reference/GlossaryOfTerms.pdf
Greenhouse gases (GHG)	Atmospheric gases such as carbon dioxide, methane, chlorofluorocarbons, nitrous oxide, ozone, and water vapor that slow the passage of re-radiated heat through the Earth's atmosphere.
Mobile monitoring	A measurement platform equipped with instrumentation that can quickly measure air pollutant concentrations while in motion.
Mobile sources	Sources of air pollution such as automobiles, motorcycles, trucks, off-road vehicles, boats, and airplanes.
Nonattainment area	A geographic area identified by the U.S. Environmental Protection Agency and/or the California Air Resources Board as not meeting either the National Ambient Air Quality Standards or the California Ambient Air Quality Standards for a given pollutant.

APPENDIX I – GLOSSARY

TERM (ACRONYM)	DESCRIPTION
Ozone	A product of the photochemical process involving the sun's energy and ozone precursors, such as hydrocarbons and oxides of nitrogen. Ozone exists in the upper atmosphere ozone layer (stratospheric ozone) as well as at the Earth's surface in the troposphere (ozone). Ozone in the troposphere causes numerous adverse health effects and is a criteria air pollutant. It is a major component of smog.
Particulate matter	Any material, except pure water, that exists in the solid or liquid state in the atmosphere. The size of particulate matter can vary from coarse, wind-blown dust particles to fine particle combustion products.
Particulate matter 10 (PM10)	Particulate matter 10 microns or less in aerodynamic diameter (about 1/7 the diameter of a single human hair). Their small size allows them to make their way to the air sacs deep within the lungs where they may be deposited and result in adverse health effects. PM10 also causes visibility reduction.
Particulate matter 2.5 (PM2.5)	Particulate matter 2.5 microns or less in aerodynamic diameter. This fraction of particulate matter penetrates most deeply into the lungs.
Proximity-based goal	Measurable goals included in community emissions reduction programs to reduce exposure at sensitive receptor locations that are exposed to elevated levels because of their proximity to emissions sources.
Remote sensing	The use of instrumentation that may be deployed on ground-based, airborne, or spaceborne platforms that measures reflected or emitted radiation to collect information about air pollutant concentrations and meteorological conditions.
Resource Center	The California Air Resources Board's online repository that houses tools for community members, air districts, and other stakeholders to use when developing and implementing the Community Air Protection Program. https://ww2.arb.ca.gov/our-work/programs/Community-Air-Protection-Program
Sensitive receptors	Includes hospitals, schools, and day care centers, and such other locations as the air district board or California Air Resources Board may determine. California Health and Safety Code § 42705.5(a)(5)
Source attribution	An assessment identifying the contributing sources or categories of sources, including, but not limited to, stationary and mobile sources, and an estimate of their relative contribution to elevated exposure to air pollution in impacted communities.

APPENDIX I – GLOSSARY

TERM (ACRONYM)	DESCRIPTION
Statewide assessment	A document developed by California Air Resources Board (CARB) staff to summarize community information as well as air district and/or CARB statewide assessment outcomes for each community that is recommended to the CARB Governing Board for consideration for deployment of community air monitoring and/or the development of community emissions reduction programs. The statewide assessment provides an overview of the information used to make the staff's recommendation to the CARB Governing Board.
Stationary sources	Non-mobile sources such as power plants, refineries, and manufacturing facilities which emit air pollutants.
Supplemental Environmental Projects	Community-based projects to improve public health, reduce pollution, increase environmental compliance, and bring public awareness to neighborhoods most burdened by environmental harm that are funded from a portion of the penalties received during settlement of enforcement actions. https://www.arb.ca.gov/enf/seppolicy.htm
Toxic air contaminants	An air pollutant, identified in regulation by CARB, which may cause or contribute to an increase in deaths or in serious illness, or which may pose a present or potential hazard to human health. Health effects of toxic air contaminants may occur at extremely low levels and it is typically difficult to identify levels of exposure that do not produce adverse health effects.
Quality assurance	An integrated program used to document and provide confidence that data quality requirements will be fulfilled.
Quality control	Quality control is a set of routine procedures used to verify the quality of data and ensure that data quality objectives are being met while monitoring is underway.

Pollutants	Example Sources	Platform			
		Trailer	Van	Compact System	Stand Alone PM2.5
PM2.5	Mobile, industry, residential	x	x	x	x
Black Carbon	Mobile, industry, residential	x	x	x	
NO, NO2, NOx	Mobile, industry	x	x	x	
CO	Mobile	x	x	x	
Ozone	Regional, formed from VOC and NOx	x	x	x	
SO2, H2S	Industry	x	x	x	
VOC (BTEX)	Gasoline distribution and marketing	x	x	x	
VOC Auto GC/MS	Industry, mobile	x	x		
Toxics	Industry, mobile	x	x		
Meteorology		x	x	x	

Glossary

PM2.5	Particulate Matter of 2.5 microns or less
Black Carbon	Primarily from diesel particulate matter
NO, NO2, NOx	Oxides of Nitrogen (precursor to PM2.5, Ozone)
CO	Carbon Monoxide
Ozone	Regional, formed from VOC and NOx
SO2, H2S	Sulfur Dioxide, Hydrogen Sulfide
VOC (BTEX)	Volatile Organic Compounds (Benzene, Toluene, Ethylene, Xylene)
VOC Auto GC/MS	Other non BTEX Volatile Organic Compounds
Toxics	Many different compounds that can cause harmful health effects
Meteorology	Wind speed, wind direction, temperature, humidity

Community Air Monitoring Network Design Worksheet

Full-sized Trailer = select top 2 air monitoring zones as your highest priority areas

Compact System = select top 3 air monitoring zones as your highest priority areas

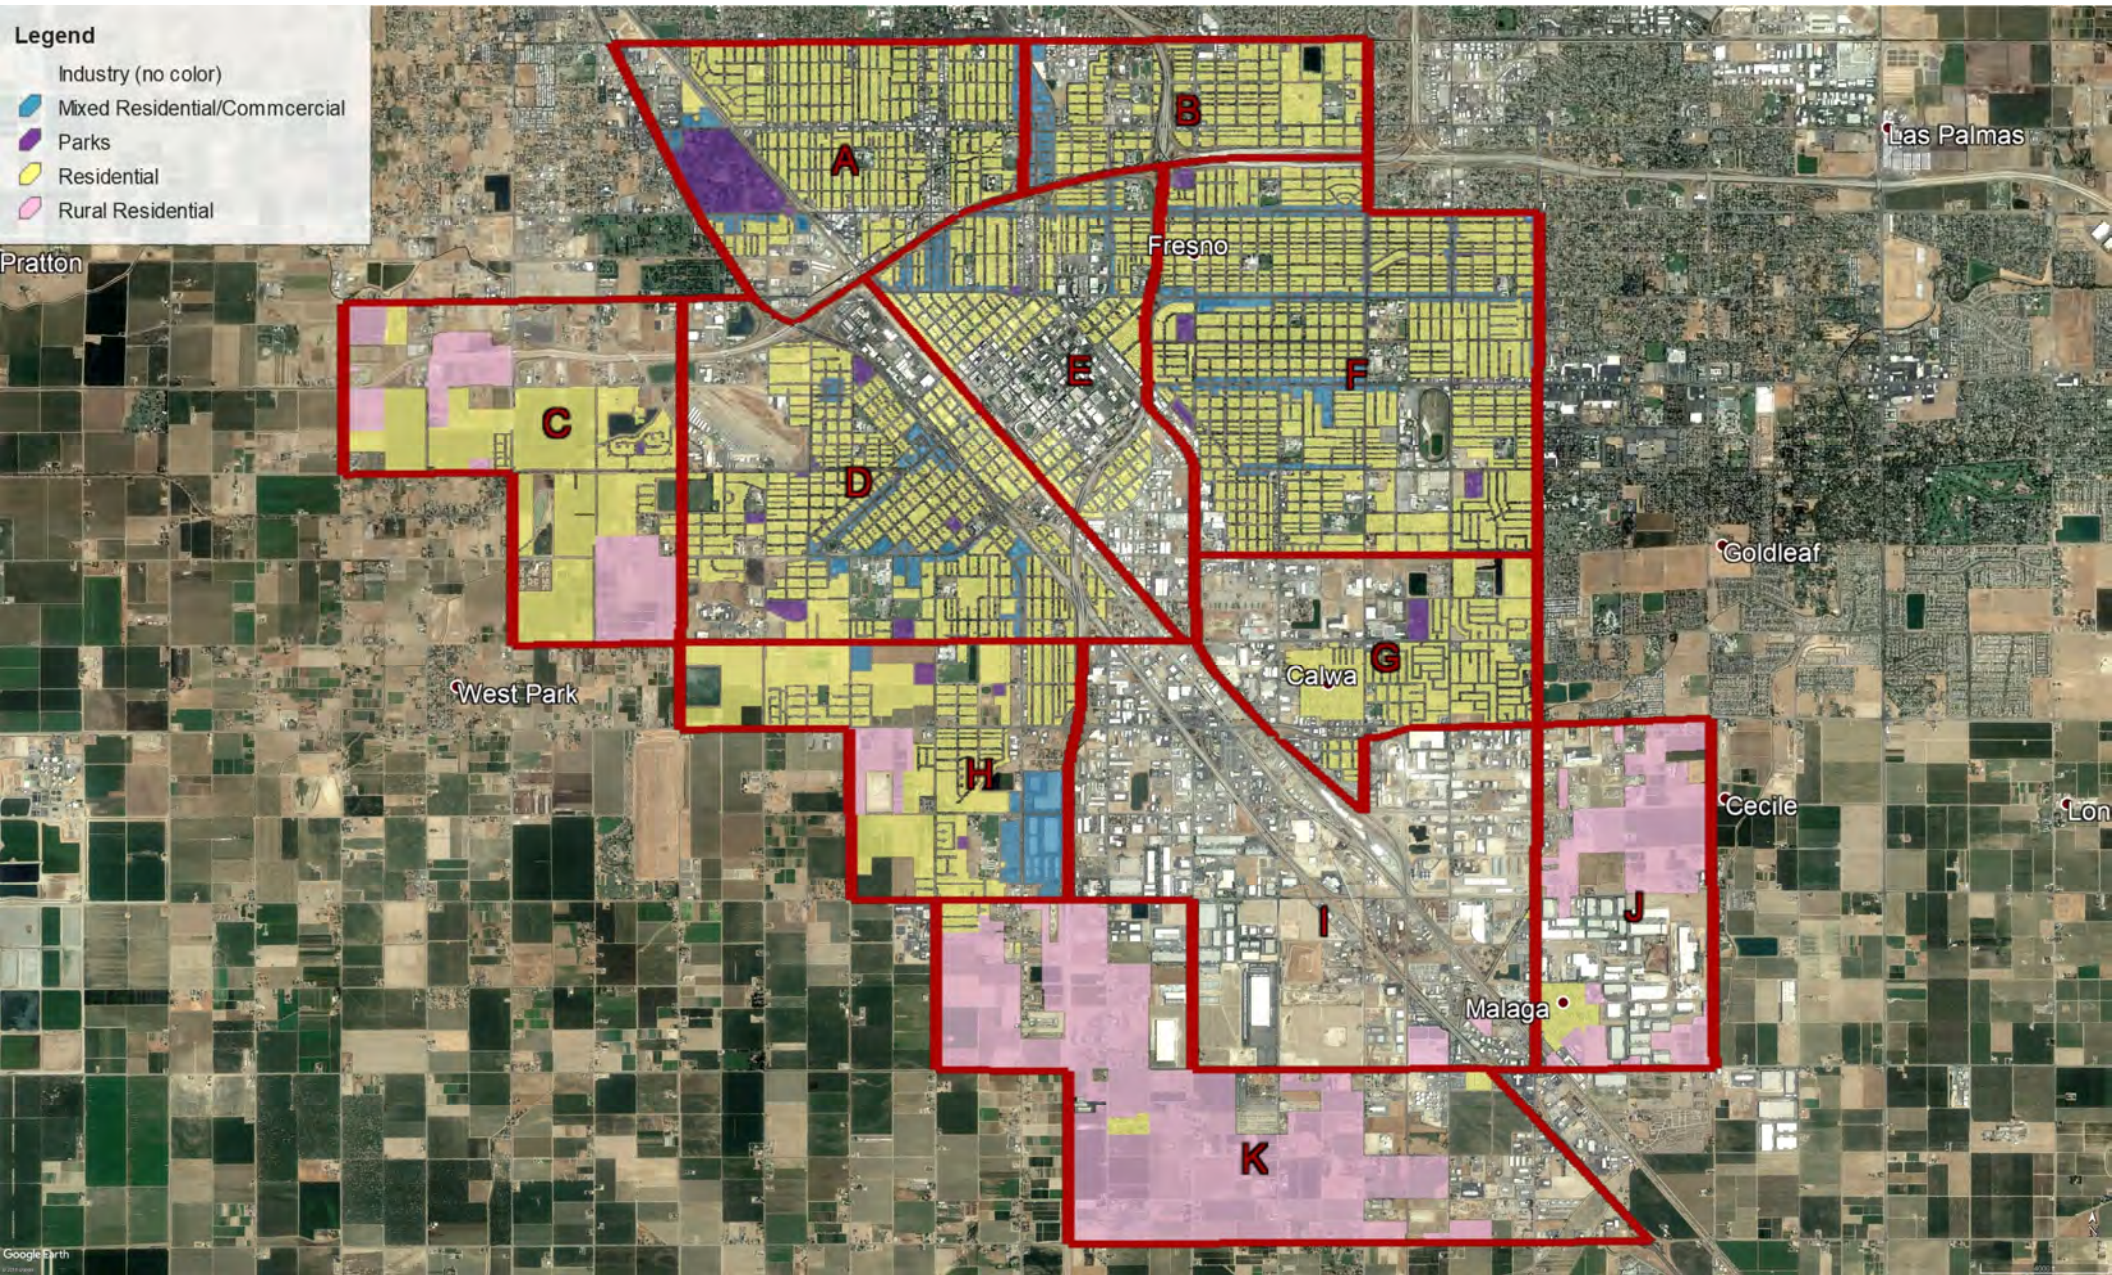

PM2.5 Stand Alone = select 4 air monitoring zones as your highest priority areas

10 Diseño Potencial

Pensando en el Monitoreo de Aire

Algunos posibles objetivos de la monitorización del aire:

- Para determinar dónde y cuándo se producen las emisiones.
- Determinar qué fuentes son las principales responsables de la contaminación del aire.
- Para seguir el progreso de los Programas Comunitarios de Reducción de Emisiones.
- Para apoyar la investigación en salud pública.
- Proporcionar información en tiempo real sobre la calidad del aire para que los miembros de la comunidad puedan tomar decisiones informadas y cambiar su comportamiento para reducir la exposición.
- Lanzar campañas de información a la comunidad.
- Crear un nuevo sistema regulador de monitores de aire (es decir, para producir datos que puedan ser utilizados por agencias locales, estatales y federales para hacer cumplir las regulaciones).
- Otras preguntas?

Algunas preguntas críticas que se deben hacer con respecto a los sistemas de monitoreo de aire y monitoreo de aire:

- ¿Cuál será la duración del monitoreo del aire? ¿Cuánto tiempo estará el monitor en funcionamiento? ¿Qué metas o propósitos apoya esta decisión?
- Cuáles son los períodos de tiempo específicos que deben ser monitoreados (por ejemplo, estaciones específicas, día vs. noche, después de que ocurran ciertos eventos o escenarios, etc.).
- ¿Qué datos ya existen y cómo se utilizan?
- ¿Dónde debe tener lugar el monitoreo? ¿Qué áreas han sido verificadas en persona? ¿Cuáles son las áreas de mayor preocupación?
- ¿Dónde se encuentran las poblaciones sensibles? ¿Cómo debería informar eso al monitoreo del aire?
- ¿Para qué deben utilizarse los datos producidos por el sistema de monitoreo? ¿Y cómo debe compartirse con el público?
- ¿Cómo se involucrará la comunidad en la implementación del monitoreo del aire?
- Otras preguntas?

APÉNDICE I.

GLOSARIO

El glosario de la Tabla I-1 tiene el objetivo de aclarar los términos usados en este documento; no contiene definiciones oficiales que se usen para otros fines. La página web donde se encuentra el glosario del Consejo de Recursos del Aire de California¹ (*California Air Resources Board, CARB*) también proporciona los términos comúnmente utilizados en todas nuestras páginas web y documentos, y puede utilizarse para consultar términos adicionales que no estén incluidos en la lista a continuación.

Tabla I-1 Glosario de Términos para el Programa de Protección del Aire en la Comunidad

TÉRMINO (SIGLA)	DESCRIPCIÓN
Año fiscal (<i>Fiscal Year, FY</i>)	Un período de 12 meses durante el cual se generan ganancias, se incurre en obligaciones, se realizan gravámenes, se gastan las asignaciones y para el cual se reconocen transacciones fiscales. En el gobierno del Estado de California, el año fiscal comienza el 1 de julio y finaliza el 30 de junio. Por ejemplo, si se hace una referencia al año fiscal estatal 2017-2018, este es el período que comienza el 1 de julio de 2017 y termina el 30 de junio de 2018. http://www.ebudget.ca.gov/reference/GlossaryOfTerms.pdf
Área de obtención	Un área geográfica con una calidad de aire igual o mejor, que los estándares de calidad del aire ambiental nacionales o de California. Un área puede ser un área de obtención con respecto a un contaminante y un área sin obtención para otros contaminantes.
Área sin obtención	Un área geográfica que la Agencia de Protección Ambiental de los Estados Unidos o el Consejo de Recursos del Aire de California identifica como un área que no cumple con los Estándares Nacionales de la Calidad del Aire Ambiental ni con los Estándares de California de la Calidad del Aire Ambiental para un agente contaminante determinado.
Aseguramiento de calidad	Un programa integrado utilizado para documentar el cumplimiento de los requisitos de calidad y generar confianza en que se cumplirán.

¹ Página web donde se encuentra el glosario del Consejo de Recursos del Aire de California:
<https://ww2.arb.ca.gov/about/glossary>.

APÉNDICE I – GLOSARIO

TÉRMINO (SIGLA)	DESCRIPCIÓN
Asociación de Funcionarios de Control de la Calidad del Aire (<i>California Air Pollution Control Officers Association, CAPCOA</i>)	CAPCOA es una asociación de funcionarios de control de la contaminación del aire que representa a las 35 agencias locales de calidad del aire de California.
Atribución de las fuentes	Una evaluación para identificar las fuentes o las categorías de las fuentes que contribuyen, incluidas, entre otras, fuentes fijas y móviles, y una estimación de su contribución relativa a la alta exposición a la contaminación del aire en las comunidades afectadas.
CalEnviroScreen	Desarrollado por la Agencia de Protección Ambiental de California y la Oficina de Evaluación de Riesgos a la Salud Ambiental (<i>Office of Environmental Health Hazard Assessment, OEHHA</i>), CalEnviroScreen es una herramienta de evaluación que se utiliza para identificar las comunidades que tienen una carga desproporcionada de fuentes de contaminación múltiples y con características poblacionales que las vuelven más susceptibles a la contaminación. https://oehha.ca.gov/calenviroscreen
Centro de Recursos	El Consejo de Recursos del Aire de California cuenta con un repositorio en línea que almacena las herramientas que los miembros de la comunidad, los distritos de aire y demás partes interesadas pueden utilizar cuando desarrollan e implementan el Programa de Protección del Aire en la Comunidad. https://ww2.arb.ca.gov/our-work/programs/Community-Air-Protection-Program-AB617
Comunidades en desventaja	Estas comunidades se identifican según criterios geográficos, socioeconómicos, de salud pública y de peligro medioambiental y pueden incluir, entre otros, lo siguiente: (1) áreas afectadas de manera desproporcionada por la contaminación ambiental y por otros peligros que pueden generar efectos negativos en la salud pública, exposición o degradación ambiental o (2) áreas con concentraciones de personas con bajos ingresos, alto desempleo, pocos propietarios de viviendas, cargas de renta elevadas, poblaciones vulnerables o niveles educativos bajos. Código de Salud y Seguridad de California §39711(a)

APÉNDICE I – GLOSARIO

TÉRMINO (SIGLA)	DESCRIPCIÓN
Consejo Gobernante del Consejo de Recursos del Aire de California (Consejo Gobernante de CARB)	El Consejo Gobernante del Consejo de Recursos del Aire de California está compuesta por 16 miembros, de los cuales 12 son designados por el gobernador y confirmados por el Senado del Estado. Los 12 incluyen 5 que trabajan en los distritos de aire locales, 4 expertos en campos que desarrollan las normas de calidad del aire, 2 miembros del público y 1, el presidente, que es el único miembro de tiempo completo. Los otros 4 miembros incluyen 2 que representan a las comunidades de justicia ambiental (1 designado por el Senado y otro, por la Asamblea) y 2 miembros sin derecho a voto designados para la supervisión legislativa, 1 del Senado y otro de la Asamblea.
Contaminantes del aire de criterio	Contaminantes del aire para los que se pueden determinar niveles aceptables y para los que se debe establecer un estándar de calidad del aire ambiental. Los ejemplos incluyen lo siguiente: ozono, monóxido de carbono, dióxido de nitrógeno, dióxido de azufre, materia particulada 10 y materia particulada 2.5.
Contaminantes tóxicos del aire	Un contaminante del aire, que se identifica según las regulaciones de CARB, que puede provocar o contribuir al aumento de muertes o enfermedades graves, o que puede generar un peligro en la actualidad o a futuro para la salud de los seres humanos. Los efectos en la salud de los contaminantes tóxicos del aire pueden ocurrir a niveles extremadamente bajos y, por lo general, es difícil identificar niveles de exposición que no produzcan efectos adversos para la salud.
Control de calidad	El control de calidad es un conjunto de procedimientos de rutina para verificar la calidad de los datos y garantizar que los objetivos de calidad de estos se cumplan, al mismo tiempo que se lleva a cabo el monitoreo.
Detección remota	El uso de instrumentos que se pueden implementar en plataformas terrestres, aéreas o espaciales, que miden la radiación emitida o reflejada a fin de recopilar información acerca de las concentraciones de contaminantes en el aire y de las condiciones meteorológicas.
Distrito de aire	Un distrito de control de la contaminación del aire, de gestión de la calidad del aire o de recursos del aire ubicado en California.
Efecto crónico en la salud	Un efecto en la salud que se produce en un período relativamente largo (p. ej., en meses o años).

APÉNDICE I – GLOSARIO

TÉRMINO (SIGLA)	DESCRIPCIÓN
Efecto grave en la salud	Un efecto en la salud que se produce en un período relativamente corto (p. ej., en minutos u horas). El término se utiliza para describir exposiciones y efectos breves que aparecen de inmediato luego de la exposición.
Estándar de calidad del aire	El nivel establecido de un contaminante en el aire exterior que no se debe superar en un período específico, a fin de proteger la salud pública. Es establecido por el gobierno estatal y el gobierno federal.
Evaluación estatal	Un documento desarrollado por el personal del Consejo de Recursos del Aire de California (<i>California Air Resources Board</i> , CARB) con el fin de resumir la información de la comunidad, como también los resultados de las evaluaciones de los distritos de aire o de la evaluación estatal de CARB para cada comunidad recomendada al Consejo Gobernante de CARB para consideración para el despliegue del monitoreo del aire en la comunidad y/o el desarrollo de programas de reducción de emisiones en la comunidad. La evaluación estatal proporciona una descripción general de la información utilizada para presentarle las recomendaciones del personal a el Consejo Gobernante de CARB.
Fuentes de áreas extendidas	Fuentes de contaminación en las cuales las emisiones se esparcen en un área amplia como, por ejemplo, productos del consumidor, chimeneas, polvo en la carretera y trabajos agrícolas. Las fuentes de áreas extendidas no incluyen las fuentes móviles ni las fuentes fijas.
Fuentes estacionarias	Fuentes que no son móviles, como plantas de energía, refinerías y fábricas, que emiten contaminantes del aire.
Fuentes móviles	Fuentes de contaminación del aire como automóviles, motocicletas, camiones, vehículos todoterreno, embarcaciones y aviones.
Gases de efecto invernadero (<i>Greenhouse gases</i> , GHG)	Los gases atmosféricos, como dióxido de carbono, metano, clorofluorocarbonos, óxido nitroso, ozono y vapor de agua, que demoran el paso del calor que se vuelve a irradiar a través de la atmósfera terrestre.

APÉNDICE I – GLOSARIO

TÉRMINO (SIGLA)	DESCRIPCIÓN
Impactos acumulativos	<p>Las exposiciones o los efectos ambientales o de salud pública de las emisiones y las descargas combinadas, en un área geográfica, que incluyen la contaminación ambiental de todas las fuentes, ya sea única o múltiple, rutinaria, accidental o emitida de algún otro modo. En los impactos se tendrán en cuenta las poblaciones vulnerables y los factores socioeconómicos, según sea necesario y en la medida en la que los datos estén disponibles. Los altos efectos acumulativos que aborda el programa de protección del aire de la comunidad son aquellos relacionados con las emisiones de contaminantes del aire de criterio y contaminantes del aire tóxicos.</p> <p>https://oehha.ca.gov/calenviroscreen/report/cumulative-impacts-building-scientific-foundation-report</p>
Indicadores de calidad de los datos	<p>Los indicadores de calidad de los datos incluyen una serie de métricas utilizadas para asegurarse de que los datos cumplan con los estándares de calidad definidos en el nivel establecido de seguridad que sea adecuado para alcanzar los objetivos de monitoreo del aire. Los ejemplos están enumerados en la Tabla E-1.</p>
Inventario de emisiones	<p>Un cálculo de la cantidad de contaminantes liberados a la atmósfera a partir de categorías de fuentes móviles, de áreas extendidas y fijas provocadas por la actividad humana y de fuentes naturales. Las fuentes naturales de emisiones incluyen hidrocarburos biogénicos y geogénicos, polvo natural transportado por el viento y emisiones de incendios forestales. Las emisiones de una fuente en particular se calculan como una masa de contaminante emitido durante un período específico, como en toneladas por día o por año.</p>
Justicia ambiental	<p>El tratamiento justo de las personas de todas las razas e ingresos con respecto al desarrollo, la implementación y la aplicación de las leyes, reglamentaciones y políticas ambientales.</p>
Ley de Calidad Ambiental de California (<i>California Environmental Quality Act</i> , CEQA)	<p>Una ley de California que establece un proceso para que las agencias públicas tomen decisiones informadas sobre las aprobaciones discrecionales de proyectos. El proceso ayuda a las personas encargadas de tomar decisiones a determinar si existe algún impacto ambiental relacionado con un proyecto propuesto. Exige que se eliminen o reduzcan los impactos ambientales relacionados con un proyecto propuesto y que se implementen medidas de mitigación de la calidad del aire.</p>

APÉNDICE I – GLOSARIO

TÉRMINO (SIGLA)	DESCRIPCIÓN
Materia particulada	Cualquier material, excepto agua pura, que existe en estado sólido o líquido en la atmósfera. El tamaño de las partículas puede variar, desde partículas gruesas transportadas por el viento hasta partículas finas de la combustión de productos.
Materia particulada 2.5 (<i>particulate matter 2.5</i> , PM2.5)	Materia particulada que tiene un diámetro aerodinámico de 2.5 micrones o menos. Esta fracción de partículas penetra más profundamente en los pulmones.
Materia particulada 10 (<i>particulate matter 10</i> , PM10)	Materia particulada que tiene un diámetro aerodinámico de 10 micrones o inferior (alrededor de 1/7 del diámetro de un cabello humano). El tamaño pequeño les permite ingresar en los sacos de aire que se encuentran en las profundidades de los pulmones, donde pueden quedar depositados y producir efectos negativos para la salud. Las PM10 también causan reducción de la visibilidad.
Materia particulada de diésel	El material sólido en el escape diésel. Por lo general, las partículas de diésel están compuestas de partículas de carbono (“hollín”, también llamado carbono negro) y varios compuestos orgánicos, incluidas más de 40 sustancias orgánicas cancerígenas. Más del 90 por ciento de las partículas de diésel tiene un diámetro inferior a 1 micrón; por lo tanto, es un subconjunto de partículas con un diámetro inferior a menos de 2.5 micrones. https://www.arb.ca.gov/research/diesel/diesel-health.htm
Medida de Control de Contaminantes Tóxicos Transmitidos en el Aire (<i>Airborne Toxic Control Measures</i> , ATCM).	Es una medida de control que adoptó el Consejo de Recursos del Aire de California, que reduce las emisiones de los contaminantes tóxicos del aire. Código de Salud y Seguridad de California §39666 y siguientes.
Mejor tecnología de control disponible para contaminantes tóxicos del aire (<i>best available control technology for toxic air contaminants</i> , T-BACT).	La técnica más efectiva para limitar o controlar las emisiones que se logró en la práctica o cualquier otra técnica para limitar o controlar las emisiones, incluyendo cambios en el proceso y equipo, que resultó ser tecnológicamente viable para una clase o categoría de fuente por el Director Ejecutivo del Consejo de Recursos del Aire de California o para el Funcionario de Control de la Contaminación del Aire de los distritos de aire.

APÉNDICE I – GLOSARIO

TÉRMINO (SIGLA)	DESCRIPCIÓN
Mejor tecnología de readaptación disponible para el control de emisiones (<i>best available retrofit control technology</i> , BARCT)	Un límite de la emisión de aire que se aplica a las fuentes existentes y que se basa en el grado máximo de reducción que se puede lograr, teniendo en cuenta los impactos ambientales, energéticos y económicos según cada clase o categoría de fuente.
Mejor tecnología disponible para el control de emisiones (<i>best available control technology</i> , BACT).	Un estándar de tecnología de control utilizado en los programas de permisos previos a la construcción. El término se utiliza en el programa federal de permisos para la prevención del deterioro significativo, y su definición puede encontrarse en la Ley de Aire Limpio (<i>Clean Air Act</i>) y el Código de Reglamentos Federales (<i>Code of Federal Regulations</i>). Sin embargo, en California, con frecuencia se utiliza para describir los requisitos de tecnología de control en las reglas de revisión de fuentes nuevas. Por lo general, las definiciones utilizadas por los distritos de control de la contaminación del aire de California son equivalentes al requisito de revisión de fuentes nuevas federal para la tecnología de control, o bien más estrictas, y más parecidas a la definición de tasa de emisión mínima alcanzable utilizada en la Ley de Aire Limpio federal.
Monitoreo móvil	Una plataforma de medición equipada con instrumentos que pueden medir rápidamente las concentraciones de contaminantes en el aire mientras están en movimiento.
Objetivo basado en la proximidad	Objetivos mensurables incluidos en los programas de reducción de emisiones en la comunidad para reducir la exposición en ubicaciones de receptores sensibles que están expuestos a niveles elevados debido a su proximidad a las fuentes de emisiones.
Objetivos de calidad de los datos	Criterios de rendimiento y aceptación para monitorear los datos necesarios y, de esta manera, respaldar medidas y decisiones específicas.
Ozono	Un producto del proceso fotoquímico que incluye energía solar y precursores de ozono, como, por ejemplo, hidrocarburos y óxidos de nitrógeno. El ozono existe en la capa de ozono superior de la atmósfera (ozono estratosférico) y en la superficie terrestre de la tropósfera (ozono). El ozono en la tropósfera provoca muchos efectos adversos en la salud y es un contaminante del aire de criterio. Es un componente importante del esmog.

APÉNDICE I – GLOSARIO

TÉRMINO (SIGLA)	DESCRIPCIÓN
Plan Marco para la Protección del Aire en la Comunidad (Plan Marco)	Un conjunto de elementos que están diseñados para cumplir con los requisitos del Proyecto de Ley de la Asamblea 617 para desarrollar una estrategia y un plan de monitoreo de aire estatales con el propósito de que sean evaluados por el Consejo de Recursos del Aire de California. Estos elementos incluyen el proceso para identificar a las comunidades afectadas, las estrategias estatales para reducir las emisiones de los contaminantes del aire de criterio y los contaminantes del aire tóxicos, como también los criterios propuestos para la implementación del monitoreo del aire en las comunidades, y el desarrollo y la implementación de los programas comunitarios de reducción de emisiones.
Programa de Protección del Aire en la Comunidad (Programa)	El programa establecido por el Consejo de Recursos del Aire de California para implementar los requisitos definidos en el Proyecto de Ley de la Asamblea 617.
Proyecto de Ley de la Asamblea 617	<p>El Proyecto de Ley de la Asamblea 617 se promulgó para reducir la exposición en las comunidades más afectadas por la contaminación del aire. Esta primera iniciativa estatal, única en su tipo, incluye el monitoreo del aire de la comunidad; programas de reducción de emisiones de la comunidad; nuevos requisitos para la adaptación acelerada de los controles de contaminación en fuentes industriales, mayores multas y mayor transparencia y disponibilidad de datos sobre la calidad y las emisiones del aire.</p> <p>El Proyecto de Ley de la Asamblea 617, Garcia, C., Capítulo 136, Estatutos de 2017, modificó el Código de Salud y Seguridad de California; enmendó § 40920.6, § 42400 y § 42402, y agregó §39607.1, § 40920.8, § 42411, § 42705.5 y § 44391.2.</p>
Proyectos ambientales suplementarios	<p>Proyectos comunitarios para mejorar la salud pública, reducir la contaminación, mejorar el cumplimiento ambiental y generar conciencia pública en los vecindarios más perjudicados por los daños ambientales, que se financian con una parte del pago de las sanciones recibidas durante la resolución de medidas de cumplimiento.</p> <p>https://www.arb.ca.gov/enf/seppolicy.htm</p>

APÉNDICE I – GLOSARIO

TÉRMINO (SIGLA)	DESCRIPCIÓN
Receptores sensibles	Incluye hospitales, escuelas, guarderías y demás instituciones similares que el consejo del distrito de aire o el Consejo de Recursos del Aire de California puedan determinar. Código de Salud y Seguridad de California §42705.5(a)(5)
Sensor de aire	Un dispositivo que mide los contaminantes del aire en tiempo real o casi tiempo real. Por lo general, es un dispositivo portátil, de bajo costo y que necesita menos energía para funcionar en comparación con otros métodos para el monitoreo del aire. https://www.epa.gov/air-sensor-toolbox
Sistema de monitoreo perimetral	Un equipo de monitoreo del aire que mide y registra las concentraciones de contaminantes en el aire, en una fuente fija o cerca de ella, que puede ser útil para detectar o calcular las emisiones de contaminantes de la fuente, incluida la cantidad de emisiones fugitivas, y para respaldar las iniciativas de cumplimiento. Código de Salud y Seguridad de California §42705.5(a)(3)
Tóxicos del aire	Un término genérico que hace referencia a un químico o a un grupo de químicos dañinos que existe en el aire. Las sustancias que son especialmente dañinas para la salud, como las que figuran en el programa de contaminantes peligrosos del aire de la Agencia de Protección Ambiental de los Estados Unidos o en los programas de agentes tóxicos del aire del Proyecto de Ley de la Asamblea 1807 o del Proyecto de Ley de la Asamblea 2588 de California, se consideran agentes tóxicos del aire. Técnicamente, cualquier compuesto que se encuentre en el aire y que tenga el potencial de producir efectos adversos en la salud es un agente tóxico del aire.

Contaminantes	Fuentes de Ejemplo	Plataforma			
		Remolque	Furgoneta	Sistema Compacto	PM2.5 Independiente
PM2.5	Móvil, industria, residencial	x	x	x	x
Negro de Carbón	Móvil, industria, residencial	x	x	x	
NO, NO2, NOx	Móvil, industria	x	x	x	
CO	Móvil	x	x	x	
Ozono	Regional, formado por VOC y NOx	x	x	x	
SO2, H2S	Industria	x	x	x	
VOC (BTEX)	Distribución y Comercialización de Gasolina	x	x	x	
VOC Auto GC/MS	Industria, móvil	x	x		
Tóxicos	Industria, móvil	x	x		
Meteorología		x	x	x	

Glosario

PM2.5	Partículas de 2.5 micrones o menos
Negro de Carbón	Principalmente de partículas de diesel
NO, NO2, NOx	Óxidos of Nitrógeno (precursor de PM2.5, Ozono)
CO	Monóxido de Carbono
Ozono	Regional, formado por VOC y NOx
SO2, H2S	Dióxido de Azufre, Sulfuro de Hidrógeno
VOC (BTEX)	Compuestos Orgánicos Volátiles (Benceno, Tolueno, Etileno, Xileno)
VOC Auto GC/MS	Otros Compuestos Orgánicos Volátiles no BTEX
Tóxicos	Muchos compuestos diferentes que pueden causar efectos dañinos a la salud
Meteorología	Velocidad del viento, dirección del viento, temperatura, humedad

Hoja de Trabajo del Diseño de la Red de Monitoreo del Aire de la Comunidad

Remolque de Tamaño-completo = seleccione las 2 zonas de monitoreo del aire principales como sus áreas c
 Sistema Compacto = seleccione las 3 zonas de monitoreo del aire principales como sus áreas de mayor prio
 PM2.5 Independiente = seleccione 4 zonas de monitoreo del aire como sus áreas de mayor prioridad

Zona de Monitoreo del Aire de la Comunidad	Prioridad de Remolque de Tamaño-Completo (seleccione 2)	Sistema Compacto (seleccione 3)	PM2.5 Independiente (seleccione 4)	Otro (explíqueme contaminante, tipo de monitor, razón)

South Central Fresno Community Steering Committee Charter

1. Committee Objectives

The South Central Fresno Community Steering Committee is a special committee that will be responsible for advising the San Joaquin Valley Air District's development of the Community Air Monitoring Plan (Monitoring Plan) and Community Emission Reduction Program (CERP) under AB 617¹.

Committee objectives include identifying areas of concern regarding air pollution sources within and outside of the Community that impact the Community and sensitive receptor sites, and reviewing existing available information on air quality to provide strategic input towards Monitoring Plan and CERP development. Committee objectives also include disseminating and soliciting information to and from community stakeholders that each committee member represents. The goal is for the Monitoring Plan to be adopted by the San Joaquin Valley Air District by July 2019 and the CERP by October 2019. Upon adoption of the CERP, the steering committee may continue to meet as needed to support and provide guidance on implementation, and develop progress reports.

2. Roles and Responsibilities

Community Steering Committee Members

The Steering Committee will consist of community stakeholders, the majority of which must be community residents. See Attachment A, *AB 617 Community Steering Committee Selection Criteria*, for more details on Steering Committee membership requirements.

To inform their role of advising the District in its development of the CERP, the Committee members will be responsible for discussing a variety of topics including:

- community issues and contributing sources to develop a shared understanding of the community's air pollution challenge;
- who has responsibility and authority to address those issues;
- proposed strategies for the community emissions reduction programs;
- mechanisms for engaging with other agencies;
- approaches for additional community outreach;
- other topics of interest to the committee.

¹ Assembly Bill 617 (Chapter 136, Statutes of 2017) is a state-mandated program that uses a community-based approach to monitor and reduce local air pollution in communities around the state that continue to experience disproportionate impacts from air pollution.

The committee will discuss the major elements of the CERP as they are developed including:

- community engagement;
- the community profile and technical assessment;
- targets and strategies; the enforcement plan; and metrics to track progress.

Government official committee members serve as full participants in the committee, except that they serve in an advisory role, not a voting role, in final consensus building and decision making processes.

Member Participation

Steering committee members (or designated alternates) are expected to attend all committee meetings, in their entirety, throughout the course of the year prior to the CERP adoption.

If the primary member is unable to attend, the designated alternate on the steering committee roster may attend in their absence and deliberate on the primary member's behalf. The primary member is responsible for working with the District ensuring that the alternate is kept informed of the committee's process.

To encourage active participation, if a primary member or their alternate has not attended three consecutive steering committee meetings, their membership may be revoked.

Facilitator

A professional and impartial facilitator will be used for moderating the steering committee meetings and for helping the committee reach consensus on issues.

3. Standard Committee Meeting Procedures

Deliberation and Consensus

A professional and impartial facilitator(s) will be employed to support the steering committee in the overall organization, order and focus of the meeting, resolve conflicts and help reach consensus to ensure the goals and objectives of this charter are met. Achieving full consensus of the steering committee may not always be possible. In the absence of consensus, a majority vote (50%+1) of all community steering committee members will be taken (excluding ex-officio members). However, reasonable efforts will be made to capture all of the perspectives that were expressed in meeting minutes, committee documents, and related reports, including the final CERP.

Open Meetings

All meetings are open to the general public and will provide a formal opportunity for members of the community to provide their perspective on the development of the Monitoring Plan and CERP. Stakeholder input is welcome and encouraged.

Meeting Schedule and Agendas

Upon consensus agreement of the committee, meeting schedules may be adjusted with adequate advance notice. Agendas and agenda topics will be informed by committee input, developed by the Air District, and will include the time, date, duration, location and topics to be discussed.

Subcommittees

Members who wish to be further involved may choose to participate in ad-hoc sub-committees when and if they are needed and established, to discuss topics that can subsequently feed the full committee's discussions. Subcommittees will meet as necessary, and report back their findings and/or recommendations at the next full steering committee.

4. Accessibility/Accommodation

The steering committee meetings and other events associated with the committee must be held at facilities that can accommodate members covered by the Americans with Disabilities Act. Language interpretation services will be provided in Spanish at all meetings, and as needed in other languages with a minimum 48-hour advance request.

5. Website

A website will be developed and maintained by the Air District, with input by the committee, to provide information to the community on the Steering Committee actions and development of the Monitoring Plan and CERP.

Attachment A

AB 617 Community Steering Committee Selection Criteria San Joaquin Valley Air Pollution Control District

The District is seeking to provide opportunity for AB 617 Steering Committee participation to all applicants as feasible. With that in mind, a large committee is preferable to eliminating applicants while continuing to seek the balanced perspectives provided by the following criteria:

1. The majority of committee membership must be residents of the defined community.
2. The core of the steering committee should directly represent the residents and businesses in the community.
3. Additional committee members may include representatives from local community-based environmental justice organizations, city and county planning agencies, transportation agencies, health departments, and schools.
4. Only one steering committee member will be allowed from each organization address, to avoid loading the committee with a single perspective. The District will make an effort to select the first application received from a given affiliation. The selected steering committee member can speak for all applicants with same affiliation.
 - a. Applicants with same affiliation may volunteer a specific committee member from amongst themselves, and the District will make the adjustment to the committee membership list.
 - b. For continuity purposes, this committee member substitution may only occur once for a given affiliation.
5. Members may assign one alternate member that can sit in their place on the committee, if, for some reason, the main member cannot attend a meeting.
 - a. The alternate must be officially assigned as the member's sole alternate on the District's committee membership list.
 - b. The alternate must meet the same membership criteria as the main member, and must submit a committee membership application.
 - c. Main member will be responsible for keeping the alternate informed of committee activities and discussions so that continuous progress is possible without significant rehashing of previously discussed topics.
6. Applicants without valid affiliation are excluded from committee membership consideration, but will be invited to attend the committee meetings to provide input as members of the public:
 - a. Applicants who claimed residence affiliation only, but whose residence is not within community boundaries.
 - b. Business entities or associations without office address within community boundaries.
7. Government officials/agencies are entities that can take action, and are encouraged to participate. Government officials serve as full participants in the committee, except that they serve in an advisory role in final consensus building and decision making processes.

Attachment B Participation Agreement

By signing below, I agree to abide by all conditions of the South Central Fresno Community Steering Committee Charter. I also agree to the following principles, goals and expected conduct to demonstrate how agencies, communities and other stakeholders working in concert can achieve meaningful improvements in air quality in the South Central Fresno Community:

- **Adopt and support the principles of ensuring improved air quality in South Central Fresno:**
 - Our goal is to identify and remedy local air pollution impacts and associated health risk exposures to people who live, work and play in and around South Central Fresno. We are committed to working collectively and cooperatively with all stakeholders within the community—local residents, businesses and organizations, youth groups, schools, local, regional and State governments, health agencies and faith-based organizations—to ensure all represented parties and interested members of the public are heard.
- **Provide strategic guidance, vision, and oversight** including:
 - Informing the development of the Monitoring Plan and CERP for the community of South Central Fresno
 - Using data to inform strategy development analysis
 - Tracking progress of the work using agreed-upon indicators at Steering Committee and subcommittee levels
 - Identifying fair, effective and feasible goals to bring about reduced health risk in South Central Fresno
- **Provide leadership and accountability** by:
 - Identifying obstacles to achieving the goal and develop solutions to overcome them
 - Considering how my own organization or those in my network can align to the common goals and principles of the Steering Committee
 - Serving as a vocal champion of the collective effort in the Steering Committee
 - To work towards consensus while recognizing that not everyone will agree on every issue and to resolve conflicts in a positive, swift and constructive manner
- **Play an active role** by:
 - Actively participating in the regularly scheduled meetings
 - Reviewing available materials prior to meetings and coming prepared for engaged discussion, active listening, and respectful dialogue
 - Committing to monthly Steering Committee meetings and a few hours of preparation in between

Comunidad de Centro-Sur Fresno

Carta Estatutaria del Comité Directivo

1. Objetivos del Comité

El Comité Directivo Comunitario de Centro-Sur Fresno es un comité especial que será responsable de aconsejar el desarrollo del Plan de Monitoreo del Aire de la Comunidad (Plan de Monitoreo) y el Programa de Reducción de Emisiones de la Comunidad (CERP, por sus siglas en inglés) del Distrito del Aire del Valle de San Joaquín, bajo AB 617¹.

Los objetivos del comité incluyen la identificación de áreas de preocupación con relación a las fuentes de contaminación del aire dentro y fuera de la Comunidad que afectan a la Comunidad y los sitios de receptores sensibles, y la revisión de la información disponible existente sobre la calidad del aire para proporcionar aporte estratégico para el Plan de Monitoreo y el desarrollo de CERP. Los objetivos del comité también incluyen la difusión y solicitud de información a y de las partes interesadas de la comunidad que representa cada miembro del comité. El objetivo es que el Plan de Monitoreo sea implementado por el Distrito del Aire del Valle de San Joaquín antes de julio de 2019 y que la Mesa Directiva del Distrito del Aire adopte el CERP antes de octubre de 2019. Después de la adopción del CERP, el Comité Directivo puede continuar reuniéndose como necesario para apoyar y proporcionar orientación sobre la implementación y desarrollar informes de progreso.

2. Funciones y Responsabilidades

Miembros del Comité Directivo Comunitario

El Comité Directivo estará compuesto por partes interesadas de la comunidad, la mayoría de las cuales deben ser residentes de la comunidad. Consulte el Anexo A, *Criterios de Selección del Comité Directivo Comunitario AB 617*, para obtener más detalles sobre los requisitos de membresía del Comité Directivo.

Para informar su función de aconsejar al Distrito en su desarrollo del CERP, los miembros del Comité serán responsables de discutir una variedad de temas que incluyen:

- problemas de la comunidad y fuentes de contribución para desarrollar un entendimiento compartido del desafío de la contaminación del aire de la comunidad;
- quién tiene la responsabilidad y la autoridad para abordar esas cuestiones;
- estrategias propuestas para los programas comunitarios de reducción de emisiones;
- mecanismos para colaborar con otras agencias;
- enfoques para un alcance comunitario adicional;

¹ La Ley de la Asamblea 617 (AB 617) (Capítulo 136, Estatutos de 2017) es un programa obligatorio por el estado que utiliza un enfoque basado en la comunidad para monitorear y reducir la contaminación del aire local en las comunidades de todo el estado que continúan sufriendo impactos desproporcionados de la contaminación del aire.

- Otros temas de interés para el comité.

El comité discutirá los elementos principales del CERP a medida que se desarrollen, incluyendo:

- involucramiento de la comunidad;
- el perfil de la comunidad y la evaluación técnica;
- objetivos y estrategias; el plan de ejecución y métricas para monitorear el progreso.

Los miembros oficiales de gobierno del comité sirven como participantes de pleno derecho en el comité, excepto que cumplen una función de asesoría, no una función de voto, en los procesos finales de creación de consenso y toma de decisiones.

Participación de los Miembros

Se espera que los miembros del comité directivo (o los suplentes designados) asistan a todas las reuniones del comité, en su totalidad, durante todo el año antes de la adopción del CERP.

Si el miembro principal no puede asistir, el suplente designado en la lista del comité directivo puede asistir en su ausencia y deliberar en nombre del miembro principal. El miembro principal es responsable de trabajar con el Distrito para garantizar que el suplente se mantenga informado del proceso del comité.

Para alentar la participación activa, si un miembro principal o su suplente no ha asistido a tres reuniones consecutivas del comité directivo, su membresía puede ser revocada.

Facilitador

Se utilizará un facilitador profesional e imparcial para moderar las reuniones del comité directivo y para ayudar al comité a alcanzar un consenso sobre los temas.

3. Procedimiento de Reuniones Comunes del Comité

Deliberación y Consenso

Se empleará un facilitador(es) profesional e imparcial para respaldar al comité directivo en la organización general, el orden y el enfoque de la reunión, resolver conflictos y ayudar a alcanzar el consenso para asegurar que se cumplan las metas y los objetivos de esta Carta Estatutaria. Lograr el consenso total del comité directivo puede no ser siempre posible. En ausencia de consenso, se tomará un voto de mayoría (50% + 1) de todos los miembros del comité directivo de la comunidad (excluyendo a los miembros de oficio). Sin embargo, se harán esfuerzos razonables para capturar todas las perspectivas que se expresaron en actas de reuniones, documentos del comité e informes relacionados, incluyendo el CERP final.

Reuniones Abiertas

Todas las reuniones están abiertas al público en general y brindarán una oportunidad formal para que los miembros de la comunidad brinden su perspectiva sobre el desarrollo del Plan de Monitoreo y el CERP. Los comentarios de los interesados son bienvenidos y alentados.

Calendario de Reuniones y Agendas

Tras el consenso acuerdo del comité, los horarios de las reuniones pueden ajustarse con aviso previo adecuado. Las agendas y los temas de la agenda serán informados por los comentarios del comité, desarrollados por el Distrito del Aire, e incluirán la hora, la fecha, la duración, la ubicación y los temas que se discutirán.

Subcomités

Los miembros que deseen participar más pueden optar por participar en subcomités ad-hoc cuando sean necesarios y establecidos, para discutir temas que posteriormente puedan alimentar las discusiones del comité. Los subcomités se reunirán según sea necesario e informarán sobre sus hallazgos y/o recomendaciones al próximo comité directivo completo.

4. Accesibilidad/Acomodación

Las reuniones del comité directivo y otros eventos asociados con el comité deben llevarse a cabo en instalaciones que puedan acomodar a los miembros cubiertos por la Ley de Estadounidenses con Discapacidades. Los servicios de interpretación se brindarán en español en todas las reuniones y, según sea necesario, en otros idiomas con una solicitud con un mínimo de 48 horas de anticipación.

5. Sitio Web

El Distrito de Aire desarrollará y mantendrá un sitio web con aportes del comité para proporcionar información a la comunidad sobre las acciones del Comité Directivo y el desarrollo del Plan de Monitoreo y el CERP.

Anexo A

Criterios de Selección del Comité Directivo Comunitario AB 617 Distrito para el Control de Contaminación del Aire del Valle de San Joaquín

El Distrito está tratando de brindar la oportunidad de que todos los solicitantes participen en el Comité Directivo AB 617, según sea posible. Teniendo esto en cuenta, es preferible un comité grande que eliminar a los solicitantes mientras se siguen buscando las perspectivas equilibradas proporcionadas por los siguientes criterios:

1. La mayoría de los miembros del comité deben ser residentes de la comunidad definida.
2. El núcleo del comité directivo debe representar directamente a los residentes y negocios en la comunidad.
3. Los miembros adicionales del comité pueden incluir representantes de organizaciones comunitarias locales de justicia ambiental, agencias de planificación de la ciudad y el condado, agencias de transporte, departamentos de salud y escuelas.
4. Solo se permitirá a un miembro del comité directivo de cada dirección de la organización, para evitar cargar el comité con una sola perspectiva. El Distrito hará un esfuerzo para seleccionar la primera solicitud recibida de una afiliación determinada. El miembro del comité directivo seleccionado puede hablar para todos los solicitantes con la misma afiliación.
 - a. Los solicitantes con la misma afiliación pueden designar un miembro del comité específico entre ellos, y el Distrito hará el ajuste a la lista de miembros del comité.
 - b. Para fines de continuidad, esta sustitución de miembros del comité solo puede ocurrir una vez para una afiliación determinada.
5. Los miembros pueden asignar un miembro alternativo que puede ocupar su lugar en el comité, si, por alguna razón, el miembro principal no puede asistir a una reunión.
 - a. El suplente debe ser asignado oficialmente como el único suplente del miembro en la lista de miembros del comité del Distrito.
 - b. El suplente debe cumplir con los mismos criterios de membresía que el miembro principal y debe someter una solicitud de membresía del comité.
 - c. El miembro principal será responsable de mantener al suplente informado de las actividades y discusiones del comité, de modo que el progreso continuo sea posible sin un cambio significativo de los temas discutidos previamente.
6. Los solicitantes sin afiliación válida están excluidos de la consideración de la membresía del comité, pero se les invitará a asistir a las reuniones del comité para brindar sus opiniones como miembros del público:
 - a. Solicitantes que reclamaron la afiliación de residencia solamente, pero cuya residencia no está dentro de los límites de la comunidad.
 - b. Entidades comerciales o asociaciones sin domicilio dentro de los límites de la comunidad.
7. Los funcionarios y agencias de gobierno son entidades que pueden tomar medidas y se les alienta participar. Los funcionarios del gobierno actúan como participantes de pleno derecho en el comité, excepto que cumplen una función de asesor en los procesos finales de creación de consenso y toma de decisiones.

Anexo B

Acuerdo de Participación Potencial

Al firmar a continuación, acepto cumplir con todas las condiciones de la Carta Estatutaria del Comité Directivo de Centro-Sur Fresno. También estoy de acuerdo con los siguientes principios, objetivos y conducta esperada para demostrar cómo las agencias, comunidades y otras partes interesadas que trabajan en conjunto pueden lograr mejoras significativas en la calidad del aire en la comunidad de Centro-Sur Fresno:

- **Adoptar y apoyar los principios para garantizar una mejor calidad del aire en Centro-Sur Fresno:**
 - Nuestro objetivo es identificar y remediar los impactos de la contaminación del aire local y las exposiciones asociadas al riesgo de la salud de las personas que viven, trabajan y juegan en y alrededor de Centro-Sur Fresno. Estamos comprometidos a trabajar de manera colectiva y cooperativa con todas las partes interesadas dentro de la comunidad: residentes locales, negocios/empresas y organizaciones, grupos de jóvenes, escuelas, gobiernos locales, regionales y estatales, agencias de salud y organizaciones religiosas para asegurar que todas las partes representadas y miembros interesados del público sean escuchados.
- **Proporcionar orientación estratégica, visión y supervisión, incluyendo:**
 - Informar el desarrollo del Plan de Monitoreo y el CERP para la comunidad de Centro-Sur Fresno
 - Uso de datos para informar análisis de desarrollo de estrategias
 - Seguimiento de del progreso de trabajo utilizando indicadores acordados a nivel del Comité Directivo y subcomité
 - Identificar objetivos justos, efectivos y factibles para reducir el riesgo de salud en Centro-Sur Fresno
- **Proporcionar liderazgo y responsabilidad por:**
 - Identificar obstáculos para alcanzar la meta y desarrollar soluciones para superarlos
 - Considerando como mi propia organización o las de mi red pueden alinearse con los objetivos y principios comunes del Comité Directivo
 - Servir como un campeón vocal del esfuerzo colectivo en el Comité Directivo
 - Trabajar hacia el consenso, reconocimiento que no todos estarán de acuerdo en cada tema y resolver los conflictos de manera positive, rápida y constructiva.
- **Jugar un papel activo al:**
 - Participar activamente en las reuniones programadas regularmente
 - Revisar los materiales disponibles antes de las reuniones y venir preparado para entablar una conversación, escuchar atentamente y el diálogo respetuoso
 - Comprometerse a las reuniones mensuales del Comité Directivo y unas pocas horas de preparación entremedio

South Central Fresno Community Steering Committee Consensus/Voting Guide and Expectations

Under the South Central Fresno Community Steering Committee Charter, the Committee is to use a “deliberation and consensus” process to provide the Committee’s advice to the San Joaquin Valley Air District towards the District’s development of the Air Quality Monitoring Plan and the Community Emission Reduction Program for South Central Fresno. In January 2019, the Committee approved a voting process to capture the majority position of the Committee, to be employed in the event consensus cannot be reached, and inserted the voting process into their Charter. As outlined in the Brown Act and other established public meeting procedures, certain requirements must be met to ensure an open and transparent process, and inclusive participation by interested Committee members and public:

1. The Committee must make an inclusive and sincere attempt to find consensus on issues prior to taking a vote on the issue. Such an effort at establishing consensus includes:
 - a. Following the Committee Participation Agreement, which requires Committee members, “To work towards consensus while recognizing that not everyone will agree on every issue and to resolve conflicts in a positive, swift and constructive manner”.
 - b. Allowing all Committee members who wish to speak on the issue to do so.
 - c. After all Committee discussion has taken place, opening the meeting to public comment and allow all members of the public who wish to speak on the topic to do so (the facilitator may limit the amount of time allowed for each commenter, and may limit comments to non-repetitive comments, as necessary to allow the meeting to progress reasonably).
 - d. Allowing additional Committee discussion on any issues of interest brought up by the public.

2. After completing the above consensus process regarding any particular decision, if consensus has not been reached, any Committee member may request the Facilitator to hold a vote on the decision. The facilitator will:
 - a. Ensure that the above consensus process was followed.

- b. Capture in sufficient detail the specific motion or issue that will be voted on, including specific wording and documentation as necessary.
 - c. Hold a vote by show of hands, allowing only one vote per member.
 - d. Record the vote, and indicate whether the motion passed (by vote of at least 50%+1 of all Committee members, excluding ex-officio members) or failed.
 - e. Report the official outcome of the vote, as well as any opposing or minority perspective expressed during the discussion, to the District and the Committee in a written summary of the meeting.
3. The Committee may only vote on items that are posted as a part of the agenda for the meeting at which the vote takes place, so that members of the Committee and the public that are interested in the item are aware of the potential action in advance and may take part in the process.

In the interests of providing sufficient notice of items on the agenda, the District intends to post agendas and associated materials 7 days in advance of each meeting. Committee members wishing to produce and distribute associated materials to be shared with other members of the Committee must share them with all members of the Committee, at least 7 days in advance of the meeting, by forwarding them to the District for timely distribution. In the interests of providing open and public deliberation, Committee members must be careful to avoid meeting or corresponding in ways that result in a majority of committee members discussing Committee meeting agenda items, whether in simultaneous (one-to-many) or string (one-to-one) communications.

Comité Directivo de la Comunidad de Centro Sur Fresno Consenso/Guía de Votación y Expectativas

Bajo la Carta Estatutaria del Comité Directivo Comunitario de Centro Sur Fresno, el Comité debe usar un proceso de “deliberación y consenso” para proporcionar el asesoramiento del Comité al Distrito del Aire del Valle de San Joaquín hacia el desarrollo del Plan de Monitoreo de la Calidad del Aire y el Programa de Reducción de Emisiones Comunitarias del Distrito para Centro Sur Fresno. En enero 2019, el Comité aprobó un proceso de votación para capturar la posición mayoría del Comité, para ser utilizado en caso de que no se pueda llegar a un consenso, e insertaron el proceso de votación en su Carta Estatutaria. Tal como se describe en la Ley Brown y otros procedimientos establecidos de reuniones públicas, se deben cumplir ciertos requisitos para garantizar un proceso abierto y transparente, y una participación inclusiva de los miembros interesados del Comité y del público:

1. El Comité debe hacer un intento inclusivo y sincero de encontrar un consenso sobre los temas antes de votar sobre el tema. Tal esfuerzo para establecer consenso incluye:
 - a. Siguiendo el Acuerdo de Participación del Comité, que exige a los miembros del Comité, “Trabajar para lograr un consenso y al mismo tiempo reconocer que no todos estarán de acuerdo en todos los temas y resolver los conflictos de manera positiva, rápida y constructiva”.
 - b. Permitir que todos los miembros del Comité que deseen hablar sobre el tema lo hagan.
 - c. Después de que se haya llevado a cabo toda la discusión del Comité, abrir la reunión para comentarios públicos y permitir que todos los miembros del público que deseen hablar sobre el tema lo hagan (el facilitador puede limitar la cantidad de tiempo permitido para cada comentarista y puede limitar los comentarios a comentarios no repetitivos, según sea necesario para permitir que la reunión progrese razonablemente).
 - d. Permitir una discusión adicional del Comité sobre cualquier tema de interés presentado por el público.

2. Después de completar el proceso de consenso antedicho con respecto a cualquier decisión en particular, si no se ha alcanzado un consenso, cualquier miembro del Comité puede solicitar al Facilitador para realizar una votación sobre la decisión. El facilitador tiene que:
 - a. Asegúrese de que se siguió el proceso de consenso antedicho.
 - b. Capturar con suficiente detalle la moción o el tema específico de votación, incluyendo la redacción específica y la documentación según sea necesario.
 - c. Realizar la votación a mano alzada, permitiendo solo un voto por miembro.
 - d. Registrar la votación e indicar si la moción fue aprobada (por votación de al menos el 50% + 1 de todos los miembros del Comité, excluyendo a los miembros de oficio) o denegada.
 - e. Informar el resultado oficial de la votación, así como cualquier perspectiva opuesta o minoritaria expresada durante la discusión, al Distrito y al Comité en un resumen escrito de la reunión.

3. El Comité solo puede votar sobre los puntos que se publican como parte de la agenda de la reunión en la que se lleva a cabo la votación, de modo que los miembros del Comité y el público que está interesado en el tema conozcan la posible acción en avanzado y participen en el proceso.

Con el fin de proporcionar un aviso suficiente de los puntos en la agenda, el Distrito tiene la intención de publicar las agendas y los materiales asociados 7 días antes de cada reunión. Los miembros del Comité que deseen producir y distribuir materiales asociados para compartir con otros miembros del Comité deben compartirlos con todos los miembros del Comité, al menos 7 días antes de la reunión, enviándolos al Distrito para su distribución oportuna. Con el fin de proporcionar una deliberación abierta y pública, los miembros del Comité deben tener cuidado de evitar reunirse o corresponder de manera tal que la mayoría de los miembros del comité discutan los temas de la agenda de la reunión del Comité, ya sea de comunicaciones simultánea (de uno a muchos) o en una cadena (una-a-uno).

FREQUENTLY USED ACRONYMS

APCD - Air Pollution Control District

AQI - Air Quality Index

ARB - Air Resources Board

CAC - Citizens Advisory Committee

CCAA - California Clean Air Act

CEQA - California Environmental Quality Act

EPA - United States Environmental Protection Agency

ICE - Internal Combustion Engine

NAAQS - National Ambient Air Quality Standards

NO_x - Oxides of Nitrogen

NOV - Notice of Violation

O₃ - Ozone

PM - Particulate Matter

SIP - State Implementation Plan

tpd - Tons per Day

tpy - Tons per Year

VMT - Vehicle Miles Traveled

VOC - Volatile Organic Compound

GLOSSARY OF FREQUENTLY USED TERMS

carbon monoxide - a colorless, odorless gas emitted from combustion processes like mobile sources.

carpool - an arrangement between people to make a regular journey in a single vehicle, typically with each person taking turns to drive the others.

dry-seasoned wood - wood that has been dried to reduce the moisture content before its use.

emissions - substances, and especially pollutants, discharged into the air.

EPA - Environmental Protection Agency, federal agency in charge of creating and enforcing regulations to protect human health and the environment.

EPA certified device - wood heaters certified by the US EPA as meeting their emission standards.

exhaust - waste gases or air expelled from an engine, turbine, or other machine in the course of its operation.

idling - keep the engine of a vehicle running while parked.

inversion layer - a layer of the atmosphere in which there is a temperature inversion, with the layer tending to prevent the air below it from rising, thus trapping any pollutants that are present.

lead - it is a soft, malleable metal and is a chemical element in the carbon group.

manufactured wood logs - engineered wood made from the same hardwoods and softwood used to manufacture lumber.

nitrogen dioxide (NO₂) - it is one of a group of highly reactive gases known as “oxides of nitrogen” or “nitrogen oxides (NO_x).” NO₂ forms quickly from mobile and industrial sources and it contributes to the formation of ground-level ozone, and fine particle pollution.

nitrogen oxides (NO_x) - or “oxides of nitrogen” is a group of gases that are composed of nitrogen and oxygen. Two of the most common nitrogen oxides are nitric oxide (NO) and nitrogen dioxide (NO₂).

ozone (O₃) - ground level or “bad” ozone which is not emitted directly into the air, it is created by chemical reactions between oxides of nitrogen (NO_x) and volatile organic compounds (VOC) in the presence of sunlight.

particulate matter - also known as particle pollution or PM, is a complex mixture of extremely small particles and liquid droplets. Particle pollution is made up of a number of components, including acids (such as nitrates and sulfates), organic chemicals, metals, and soil or dust particles.

PM_{2.5} - is fine particulate matter 2.5 micrometers in diameter and smaller. These particles can be directly emitted from sources such as forest fires and wood-burning devices.

smog - fog or haze combined with smoke and other atmospheric pollutants.

sulfur dioxide - is a toxic gas with a strong, irritating smell. It is one of a group of highly reactive gases known as “oxides of sulfur.”

Volatile Organic Compounds (VOCs) - are a large group of carbon-based chemicals that easily become vapors or gases. They include both human-made and naturally occurring chemical compounds.

wood pellet - a small capsule compacted with sawdust and other lumber waste. Burned to create a source of heat for residential homes.

SIGLAS DE USO FRECUENTE (por sus siglas en inglés)

APCD - Distrito del Control de la Contaminación del Aire

AQI - Índice de Calidad del Aire

ARB - Junta de Recursos del Aire

CAC - Comité Asesor de Ciudadanos

CCAA - Ley de Aire Limpio de California

CEQA - Ley de Calidad Ambiental de California

EPA - Agencia de Protección Ambiental de los Estados Unidos

ICE - Motor de Combustión Interna

NAAQS - Estándares Nacionales de la Calidad del Aire Ambiental

NO_x - Óxidos de Nitrógeno

NOV - Aviso de Violación

O₃ - Ozono

PM - Materia Particulada (Partículas)

SIP - Plan de Implementación del Estado

tpd - Toneladas por Día

tpy - Toneladas por Año

VMT - Millas Recorridas por Vehículos

VOC - Compuesto orgánico volátil

GLOSARIO DE TÉRMINOS DE USO FRECUENTE

monóxido de carbono - un gas incoloro e inodoro emitido por los procesos de combustión, como las fuentes móviles.

compartir el viaje - un acuerdo entre varias personas para hacer un viaje regular en un solo vehículo, generalmente cada persona toma turnos para conducir a los otros.

leña seca - leña que se ha secado para reducir el contenido de humedad antes de su uso.

emisiones - materia, especialmente los contaminantes descargados en el aire.

EPA - La Agencia de Protección Ambiental, es una agencia federal a cargo de crear y ejecutar regulaciones para proteger la salud humana y el medio ambiente.

aparato certificado por la EPA - aparatos de leña certificados por la EPA de los Estados Unidos cumpliendo con los estándares de emisiones.

escape - gases residuales o aire expulsado de un motor, turbina u otra máquina en el curso de su funcionamiento.

ralentí - mantener el motor encendido mientras el vehículo está estacionado.

inversión térmica - una capa en la atmósfera en donde hay una inversión térmica, con la capa impidiendo que el aire por debajo se eleve, atrapando contaminantes que estén presente.

plomo - es un metal suave, maleable y es un elemento químico en el grupo de carbono.

leños prefabricados - leña fabricada con madera dura y madera blanda.

dióxido de nitrógeno (NO₂) - es uno del grupo de gases altamente reactivos conocidos como "óxidos de nitrógeno (NO_x)". NO₂ se forma rápidamente de fuentes móviles e industriales y contribuye a la formación del ozono al nivel del suelo, y contaminación de partículas finas.

óxidos de nitrógeno (NO_x) - es un grupo de gases compuestos de nitrógeno y oxígeno. Dos de los óxidos de nitrógeno más comunes son el óxido nítrico (NO) y el dióxido de nitrógeno (NO₂).

ozono (O₃) - el ozono al nivel del suelo u ozono "malo" que no se emite directamente al aire, se crea por reacciones químicas entre los óxidos de nitrógeno (NO_x) y los compuestos orgánicos volátiles (VOC) en presencia de la luz solar.

partículas - también conocidas como contaminación de partículas (PM), es una mezcla compleja de partículas extremadamente pequeñas y gotas de líquido. La contaminación de partículas está formada por varios componentes, incluyendo los ácidos (como nitratos y sulfatos), químicos orgánicos, metales y polvo.

PM_{2.5} - son partículas finas de 2.5 micrómetros de diámetro y más pequeñas. Estas partículas pueden ser emitidas directamente de fuentes tales como incendios forestales y la quema de leña.

smog - neblina o calina combinada con humo y otros contaminantes atmosféricos.

dióxido de azufre - es un gas tóxico con un olor fuerte e irritante. Es uno del grupo de gases altamente reactivos conocidos como "óxidos de azufre".

Compuestos orgánicos volátiles (VOCs) - son un grupo grande de químicos basados en carbono que fácilmente se convierten en vapores o gases. Incluyen compuestos químicos artificiales y naturales.

combustible granulado - cápsulas pequeñas compactadas con serrín y otros desechos de madera. Estas capsulas son quemadas en estufas de leña para calentar el hogar.

Agenda for Stockton Community Steering Committee Meeting #20

Wednesday, May 5, 2021 – 5:00 pm - 7:00 pm

Public Participation: Join via *YouTube Live* - www.youtube.com/healthyairliving

Comments and questions posted on Facebook or submitted to ab617@valleyair.org during the meeting will be addressed during the meeting's public comment period.

- 5:00 p.m. Welcome, Introductions**
Erica Manuel, Facilitator, Institute for Local Government
Ryan Hayashi, Deputy Air Pollution Control Officer, Valley Air District
- 5:10 p.m. Icebreaker**
To kick off the new phase of the CSC, we will host an icebreaker in breakout rooms to reengage with our fellow CSC members!
- 5:30 p.m. What does Implementation Look Like?**
Overview of CERP Implementation with CSC, including discussing how we'll prioritize measures, establish subcommittees, review tools for tracking and reporting CERP implementation progress, and need process for developing/modifying incentive project plans for community identified projects required by CARB.
- 6:00 p.m. Review and Discuss Committee Charter**
The Charter is the foundation for how the CSC will continue to operate and implement the CERP moving forward. During this item, the CSC will review and discuss the [Committee Charter](#).
- 6:30 p.m. Standing Updates**
- *Community Air Monitoring – District, Stockton Unified School District*
 - *CARB*
- This section of the agenda will always appear here, with the standing items continuing to grow as implementation work begins.
- 6:50 p.m. Wrap Up/Next Steps**
Interest in participating in technical advisory subcommittee - Email
AB617@valleyair.org
Next Meeting: Wednesday, June 2, 5 pm via ZOOM
- 6:55 p.m. Public Comment**

To request Spanish interpreting services, please contact Jaime Holt or Heather Heinks at (559) 230-6000 or AB617@valleyair.org at least 7 days prior to the meeting date.

Learn more: community.valleyair.org

Agenda for Stockton Community Steering Committee Meeting #19

Wednesday, April 7, 2021 – 5:00 pm - 7:00 pm

Public Participation: Join via *YouTube Live* - www.youtube.com/healthyairliving

Comments and questions posted on Facebook or submitted to ab617@valleyair.org during the meeting will be addressed during the meeting's public comment period.

- 5:00 p.m. Welcome, Introductions**
Erica Manuel, Facilitator, Institute for Local Government
Ryan Hayashi, Deputy Air Pollution Control Officer, Valley Air District
Jeff Wingfield, Community Co-host, Director of Environmental & Public Affairs, Port of Stockton
- 5:10 p.m. Discussion of Concerns Raised by Community Steering Committee Members Regarding Conduct**
- 5:25 p.m. CERP Adoption and Next Steps**
Overview of CERP adoption at District's Governing Board hearing, and review of next steps as the CSC transitions to the implementation phase.
- 5:35 p.m. Discuss Inclusion of Previously-Considered Port Measures in CERP (Potential Voting Item)**
On March 18, 2021, the District Governing Board approved the proposed CERP for Stockton. In response to public requests and support for the inclusion of Port measures, in addition to approving the proposed CERP, the District's Board took additional action to provide a window of opportunity for the CSC to discuss previously-shared port measures (see attached), and, if able to reach collaborative consensus with the Port, return the measures (including \$5 million funding allocation) to the District Governing Board for consideration for inclusion in the approved CERP, by no later than May 2021.
- 6:15 p.m. Discuss Potential Location of Community Air Monitoring Equipment**
CSC and District to review and discuss the proposed air monitoring equipment location recommendations based on feedback from Air Monitoring Subcommittee (see attached).
- 6:45 p.m. Wrap Up/Next Steps**
Erica Manuel, Facilitator
- 6:50 p.m. Public Comment**

To request Spanish interpreting services, please contact Jaime Holt or Heather Heinks at (559) 230-6000 or AB617@valleyair.org at least 7 days prior to the meeting date.

P.1 Collaborating to Facilitate Enhanced Platforms for Discussion and Information Sharing Between the Community and the Port of Stockton

Description of Proposed Actions: Port of Stockton will establish recurring Community Environmental Committee (CEC) to build collaboration, improve dialogue between concerned citizens in community and environmental justice organizations to allow them a forum to raise awareness of health-related concerns regarding emissions from existing and future operations at the Port of Stockton. Goals of CEC will be to encourage additional community engagement, bring community insights to the Port's environmental improvement efforts, and work on select environmental projects within Port's jurisdiction to help preserve, protect, and improve the environment. Prospective projects that would be brought before the CEC include:

- Discussion of future Port of Stockton projects and expansion
 - Port of Stockton emission reduction strategy development
 - Environmental event planning
 - Community outreach support
 - Program development
- Utilizing Port's website to broadcast outward-facing communications through quarterly updates, and add functionality for submitting comments, questions, and complaints
 - Providing routine updates to CSC regarding ongoing projects happening at Port

P.2 Incentive Program for Deployment of Clean Heavy-duty Mobile Equipment Operating at Ports, Intermodal Railyards and Distribution Centers

Description of Proposed Actions: The goal of this strategy is to reduce emissions from old, high-polluting diesel engines in heavy-duty mobile off-road equipment operating at the Port of Stockton. Diesel pollution from on-road and off-road operations greatly impacts the health of the community surrounding the Port. Funding will be offered to replace diesel mobile cargo handling equipment used to handle cargo or perform routine maintenance activities at the Port with new, zero and near-zero emissions technologies. Based on CSC priorities, zero-emissions will be prioritized for funding where applicable to the equipment type. Established methodology through the Carl Moyer Program will be used to quantify the emission reductions for funded projects, but an estimate of potential project reductions is summarized below.

Budget Amount: \$2,000,000

Quantifiable Emissions Reductions: Estimated emission reductions associated with this measure includes up to 2 tons of NOx

P.3 Tug Boat Replacement/Repower

Description of Proposed Actions: The goal of this strategy is to reduce emissions from old, high-polluting diesel engines in tugboats operating at the Port of Stockton. Diesel pollution from freight transport operations greatly impacts the health of the community surrounding the Port. Funding will be offered to repower the existing propulsion and auxiliary engines with new diesel engines. The new engines will have the highest tier rating available that will fit within the confines of their engine compartments. Established methodology through the Carl Moyer Program will be used to quantify the emission reductions for funded projects.

Budget Amount: \$1,000,000

Quantifiable Emissions Reductions: Estimated emission reductions associated with this measure includes up to 1 ton of PM and 29 tons of NOx

P.4 Marine Exhaust Intake Bonnet Emissions Control

Description of Proposed Actions: The goal of this strategy is to reduce emissions from the diesel engines of marine vessels while berthed at the Port of Stockton. Diesel pollution from freight transport operations greatly impacts the health of the community surrounding the Port. Funding will be offered to purchase and install a marine vessel exhaust capture and control system. This system will work with marine vessels to reduce PM and NO_x emissions while at berth. Available exhaust capture and control systems can reduce PM_{2.5} up to 95% and NO_x up to 90%. Emission reductions for these projects will be quantified using state approved calculation methodology.

Budget Amount: \$2,000,000

Quantifiable Emissions Reductions: Estimated emission reductions associated with this measure includes up to 68 tons of NO_x

Agenda for Stockton Community Steering Committee Meeting #18

Wednesday, March 9, 2021 – 5:00 pm - 7:00 pm

Public Participation: Join via *YouTube Live* - www.youtube.com/healthyairliving

Comments and questions posted on Facebook or submitted to ab617@valleyair.org during the meeting will be addressed during the meeting's public comment period.

- 5:00 p.m. Welcome, Introductions**
Erica Manuel, Facilitator, Institute for Local Government
Ryan Hayashi, Deputy Air Pollution Control Officer, Valley Air District
- 5:15 p.m. Discuss Port measures**
CSC and District will review and discuss the remaining Port measures for possible inclusion in the CERP. A vote will be taken if needed.
Community Steering Committee
- 6:15 p.m. Review and discuss additional CERP language**
CSC and District review and discuss the additional language requested by the CSC be included in the final CERP document.
Community Steering Committee
- 6:45 p.m. Wrap Up/Next Steps**
Erica Manuel, Facilitator
- 6:50 p.m. Public Comment**

REMINDERS

- Next meeting: Wednesday, April 7, 2021, via Zoom for CSC members and **YouTube Live** for public.

To request Spanish interpreting services, please contact Jaime Holt or Heather Heinks at (559) 230-6000 or AB617@valleyair.org at least 7 days prior to the meeting date.

Learn more: community.valleyair.org

Agenda for Stockton Community Steering Committee Meeting #17

Wednesday, March 3, 2021 – 5:00 pm - 7:30 pm

Public Participation: Join via *YouTube Live* - www.youtube.com/healthyairliving

Comments and questions posted on Facebook or submitted to ab617@valleyair.org during the meeting will be addressed during the meeting's public comment period.

- 5:00 p.m. Welcome, Introductions**
Erica Manuel, Facilitator, Institute for Local Government
Ryan Hayashi, Deputy Air Pollution Control Officer, Valley Air District
- 5:15 p.m. Discuss inclusion of remaining CERP measures**
Electric School Buses (HD.7), Local Locomotive Switchers (HD.10), & Port Measures (PO.2, PO.3, PO.4)
Erica Manuel, Facilitator, Institute for Local Government
- 6:15 p.m. Vote: Final CERP review and support**
CSC and District discuss final changes made to CERP based on feedback received. CSC will have opportunity to vote to support the CERP for 3/18 adoption by District Governing Board
Community Steering Committee
- 7:10 p.m. Wrap Up/Next Steps**
Erica Manuel, Facilitator
- 7:15 p.m. Public Comment**

REMINDERS

- CERP Adoption Governing Board Meeting: Thursday, March 18, at 9 a.m.
- Next meeting: Wednesday, April 7, 2021, via Zoom for CSC members and **YouTube Live** for public.

To request Spanish interpreting services, please contact Jaime Holt or Heather Heinks at (559) 230-6000 or AB617@valleyair.org at least 7 days prior to the meeting date.

Meeting Highlights*

AB 617 Stockton Community Steering Committee Meeting #16

February 16, 2021 | 5:00 pm - 7:30 pm

Virtual Zoom Meeting

Action items for the Stockton Community Steering Committee (CSC):

- Review and send in comments on draft CERP by Feb. 28

Action items for San Joaquin Valley Air Pollution Control District (District):

- Denote CERP language revisions in a different font or color for CSC
- Add the locomotive switchers and electric school bus measures to the discussion agenda for the next CSC meeting
- Follow up with Stockton Unified on measure related to air filtration in schools and MERV filters they are installing
- Provide additional information on Port-related measures not currently approved for the CERP; consider additional discussion at next meeting

Welcome and Introductions

Erica Manuel, Facilitator & Executive Director/CEO, Institute for Local Government (ILG)

Ryan Hayashi, Deputy Air Pollution Control Officer, District

Erica welcomed the Stockton CSC participants to the second meeting of the month, introduced the ILG facilitation team, gave an agenda overview and flagged the extended meeting time.

Ryan thanked the CSC for the many comments they submitted to the District on the draft CERP. He noted that the CSC has reached a big milestone in the AB 617 process.

Erica recapped the previous CSC meeting and discussed some process improvements that may help the virtual meetings remain productive and engaging for all members.

The following items were discussed and incorporated into the meeting:

- **Elevating resident voices**—every perspective is valid and the plan is to adjust our discussion practices to make sure resident voices and quieter voices are elevated, even in a virtual environment
- **Chat box activity**—the chat log at the last meeting was dozens of pages long and included many side conversations that were not specifically related to the topic being discussed verbally. CSC members had shared concerns with being unable to follow both. CSC members were asked to please limit the chat comments to only reflect the item being discussed at that time
- **Voting process**—voting can be done more quickly and in a more streamlined, transparent manner. In the future, every CSC member vote will be shown on the screen so voting members can validate their choices in real time

Comment: Thank you, I think these clarifications are extremely helpful and I appreciate the toning down of the chat box.

ILG Response: Thank you. We received similar feedback from other CSC members as well.

Erica also identified a number of discussion topics from the last meeting that generated significant CSC interest. She outlined the following subjects and next steps related to them:

- **Health studies**—the District is going to clarify the exact type of health studies the CSC is looking for to help inform the decision-making process
- **Adding measures to CERP after Board approval**—there may be some confusion about what can and cannot be added to the CERP after it is approved by the District or CARB board; the District will clarify this
- **Delaying the CERP**—there have been discussions about getting another extension on the CERP; the District will provide clarity on options for delaying the CERP
- **How CERP measures impact Stockton’s AB 617 budget**—there is a correlation between which measures are included in the CERP and the final budget for AB 617 activities in Stockton; the District will explain that dynamic

District staff shared the following insights related to the above:

- **Health studies** - The District has reviewed the legislation, the scientific review panels, the federal EPA guidance and other existing studies of the Central Valley; there are no existing health studies that have been completed for the Stockton area that show a direct nexus between the implementation of specific measures and types of pollution reduced and certain types of health indicators. The AB 617 legislation was crafted to remove criteria pollutant emissions; if the CSC does that with measures in its CERP, the region will get the health benefits desired
- **Adding measures to CERP after Board approval** – The District has received feedback from CARB that the CERPs should be “living documents”. This reflects the possibility that there may be new technologies that would benefit the AB 617 communities over the course of the CERP implementation timeframe. The Stockton CSC will be able to recommend amending the CERP to include measures that incorporate new or emerging technology or make substantive changes as more information becomes available through implementation. However, the CERP should not be amended frequently and any amendments the CSC votes on after initial adoption may require District Board approval
- **Delaying the CERP** – At the request of the CSC, the District submitted an extension request on behalf of this CSC in December. CSC members have been working very hard to meet the new deadline and the committee is close to finalizing a CERP that reflects CSC input. An additional extension is likely not possible, as the statute is clear that the deadline has already passed. Additional delays would begin to impact implementation timeframes with incentive funding having specific timelines to expend funds
- **How CERP strategies impact Stockton AB 617 budget** - The District previously shared what the budget could be for incentive strategies; those budget suggestions were included in the strategy prioritization survey the District sent out in late summer that the CSC responded to. During the October 2020 meeting, the District shared what the possible funding may be available to the Stockton community, provided the CSC identified strategies that could be spent within the required timelines (June 30, 2025).

The District shared the budget amounts for the CERP strategies that the CSC is considering for inclusion in the latest draft of the CERP. If the CSC does not want to include a particular measure in the CERP, those dollars may not be able to be redirected to the overall budget. For example, if certain high emission reduction measures with considerable costs are excluded from the CERP, that may potentially reduce the total incentive funding available for the Stockton community as those funds cannot necessarily be re-allocated to other strategies unless there is a clear ability to spend incentive funds within the timelines to expend the funds

Review and Discuss Draft CERP

Jessica Olsen, Program Manager, District

Jessica reviewed the initial draft CERP comments received from the CSC. Presentation highlights included:

- All comments received are included in the draft posted on the Stockton AB 617 webpage
- Comment highlights included:
 - Acknowledgement of the hard work and input provided by the CSC
 - Re-order CERP layout to reflect community priorities in each of the sections; based on prioritization survey
 - Prioritize zero-emission over near-zero emission technologies where feasible
 - Clarify match funding in places where CERP mentions “identifying funds”
 - Clarify implementation timeline

Based on this feedback, the District agreed to the following revisions in the later drafts:

- Include historical background of Stockton
- Re-order measures in the CERP to reflect CSC prioritization
- Include a ranked list of community priorities
- Specify how the District will work to leverage other funding for several measures to get more out of AB 617
- Clarify that resident incentives are only for those in the AB 617 boundary
- Include a proposed implementation timeline
- Rewrite the CERP measures to prioritize electric technologies where feasible
- Include more details about school filtration measures, including monitoring component

Question: Is it possible for the revisions to be in a different font or color?

District Response: Absolutely, I think that’s a great idea.

Comment: It seems like we are funding already existing programs. When we have asked how much is already being spent on certain programs, we don’t get a response--I think that’s where the friction is. We want to move things forward, but want to have these questions answered.

District Response: Good point. Some programs may have funding right now through other programs or agencies, but that amount may be on a year-by-year basis. AB 617 is a five-year program and we have dedicated funding for these projects for the next five years. If a project or

measure is important to the CSC, it should be included in this CERP to ensure that funding is made available. We cannot rely on consistent or appropriate funding from other programs.

Follow-up comment: We are not trying to be obstructionists. So much money seems to go to industries that have polluted in our community and have never done outreach, which is traumatic for us.

District Response: It is definitely personal and we understand the trust-building that needs to take place.

Comment: I would like to see more innovative programs and measures included in the CERP. For example, a community-run air monitoring system would be wonderful.

Response from ILG: Thanks for your suggestion.

Comment: People are stealing catalytic converters and it seems like a burden to get them replaced. Etching on them will help dissuade thieves from stealing them and keep our air clean, since people don't have the funds to replace them.

Question: Given that we endure the worst asthma rates in the state, I am curious about who we are waiting behind for funding?

District Response: The programs follow statewide guidelines that extend beyond the District. These programs most often allocate funding on a first-come, first-serve basis and are Valley-wide. We do not have the ability to reserve funding from other sources and demand it go to Stockton. The Valley has the most disadvantaged communities with needs and desires to benefit from emission reductions from projects funded

Comment: We held a formal vote on a red category item in which we had a tie. Is there a consensus on that item? Since Stockton is a major logistics hub, I would like us to put together a delegation where we approach Amazon for funding technologies that could be developed if the industries are willing.

ILG Response: Thank you. A comment in the chat says that Amazon is already looking at alternative energy sources. In regards to the vote, we did have a tie, so that measure was not included in the CERP, based on our charter.

District Response: Our plan is to better inform the CSC so members have a better understanding of the benefits certain measures provide.

Question: At the last CAMP meeting, we were notified that the air monitoring equipment has already been purchased. A few months ago, the CSC voted that we would only approve the map of monitoring locations. Can someone clarify how equipment was purchased when the CSC only approved the map?

District Response: The District worked closely with the CSC on identifying sources of concerns and their location. During the August 2020 meeting, the District shared a map of the general locations the CSC proposed for air monitoring equipment and the District shared what types of air monitoring equipment would be needed to monitor the air pollution. The District informed CSC that the next step would be to purchase some of the air monitoring equipment, such as the trailer, with the intent of placing it at Washington Elementary and asked for the CSCs feedback and did not receive any. The PM 2.5 monitors are a more standard type of equipment that we will need in our inventory. We also bought a couple multi-pollutant monitors as well, based on the

types of pollutants the CSC identified they were concerned about. These items have been purchased but not yet placed.

Budget Prioritization Exercise

Ryan Hayashi, Deputy Air Pollution Control Officer, District

Ryan presented the CERP incentive funding strategy to the CSC. Presentation highlights included:

- Funding must be liquidated by 6/30/2025
- Proposed funding amounts based on multiple factors
 - Cost effectiveness
 - Exposure reduction for sensitive populations
 - Availability of potential projects
 - Willingness/availability of businesses/organizations/agencies to provide cost share and partner on projects
 - Ability to complete project within legislative deadline
 - Overall project cost
- Stockton CERP incentive measures are anticipated to have a budget of \$36-\$42 million

The District shared a spreadsheet with CSC-suggested incentive measures listed with the incentive cost per units, proposed number of units, allocation amount, and direct reductions estimate.

Question: Did you assess barriers to electrical panel upgrades to homes and providing incentives for panel upgrades so more folks can apply for the regular incentive programs to purchase an electric car?

District Response: We want residents to understand that trickle charging really does work. While it is great to have in-home Level II chargers, you do not need to redo all of the electrical in your house to participate.

Comment: The EV mechanic training is a great example of innovative programs that can really elevate this CERP. It could make a lasting impact in Stockton.

District Response: Thank you.

The CSC flagged the EV mechanic training measure as one that should have increased funding if the college district can accommodate additional capacity.

Question: Is the car share program the same one the Housing Authority presented? How long is this \$1 million going to last?

Housing Authority Response: Yes. The Housing Authority has the money for the chargers and this money would be for the cars. The budget is intended to fund the five-year length of the grant. It is specifically for Sierra Vista I, Sierra Vista II, and Conway Homes.

Comment: I think we are light on our budget for the EV mechanic training. The real concern is, for some of our community members, being able to afford the tools that they need to accomplish the task of working in the field after they have met the standard. That might be something we want to look at.

ILG Response: Thanks for that comment; it is an important workforce development conversation.

Note: The District included the locomotive switchers incentive measure in the funding spreadsheet even though it is not currently approved to be included in the Stockton CERP; this was done to show the CSC what the funding amount and emissions reductions might be.

Comment: We should focus on small business trucking over fleets.

District Response: Yes, we will put together outreach campaigns. This will require significant effort from the CSC to engage residents and ensure that we inform all the local businesses.

Stockton Unified School District Comment: Stockton Unified has done \$1.8 million in infrastructure upgrades. We have obtained two buses from the CEC, four buses from CARB, and we have a 24-bus infrastructure that we can accommodate. If the CSC uses some of your money for this, it would help us fill our fleet.

ILG Comment: Thank you for that context. We'll try to get a consensus from the CSC about whether to re-consider that item at a future meeting.

Comment: We did not hear people's rationale for how they voted in the last meeting on the red measures that did not get into the CERP. I get the sense there is a lot of push to include huge polluters and we need to consider it more carefully. We need to prioritize cleaning the air.

ILG Comment: Thanks for that comment. This is why the budget prioritization exercise is an important step; so you can see the cost effectiveness of each measure and the potential emission reductions.

Question: I would like to have a COVID lens in this program. Can that be added on rail and buses—places where people are confined? Has anyone thought of including and funding that?

District Response: There is some discussion at the state level, specifically about schools. We are closely watching what the state does so that any filtration the District incorporates also aligns with what the state is doing.

CARB Comment: If the CSC decides not to fund switchers, there is no reason you cannot approach your local railyard and ask for a voluntary agreement that the first locomotives they replace are voluntarily restricted to operate only in your community.

District Comment: There is a contract requirement that would require them to spend a certain amount of time in the AB 617 community because we are using local money and want to ensure emissions reductions stay local.

Based on the dialogue and CSC interest, Erica suggested that the CSC and District put the locomotive switchers and electric school bus measures back on the agenda for the March meeting so the CSC can decide on inclusion in the CERP.

Question: For the air filtration in schools measure, Stockton Unified is already planning to put MERV 13 filters in all of the classrooms. Are these measures intended for outside of Stockton Unified?

District Response: That is new information for us, so we will reach out to Stockton Unified to better answer that question.

Question: Is \$80,000 per school sufficient funding for the air filtration in schools measure?

District Response: There are 33 schools in the community and we think that budget is appropriate.

Wrap Up/Next Steps

Erica Manuel, Facilitator & Executive Director/CEO, ILG

Erica thanked the CSC for their work and reminded the group that the committee is scheduled to vote on the CERP at their next meeting.

Reminders

The next CSC meeting is March 3 on Zoom. All the presentations, meetings highlights, transcripts and the Zoom meeting recording will be posted online.

**Refer to meeting audio to review the full details and comments from the meeting.*

Public Comment

No public comment.

Puntos Importantes de la Reunión*
Comité Directivo de la Comunidad AB 617 de Stockton Reunión #16
16 de febrero de 2021 | 5:00 pm - 7:30 pm
Reunión Virtual a través de Zoom

Artículos de Acción para el Comité Directivo de la Comunidad de Stockton (Comité):

- Revisar y enviar comentarios sobre el borrador del CERP antes del 28 de febrero

Artículos de Acción para el Distrito del Aire del Valle (Distrito):

- Indica las revisiones del lenguaje del CERP en una tipografía o color diferente para el Comité
- Agregue los conmutadores de locomotoras y las medidas de los autobuses escolares eléctricos a la agenda de discusión para la próxima reunión del Comité
- Dar seguimiento con Stockton Unified sobre las medidas relacionadas con la filtración de aire en las escuelas y los filtros MERV que están instalando
- Proporcionar información adicional sobre medidas relacionadas con el Puerto que actualmente no están aprobadas para el CERP; considerar una discusión adicional en la próxima reunión

Bienvenida e Introducciones

Erica Manuel, Facilitadora y Directora Ejecutiva, Institute for Local Government (ILG)

Ryan Hayashi, Oficial Adjunto de Control de la Contaminación del Aire, Distrito

Erica dio la bienvenida a los participantes del Comité de Stockton a la segunda reunión del mes, presentó al equipo de facilitación de ILG, dio una descripción general de la agenda y señaló el tiempo de reunión extendido.

Ryan agradeció al Comité por los muchos comentarios que enviaron al Distrito sobre el borrador del CERP. Señaló que el Comité ha alcanzado un gran hito en el proceso AB 617.

Erica resumió la reunión anterior del Comité y discutió algunas mejoras en el proceso que pueden ayudar a que las reuniones virtuales sigan siendo productivas y atractivas para todos los miembros.

Los siguientes puntos fueron discutidos e incorporados a la reunión:

- **Elevar las voces de los residentes**—todas las perspectivas son válidas y el plan es ajustar nuestras prácticas de discusión para asegurar que las voces de los residentes y las voces más tranquilas sean elevadas, incluso en un entorno virtual
- **Actividad del cuadro de chat**—el registro de chat de la última reunión tenía decenas de páginas e incluía muchas conversaciones paralelas que no estaban específicamente relacionadas con el tema que se discutía verbalmente. Los miembros del Comité habían compartido preocupaciones por no poder seguir a ambos. Se pidió a los miembros del Comité que limitaran los comentarios del chat para reflejar solo el tema que se está discutiendo en ese momento

- **Proceso de votación**—la votación se puede realizar de manera más rápida, simplificada y transparente. En el futuro, todos los votos de los miembros del Comité se mostrarán en la pantalla para que los miembros votantes puedan validar sus elecciones en tiempo real

Comentario: Gracias, creo que estas aclaraciones son extremadamente útiles y agradezco la atenuación del chat.

Respuesta de ILG: Gracias. También recibimos comentarios similares de otros miembros del Comité.

Erica también identificó una serie de temas de discusión de la última reunión que generaron un interés significativo del Comité. Ella describió los siguientes temas y los próximos pasos relacionados con ellos:

- **Estudios de salud**—el Distrito aclarará el tipo exacto de estudios de salud que el Comité está buscando para ayudar a informar el proceso de toma de decisiones
- **Agregar medidas al CERP después de la aprobación de la Mesa**—puede haber cierta confusión sobre lo que se puede y no se puede agregar al CERP después de que sea aprobado por el Distrito o la Junta de CARB; el Distrito aclarará esto
- **Retrasar el CERP**—se ha debatido la posibilidad de obtener otra extensión del CERP; el Distrito proporcionará claridad sobre las opciones para retrasar el CERP
- **Cómo impactan las medidas del CERP en el presupuesto AB 617 de Stockton**—existe una correlación entre las medidas que se incluyen en el CERP y el presupuesto final para las actividades AB 617 en Stockton; el Distrito explicará esa dinámica

El personal del Distrito compartió las siguientes ideas relacionadas con lo anterior:

- **Estudios de salud**—el Distrito ha revisado la legislación, los paneles de revisión científica, la guía federal de la EPA y otros estudios existentes del Valle Central; No hay estudios de salud existentes que se hayan completado para el área de Stockton que muestren un nexo directo entre la implementación de medidas específicas y tipos de contaminación reducidos y ciertos tipos de indicadores de salud. La legislación AB 617 se elaboró para eliminar las emisiones de contaminantes de criterio; si el Comité hace eso con medidas en su CERP, la región obtendrá los beneficios de salud deseados
- **Agregar medidas al CERP después de la aprobación de la Mesa**—el Distrito ha recibido comentarios de CARB de que los CERP deben ser “documentos vivos”. Esto refleja la posibilidad de que pueda haber nuevas tecnologías que beneficiarían a las comunidades AB 617 en el transcurso del plazo de implementación del CERP. El Comité de Stockton podrá recomendar enmendar el CERP para incluir medidas que incorporen tecnología nueva o emergente o realizar cambios sustanciales a medida que se disponga de más información a través de la implementación. Sin embargo, el CERP no debe enmendarse con frecuencia y cualquier enmienda que el Comité vote después de la adopción inicial puede requerir la aprobación de la Mesa del Distrito
- **Retrasar el CERP**—a pedido del Comité, el Distrito presentó una solicitud de extensión en nombre de este Comité en diciembre. Los miembros del Comité han estado trabajando muy duro para cumplir con la nueva fecha límite y el comité está cerca de finalizar un CERP que refleje los aportes del Comité. Es probable que no sea posible una extensión adicional, ya que el estatuto deja claro que la fecha límite ya pasó. Las demoras

adicionales comenzarían a afectar los plazos de implementación con el financiamiento de incentivos con plazos específicos para gastar fondos

- **Cómo impactan las estrategias del CERP en el presupuesto de Stockton AB 617**—el Distrito previamente compartió cuál podría ser el presupuesto para las estrategias de incentivos; esas sugerencias presupuestarias se incluyeron en la encuesta de priorización de estrategias que el Distrito envió a fines del verano a la que respondió el Comité. Durante la reunión de octubre de 2020, el Distrito compartió cuáles son los posibles fondos disponibles para la comunidad de Stockton, siempre que el Comité identifique estrategias que se podrían gastar dentro de los plazos requeridos (30 de junio de 2025). El Distrito compartió los montos presupuestarios para las estrategias CERP que el Comité está considerando incluir en el último borrador del CERP. Si el Comité no desea incluir una medida en particular en el CERP, es posible que esos dólares no puedan redirigirse al presupuesto general. Por ejemplo, si ciertas medidas de alta reducción de emisiones con costos considerables se excluyen del CERP, eso puede reducir potencialmente el financiamiento de incentivos total disponible para la comunidad de Stockton, ya que esos fondos no necesariamente pueden reasignarse a otras estrategias a menos que exista una clara capacidad para gastar fondos de incentivos dentro de los plazos para gastar los fondos

Repasar y Discutir el Borrador del CERP

Jessica Olsen, Gerente de Programas, Distrito

Jessica revisó el borrador inicial de los comentarios del CERP recibidos del Comité. Los puntos importantes de la presentación incluyeron:

- Todos los comentarios recibidos se incluyen en el borrador publicado en la página web de Stockton AB 617
- Los puntos importantes de los comentarios incluyeron:
 - Reconocimiento del arduo trabajo y aportes proporcionados por el Comité
 - Reordenar el diseño del CERP para reflejar las prioridades de la comunidad en cada una de las secciones; basado en una encuesta de priorización
 - Priorizar las tecnologías de cero emisiones sobre las tecnologías de emisión casi cero cuando sea posible
 - Aclarar el financiamiento de contrapartida en lugares donde el CERP menciona "identificar fondos"
 - Aclarar el cronograma de implementación

Con base en los comentarios recibidos, el Distrito acordó las siguientes revisiones en los borradores posteriores:

- Incluir antecedentes históricos de Stockton
- Reordenar las medidas en el CERP para reflejar la priorización del Comité
- Incluir una lista clasificada de prioridades de la comunidad
- Especificar cómo trabajará el Distrito para aprovechar otros fondos para varias medidas para sacar más provecho de AB 617
- Aclarar que los incentivos para residentes son solo para aquellos en el límite AB 617
- Incluir un cronograma de implementación propuesto

- Reescribir las medidas del CERP para priorizar las tecnologías eléctricas cuando sea factible
- Incluir más detalles sobre las medidas de filtración de la escuela, incluyendo el componente de monitoreo

Pregunta: ¿Es posible que las revisiones estén en un tipografía o color diferente?

Respuesta del Distrito: Absolutamente, creo que es una gran idea.

Comentario: Parece que estamos financiando programas ya existentes. Cuando preguntamos cuánto se está gastando ya en ciertos programas, no obtenemos una respuesta; creo que ahí es donde está la fricción. Queremos hacer avanzar las cosas, pero queremos que se respondan estas preguntas.

Respuesta del Distrito: Buen punto. Algunos programas pueden tener financiación en este momento a través de otros programas o agencias, pero esa cantidad puede ser anual. AB 617 es un programa de cinco años y hemos dedicado fondos para estos proyectos durante los próximos cinco años. Si un proyecto o medida es importante para el Comité, debe incluirse en este CERP para garantizar que haya fondos disponibles. No podemos depender de una financiación constante o adecuada de otros programas.

Comentario de seguimiento: No intentamos ser obstruccionistas. Parece que tanto dinero se destina a industrias que han contaminado en nuestra comunidad y nunca han realizado actividades de alcance, lo cual es traumático para nosotros.

Respuesta del Distrito: Definitivamente es personal y entendemos la construcción de confianza que debe tener lugar.

Comentario: Me gustaría ver más programas y medidas innovadores incluidos en el CERP. Por ejemplo, un sistema de monitoreo del aire administrado por la comunidad sería maravilloso.

Respuesta de ILG: Gracias por su sugerencia.

Comentario: La gente está robando convertidores catalíticos y parece una carga reemplazarlos. Grabarlos ayudará a disuadir a los ladrones de robarlos y mantendrá nuestro aire limpio, ya que la gente no tiene los fondos para reemplazarlos.

Pregunta: Dado que sufrimos las peores tasas de asma en el estado, tengo curiosidad por saber a quién estamos esperando para recibir fondos.

Respuesta del Distrito: Los programas siguen las pautas estatales que se extienden más allá del Distrito. Estos programas suelen asignar fondos por orden de llegada y se realizan en todo el Valle. No tenemos la capacidad de reservar fondos de otras fuentes y exigir que se envíen a Stockton. El Valle tiene las comunidades más desfavorecidas con necesidades y deseos de beneficiarse de las reducciones de emisiones de los proyectos financiados

Comentario: Realizamos una votación formal sobre un artículo de la categoría roja en el que teníamos un empate. ¿Existe consenso sobre ese tema? Dado que Stockton es un importante centro logístico, me gustaría que reuniéramos una delegación en la que nos acerquemos a Amazon para financiar tecnologías que podrían desarrollarse si las industrias están dispuestas.

Respuesta de ILG: Gracias. Un comentario en el chat dice que Amazon ya está buscando fuentes de energía alternativas. En cuanto a la votación, sí tuvimos un empate, por lo que esa medida no estaba incluida en el CERP, según nuestra carta.

Respuesta del Distrito: Nuestro plan es informar mejor al Comité para que los miembros comprendan mejor los beneficios que brindan ciertas medidas.

Pregunta: En la última reunión del CAMP, se nos notificó que ya se había comprado el equipo de monitoreo del aire. Hace unos meses, el Comité votó que solo aprobaríamos el mapa de ubicaciones de monitoreo. ¿Alguien puede aclarar cómo se compró el equipo cuando el Comité solo aprobó el mapa?

Respuesta del Distrito: El Distrito trabajó en estrecha colaboración con el Comité para identificar las fuentes de inquietud y su ubicación. Durante la reunión de agosto de 2020, el Distrito compartió un mapa de las ubicaciones generales que el Comité propuso para el equipo de monitoreo del aire y el Distrito compartió qué tipos de equipo de monitoreo del aire se necesitarían para monitorear la contaminación del aire. El Distrito informó al Comité que el próximo paso sería comprar algunos de los equipos de monitoreo de aire, como el remolque, con la intención de colocarlo en la Primaria Washington y pidió comentarios del Comité y no recibió ninguno. Los monitores PM2.5 son un tipo de equipo más estándar que necesitaremos en nuestro inventario. También compramos un par de monitores de contaminantes múltiples, basados en los tipos de contaminantes que el Comité identificó que les preocupaba. Estos artículos se han comprado pero aún no se han colocado.

Ejercicio de Priorización Presupuestaria

Ryan Hayashi, Oficial Adjunto de Control de la Contaminación del Aire, Distrito

Ryan presentó la estrategia de financiación de incentivos del CERP al Comité. Los puntos importantes de la presentación incluyeron:

- La financiación debe liquidarse antes del 6/30/2025
- Montos de financiamiento propuestos basados en múltiples factores
 - Rentabilidad
 - Reducción de la exposición para poblaciones sensibles
 - Disponibilidad de proyectos potenciales
 - Voluntad/disponibilidad de empresas/organizaciones/agencias para proporcionar costos compartidos y socios en proyectos
 - Capacidad para completar el proyecto dentro del plazo legislativo
 - Costo total del proyecto
- Se prevé que las medidas de incentivo del CERP de Stockton tengan un presupuesto de \$36-\$42 millones

El Distrito compartió una hoja de cálculo con las medidas de incentivo sugeridas por el Comité enumeradas con el costo de incentivo por unidades, el número propuesto de unidades, el monto de la asignación y la estimación de reducciones directas.

Pregunta: ¿Evaluó las barreras para la actualización de los paneles eléctricos de los hogares y proporcionó incentivos para las actualizaciones de los paneles para que más personas puedan solicitar los programas de incentivos regulares para comprar un automóvil eléctrico?

Respuesta del Distrito: Queremos que los residentes comprendan que el cobro por goteo realmente funciona. Si bien es genial tener cargadores de Nivel II en el hogar, no es necesario que rehagas todos los componentes eléctricos de tu casa para participar.

Comentario: El entrenamiento de mecánicos de vehículos eléctricos es un gran ejemplo de programas innovadores que realmente pueden elevar este CERP. Podría tener un impacto duradero en Stockton.

Respuesta del Distrito: Gracias.

El Comité señaló la medida de capacitación para mecánicos de vehículos eléctricos como una que debería haber aumentado los fondos si el distrito universitario puede acomodar capacidad adicional.

Pregunta: ¿El programa de autos compartidos es el mismo que presentó la Autoridad de Vivienda? ¿Cuánto tiempo van a durar este millón de dólares?

Respuesta de la Autoridad de Vivienda: Sí. La Autoridad de Vivienda tiene el dinero para los cargadores y este dinero sería para los vehículos. El presupuesto está destinado a financiar los cinco años de duración de la subvención. Es específicamente para Sierra Vista I, Sierra Vista II y Conway Homes.

Comentario: Creo que tenemos poco presupuesto para la capacitación de mecánicos de vehículos eléctricos. La verdadera preocupación es, para algunos de los miembros de nuestra comunidad, poder pagar las herramientas que necesitan para realizar la tarea de trabajar en el campo después de haber cumplido con el estándar. Eso podría ser algo que queremos ver.

Respuesta de ILG: Gracias por ese comentario; es una conversación importante sobre el desarrollo de la fuerza laboral.

Nota: El Distrito incluyó la medida de incentivo de los cambiadores de locomotoras en la hoja de cálculo de financiamiento, aunque actualmente no está aprobada para ser incluida en el CERP de Stockton; esto se hizo para mostrarle al Comité cuál podría ser la cantidad de financiamiento y las reducciones de emisiones.

Comentario: Deberíamos centrarnos en el transporte de camiones de pequeñas empresas sobre flotillas.

Respuesta del Distrito: Sí, organizaremos campañas de alcance. Esto requerirá un esfuerzo significativo por parte del Comité para involucrar a los residentes y garantizar que informamos a todas las empresas locales.

Comentario del Distrito Escolar Unificado de Stockton: El Distrito Escolar Unificado de Stockton ha realizado \$1.8 millones en mejoras de infraestructura. Hemos obtenido dos autobuses de la CEC, cuatro autobuses de CARB y tenemos una infraestructura de 24 autobuses que podemos acomodar. Si el Comité utiliza parte de su dinero para esto, nos ayudaría a llenar nuestra flotilla.

Comentario de ILG: Gracias por ese contexto. Intentaremos obtener un consenso del CSC sobre si volver a considerar ese tema en una reunión futura.

Comentario: No escuchamos la justificación de la gente sobre cómo votaron en la última reunión sobre las medidas rojas que no entraron en el CERP. Tengo la sensación de que se está presionando mucho para incluir a los grandes contaminadores y debemos considerarlo más detenidamente. Necesitamos priorizar la limpieza del aire.

Comentario de ILG: Gracias por ese comentario. Es por eso que el ejercicio de priorización presupuestaria es un paso importante; para que pueda ver la rentabilidad de cada medida y las posibles reducciones de emisiones.

Pregunta: Me gustaría tener un lente COVID en este programa. ¿Se puede agregar eso en trenes y autobuses, lugares donde la gente está confinada? ¿Alguien ha pensado en incluirlo y financiarlo?

Respuesta del Distrito: Existe cierta discusión a nivel estatal, específicamente sobre las escuelas. Estamos observando de cerca lo que hace el estado para que cualquier filtración que incorpore el Distrito también se alinee con lo que está haciendo el estado.

Comentario de CARB: Si el Comité decide no financiar a los cambiadores, no hay razón para que no pueda acercarse a su estación ferroviaria local y solicitar un acuerdo voluntario de que las primeras locomotoras que reemplazan están restringidas voluntariamente para operar solo en su comunidad.

Comentario del Distrito: Existe un requisito contractual que les exigiría pasar una cierta cantidad de tiempo en la comunidad AB 617 porque estamos usando dinero local y queremos asegurarnos de que las reducciones de emisiones sigan siendo locales.

Con base en el diálogo y el interés del Comité, Erica sugirió que el Comité y el Distrito vuelvan a poner los conmutadores de locomotoras y las medidas de los autobuses escolares eléctricos en la agenda de la reunión de marzo para que el Comité pueda decidir su inclusión en el CERP.

Pregunta: Para la medida de filtración de aire en las escuelas, el Distrito Escolar Unificado de Stockton ya está planeando colocar filtros MERV 13 en todas las aulas. ¿Están estas medidas destinadas a fuera del Distrito Unificado de Stockton?

Respuesta del Distrito: Esa es información nueva para nosotros, por lo que nos comunicaremos con el Distrito Unificado de Stockton para responder mejor esa pregunta.

Pregunta: ¿\$80,000 por escuela son fondos suficientes para la medida de filtración de aire en las escuelas?

Respuesta del Distrito: Hay 33 escuelas en la comunidad y creemos que el presupuesto es apropiado.

Concluir/Próximos Pasos

Erica Manuel, Facilitadora y Directora Ejecutiva, ILG

Erica agradeció al Comité por su trabajo y le recordó al grupo que el comité está programado para votar sobre el CERP en su próxima reunión.

Recordatorios

La próxima reunión regular del Comité Directivo es el 3 de marzo en Zoom. Todas las presentaciones, los puntos importantes de las reuniones, las transcripciones y la grabación de la reunión de Zoom se publicarán en línea.

Meeting Highlights*

AB 617 Stockton Community Steering Committee Meeting #14

January 19, 2021 | 5:00 pm - 7:00 pm

Virtual Zoom Meeting

Action items for the Stockton Community Steering Committee (CSC):

- Email the District if interested in being a future community co-host (after CERP)

Action items for San Joaquin Valley Air Pollution Control District (District):

- Inform residents if the rescheduled January CSC meeting is eligible for stipend
- Confirm that the Port will present to the CSC about the four port-related CERP measures in February
- Send the residential wood burning outreach surveys to CSC to evaluate
- Remind CARB to share the truck forum details with the CSC

Welcome and Introductions

Erica Manuel, Facilitator & CEO, Institute for Local Government (ILG)

Ryan Hayashi, Deputy Air Pollution Control Officer, the District

Erica welcomed the Stockton CSC participants to the second meeting of the month, introduced the ILG facilitation team and gave an overview of the CERP strategies sorting process.

Ryan welcomed the CSC and expressed appreciation for the fast turnaround from the previous meeting.

Community Emission Reduction Program (CERP) Strategies

Erica Manuel, Facilitator & CEO, ILG

Erica presented a “CERP refresher” slide to reiterate what step in the process the CSC is in. Presentation highlights included:

- The CERP is a dynamic and flexible document; it is a framework for the work the CSC is going to do over five years of implementation
- Even after CERP consensus is achieved, the document can be modified during implementation
- The CERP includes emission reduction, exposure reduction and coordination measures
- The task of the CSC is to create a CERP document that will achieve emissions reductions through programs and activities that reflect community priorities
- The new deadline for the CSC to achieve consensus on the CERP is March
- The CERP that goes to the District Board in March will not be all inclusive (and it can be changed after “board approval”) but it should reflect the major priorities that need to be addressed during implementation

Erica also shared the proposed CSC work plan and schedule necessary to accomplish the objective of approving the CERP by March. She also provided an update that the Port data discussed at the previous meeting had not yet been completed and that the Port would work with the District to present those incentive measures at a future meeting rather than tonight.

Question: Can the Port let us know the emissions numbers on trucks idling around the area?

Port of Stockton Response: We have an anti-idling policy enforced at the Port, but it is only on Port property. I will talk to the District to see what we can work out.

Question: Can information be provided for existing funding for some of these measures?

ILG Response: We will have a comprehensive budget meeting as part of this CERP development process. The goal is to have the CSC prioritize the incentives first, so the District can develop an appropriate budget and give the CSC all necessary financial information based on that intel.

The CSC participated in a sorting exercise for the non-incentive CERP measures. Discussion highlights included:

Question: Is enforcement more of a priority than education and coordination?

District Response: They are all equally important. The nice thing about the CERP is that if a measure is included in the CERP, you don't have to pick and choose which ones you want to do. The District implements all the measures that the CSC includes.

Question: Has there been any data collected about the public health impact of these enforcements? I think that will help us prioritize.

District Response: If you're looking for data that supports enhanced enforcement and demonstrated impacts of improved health in studies, I am not aware of that. However, higher compliance rates with District rules and regulation will result in less emissions.

Erica highlighted seven of the yellow measures that CARB will be enforcing regardless of the Stockton CERP.

CARB Comment: These seven measures are CARB regulations, and we already enforce them in Stockton. We will still be involved with Stockton and will come back to CSC to report back.

Question: When it comes to enhanced enforcement, does that mean quicker reporting and a quicker turnaround?

CARB Response: We currently do annual reports, but if the CSC would like us to come back on a quarterly basis to provide an update on our activities, that is something we can commit to if it is included in this CERP.

Question: Some CARB measures are being implemented in a faster timeline because the Valley as a whole has such bad air quality. For those measures that are in that expedited timeline, how much faster would we get these reductions in Stockton?

CARB Comment: It focuses the compliance of the regulation in your community because they are doing more checks than they normally would.

The CSC reached consensus to move the seven CARB regulation enforcement measures to green. The CSC then discussed enforcement of the residential wood burning rule and vehicle miles traveled reductions next.

Comment: I think enforcement of wood burning won't go far in Stockton; it should be an incentive.

District Response: As an organization we are required to enforce our regulations, but if you don't include this measure in the CERP, it wouldn't be enhanced enforcement.

Comment: I want to voice support for the enforcement of wood burning. A few weeks ago, I submitted a form about a wood burning violation and about ten minutes later, it was responded to and the violator was cited. It was quick and efficient.

Comment: I am ok with moving it to green with enforcement if we match that with very strong incentives and outreach.

District Response: Thank you. We do have outreach included in the incentive measures you already approved.

Comment: I am worried that by increasing enforcement and potentially fining people, it would be an added stressor to an area that is already vulnerable and disproportionately challenged.

Comment: Realtors in the area should have forms that tell them what is and is not permitted so they can educate buyers how to be environmentally-friendly.

ILG Comment: Based on the comments from the District and the mix of perspectives from the CSC, there are a number of options. If you want to include enhanced enforcement of residential wood burning but you're concerned about the adverse impacts to the community right now, you could include this measure in the CERP with specific language that delays enhanced enforcement for 2-3 years down the road. You could focus on outreach and incentives in the first two years to give people a chance to get caught up from the impacts of COVID.

The CSC reached consensus to review the language options for including enforcement of residential wood burning, but staggering enforcement after education and outreach. Not officially moved to green.

Question: In three years, if we bring this back as enhanced enforcement, would we be able to do a study to show the cause and effects of enhancement on the community or on providing incentive funding to them to see if there is a huge change?

District Response: We have done significant outreach surveys on this issue. That research shows a direct correlation between education, enforcement and incentives reducing the levels of wood burning within the community.

District Comment: The vehicle miles traveled reduction measure is in alignment with the efforts of other agencies and jurisdictions that exist to ensure there is coordination around these projects.

The CSC reached consensus to move vehicle miles traveled reduction to green.

Two measures remained in red and will be discussed at the next CSC meeting.

All Non-Incentive Strategies by Color (after meeting)		
Green	Green	Red
<ul style="list-style-type: none"> • Permitted Stationary Sources (Measure #1) • Truck Idling (Measure #2) • Facility Risk Assessment (Measure #3) • Enforcement of Heavy-Duty Vehicle Inspection Programs (Measure #4) • Multilingual Outreach – Air Quality Info and Program (Measure #5) • Reduce Children’s Exposure to Poor Air Quality at Schools (Measure #7) • Port of Stockton (Measure #8) • Fugitive Dust (Measure #10) • Evaluation of District Rules (Measure #13) • Illegal Burning (Measure #16) • Illegal Residential Open Burning (Measure #19) • Transportation Planning (Measure #23) • Algal Bloom (Measure #24) 	<ul style="list-style-type: none"> • Ocean Going Vessel Fuel Regulation (Measure #6) • Mobile Cargo Handling Equipment Regulation (Measure #9) • Transport Refrigeration Units Regulation (Measure #12) • Consumer Products Regulatory Program (Measure #15) • Commercial Harbor Craft Regulation (Measure #17) • In-Use Off-Road Diesel-Fueled Fleets (Measure #14) • Truck and Bus Regulation (Measure #11) • Enforcement of Residential Wood Burning Rule (Measure #18) • Vehicle Miles Traveled Reduction (Measure #20) 	<ol style="list-style-type: none"> 1. Outdoor Commercial Cooking Emissions (Measure #21) 2. (Gas Station) Self-Inspections Training Program (Measure #22)

Wrap Up/Next Steps

Erica Manuel, Facilitator & CEO, ILG

Erica thanked the CSC for their work and reminded the CSC there will not be community co-hosts until the CERP has been finalized by the CSC. CSC members are still encouraged to volunteer to co-host future meetings.

Reminders

The next CSC meeting is Feb. 3 on Zoom. All the presentations, meetings highlights, transcripts and the Zoom meeting recording will be posted online.

Puntos Importantes de la Reunión*
Comité Directivo de la Comunidad AB 617 de Stockton Reunión #14

19 de enero de 2021 | 5:00 pm - 7:00 pm

Reunión Virtual a través de Zoom

Artículos de Acción para el Comité Directivo Comunitario de Stockton (Comité):

- Envié un correo electrónico al Distrito si está interesado en ser coanfitrión de la comunidad en el futuro (después del CERP)

Artículos de Acción para el Distrito del Aire del Valle (Distrito):

- Informar a los residentes si la reunión del Comité de enero reprogramada es elegible para recibir un estipendio
- Confirmar que el Puerto presentará al Comité sobre las cuatro medidas del CERP relacionadas con el puerto en febrero
- Envié las encuestas de alcance residencial sobre la quema de leña al Comité para evaluar
- Recordarle a CARB que comparta los detalles del foro de camiones con el Comité

Bienvenida e Introducciones

Erica Manuel, Facilitadora y Directora Ejecutiva, Institute for Local Government (ILG)

Ryan Hayashi, Oficial Adjunto de Control de la Contaminación del Aire, Distrito

Erica dio la bienvenida a los participantes del Comité de Stockton a la segunda reunión del mes, presentó al equipo de facilitación de ILG y brindó una descripción general del proceso de clasificación de estrategias del CERP.

Ryan dio la bienvenida al Comité y expresó su agradecimiento por el rápido cambio de rumbo de la reunión anterior.

Estrategias del Programa de Reducción de Emisiones en la Comunidad (CERP, por sus siglas en inglés)

Erica Manuel, Facilitadora y Directora Ejecutiva, ILG

Erica presentó una “Actualización del CERP” para reiterar en qué paso del proceso se encuentra el Comité. Los puntos importantes de la presentación incluyeron:

- El CERP es un documento dinámico y flexible; es un marco para el trabajo que el Comité va a realizar durante cinco años de implementación
- Incluso después de lograr el consenso del CERP, el documento puede modificarse durante la implementación
- El CERP incluye medidas de reducción de emisiones, reducción de exposición y coordinación
- La tarea del Comité es crear un documento CERP que logre reducciones de emisiones a través de programas y actividades que reflejen las prioridades de la comunidad
- La nueva fecha límite para que el Comité logre un consenso sobre el CERP es marzo

- El CERP que se envía a la Mesa Directiva del Distrito en marzo no incluirá todo (y se puede cambiar después de la "aprobación de la Mesa"), pero debe reflejar las principales prioridades que deben abordarse durante la implementación

Erica también compartió el plan de trabajo propuesto del Comité y el cronograma necesario para lograr el objetivo de aprobar el CERP para marzo. También proporcionó una actualización de que los datos del Puerto de cual se hablaron en la reunión anterior aún no se habían completado y que el Puerto trabajaría con el Distrito para presentar esos incentivos en una reunión futura en lugar de esta noche.

Pregunta: ¿Puede el Puerto informarnos las cifras de emisiones de los camiones que están inactivos (con el motor encendido) en el área?

Respuesta del Puerto de Stockton: Tenemos una regla contra dejar el motor encendido que se aplica en el Puerto, pero solo en la propiedad del Puerto. Hablaré con el Distrito para ver qué podemos hacer.

Pregunta: ¿Se puede proporcionar información sobre la financiación existente para algunas de estas medidas?

Respuesta de ILG: Tendremos una reunión presupuestaria integral como parte de este proceso de desarrollo del CERP. El objetivo es que el Comité dé prioridad a los incentivos primero, para que el Distrito pueda desarrollar un presupuesto apropiado y darle al Comité toda la información financiera necesaria basada en esa información.

El Comité participó en un ejercicio de clasificación de las medidas del CERP sin incentivos. Los puntos importantes de la discusión incluyeron:

Pregunta: ¿Es el cumplimiento de la ley una prioridad más que la educación y la coordinación?

Respuesta del Distrito: Todos son igualmente importantes. Lo bueno del CERP es que si se incluye una medida en el CERP, no tiene que elegir cuáles quiere hacer. El Distrito implementa todas las medidas que incluye el Comité.

Pregunta: ¿Se han recopilado datos sobre el impacto de estas medidas en la salud pública? Creo que eso nos ayudará a priorizar.

Respuesta del Distrito: Si está buscando datos que respalden el cumplimiento mejorado y los impactos demostrados de una mejor salud en los estudios, no estoy al tanto de eso. Sin embargo, las tasas de cumplimiento más altas con las reglas y regulaciones del Distrito resultarán en menos emisiones.

Erica recalcó siete de las medidas amarillas que CARB aplicará independientemente del CERP de Stockton.

Comentario de CARB: Estas siete medidas son regulaciones de CARB y ya las hacemos cumplir en Stockton. Seguiremos involucrados con Stockton y regresaremos al Comité para informarles.

Pregunta: Cuando se trata del cumplimiento mejorado, ¿eso significa informes más rápidos y una respuesta más rápida?

Respuesta de CARB: Actualmente hacemos informes anuales, pero si el Comité desea que regresemos trimestralmente para brindar una actualización de nuestras actividades, eso es algo a lo que podemos comprometernos si se incluye en este CERP.

Pregunta: Algunas medidas de CARB se están implementando en un plazo más rápido porque el Valle tiene una calidad de aire muy mala. Para aquellas medidas que se encuentran en esa línea de tiempo acelerada, ¿cuánto más rápido obtendríamos estas reducciones en Stockton?

Comentario de CARB: Se enfoca en el cumplimiento de la regulación en su comunidad porque están haciendo más verificaciones de las que normalmente harían.

El Comité llegó a un consenso para cambiar las siete medidas de cumplimiento de la regulación CARB a verde. El Comité luego discutió el cumplimiento de la regla de quema de leña residencial y las reducciones de millas recorridas por vehículos.

Comentario: Creo que el cumplimiento de la quema de leña no llegará muy lejos en Stockton; debería ser un incentivo.

Respuesta del Distrito: Como organización, estamos obligados a hacer cumplir nuestras regulaciones, pero si no incluye esta medida en el CERP, no mejoraría el cumplimiento.

Comentario: Quiero expresar mi apoyo a el cumplimiento de la quema de leña. Hace unas semanas, envié un formulario sobre una infracción de quema de leña y unos diez minutos después, se respondió y se citó al infractor. Fue rápido y eficiente.

Comentario: Estoy de acuerdo con cambiarlo a verde con el cumplimiento si lo combinamos con incentivos y alcance muy fuertes.

Respuesta del Distrito: Gracias. Tenemos el alcance incluido en las medidas de incentivo que ya aprobó.

Comentario: Me preocupa que al aumentar el cumplimiento y potencialmente multar a las personas, sería un factor de estrés adicional para un área que ya es vulnerable y desproporcionadamente desafiada.

Comentario: Los agentes inmobiliarios en el área deben tener formularios que les digan qué está y qué no está permitido para que puedan educar a los compradores sobre cómo ser respetuosos con el medio ambiente.

Comentario de ILG: En base a los comentarios del Distrito y la combinación de perspectivas del Comité, hay varias opciones. Si desea incluir el cumplimiento mejorado de la quema de leña residencial, pero le preocupan los impactos adversos para la comunidad en este momento, podría incluir esta medida en el CERP con un lenguaje específico que retrasa el cumplimiento mejorado durante 2-3 años en el futuro. Podría centrarse en el alcance y los incentivos en los primeros dos años para dar a las personas la oportunidad de ponerse al día con los impactos de COVID.

El Comité llegó a un consenso para repasar las opciones de lenguaje para incluir el cumplimiento de la quema de leña residencial, pero un cumplimiento asombroso después de la educación y el alcance. No se movió oficialmente a verde.

Pregunta: En tres años, si recuperamos esto como el cumplimiento mejorado, ¿podríamos hacer un estudio para mostrar la causa y los efectos de la mejora en la comunidad o para proporcionarles fondos de incentivo para ver si hay un cambio enorme?

Respuesta del Distrito: Hemos realizado importantes encuestas de alcance sobre este tema. Esa investigación muestra una correlación directa entre la educación, el cumplimiento y los incentivos que reducen los niveles de quema de leña dentro de la comunidad.

Comentario del Distrito: La medida de reducción de millas recorridas por vehículos está alineada con los esfuerzos de otras agencias y jurisdicciones que existen para asegurar que haya coordinación en torno a estos proyectos.

El Comité llegó a un consenso para mover la reducción de millas recorridas por vehículos a verde.

Dos medidas permanecieron en rojo y se discutirán en la próxima reunión del Comité.

Todas las Estrategias sin Incentivos por Color (después de la reunión)

Fuentes Estacionarias con Permisos (Medida #1)

Camiones con Motores Encendidos Mientras Estacionados (Medida #2)

Evaluación de Riesgos de Instalaciones (Medida #3)

Programas de Inspección de Cumplimiento de Vehículos de Carga Pesada (Medida #4)

Alcance Multilingüe – Información de la Calidad del Aire y Programas (Medida #5)

Regulación de Combustible para Buques Oceánicos (Medida #6)

Reducir la Exposición de los Niños a la Mala Calidad del Aire en las Escuelas (Medida #7)

Puerto de Stockton (Medida #8)

Regulación de Equipo Móvil de Manejo de Carga (Medida #9)

Polvo Fugitivo (Medida #10)

Regulación de Camiones y Autobuses (Medida #11)

Regulación de Unidades de Refrigeración de Transporte (Medida #12)

Evaluación de las Reglas del Distrito (Medida #13)

Flotillas de Combustible Diésel de Todo Terreno en Uso (Medida #14)

Programa Regulatorio de Productos de Consumo (Medida #15)

Quema Ilegal (Medida #16)

Regulación de Embarcaciones Portuarias Comerciales (Medida #17)

Cumplimiento de la Regla de la Quema de Leña Residencial (Medida #18)

Quema Ilegal Residencial Al Aire Libre (Medida #19)

Reducción de Millas Recorridas por Vehículo (Medida #20)

Planeamiento del Transporte (Medida #23)

Floraciones de Alga (Medida #24)

Emisiones de Cocina Comercial al Aire Libre (Medida #21)

Programa de Capacitación de Autoinspecciones (Gasolineras) (Medida #22)

Concluir/Próximos Pasos

Erica Manuel, Facilitadora y Directora Ejecutiva, ILG

Erica agradeció al Comité por su trabajo y les recordó que no habrá coanfitriones de la comunidad hasta que el CERP haya sido finalizado por el Comité. Aún se anima a los miembros del Comité a ofrecerse como voluntarios para ser coanfitriones de futuras reuniones.

Recordatorios

La próxima reunión regular del Comité Directivo es el 3 de febrero en Zoom. Todas las presentaciones, los puntos importantes de las reuniones, las transcripciones y la grabación de la reunión de Zoom se publicarán en línea.

Comentario Público

Ningún comentario público.

Meeting Highlights

(Refer to meeting audio to review the full details and comments from the meeting)

AB 617 Stockton Community Steering Committee Meeting #13a

January 14, 2021 | 5:00 pm - 7:00 pm (rescheduled from January 6, 2021)

Virtual Zoom Meeting

Action items for the Stockton Community Steering Committee (CSC):

- Volunteer to be a community co-host at a future meeting (post-CERP)

Action items for San Joaquin Valley Air Pollution Control District (District):

- Send a Doodle Poll with possible dates and times for CAMP subcommittee to meet
- Determine the possibility of getting a future presentation on Carl Moyer, which funds a lot of infrastructure and heavy duty equipment
- Work with Port of Stockton to present emissions inventory data to the CSC

Welcome and Introductions

Erica Manuel, Facilitator & CEO, Institute for Local Government (ILG)

Ryan Hayashi, Deputy Air Pollution Control Officer, District

Irene Calimlim, Fathers & Families of San Joaquin, Community Co-host

Erica welcomed the Stockton CSC participants, introduced the ILG facilitation team and gave an overview of the agenda for the rescheduled CSC meeting

Ryan welcomed the CSC before introducing Irene

Community Co-host Remarks

Irene Calimlim, Community Co-host

Irene shared a presentation detailing the mission of Fathers and Families of San Joaquin. She highlighted the organization's focus on health justice and environmental justice in order to reverse environmental harm and restore healing. She also shared details about their *Greenlining the Hood* initiative, which raises awareness of environmental injustice in South Stockton neighborhoods.

Community Emission Reduction Program (CERP) Strategies

Erica Manuel, Facilitator & CEO, ILG

Erica presented a "CERP refresher" slide that recapped the purpose of the CERP and the usual content in the document. She also outlined where the CSC is in the CERP development process to date and the steps still to be completed. Presentation highlights included:

- The CERP is a dynamic and flexible document; it is a framework for the work the CSC is going to do
- Even after CERP consensus is achieved, the document can be modified during implementation

- The CERP includes emission reduction, exposure reduction and coordination measures
- The task of the CSC is to create a CERP document that will achieve emissions reductions through programs and activities that reflect community priorities
- The new deadline for the CSC to achieve consensus on the CERP is March
- The CERP that goes to the District Board in March is the framework for the work to be done during implementation (and it can be changed after being approved) and it should reflect the major priorities that need to be addressed during implementation

The CSC discussed the schedule for reviewing all CERP measures and determining which should be included. Then the CSC participated in a sorting exercise for the remaining CERP incentive measures. Discussion highlights included:

District Comment: Is there any chance the CSC wants to combine the bike share and car share program measures? The proposal we sent out that some partner agencies are looking at pairing those two things.

Question: I have never used car share or bike share. Is there data on the actual usage rates in the Valley?

District Response: There was a survey of residents in Sierra Vista and Conway Homes and an overwhelming percentage of people were interested. We have operated several of these programs in the District and they have been hugely successful.

Question: Does the District know anything about the COG's strategy for integrating those two things?

District Response: I know the COG has a program that is not as targeted as the Housing Authority's. It goes beyond the boundaries of AB 617.

Comment: There is no end in sight with COVID, so I don't know what that means with approving this initiative—the cost of sanitizing the vehicles and bikes between each use will be more expensive.

Comment: My priority is green areas. My concern is when we put trees in, will they be installed with a sprinkler to keep them green? We need to look at other expenses as well, such as insurance.

District Comment: Understanding that this is a five-year implementation period, there are a couple different options. Right now, there may not be great infrastructure for the bike share program. One option is to not include it now and if things change over the five years, add it back in. Alternatively, we can look at adding it now and not prioritizing it for implementation until later in the cycle.

The CSC reached consensus to move the car share program to green, but move bike share measure to red. The next measure discussed was large clean fuel infrastructure, which focuses on clean truck deployment within the community.

Question: Does this measure imply that it is only at the Port?

District Response: This type of infrastructure would support any clean trucks that would fuel in the region.

Comment: We don't have a lot of information about how big the emissions from these measures will be and I think we need to wait for more information so we can evaluate them.

District Response: There is a lot of information that is still being gathered. As a reminder, just because a measure is listed in the CERP that does not mean it is definitively going to get done. If the latest information challenges the original goals, the CSC will be able to adjust accordingly during implementation.

Comment: It is an extremely important measure that we ensure that kind of fuel and electric plug-ins are available, whether it is at the Port or at every truck stop.

Comment: Having been RTD's Director of Planning until a year ago, despite how many electric buses are out there, they are still working on getting the gold standard reliability of charging. This infrastructure needs another year or two to get standardized before we put a lot of money behind it.

Comment: The CSC needs to consider that we have scarce incentive funding. I would love to see the District step forward and do a presentation on Carl Moyer, which funds a lot of infrastructure and heavy duty equipment.

District Response: We are always interested in providing that kind of information. There are some concerns about the way the money from the state will be distributed; it is often first come, first serve.

The CSC reached consensus on moving large clean fuel infrastructure to green. Erica asked the CSC to review the red column and discuss if any of the items could be moved to green. The CSC agreed to keep all items in the red column and only discuss the items in the yellow column.

Comment: I think all the items in red are extremely important, but we are hesitant to move them because we are hoping there is other grant money available.

Port of Stockton Comment: We are in the process of doing an emissions inventory at the Port and I received a draft copy last week. The marine emissions are 4-5 times higher than anything else on there. I am hoping to share these findings with the group in the future.

The next measure discussed was related to replacing wood burning fireplaces, stoves, and inserts.

Comment: It would be nice to see the data on how many units the District replaces each year.

District Response: Fresno and Kern County are hot spot counties with increased incentive funding and, as a result, we see a higher level of participation in the program in this county. A higher incentive amount could lead to higher levels of participation in Stockton as well, which will help reduce localized PM2.5 emissions.

Comment: As part of TCC, there is an organization that is doing home weatherization and retrofits; they may be able to help out with this.

Comment: This issue is important because our air quality has been in the no-burn section for many days.

Comment: I think the wood burning stove is a good bang for the buck. This is a great way to impact people right in their homes.

The CSC reached consensus to move wood burning fireplace, stoves, and inserts into green. The next measure discussed was trains and other rail equipment operating in the community.

Port of Stockton Comment: As much as I can get from the technical advisory committee, I will share. It will show data for all categories in this column.

The CSC reached consensus to keep trains and other rail equipment in the red column. The CSC decided not to move forward with discussing trucks and other heavy duty equipment operating at the port until getting additional data and speaking with the port at the next meeting. The next measure discussed was truck idling plug-ins.

Comment: I thought truck idling was one of our larger issues, especially in Boggs Tract. I didn't realize it was specific to TRUs. I think this would be an important issue for us.

District Response: Generally, these are a bank of plugs that can be used by 20-30 trucks that are queued up. It allows them to operate their TRUs. Overall, these are not super costly.

The CSC reached consensus to move truck idling plug-ins to green.

At the end of the meeting, the sorting assignments were as follows:

Green (in progress)	Yellow	Red
<ol style="list-style-type: none"> 1. Vegetative Barriers (Measure #1) 2. Trees and Urban Greening (Measure # 2) 3. Air Filtration in Schools (Measure #4) 4. Bike Paths and Infrastructure (Measure #5) 5. Trucks (Measure #6) 6. Charging Stations for Electric Vehicles (Measure #7) 7. Training for Electric Vehicle Mechanics (Measure #8) 8. New Electric Vehicles, Plug-in EVs, and Home Chargers for Residents (Measure #11) 9. Repair Cars to Pass Smog Check (Measure #14) 10. Air Filtration in Homes (Measure #22) 11. Home Weatherization, Solar and Electrification (Measure #23) 12. Truck Routes (Measure #3) 13. Replace Commercial Lawn Care Equipment (Measure #19) 14. Replace Home Lawn Care Equipment (Measure #20) 15. Parklets, Pocket Parks, Traffic Calming Measures (Measure #25) 16. Car Share Program (Measure #15) 17. Large Clean Fuel Infrastructure (Measure #10) 18. Replace Wood Burning Fireplace, Stoves and Inserts (Measure #17) 19. Truck Idling Plug Ins (new - (Measure #26) 	<ol style="list-style-type: none"> 1. Trucks and Other Heavy Duty Equipment Operating at the Port (Measure #13) 	<ol style="list-style-type: none"> 1. School Buses (Measure #9) 2. Trains and Other Rail Equipment Operating in the Community (Measure #12) 3. Tug Boats (Measure #16) 4. Marine Exhaust (Measure #21) 5. Electric Bike Share Program (Measure #18)

CAMP Subcommittee

Jon Klassen, Strategies and Incentives, District

Jon highlighted the CAMP subcommittee process. Presentation highlights included:

- The District has been working out logistics on monitoring locations
- The mobile air monitoring van has been deployed to Washington Elementary School
- The van will continue to visit the zones the CSC recommended
- The District would like to work with the CSC to form a subcommittee and get specific recommendations on properties and locations of each zone
- The District will work with subcommittee to refine the language in the CAMP

Wrap Up/Next Steps

Erica Manuel, Facilitator & CEO, ILG

Erica thanked the CSC for their time and productivity despite the virtual process. She also thanked Irene for co-hosting. Irene thanked everyone for their patience and extra time while finishing the measure sorting.

Reminders

The next CSC meeting is January 19 on Zoom. All the presentations, meetings highlights, transcripts and the Zoom meeting recording will be posted online.

Puntos Importantes de la Reunión

(Consulte el audio de la reunión para repasar todos los detalles y comentarios de la reunión)

Comité Directivo de la Comunidad AB 617 de Stockton Reunión #13a

14 de enero de 2021 | 5:00 pm - 7:00 pm (reprogramada del 6 de enero de 2021)

Reunión Virtual a través de Zoom

Artículos de Acción para el Comité Directivo Comunitario de Stockton (Comité):

- Ofrecerse como voluntario para ser coanfitrión de la comunidad en una reunión futuro (después del CERP)

Artículos de Acción para el Distrito de Control de la Contaminación del Aire del Valle de San Joaquín (Distrito):

- Envié una encuesta por Doodle con posibles fechas y horas para que el subcomité del CAMP se reúna
- Determinar la posibilidad de obtener una presentación futura sobre Carl Moyer, que financia una gran cantidad de infraestructura y equipo de servicio pesado
- Trabajar con el Puerto de Stockton para presentar los datos de inventario de emisiones al Comité

Bienvenida e Introducciones

Erica Manuel, Facilitadora y Directora Ejecutiva, Institute for Local Government (ILG)

Ryan Hayashi, Oficial Adjunto de Control de la Contaminación del Aire, Distrito

Irene Calimlim, Fathers & Families of San Joaquin, Coanfitrión de la Comunidad

Erica dio la bienvenida a los participantes del Comité de Stockton, presentó al equipo de facilitación del ILG y dio una descripción general de la agenda para la reunión reprogramada del Comité.

Ryan dio la bienvenida al Comité antes de presentar a Irene.

Comentarios del Coanfitrión de la Comunidad

Irene Calimlim, Coanfitrión de la Comunidad

Irene compartió una presentación detallando la misión de Fathers and Families of San Joaquin. Resaltó el enfoque de la organización en la justicia de la salud y la justicia ambiental para revertir el daño ambiental y restaurar la curación. También compartió detalles sobre su iniciativa *Greenlining the Hood*, que crea conciencia sobre la injusticia ambiental en los vecindarios de South Stockton.

Estrategias del Programa de Reducción de Emisiones de la Comunidad (CERP)

Erica Manuel, Facilitadora y Directora Ejecutiva, ILG

Erica presentó una “actualización del CERP” que resumía el propósito del CERP y el contenido habitual del documento. También describió dónde se encuentra el Comité en el proceso de

desarrollo del CERP hasta la fecha y los pasos que aún deben completarse. Los puntos importantes de la presentación incluyeron:

- El CERP es un documento dinámico y flexible; es un marco para el trabajo que va a hacer el Comité
- Incluso después de lograr el consenso del CERP, el documento puede modificarse durante la implementación
- El CERP incluye medidas de reducción de emisiones, reducción de exposición y coordinación
- La tarea del Comité es crear un documento CERP que logre reducciones de emisiones a través de programas y actividades que reflejen las prioridades de la comunidad
- La nueva fecha límite para que el Comité logre un consenso sobre el CERP es marzo
- El CERP que se envía a la Mesa Directiva del Distrito en marzo es el marco para el trabajo a realizar durante la implementación (y puede cambiarse después de ser aprobado) y debe reflejar las principales prioridades que deben abordarse durante la implementación

El Comité discutió el cronograma para revisar todas las medidas del CERP y determinar cuáles deberían incluirse. Luego, el Comité participó en un ejercicio de clasificación para las medidas de incentivo del CERP restantes. Los puntos importantes de la discusión incluyeron:

Comentario del Distrito: ¿Existe alguna posibilidad de que el Comité quiera combinar las medidas del programa de bicicletas compartidas y automóviles compartidos? La propuesta que enviamos es que algunas agencias asociadas están buscando emparejar esas dos cosas.

Pregunta: Nunca he usado un coche compartido o una bicicleta compartida. ¿Hay datos sobre las tasas de uso reales en el Valle?

Respuesta del Distrito: Hubo una encuesta a los residentes de Sierra Vista y Conway Homes y un porcentaje abrumador de personas estaba interesado. Hemos operado varios de estos programas en el Distrito y han tenido un gran éxito.

Pregunta: ¿Sabe el Distrito algo sobre la estrategia del COG para integrar esas dos cosas?

Respuesta del Distrito: Sé que el COG tiene un programa que no es tan específico como el de la Autoridad de Vivienda. Va más allá de los límites de AB 617.

Comentario: No se vislumbra un final con COVID, por lo que no sé qué significa eso con la aprobación de esta iniciativa—el costo de desinfectar los vehículos y las bicicletas entre cada uso será más caro.

Comentario: Mi prioridad son las zonas verdes. Mi preocupación es que cuando coloquemos árboles, ¿se instalarán con un rociador para mantenerlos verdes? También debemos considerar otros gastos, como el seguro.

Comentario del Distrito: Entendiendo que este es un período de implementación de cinco años, hay un par de opciones diferentes. En este momento, puede que no haya una gran infraestructura para el programa de bicicletas compartidas. Una opción es no incluirlo ahora y si las cosas

cambian durante los cinco años, agregarlo nuevamente. Alternativamente, podemos considerar agregarlo ahora y no priorizar su implementación hasta más adelante en el ciclo.

El Comité llegó a un consenso para cambiar el programa de uso compartido de automóviles a verde, pero cambiar la medida de bicicletas compartidas a rojo. La siguiente medida discutida fue una gran infraestructura de combustible limpio, que se enfoca en el despliegue de camiones limpios (menos contaminantes) dentro de la comunidad.

Pregunta: ¿Esta medida implica que es solo en el Puerto?

Respuesta del Distrito: Este tipo de infraestructura respaldaría cualquier camión limpio que abasteciera de combustible en la región.

Comentario: No tenemos mucha información sobre qué tan grandes serán las emisiones de estas medidas y creo que debemos esperar más información para poder evaluarlas.

Respuesta del Distrito: Todavía se está recopilando mucha información. Como recordatorio, el hecho de que una medida esté incluida en el CERP no significa que definitivamente se vaya a llevar a cabo. Si la información más reciente desafía los objetivos originales, el Comité podrá realizar ajustes en consecuencia durante la implementación.

Comentario: Es una medida sumamente importante que nos aseguremos de que se disponga de tipo de combustible y enchufes eléctricos, ya sea en el Puerto o en cada parada de camiones.

Comentario: Habiendo sido Director de Planificación de RTD hasta hace un año, a pesar de la cantidad de autobuses eléctricos que existen, todavía están trabajando para obtener la confiabilidad de carga estándar de oro. Esta infraestructura necesita uno o dos años más para estandarizarse antes de invertir mucho dinero.

Comentario: El Comité debe tener en cuenta que tenemos escasa financiación de incentivos. Me encantaría ver al Distrito dar un paso adelante y hacer una presentación sobre Carl Moyer, que financia una gran cantidad de infraestructura y equipo de servicio pesado.

Respuesta del Distrito: Siempre estamos interesados en brindar ese tipo de información. Existen algunas preocupaciones sobre la forma en que se distribuirá el dinero del estado; a menudo es por orden de llegada.

El Comité llegó a un consenso de cambiar la gran infraestructura de combustible limpio a verde. Erica pidió al Comité que revisara la columna roja y discutiera si alguno de los elementos podría cambiarse a verde. El Comité acordó mantener todos los elementos en la columna roja y solo discutir los elementos en la columna amarilla.

Comentario: Creo que todos los elementos en rojo son extremadamente importantes, pero dudamos en moverlos porque esperamos que haya otro dinero de subvención disponible.

Comentario del Puerto de Stockton: Estamos en el proceso de hacer un inventario de emisiones en el Puerto y recibí un borrador la semana pasada. Las emisiones marinas son 4-5 veces más altas que cualquier otra cosa allí. Espero compartir estos hallazgos con el grupo en el futuro.

La siguiente medida que se hablo estuvo relacionada con el reemplazo de chimeneas, estufas e insertos de leña.

Comentario: Sería bueno ver los datos sobre cuántas unidades reemplaza el Distrito cada año.

Respuesta del Distrito: Fresno y el condado de Kern son condados de zonas conflictivas con mayor financiamiento de incentivos y, como resultado, vemos un mayor nivel de participación en el programa en este condado. Un monto de incentivo más alto también podría conducir a niveles más altos de participación en Stockton, lo que ayudará a reducir las emisiones localizadas de PM2.5.

Comentario: Como parte de TCC, hay una organización que está haciendo acondicionamiento y modernización de viviendas; es posible que puedan ayudar con esto.

Comentario: Este problema es importante porque la calidad del aire ha estado en la sección de no quema durante muchos días.

Comentario: Creo que la estufa de leña es una buena inversión. Esta es una excelente manera de impactar a las personas directamente en sus hogares.

El Comité llegó a un consenso para trasladar la chimenea, las estufas y los insertos de leña a verde. La siguiente medida discutida fueron los trenes y otros equipos ferroviarios que operan en la comunidad.

Comentario del Puerto de Stockton: Compartiré todo lo que pueda obtener del comité asesor técnico. Mostrará datos para todas las categorías en esta columna.

El Comité llegó a un consenso para mantener los trenes y otros equipos ferroviarios en la columna roja. El Comité decidió no seguir adelante con la discusión de camiones y otros equipos pesados que operan en el puerto hasta obtener datos adicionales y hablar con el puerto en la próxima reunión. La siguiente medida discutida fueron los enchufes para minimizar camiones que dejan el motor encendido.

Comentario: Pensé que el dejar el motor encendido del camión era uno de nuestros problemas más importantes, especialmente en Boggs Tract. No me di cuenta de que era específico de las TRU. Creo que este sería un tema importante para nosotros.

Respuesta del Distrito: Generalmente, estos son un banco de enchufes que pueden ser utilizados por 20-30 camiones que están en línea. Les permite operar sus TRU. En general, estos no son muy costosos.

El Comité llegó a un consenso para cambiar los complementos de inactividad de los camiones a verde.

Al final de la reunión, las asignaciones de clasificación fueron las siguientes:

Verde (en progreso)

1. Barreras Vegetativas (Medida #1)

2. Árboles y Ecologización Urbana (Medida #2)
3. Filtración de Aire en las Escuelas (Medida #4)
4. Carriles de Bicicleta e Infraestructura (Medida #5)
5. Camiones (Medida #6)
6. Estaciones de Cargadores para Vehículos Eléctricos (Medida #7)
7. Capacitación para Mecánicos de Vehículos Eléctricos (Medida #8)
8. Vehículos Eléctricos Nuevos, Vehículos de Enchufar, y Cargadores para Hogares para Residentes (Medida #11)
9. Reparar Vehículos para Pasar Control de Smog (Medida #14)
10. Filtración de Aire en Hogares (Medida #22)
11. Climatización, Solar y Electrificación del Hogar (Medida #23)
12. Rutas de Camiones (Medida #3)
13. Reemplazar Equipo de Césped y Jardín Comercial (Medida #19)
14. Reemplazar Equipo de Césped y Jardín Residencial (Medida #20)
15. Parklets, Parquecitos, Medidas para Calmar el Trafico (Medida #25)
16. Programa de Vehículo Compartido (Medida #15)
17. Infraestructura de Combustible Limpio (Medida #10)
18. Reemplazar Chimeneas, Estufas, e Insertos que Queman Leña (Medida #17)
19. Enchufes para Minimizar el Dejar el Motor Encendido por Camiones (nuevo, Medida #26)

Amarillo

1. Camiones y Otro Equipo de Servicio Pesado Operando en un Puerto (Medida #13)

Rojo

1. Autobuses Escolares (Medida #9)
2. Trenes y Otros Equipos de Ferroviarios Operando en la Comunidad (Medida #12)
3. Remolcadores (Medida #16)
4. Escape Marino (Medida #21)
5. Programa de Bicicletas Eléctricas Compartidas (Medida #18)

Subcomité del CAMP

Jon Klassen, Estrategias e Incentivos, Distrito

Jon resaltó el proceso del subcomité del CAMP. Los puntos importantes de la presentación incluyeron:

- El Distrito ha estado trabajando en la logística para monitorear los lugares.
- La camioneta móvil de monitoreo de aire se ha desplegado en la Escuela Primaria Washington.
- La camioneta seguirá visitando las zonas recomendadas por el Comité.
- El Distrito quisiera trabajar con el Comité para formar un subcomité y obtener recomendaciones específicas sobre las propiedades y ubicaciones de cada zona.
- El Distrito trabajará con el subcomité para refinar el lenguaje en el CAMP.

Concluir/Próximos Pasos

Erica Manuel, Facilitadora y Directora Ejecutiva, ILG

Erica agradeció al Comité por su tiempo y productividad a pesar del proceso virtual. También agradeció a Irene por ser coanfitrión. Irene agradeció a todos por su paciencia y tiempo extra mientras terminaba la clasificación de las medidas.

Recordatorios

La próxima reunión regular del Comité Directivo es el 19 de enero en Zoom. Todas las presentaciones, los puntos importantes de las reuniones, las transcripciones y la grabación de la reunión de Zoom se publicarán en línea.

Agenda for Stockton Community Steering Committee Meeting #13.a

Thursday, January 14, 2021 – 5:00 pm - 7:00 pm

Public Participation: Join via *Facebook Live* - www.facebook.com/valleyair

Comments and questions posted on Facebook or submitted to ab617@valleyair.org during the meeting will be addressed during the meeting's public comment period.

- 5:00 p.m. Welcome, Introductions**
Erica Manuel, Facilitator, Institute for Local Government
Ryan Hayashi, Deputy Air Pollution Control Officer, Valley Air District
Irene Calimlim, Community Co-host, Fathers & Families of San Joaquin
- 5:10 p.m. Icebreaker Poll**
- 5:15 p.m. Fathers & Families of San Joaquin's Greenlining the Hood Report: How resident participation and perspectives align with CERP measures**
Irene Calimlim, Community Co-host, Fathers & Families of San Joaquin
- 5:35 p.m. Community Emission Reduction Program (CERP) Strategies**
Review draft list of CERP strategies: continue discussion of individual measures and work toward developing a list of measures to be included in the draft CERP
Community Steering Committee
- 6:40 p.m. CAMP Subcommittee**
Discuss forming a subcommittee to review the CAMP
District Staff
- 6:50 p.m. Wrap Up/Next Steps**
 - Subcommittee to review the CAMP
 - Additional CSC Meetings*Erica Manuel, Facilitator*
- 6:55 p.m. Public Comment**

REMINDERS

- Next meeting: Tuesday, January 19, 2021, via Zoom for CSC members and Facebook Live for public.

To request Spanish interpreting services, please contact Jaime Holt or Heather Heinks at (559) 230-6000 or AB617@valleyair.org at least 7 days prior to the meeting date.

Measure	Concerns	Suggestions	Questions/Add'l Discussion	Status Based on CSC Feedback
<p>2. TREES AND URBAN GREENING</p> <p>Overall, CSC supports this measure. Some implementation concerns.</p>	<ul style="list-style-type: none"> • Long term maintenance trust • Quantifying benefits 	<ul style="list-style-type: none"> • Include Hazelton Ave • Consider planting from seeds • Increase number of sites • Connect with Caltrans 		Green
<p>3. TRUCK ROUTES</p> <p>CSC supports and wants to ensure focus around Port and through Boggs Tract.</p>	<ul style="list-style-type: none"> • Don't use money for another study • Line up with the air monitoring results • Port actions on this • Quantifiable goals 	<ul style="list-style-type: none"> • Could this money be used to actually add speed bumps and signs directing trucks rather than just studying? 	<ul style="list-style-type: none"> • Supporting information is appreciated • CLARIFY to establish what the money is needed for • What "access means" • Please ask the county's consultant to give an update on the Boggs Tract Sustainability Plan 	Green
<p>4. AIR FILTRATION IN SCHOOLS</p> <p>CSC supports for schools within AB 617 boundary.</p>	<ul style="list-style-type: none"> • Prioritize older schools first • Consider health benefits and use monitoring data to show that 33 schools are in need 	<ul style="list-style-type: none"> • For schools near transportation corridors • Public and private schools • Should cover full cost for schools to transition as well as support for ongoing maintenance • Oldest school building should get it first 	<ul style="list-style-type: none"> • Are these schools in the boundaries? • Is this upgrading the system plus a supply of filters? • Needs more detail on where the money goes. 	Green
<p>5. BIKE PATHS AND INFRASTRUCTURE</p> <p>CSC supports and wants to see money is spent on projects that provide connectivity and safety, do not overlap, and are based on recent studies.</p>	<ul style="list-style-type: none"> • Don't spend money on planning • Ensure safety 	<ul style="list-style-type: none"> • Considered Van Buskirk Golf Course • Matching funds for safe routes to school, bicycle helmets, safety education • Connect with other projects (TCC) and infrastructure to maximize the benefit 	<ul style="list-style-type: none"> • Share the list of potential projects 	Green
<p>6. TRUCKS</p> <p>CSC supports and wants to focus on zero emission truck only.</p>	<ul style="list-style-type: none"> • How do we ensure 50 trucks are part of the local solution • Need robust charging infrastructure too 		<ul style="list-style-type: none"> • Zero emission vs near zero emission • Who should pay this cost 	Green

Measure	Concerns	Suggestions	Questions/Add'l Discussion	Status Based on CSC Feedback
<p>7. CHARGING STATIONS FOR ELECTRIC VEHICLES</p> <p>Overall, CSC supports this measure.</p>	<ul style="list-style-type: none"> • Long term solution • This should be an ongoing program as we transition from fossil fuels to electrification 	<ul style="list-style-type: none"> • Electric upgrade for residents • Outreach to business • Assistance with accessing incentive 	<ul style="list-style-type: none"> • Where is VW settlement funding being spent? • Fees and fines from local facilities? • Other sources of money? 	<p>Green</p>
<p>8. TRAINING FOR ELECTRIC VEHICLE MECHANICS</p> <p>Overall, CSC supports this measure and suggests adding more trainings and establishing more concrete goals.</p>	<ul style="list-style-type: none"> • Two mechanics trainings is not enough to keep up with growth in EVs 	<ul style="list-style-type: none"> • More trainings • Connect with Delta College vocational training • Check on feasibility at SJDC or find the nearest opportunity to be available for potential residents of our area • Spend on a "graduate" stipend, including tuition for Delta College electrical technical program (\$1800/mo) • It seems cost efficient to invest more here and bring green jobs to the AB 617 community 	<ul style="list-style-type: none"> • Number of trainings • Concrete details • What would this money be used for? (Scholarships, hiring staff, etc.) Is it enough? 	<p>Green</p>
<p>9. SCHOOL BUSES</p> <p>CSC questions 'bang for the buck', availability of other funding and COVID's shifting priorities. CSC may not want to include in CERP.</p>	<ul style="list-style-type: none"> • Other heavy equipment programs can deliver more bang for the buck • Buses are still used in the community? Be clear on need before spending so much money • More immediate Covid-19 needs? 	<ul style="list-style-type: none"> • School lists. Need emergency charging opportunities • Maybe check on disabled buses • Invest in more immediate needs 	<ul style="list-style-type: none"> • How many of these buses are in use in the community? • Are there other grants to access? 	<p>Red</p>
<p>10. LARGE CLEAN FUEL INFRASTRUCTURE</p> <p>CSC support installation of large clean fuel infrastructure, but needs more discussion regarding types of fuel.</p>	<ul style="list-style-type: none"> • Don't spend on planning • No incentivizing dirty forms of upstream energy 	<ul style="list-style-type: none"> • Blend into HD.1 • Planning here should include partnering with the City of Stockton to update the Climate Action Plan 	<ul style="list-style-type: none"> • What is "clean fuel" here? <i>Need to clearly define</i> • Program is vague 	<p>Yellow</p>

Measure	Concerns	Suggestions	Questions/Add'l Discussion	Status Based on CSC Feedback
<p>11. NEW ELECTRIC VEHICLES, PLUG-IN EVs, AND HOME CHARGERS FOR RESIDENTS</p> <p>CSC supports program.</p>	<ul style="list-style-type: none"> Investments stay in the AB 617 area 	<ul style="list-style-type: none"> Include assistance to homeowners in finding rebate Target AB 617 area investment 	<ul style="list-style-type: none"> Timeframe Program details Metrics 	<p>Green</p>
<p>12. TRAINS AND OTHER RAIL EQUIPMENT OPERATING IN THE COMMUNITY</p> <p>While CSC recognizes emission reduction potential, cost and who picks up the bill is a concern. Need more discussion on benefits.</p>	<ul style="list-style-type: none"> Why does CSC have to pick up the bill? 	<ul style="list-style-type: none"> Use other grant options first Port has to do that 	<ul style="list-style-type: none"> Timeframe What is estimated emission reduction? 	<p>Red</p>
<p>13. TRUCKS AND OTHER HEAVY DUTY EQUIPMENT OPERATING AT THE PORT</p> <p>Despite the concerns, CSC recognizes an opportunity with this strategy.</p>	<ul style="list-style-type: none"> Only zero emission, not near zero Port needs to be involved Large operations should pay for it 	<ul style="list-style-type: none"> Equipment primarily used in Stockton; vehicles that will be in area >75% of time Money only goes to low income independent owners 	<ul style="list-style-type: none"> Timeframe, how many? What is emission reduction? 	<p>Yellow</p>
<p>14. REPAIR CARS TO PASS SMOG CHECK</p> <p>CSC supports program and wants to further target it in AB 617 community and potentially increase the incentive.</p>	<ul style="list-style-type: none"> How effective is this program? \$500 does not cover smog repair cost Limited to certain mechanics 	<ul style="list-style-type: none"> Replace 1999 and newer vehicles Host the program in smaller communities 	<ul style="list-style-type: none"> Aren't existing programs adequate? Metrics Provide summaries of existing programs 	<p>Green</p>

Measure	Concerns	Suggestions	Questions/Add'l Discussion	Status Based on CSC Feedback
<p>15. CAR SHARE PROGRAM</p> <p>CSC supports further discussion of joining forces with SJCOG and HACSJ to expand car sharing grant to provide super low cost car share for residents in AB 617.</p>	<ul style="list-style-type: none"> • Transit could be harmed 	<ul style="list-style-type: none"> • Ability to rent 4WD for winter sports • The vehicle should be a truck--can reach more people since everybody needs a truck • Get the pilot first then expand 	<ul style="list-style-type: none"> • What does it cover? • Where the money is going to? • What's the emission reduction? • Strictly for AB 617 residents? 	<p>Yellow</p>
<p>16. TUG BOATS</p> <p>More discussion needs to occur regarding other resources and the port being responsible for financing and implementing this.</p>	<ul style="list-style-type: none"> • Port & operators should pay for it • Port should seek funding and cover the cost • CSC is not in position to determine what port needs 	<ul style="list-style-type: none"> • Relocate money • Compare benefits to other programs first 	<ul style="list-style-type: none"> • Need to know port's operations 	<p>Red</p>
<p>17. REPLACE WOOD BURNING FIREPLACE, STOVES AND INSERTS</p> <p>There is some skepticism about this measure. Need more information.</p>	<ul style="list-style-type: none"> • If all electric is not an option, use money elsewhere • Residents will never convert from wood and will resent the mandates 	<ul style="list-style-type: none"> • Should be all electric • Enforcement should focus on assistance with options to replace 	<ul style="list-style-type: none"> • Program metrics and impact • How much each type are and how much does the resident pay or is it based on need/income? 	<p>Yellow</p>
<p>18. ELECTRIC BIKE SHARE PROGRAM</p> <p>CSC likes this measure in general. Safety is a big concern.</p>	<ul style="list-style-type: none"> • Safety • Don't use money for a study 	<ul style="list-style-type: none"> • Include update from SJCOG with status of their grant and overlap 	<ul style="list-style-type: none"> • What about road diets? 	<p>Yellow</p>
<p>19. REPLACE COMMERCIAL LAWN CARE EQUIPMENT</p> <p>CSC is concerned with ensuring that the equipment stays in the area and questions why commercial is prioritized over residential.</p>	<ul style="list-style-type: none"> • Ensure these stay within the boundary (at least 75%) • Isn't it better to fund residential? 	<ul style="list-style-type: none"> • Use existing funds • Shift funds to community used equipment rather than commercial used • If commercial, fund small businesses 	<ul style="list-style-type: none"> • How much each type are and how much does the resident pay or is it based on need/income? 	<p>Green</p>

Measure	Concerns	Suggestions	Questions/Add'l Discussion	Status Based on CSC Feedback
<p>20. REPLACE HOME LAWN CARE EQUIPMENT</p> <p>It's a mix of high and low priority ranking. CSC prioritizes effectiveness, AB 617 boundary, direct benefits to residents and lower electric bills.</p>	<ul style="list-style-type: none"> • Need to stay in the boundary • People will resent mandates • Will replacement increase electric bill higher? 	<ul style="list-style-type: none"> • Education is an important piece • Flip allocation so residents get most of the funding • What about assistance with rooftop solar for residents? It might be a good option instead 	<ul style="list-style-type: none"> • Are we replacing to electric? 	<p>Green</p>
<p>21. MARINE EXHAUST</p> <p>One member recognizes this strategy as "good to reduce stationary pollution sources." Majority of a few comments received suggest the port should pay for it.</p>	<ul style="list-style-type: none"> • Port should pay for clean-up, especially if it's required by regulation 	<ul style="list-style-type: none"> • Re-allocate funds • Partner funds for feasibility study that assesses emission reduction and ability to implement. 		<p>Red</p>
<p>22. AIR FILTRATION IN HOMES</p> <p>This is a very important, high priority measure for CSC. Members want to see a more data driven approach, increased funding and ensure that the most vulnerable benefit from this strategy.</p>	<ul style="list-style-type: none"> • Ensure protection of residents living closest to major polluting sources 	<ul style="list-style-type: none"> • Use fines from polluters in the area to create a fund to support long term • Should be done in conjunction with proper health studies • Could use some data analysis • Income and <i>need</i> determines eligibility 	<ul style="list-style-type: none"> • Can someone use GIS to analyze how many homes and sensitive sites are within danger zones? Or what is the unit allocation estimated from? 	<p>Green</p>
<p>23. HOME WEATHERIZATION AND ELECTRIFICATION</p> <p>CSC supports this measure and wants to maximize partnerships.</p>	<ul style="list-style-type: none"> • Ensure that funding benefits people living in the community • Since PG&E already provides these benefits, this should not be an AB 617 project 	<ul style="list-style-type: none"> • Partner up with CPUC, Grid Alternative, and other agencies • Use funds from fines to support long term • Focus on solar rooftops 	<ul style="list-style-type: none"> • What would 100% rooftop solar look like in these charts? • Clarify what constitutes electrification 	<p>Green</p>
<p>NEW. TRUCK IDLING PLUG INS</p> <p>CSC member new suggestion needs discussion.</p>	<ul style="list-style-type: none"> • 	<ul style="list-style-type: none"> • Need research and responsible parties 	<ul style="list-style-type: none"> • 	<p>Yellow</p>

Measure	Concerns	Suggestions	Questions/Add'l Discussion	Status Based on CSC Feedback
<p>NEW. PARKLETS, POCKET PARKS, TRAFFIC CALMING MEASURE</p> <p>CSC member new suggestion needs discussion.</p>	<ul style="list-style-type: none"> • 	<ul style="list-style-type: none"> • Need research and responsible parties 	<ul style="list-style-type: none"> • 	<p>Green</p>

Agenda for Stockton Community Steering Committee Meeting #13

Wednesday, January 6, 2021 – 5:00 pm - 7:00 pm

Public Participation: Join via *Facebook Live* - www.facebook.com/valleyair

Comments and questions posted on Facebook or submitted to ab617@valleyair.org during the meeting will be addressed during the meeting's public comment period.

- 5:00 p.m. Welcome, Introductions**
Erica Manuel, Facilitator, Institute for Local Government
Ryan Hayashi, Deputy Air Pollution Control Officer, Valley Air District
Irene Calimlim, Community Co-host, Fathers & Families of San Joaquin
- 5:10 p.m. Icebreaker Poll**
- 5:15 p.m. Fathers & Families of San Joaquin's Greenlining the Hood Report: How resident participation and perspectives align with CERP measures**
Irene Calimlim, Community Co-host, Fathers & Families of San Joaquin
- 5:35 p.m. Community Emission Reduction Program (CERP) Strategies**
Review draft list of CERP strategies: continue discussion of individual measures and work toward developing a list of measures to be included in the draft CERP
Community Steering Committee
- 6:40 p.m. CAMP Subcommittee**
Discuss forming a subcommittee to review the CAMP
District Staff
- 6:50 p.m. Wrap Up/Next Steps**
 - Subcommittee to review the CAMP
 - Additional CSC Meetings*Erica Manuel, Facilitator*
- 6:55 p.m. Public Comment**

REMINDERS

- Next meeting: Tuesday, January 19, 2021, via Zoom for CSC members and Facebook Live for public.

To request Spanish interpreting services, please contact Jaime Holt or Heather Heinks at (559) 230-6000 or AB617@valleyair.org at least 7 days prior to the meeting date.

Measure	Concerns	Suggestions	Questions/Add'l Discussion	Status Based on CSC Feedback
<p>2. TREES AND URBAN GREENING</p> <p>Overall, CSC supports this measure. Some implementation concerns.</p>	<ul style="list-style-type: none"> • Long term maintenance trust • Quantifying benefits 	<ul style="list-style-type: none"> • Include Hazelton Ave • Consider planting from seeds • Increase number of sites • Connect with Caltrans 		Green
<p>3. TRUCK ROUTES</p> <p>CSC supports and wants to ensure focus around Port and through Boggs Tract.</p>	<ul style="list-style-type: none"> • Don't use money for another study • Line up with the air monitoring results • Port actions on this • Quantifiable goals 	<ul style="list-style-type: none"> • Could this money be used to actually add speed bumps and signs directing trucks rather than just studying? 	<ul style="list-style-type: none"> • Supporting information is appreciated • CLARIFY to establish what the money is needed for • What "access means" • Please ask the county's consultant to give an update on the Boggs Tract Sustainability Plan 	Green
<p>4. AIR FILTRATION IN SCHOOLS</p> <p>CSC supports for schools within AB 617 boundary.</p>	<ul style="list-style-type: none"> • Prioritize older schools first • Consider health benefits and use monitoring data to show that 33 schools are in need 	<ul style="list-style-type: none"> • For schools near transportation corridors • Public and private schools • Should cover full cost for schools to transition as well as support for ongoing maintenance • Oldest school building should get it first 	<ul style="list-style-type: none"> • Are these schools in the boundaries? • Is this upgrading the system plus a supply of filters? • Needs more detail on where the money goes. 	Green
<p>5. BIKE PATHS AND INFRASTRUCTURE</p> <p>CSC supports and wants to see money is spent on projects that provide connectivity and safety, do not overlap, and are based on recent studies.</p>	<ul style="list-style-type: none"> • Don't spend money on planning • Ensure safety 	<ul style="list-style-type: none"> • Considered Van Buskirk Golf Course • Matching funds for safe routes to school, bicycle helmets, safety education • Connect with other projects (TCC) and infrastructure to maximize the benefit 	<ul style="list-style-type: none"> • Share the list of potential projects 	Green
<p>6. TRUCKS</p> <p>CSC supports and wants to focus on zero emission truck only.</p>	<ul style="list-style-type: none"> • How do we ensure 50 trucks are part of the local solution • Need robust charging infrastructure too 		<ul style="list-style-type: none"> • Zero emission vs near zero emission • Who should pay this cost 	Green

Measure	Concerns	Suggestions	Questions/Add'l Discussion	Status Based on CSC Feedback
<p>7. CHARGING STATIONS FOR ELECTRIC VEHICLES</p> <p>Overall, CSC supports this measure.</p>	<ul style="list-style-type: none"> Long term solution This should be an ongoing program as we transition from fossil fuels to electrification 	<ul style="list-style-type: none"> Electric upgrade for residents Outreach to business Assistance with accessing incentive 	<ul style="list-style-type: none"> Where is VW settlement funding being spent? Fees and fines from local facilities? Other sources of money? 	Green
<p>8. TRAINING FOR ELECTRIC VEHICLE MECHANICS</p> <p>Overall, CSC supports this measure and suggests adding more trainings and establishing more concrete goals.</p>	<ul style="list-style-type: none"> Two mechanics trainings is not enough to keep up with growth in EVs 	<ul style="list-style-type: none"> More trainings Connect with Delta College vocational training Check on feasibility at SJDC or find the nearest opportunity to be available for potential residents of our area Spend on a "graduate" stipend, including tuition for Delta College electrical technical program (\$1800/mo) It seems cost efficient to invest more here and bring green jobs to the AB 617 community 	<ul style="list-style-type: none"> Number of trainings Concrete details What would this money be used for? (Scholarships, hiring staff, etc.) Is it enough? 	Green
<p>9. SCHOOL BUSES</p> <p>CSC questions 'bang for the buck', availability of other funding and COVID's shifting priorities. CSC may not want to include in CERP.</p>	<ul style="list-style-type: none"> Other heavy equipment programs can deliver more bang for the buck Buses are still used in the community? Be clear on need before spending so much money More immediate Covid-19 needs? 	<ul style="list-style-type: none"> School lists. Need emergency charging opportunities Maybe check on disabled buses Invest in more immediate needs 	<ul style="list-style-type: none"> How many of these buses are in use in the community? Are there other grants to access? 	Red
<p>10. LARGE CLEAN FUEL INFRASTRUCTURE</p> <p>CSC support installation of large clean fuel infrastructure, but needs more discussion regarding types of fuel.</p>	<ul style="list-style-type: none"> Don't spend on planning No incentivizing dirty forms of upstream energy 	<ul style="list-style-type: none"> Blend into HD.1 Planning here should include partnering with the City of Stockton to update the Climate Action Plan 	<ul style="list-style-type: none"> What is "clean fuel" here? <i>Need to clearly define</i> Program is vague 	Yellow

Measure	Concerns	Suggestions	Questions/Add'l Discussion	Status Based on CSC Feedback
<p>11. NEW ELECTRIC VEHICLES, PLUG-IN EVs, AND HOME CHARGERS FOR RESIDENTS</p> <p>CSC supports program.</p>	<ul style="list-style-type: none"> Investments stay in the AB 617 area 	<ul style="list-style-type: none"> Include assistance to homeowners in finding rebate Target AB 617 area investment 	<ul style="list-style-type: none"> Timeframe Program details Metrics 	<p>Green</p>
<p>12. TRAINS AND OTHER RAIL EQUIPMENT OPERATING IN THE COMMUNITY</p> <p>While CSC recognizes emission reduction potential, cost and who picks up the bill is a concern. Need more discussion on benefits.</p>	<ul style="list-style-type: none"> Why does CSC have to pick up the bill? 	<ul style="list-style-type: none"> Use other grant options first Port has to do that 	<ul style="list-style-type: none"> Timeframe What is estimated emission reduction? 	<p>Red</p>
<p>13. TRUCKS AND OTHER HEAVY DUTY EQUIPMENT OPERATING AT THE PORT</p> <p>Despite the concerns, CSC recognizes an opportunity with this strategy.</p>	<ul style="list-style-type: none"> Only zero emission, not near zero Port needs to be involved Large operations should pay for it 	<ul style="list-style-type: none"> Equipment primarily used in Stockton; vehicles that will be in area >75% of time Money only goes to low income independent owners 	<ul style="list-style-type: none"> Timeframe, how many? What is emission reduction? 	<p>Yellow</p>
<p>14. REPAIR CARS TO PASS SMOG CHECK</p> <p>CSC supports program and wants to further target it in AB 617 community and potentially increase the incentive.</p>	<ul style="list-style-type: none"> How effective is this program? \$500 does not cover smog repair cost Limited to certain mechanics 	<ul style="list-style-type: none"> Replace 1999 and newer vehicles Host the program in smaller communities 	<ul style="list-style-type: none"> Aren't existing programs adequate? Metrics Provide summaries of existing programs 	<p>Green</p>

Measure	Concerns	Suggestions	Questions/Add'l Discussion	Status Based on CSC Feedback
<p>15. CAR SHARE PROGRAM</p> <p>CSC supports further discussion of joining forces with SJCOG and HACSJ to expand car sharing grant to provide super low cost car share for residents in AB 617.</p>	<ul style="list-style-type: none"> Transit could be harmed 	<ul style="list-style-type: none"> Ability to rent 4WD for winter sports The vehicle should be a truck--can reach more people since everybody needs a truck Get the pilot first then expand 	<ul style="list-style-type: none"> What does it cover? Where the money is going to? What's the emission reduction? Strictly for AB 617 residents? 	<p>Yellow</p>
<p>16. TUG BOATS</p> <p>More discussion needs to occur regarding other resources and the port being responsible for financing and implementing this.</p>	<ul style="list-style-type: none"> Port & operators should pay for it Port should seek funding and cover the cost CSC is not in position to determine what port needs 	<ul style="list-style-type: none"> Relocate money Compare benefits to other programs first 	<ul style="list-style-type: none"> Need to know port's operations 	<p>Red</p>
<p>17. REPLACE WOOD BURNING FIREPLACE, STOVES AND INSERTS</p> <p>There is some skepticism about this measure. Need more information.</p>	<ul style="list-style-type: none"> If all electric is not an option, use money elsewhere Residents will never convert from wood and will resent the mandates 	<ul style="list-style-type: none"> Should be all electric Enforcement should focus on assistance with options to replace 	<ul style="list-style-type: none"> Program metrics and impact How much each type are and how much does the resident pay or is it based on need/income? 	<p>Yellow</p>
<p>18. ELECTRIC BIKE SHARE PROGRAM</p> <p>CSC likes this measure in general. Safety is a big concern.</p>	<ul style="list-style-type: none"> Safety Don't use money for a study 	<ul style="list-style-type: none"> Include update from SJCOG with status of their grant and overlap 	<ul style="list-style-type: none"> What about road diets? 	<p>Yellow</p>
<p>19. REPLACE COMMERCIAL LAWN CARE EQUIPMENT</p> <p>CSC is concerned with ensuring that the equipment stays in the area and questions why commercial is prioritized over residential.</p>	<ul style="list-style-type: none"> Ensure these stay within the boundary (at least 75%) Isn't it better to fund residential? 	<ul style="list-style-type: none"> Use existing funds Shift funds to community used equipment rather than commercial used If commercial, fund small businesses 	<ul style="list-style-type: none"> How much each type are and how much does the resident pay or is it based on need/income? 	<p>Green</p>

Measure	Concerns	Suggestions	Questions/Add'l Discussion	Status Based on CSC Feedback
<p>20. REPLACE HOME LAWN CARE EQUIPMENT</p> <p>It's a mix of high and low priority ranking. CSC prioritizes effectiveness, AB 617 boundary, direct benefits to residents and lower electric bills.</p>	<ul style="list-style-type: none"> • Need to stay in the boundary • People will resent mandates • Will replacement increase electric bill higher? 	<ul style="list-style-type: none"> • Education is an important piece • Flip allocation so residents get most of the funding • What about assistance with rooftop solar for residents? It might be a good option instead 	<ul style="list-style-type: none"> • Are we replacing to electric? 	Green
<p>21. MARINE EXHAUST</p> <p>One member recognizes this strategy as "good to reduce stationary pollution sources." Majority of a few comments received suggest the port should pay for it.</p>	<ul style="list-style-type: none"> • Port should pay for clean-up, especially if it's required by regulation 	<ul style="list-style-type: none"> • Re-allocate funds • Partner funds for feasibility study that assesses emission reduction and ability to implement. 		Red
<p>22. AIR FILTRATION IN HOMES</p> <p>This is a very important, high priority measure for CSC. Meeting Highlights*

AB 617 Stockton Community Steering Committee Meeting #12

December 2, 2020 | 5:00 pm - 7:00 pm

Virtual Zoom Meeting

Action items for the Stockton Community Steering Committee (CSC):

- Email Air District to volunteer to be a community co-host at a future meeting
- Reach out to CARB if there are any additional questions about the new heavy-duty omnibus regulations

Action items for San Joaquin Valley Air Pollution Control District (District):

- Send out a doodle poll for additional CSC meeting dates
- Send Zoom links for standing CSC meetings
- Allocate time to discuss CAMP into future agendas

Welcome and Introductions

Erica Manuel, Facilitator & CEO, Institute for Local Government (ILG)

Ryan Hayashi, Deputy Air Pollution Control Officer, District

Stacey Panyasee, Community Co-host

Erica welcomed the Stockton CSC participants, introduced the ILG facilitation team and gave an overview of the agenda.

Ryan welcomed the CSC before introducing Stacey.

Community Co-host Remarks

Stacey Panyasee, Community Co-host

Stacey shared a presentation detailing how residents of Stockton experience the impacts of air pollution daily. She shared statistics about average life expectancy in Stockton compared to the rest of San Joaquin County and California. Stacey urged the CSC to continue working together as the decisions will impact 132,000 lives and counting.

Community Emission Reduction Program (CERP) Strategies

Erica Manuel, Facilitator & CEO, ILG

Jaime Holt, Chief Communications Officer, District

Erica presented a slide that recapped the CERP development process and showed the CSC which stage they are currently in. The District showed examples of measures from other community CERPs. Presentation highlights include:

- At this stage, a measure is very high level and does not include specific details until the implementation phase
- The District wants to ensure there is flexibility to implement CSC suggestions
- The CERP is a living document that can be changed as needed during the implementation phase

Question: What is ongoing oversight of the implementation phase like? Have we anticipated any planning and collaborative strategies for integrating agency leads into the specific measure details?

District Response: The District has incorporated some of that during the implementation phase in other communities and has created numerous subcommittees that include relevant agencies to achieve specific goals. As an example, there is a pesticide measure in Shafter and DPR is heavily involved.

Question: Who is writing up the measures?

ILG Response: The District will take the lead on writing and refinement.

Question: What is the compensation for community volunteers in subcommittees? Can we have the same overview that we're getting for the incentive measures with the enforcement measures?

District Response: Absolutely, we'll structure the enforcement measure overview in the same way. Regarding compensation, the District follows the statewide stipend guidance. Stipends are only paid for full CSC meetings, not committee meetings. But the residents in Fresno and Shafter are participating actively in the subcommittees and we have not seen a decrease in resident participation.

Question: How will the proposed schedule accommodate that we still need more time to discuss the monitoring plan?

District Response: The District is currently reaching out to property owners to get access and approval on specific locations. We will provide an update to the CSC on those discussions. We'll also make time in a future agenda to discuss the draft that was sent out. If the CSC wants to explore having a subcommittee to talk about the draft CAMP or additional meetings, we can explore that as well.

Erica explained the measure sorting process to the CSC. The measures were sorted into green, yellow, and red columns, color coded based on CSC feedback. Green measures have received general consensus and can start to be refined, yellow measures have some agreement but need additional discussion and red measures have a lot of confusion and little agreement from the CSC. ILG presented all 25 measures and what color they have been coded based on initial feedback. The CSC discussed the measures and if they thought some should be moved to different color categories.

Comment: Within the vegetative barriers measure, I had suggested we place trees in people's homes and have a contract signed by the residents saying they will maintain the trees.

District Response: The District has taken note of that. The process is complex and would include further investigation and asking the public about locations, but that definitely can be part of the process.

Question: For green trucks, these are local, but not long-haul right?

District Response: The CSC has said they want to focus on zero-emission technology. The majority of the use for those vehicles would have to be local.

Question: Can we hear about CARB's heavy-duty omnibus regulation that was passed by CARB? I think we need an understanding of what businesses operating at the port will be doing in the future.

CARB Response: The regulation is adding several different layers of regulatory measures to the heavy-duty regulations. The regulation is complex, so I will post a fact sheet in the chat. Feel free to reach out to CARB.

Comment: Urban greening and parklets/traffic calming measures are all urban greening. The planning for urban greening costs as much as the urban greening itself.

ILG Response: Each one of these individual items will have a budget allocation, so if we want to prioritize some items for emphasis and budget considerations, that may be why they are currently listed as separate.

District Comment: Another reason why some related measures are separate right now has to do with who the District thinks may be partner agencies in this. For vegetative barriers, trees, and urban greening, we see PUENTES or Fathers and Families of San Joaquin being the main points of contacts.

Comment: I am with PUENTES and we have been doing a lot of the individual planting throughout Stockton and have strategies for people to take accountability for that.

ILG Response: That's great.

Comment: I am more supportive of green space. The District used to have incentives for electric bikes and I could go to work or city hall on one. Do you have that type of program in Fresno?

District Response: The District doesn't currently have a bike sharing program. There have been versions of those programs started in a lot of different cities with varying success. It is certainly a possibility.

Question: Why are the home lawn care equipment and wood burning fireplaces in the yellow box? I think these are important.

District Response: They are definitely important but we wanted to make sure the CSC understand what the measures entailed before moving them to green. The home lawn care equipment measure can be explained like you going to Lowe's and buying a trimmer and getting a rebate for that. The commercial equipment measure is for equipment that is significantly more expensive than residential lawn care equipment and it often has to run for 8-10 hours at a time. The percentage that this program would pay for residential would be more than it would pay for commercial, but the commercial dollar amount may be more because that equipment is in operation longer. With regards to wood stoves, an incentive for people to go from wood to gas is something some want to do. Gas still does have emissions and needs a little bit more discussion.

District Response: The lawn care equipment is the one program at the District that really targets neighborhoods. The emission reductions and benefits are highly localized. Even the new pieces of equipment are fairly dirty when talking about combustible equipment, so going all electric has many emission benefits.

Comment: I used to have a powerful gas lawn mower. With electrical, they stop every five minutes because they get stuck or the battery dies.

District Response: That is a great point and has been the experience of a lot of early adopters of the technology. Over the last 2-3 years, there has been a huge increase in the number of manufacturers of this equipment and the power and battery storage has increased.

Comment: I don't know enough about cycling in Stockton, but I believe the city doesn't have the infrastructure in place for a safe cycling community. There is a world of planning and infrastructure that needs to happen before bike share can be introduced.

The following measures were moved from yellow to green:

- Truck routes
- Replace commercial lawn care equipment
- Replace home lawn care equipment
- Parklets, pocket parks, traffic calming measures

There will be six yellow and four red measures to continue discussing at future meetings.

District Comment: If the CSC still wants to consider the bike share, we can include it, place a lower priority on it and look to launch a program later as opposed to right out of the gate.

Comment: The truck idling plug-ins should be green. Perhaps there are other programs that handle that concept and we can encourage that to start taking place.

ILG Comment: Noted. Also remember that anything yellow is going to continue to be discussed.

Comment: Stockton does not have the infrastructure for healthy bike riding. The main thing is that we have such a problem with illegal bicycling. I am not in favor of spending any money on electric bikes at this time.

ILG Response: Thank you. The chat reflects there is still a lot of interest in continuing the conversation on that item.

The Original and Revised color coding assignments are as follows:

All Incentive Strategies in Order - Original

1. Vegetative Barriers
 2. Trees and Urban Greening
 3. Truck Routes
 4. Air Filtration in Schools
 5. Bike Paths and Infrastructure
 6. Trucks
 7. Charging Stations for Electric Vehicles
 8. Training for Electric Vehicle Mechanics
 9. School Buses
 10. Large Clean Fuel Infrastructure
 11. New Electric Vehicles, Plug-in EVs, and Home Chargers for Residents
 12. Trains and Other Rail Equipment Operating in the Community
 13. Trucks and Other Heavy Duty Equipment Operating at the Port
 14. Repair Cars to Pass Smog Check
 15. Car Share Program
 16. Tug Boats
 17. Replace Wood Burning Fireplace, Stoves and Inserts
 18. Electric Bike Share Program
 19. Replace Commercial Lawn Care Equipment
 20. Replace Home Lawn Care Equipment
 21. Marine Exhaust
 22. Air Filtration in Homes
 23. Home Weatherization and Electrification
- New. Truck Idling Plug Ins
New. Parklets, Pocket Parks, Traffic Calming Measures

All Incentive Strategies by Color - Original

Extension Letter

*Ryan Hayashi, Deputy Air Pollution Control Officer, District
Skott Wall, Community Air Protection Program, CARB*

Ryan explained the process for requesting a CERP extension. Presentation highlights include:

- State law requires that the CERP is completed no later than 12 months after the community was selected, which was December 2019
- CARB released guidance that includes the process for extending the deadline
- The draft extension letter shows the CERP being presented to the District board for approval on March 18, 2021
- The CERP would go to CARB for adoption shortly after

CARB Comment: If you submit the letter and have CSC and District buy-in on the request to extend the deadline, there should be no problem with CARB approving the extension.

The CSC approved the extension of the CERP.

Wrap Up/Next Steps

Erica Manuel, Facilitator, ILG

Erica reminded the CSC that they will continue to discuss the yellow and red color-coded measures at future meetings. Ryan thanked the CSC for getting a great amount of work done and wished everyone happy holidays. Stacey, community co-host, thanked everyone for their energy and time in making a difference.

Reminders

The next regular CSC meeting is January 6 on Zoom. All the presentations, meetings highlights, transcripts and the Zoom meeting recording will be posted online.

**Refer to meeting audio to review the full details and comments from the meeting.*

Puntos Importantes de la Reunión*
Comité Directivo de la Comunidad AB 617 de Stockton Reunión #12

2 de diciembre de 2020 | 5:00 pm - 7:00 pm

Reunión Virtual a través de Zoom

Artículos de Acción para el Comité Directivo de la Comunidad de Stockton (Comité):

- Envíe un correo electrónico al Distrito de Aire para ofrecerse como voluntario para ser coanfitrión de la comunidad en una reunión futura
- Comuníquese con CARB si tiene alguna pregunta adicional sobre las nuevas regulaciones de ómnibus de servicio pesado

Artículos de Acción para el Distrito del Aire del Valle (Distrito):

- Envíe una encuesta de doodle para más fechas de reuniones del Comité
- Enviar enlaces de Zoom para reuniones del Comité
- Asignar tiempo para discutir el CAMP en agendas futuras

Bienvenida e Introducciones

Erica Manuel, Facilitadora y Directora Ejecutiva, Institute for Local Government (ILG)

Ryan Hayashi, Oficial Adjunto del Control de la Contaminación del Aire, Distrito

Stacey Panyasee, Coanfitrión de la Comunidad

Erica dio la bienvenida a los participantes del Comité de Stockton, presentó al equipo de facilitación de ILG y dio una descripción general de la agenda.

Ryan dio la bienvenida al Comité antes de presentar a Stacey.

Comentarios del Coanfitrión de la Comunidad

Stacey Panyasee, Coanfitrión de la Comunidad

Stacey compartió una presentación que detalla cómo los residentes de Stockton sufren los impactos de la contaminación del aire a diario. Ella compartió estadísticas sobre la esperanza de vida promedio en Stockton en comparación con el resto del condado de San Joaquín y California. Stacey instó al Comité a continuar trabajando juntos ya que las decisiones afectarán 132,000 vidas y contando.

Estrategias del Programa de Reducción de Emisiones de la Comunidad (CERP)

Erica Manuel, Facilitadora y Directora Ejecutiva, ILG

Jaime Holt, Directora de Comunicaciones, Distrito

Erica presentó el proceso de desarrollo del CERP y le mostró al Comité en qué etapa se encuentran actualmente. El Distrito mostró ejemplos de medidas de otros CERP comunitarios. Los puntos importantes de la presentación incluyen:

- En esta etapa, una medida es de muy alto nivel y no incluye detalles específicos hasta la fase de implementación

- El Distrito quiere asegurarse de que haya flexibilidad para implementar las sugerencias del Comité
- El CERP es un documento vivo que se puede modificar según sea necesario durante la fase de implementación

Pregunta: ¿Cómo es la supervisión continua de la fase de implementación? ¿Hemos anticipado alguna estrategia de planificación y colaboración para integrar los clientes potenciales de la agencia en los detalles específicos de la medida?

Respuesta del Distrito: El Distrito ha incorporado algo de eso durante la fase de implementación en otras comunidades y ha creado numerosos subcomités que incluyen agencias relevantes para lograr metas específicas. Por ejemplo, hay una medida de pesticidas en Shafter y el DPR está muy involucrado.

Pregunta: ¿Quién está redactando las medidas?

Respuesta de ILG: El Distrito tomará la iniciativa en la redacción y el refinamiento.

Pregunta: ¿Cuál es la compensación para los voluntarios de la comunidad en los subcomités? ¿Podemos tener la misma visión general que estamos obteniendo para las medidas de incentivo con las medidas de ejecución?

Respuesta del Distrito: Absolutamente, estructuraremos la descripción general de la medida de cumplimiento de la misma manera. Con respecto a la compensación, el Distrito sigue la guía de estipendios a nivel estatal. Los estipendios solo se pagan por las reuniones completas del Comité, no por las reuniones del comité. Pero los residentes de Fresno y Shafter están participando activamente en los subcomités y no hemos visto una disminución en la participación de los residentes.

Pregunta: ¿Cómo se adaptará el cronograma propuesto a que todavía necesitamos más tiempo para discutir el plan de monitoreo?

Respuesta del Distrito: El Distrito se está comunicando con los propietarios para obtener acceso y aprobación en ubicaciones específicas. Proporcionaremos una actualización al Comité sobre esas discusiones. También haremos tiempo en una agenda futura para discutir el borrador que se envió. Si el Comité quiere explorar la posibilidad de tener un subcomité para hablar sobre el borrador del CAMP o reuniones adicionales, también podemos explorar eso.

Erica explicó el proceso de clasificación de medidas al Comité. Las medidas se clasificaron en columnas verdes, amarillas y rojas, codificadas por colores según los comentarios del Comité. Las medidas verdes han recibido un consenso general y pueden comenzar a refinarse, las medidas amarillas tienen cierto acuerdo pero necesitan discusión adicional y las medidas rojas tienen mucha confusión y poco acuerdo por parte del Comité. ILG presentó las 25 medidas y el color que se han codificado en función de la retroalimentación inicial. El Comité discutió las medidas y si pensaban que algunas deberían trasladarse a diferentes categorías de colores.

Comentario: Dentro de la medida de barreras vegetativas, había sugerido que colocáramos árboles en las casas de las personas y que los residentes firmen un contrato diciendo que ellos mantendrán los árboles.

Respuesta del Distrito: El Distrito ha tomado nota de eso. El proceso es complejo e incluiría una mayor investigación y preguntar al público sobre ubicaciones, pero eso definitivamente puede ser parte del proceso.

Pregunta: Para los camiones ecológicos, estos son locales, pero no de largo recorrido, ¿verdad?

Respuesta del Distrito: El Comité ha dicho que quieren enfocarse en la tecnología de cero emisiones. La mayor parte del uso de esos vehículos tendría que ser local.

Pregunta: ¿Podemos escuchar sobre la regulación de ómnibus de servicio pesado de CARB que fue aprobada por CARB? Creo que necesitamos comprender qué harán en el futuro las empresas que operan en el puerto.

Respuesta de CARB: La regulación está agregando varios niveles diferentes de medidas regulatorias a las regulaciones de servicio pesado. La regulación es compleja, así que publicaré una hoja informativa en el chat. No dude en comunicarse con CARB.

Comentario: La ecologización urbana y los parklets/las medidas para calmar el tráfico son todos de la ecologización urbana. La planificación de la ecologización urbana cuesta tanto como la ecologización urbana en sí.

Respuesta de ILG: Cada uno de estos elementos individuales tendrá una asignación presupuestaria, por lo que si queremos priorizar algunos elementos por énfasis y consideraciones presupuestarias, esa puede ser la razón por la que actualmente se enumeran como separados.

Comentario del Distrito: Otra razón por la que algunas medidas relacionadas están separadas en este momento tiene que ver con quiénes el Distrito cree que pueden ser agencias asociadas en esto. Para barreras vegetativas, arbolado y ecologización urbana, vemos a PUENTES o Fathers and Families of San Joaquin como los principales puntos de contacto.

Comentario: Estoy con PUENTES y hemos estado haciendo muchas plantaciones individuales en todo Stockton y tenemos estrategias para que la gente se responsabilice por ello.

Respuesta de ILG: Eso es genial.

Comentario: Apoyo más los espacios verdes. El Distrito solía tener incentivos para las bicicletas eléctricas y yo podía ir al trabajo o al ayuntamiento en una. ¿Tiene ese tipo de programa en Fresno?

Respuesta del Distrito: El Distrito no tiene actualmente un programa para compartir bicicletas. Ha habido versiones de esos programas iniciadas en muchas ciudades diferentes con éxito variable. Ciertamente es una posibilidad.

Pregunta: ¿Por qué el equipo para el cuidado del césped de la casa y las chimeneas de leña están en la caja amarilla? Creo que estos son importantes.

Respuesta del Distrito: Definitivamente son importantes, pero queríamos asegurarnos de que el Comité comprenda lo que implican las medidas antes de cambiarlas a verde. La medida del equipo para el cuidado del césped en el hogar se puede explicar como si usted fuera a Lowe's, comprara una podadora y obtenga un reembolso por eso. La medida para equipos comerciales es para equipos que son significativamente más costosos que los equipos residenciales para el cuidado del césped y, a menudo, debe dejar correr durante 8 a 10 horas seguidas. El porcentaje que este programa pagaría por viviendas residenciales sería más de lo que pagaría por comerciales, pero la cantidad comercial en dólares puede ser mayor porque el equipo está en funcionamiento por más tiempo. Con respecto a las estufas de leña, un incentivo para que las

personas pasen de la leña al gas es algo que algunos quieren hacer. El gas todavía tiene emisiones y necesita un poco más de discusión.

Respuesta del Distrito: El equipo para el cuidado del césped es el único programa del Distrito que realmente se enfoca en los vecindarios. Las reducciones de emisiones y los beneficios están muy localizados. Incluso los equipos nuevos están bastante sucios cuando se habla de equipos combustibles, por lo que utilizar un sistema totalmente eléctrico tiene muchos beneficios de emisiones.

Comentario: Yo antes tenía una potente cortadora de césped de gas. Con los eléctricos, se detienen cada cinco minutos porque se atascan o la batería se agota.

Respuesta del Distrito: Ese es un gran punto y ha sido la experiencia de muchos de los primeros en adoptar la tecnología. Durante los últimos 2-3 años, ha habido un gran aumento en el número de fabricantes de este equipo y ha aumentado la energía y el almacenamiento de la batería.

Comentario: No sé lo suficiente sobre el ciclismo en Stockton, pero creo que la ciudad no cuenta con la infraestructura necesaria para una comunidad ciclista segura. Hay un mundo de planificación e infraestructura que debe suceder antes de que se pueda introducir la bicicleta compartida.

Las siguientes medidas se cambiaron de amarillo a verde:

- Rutas de camiones
- Reemplazar el equipo comercial para el cuidado del césped
- Reemplazar el equipo de cuidado del césped de la casa
- Parklets, parquecitos, medidas para calmar el tráfico

Habrán seis medidas amarillas y cuatro rojas para seguir discutiendo en reuniones futuras.

Comentario del Distrito: Si el Comité todavía quiere considerar la bicicleta compartida, podemos incluirla, darle una prioridad más baja y buscar lanzar un programa más tarde en lugar de hacerlo desde el principio.

Comentario: Los enchufes para camiones con los motores encendidos deben ser de color verde. Quizás hay otros programas que manejan ese concepto y podemos alentarlos a que comience a tener lugar.

Comentario de ILG: Anotado. También recuerde que todo lo amarillo se seguirá discutiendo.

Comentario: Stockton no tiene la infraestructura para andar en bicicleta de manera saludable. Lo principal es que tenemos un gran problema con el ciclismo ilegal. No estoy a favor de gastar dinero en bicicletas eléctricas en este momento.

Respuesta de ILG: Gracias. El chat refleja que todavía hay mucho interés en continuar la conversación sobre ese tema.

Las asignaciones de codificación de colores originales y revisadas son las siguientes:

Todas las Estrategias de Incentivos en Orden – Original

1. Barreras Vegetativas
 2. Árboles y Ecologización Urbana
 3. Rutas de Camiones
 4. Filtración de Aire en las Escuelas
 5. Carriles de Bicicleta e Infraestructura
 6. Camiones
 7. Estaciones de Cargadores para Vehículos Eléctricos
 8. Capacitación para Mecánicos de Vehículos Eléctricos

Carta de Extensión

*Ryan Hayashi, Oficial Adjunto de Control de la Contaminación del Aire, Distrito
Skott Wall, Programa Comunitario de Protección del Aire, CARB*

Ryan explicó el proceso para solicitar una extensión del CERP. Los puntos importantes de la presentación incluyen:

- La ley estatal requiere que el CERP se complete a más tardar 12 meses después de que se seleccionó la comunidad, que fue en diciembre de 2019
- CARB publicó una guía que incluye el proceso para extender el plazo
- El borrador de la carta de extensión muestra que el CERP se presenta a la Mesa Directiva del Distrito para su aprobación el 18 de marzo de 2021
- El CERP iría a CARB para su adopción poco después

Comentario de CARB: Si envía la carta y tiene la aceptación del Comité y del Distrito en la solicitud para extender el plazo, no debería haber ningún problema con que CARB apruebe la extensión.

El Comité aprobó la extensión del CERP.

Concluir/Próximos Pasos

Erica Manuel, Facilitadora, ILG

Erica recordó al Comité que continuarán discutiendo las medidas codificadas por colores amarillo y rojo en reuniones futuras. Ryan agradeció al Comité por hacer una gran cantidad de trabajo y les deseó a todos felices fiestas. Stacey, coanfitrión de la comunidad, agradeció a todos por su energía y tiempo en haciendo la diferencia.

Recordatorios

La próxima reunión regular del Comité Directivo es el 6 de enero en Zoom. Todas las presentaciones, los puntos importantes de las reuniones, las transcripciones y la grabación de la reunión de Zoom se publicarán en línea.

**Consulte el audio de la reunión para repasar todos los detalles y comentarios de la reunión.*

Ningún comentario público.

Agenda for Stockton Community Steering Committee Meeting #12

Wednesday, December 2, 2020 – 5:00 pm - 7:00 pm

Public Participation: Join via *Facebook Live* - www.facebook.com/valleyair

Comments and questions posted on Facebook or submitted to ab617@valleyair.org during the meeting will be addressed during the meeting's public comment period.

- 5:00 p.m. Welcome, Introductions**
Erica Manuel, Facilitator, Institute for Local Government
Ryan Hayashi, Deputy Air Pollution Control Officer, Valley Air District
Stacey Panyasee, Community Co-host, Resident
- 5:15 p.m. On the Front Line: Living the Impacts of Air Pollution Every Day**
Stacey Panyasee, Community Co-host, Resident
- 5:30 p.m. Community Emission Reduction Program (CERP) Strategies**
Review draft list of CERP strategies: continue discussion of individual measures and work toward developing a list of measure to be included in the draft CERP
Community Steering Committee
- 6:40 p.m. Extension Letter**
Review and discuss the draft extension letter to CARB
District Staff
- 6:50 p.m. Wrap Up/Next Steps**
Additional CSC Meetings
Erica Manuel, Facilitator
- 6:55 p.m. Public Comment**

REMINDERS

- Next meeting January 6, 2021, via Zoom for CSC members and Facebook Live for public.

To request Spanish interpreting services, please contact Jaime Holt or Heather Heinks at (559) 230-6000 or AB617@valleyair.org at least 7 days prior to the meeting date.

On the Front Line: Living the Impacts of Air Pollution Every Day

STACEY PANYASEE-STOCKTON AB 617 CSC RESIDENT

I am ONE of MANY residents

- ▶ New mom to a one yr. old
- ▶ My partner is a mail carrier who serves the zip codes in Stockton AB617 Community with the worst air quality
- ▶ I have family members who suffer from asthma

NOx Emissions

NOx Emissions + PM2.5 Emissions

NOx Emissions + PM2.5 Emissions+ Diesel Particulate Emissions

74

- ▶ **South Stockton residents have an avg. life expectancy of approx. 74 yrs**
 - ▶ -4 years vs San Joaquin County (78 yrs)
 - ▶ -7 years vs California (81 yrs)
 - ▶ Source: [U.S. Census Tract](#)
- ▶ **Example:** At my current age (30 yrs), I have approx. 44 more yrs. to live.
- ▶ I joined the Stockton AB 617 Steering Committee for two reasons:
 - ▶ Reason One: **Access to clean air is a human right!**
 - ▶ Reason Two: It is important for the voices of my community and the most vulnerable/marginalized to be heard **especially, when our lives are directly impacted by the decisions we make.**

Challenges, Fears and Concerns

- ▶ How can we work together to prolong the lives of thousands who are negatively impacted by major sources of pollution, including the Port of Stockton and DTE?
- ▶ At what cost will it take for every resident in my community to have access to clean air?
- ▶ When will it be safe for children to play outside without having to think twice about emissions that are harmful to their health?

Let us work together!

- ▶ The decisions we make moving forward will have a direct impact on 132,000 lives. Let's thoroughly review the measures and save lives!
- ▶ <https://www.youtube.com/watch?v=Z-aVMdJ3Aok>

Collectively, we can make a greater positive difference.

THANK YOU!

Meeting Highlights*

AB 617 Stockton Community Steering Committee (CSC) Meeting #11

November 18, 2020 | 5:00 pm - 7:00 pm

Virtual Zoom Meeting

Action items for San Joaquin Valley Air Pollution Control District (District):

- Distribute CAMP response to comment letters to full CSC
- Send updated CAMP with incorporated CSC changes
- Send dates for additional CSC meetings to approve CERP measures
- Outline approach for CAMP revisions with CSC input

Welcome and Introductions

Erica Manuel, Facilitator & CEO, Institute for Local Government (ILG)

Ryan Hayashi, Deputy Air Pollution Control Officer, District

Catherine Garoupa White, Community Co-host

Erica welcomed the Stockton CSC participants, introduced the ILG facilitation team, and thanked everyone for attending the second November special meeting. She outlined the AB 617 process, recapped comments made at the last regular CSC meeting, and gave an overview of the agenda. She specifically outlined the following key priorities and process improvements related to committee governance moving forward:

- Explained and reiterated the CERP development and approval process
- Make agendas more specific; highlight action items (like voting) on the agenda
- Be clear about the meeting times and possible trade-offs of spending more time on specific agenda items
- If the meeting will go more than 2 hours, send an updated invite in advance
- Provide meeting materials 72 hours in advance, if possible
- Allow adequate time during the meeting for deliberation and discussion
- Please end on time!

Ryan welcomed the CSC and introduced a new CSC member, Matt Holmes.

Community Co-host Remarks

Catherine Garoupa White, Community Co-host

Catherine provided a community co-host welcome, thanked the CSC for joining the meeting and acknowledged the community's resilience to keep moving with the AB 617 process despite a challenging year. She then shared a presentation on the work of the Central Valley Air Quality Coalition and her perspective on air quality in Stockton as it relates to environmental justice.

Comment: This meeting has a formal agenda and I don't think this presentation reflects the core of why this meeting was called. The presentation was redundant and did not meet its allotted timeframe, so I won't be able to stay on the line to discuss the CAMP. I gave the District a letter

with comments related to the CAMP and did not get a complete response. I will vote no on the CAMP because I do not think I received a complete response to my letter.

ILG Response: Thank you for that feedback about the community co-host presentation. We have consistently provided time during each meeting for the community co-host time to share insights with the CSC. We do understand that this presentation went longer than scheduled and your concerns have been noted. We're sorry you won't be able to participate in the rest of the meeting,

The CSC participated in a virtual breakout activity, which was requested by the community co-host.

Overview of CSC Charter for Consensus Process and Voting

Erica Manuel, Facilitator & CEO, ILG

Erica reminded the CSC about a few key elements of the charter document that was developed when the CSC initially convened. The charter specifies a desire to achieve consensus on key issues, but in the absence of consensus, a majority vote (50% + 1) of all CSC members present will be taken. Erica then explained virtual voting protocol in preparation for discussing the CAMP.

Action: Community Air Monitoring Plan Discussion and Vote

Jon Klassen, Director of Strategies and Incentives, Air District

Jon reviewed the community air monitoring plan (CAMP) and how it has evolved to reflect the CSC's input. Presentation highlights:

- The CSC can access the CAMP comments and responses on the community webpage
- The community air monitoring network will provide a spatial understanding of air quality in Stockton and that data will be available in real time
- The District has made some changes to the CAMP based on CSC comments
- The District will link to the monitoring equipment and data on the community webpage once that feature is available The District would like to move forward with the suggested areas for monitoring in the CAMP, in order to get specific locations identified
- The CAMP is not a static document and equipment can be moved around even after it is approved

Comment: I think we should have a manual tally to gauge CSC priorities. Also, San Joaquin Board of Education included in their budget funding for research related to the District. Do you have any documentation of that project?

District Response: We are not familiar with that project, maybe you could send some information and we can look into that.

Question: What are you considering "real time data"?

District Response: The way we set it up in Shafter, real time data means hourly measurements.

Follow-up comment: Monitoring is useful to show emissions being reduced effectively, but I think it is most useful for behavior modification, specifically for the public to protect themselves. In order to do this, people need access. Are you doing any modeling with real time access that the public will be able to use? I think this CAMP plan is good, and I think modeling and monitoring can be complementary. Monitoring can build trust and the CSC participating in not just the location and siting, but long-term monitoring will build a lot more goodwill. With additional adjustments this CAMP could be even better and we should consider how to move parts of it forward while fixing the parts that need refinement.

ILG Comment: To paraphrase, you're saying the plan is substantively good and your background in behavior change and community organizing has led you to realize how helpful it is to continue to infuse the value and expertise of this CSC as we evolve that plan. Even if there is an approval to proceed, it is not an approval to rubber stamp the plan without adjustments.

Comment: My biggest concern is we are delaying getting the monitoring started. It sounds like the Air District wants the map approved so we can get the locations started instead of delaying the monitoring to wordsmith the CAMP. I support voting for the map with the understanding that the wording in the CAMP can still be refined.

ILG Response: Correct.

District Comment: When the District received AB 617 nominations for Stockton from residents the city and others, the request received were for both air monitoring and community emission reduction program combined. This makes completing the work in the legislative timelines even more difficult and challenging. However, the District is supportive of the addition to co-locate different types of monitors, such as indoor/outdoors at schools. The conversation will continue about air monitoring that can be done by the community.

ILG Response: The CSC has three options to consider for moving forward with the CAMP: a full green light to proceed, a yellow to approve the map and start getting land owner approvals for equipment while working on the CAMP language, and a full stop to review and reset.

Question: What does approving the map mean in terms of the resources? Where are we in the overall timeline?

District Response: If the CSC is ok with the District moving forward with the locations you recommended, that doesn't mean we can't talk about how the community can be involved and do air monitoring themselves to compliment these efforts in the CAMP.

Vote: The CSC reached consensus and approved the map portion of the CAMP. They requested additional agenda and/or committee time to refine the language in the CAMP.

District Comment: Thank you for your approval. The District is looking forward to setting up the sites and reporting back.

Erica, Facilitator, reviewed the AB 617 timeline and process. The CSC is currently in the stage of selecting individual measures to include in the final CERP. The CERP is due to CARB by the end of the year, but CARB has indicated that the Stockton CSC can request an extension.

Wrap Up/Next Steps

Erica Manuel, Facilitator, ILG

Erica thanked Catherine for co-hosting and setting the stage for the meeting and emphasized the importance of community input in processes like AB 617. Catherine thanked the CSC and congratulated everyone for making progress.

Stacey Panyasee volunteered to be the next community co-host.

Question: What are the next steps for the CAMP process since the CSC only voted on the map?

District Response: The Air District will formalize all the changes we went over and will send that to the CSC. This will be an ongoing conversation. We will work with the CSC on the specific sites for the monitors.

Comment: I heard about a car-share program from the Housing Authority and I hope we work closely with all the other entities doing similar and complimentary work.

District Response: We hear you and we agree.

Reminders

The next regular CSC meeting is December 2 on Zoom. All the presentations, meetings highlights, transcripts and the Zoom meeting recording will be posted online.

Puntos Importantes de la Reunión*

Comité Directivo de la Comunidad AB 617 de Stockton Reunión #11

18 de noviembre de 2020 | 5:00 pm - 7:00 pm

Reunión Virtual a través de Zoom

Artículos de Acción para el Distrito del Aire del Valle (Distrito):

- Distribuir la respuesta del CAMP a las cartas de comentarios al Comité Directivo completo
- Enviar el CAMP actualizado con cambios del Comité Directivo incorporados
- Enviar fechas para reuniones adicionales del Comité Directivo para aprobar medidas del CERP
- Esquema del enfoque para las revisiones del CAMP con aportes del Comité Directivo

Bienvenida e Introducciones

Erica Manuel, Facilitadora & CEO, Institute for Local Government (ILG)

Ryan Hayashi, Oficial Adjunto de Control de la Contaminación del Aire, Distrito

Catherine Garoupa White, Coanfitrión de la Comunidad

Erica dio la bienvenida a los participantes del Comité Directivo de Stockton, presentó al equipo de facilitación de ILG y agradeció a todos por asistir a la segunda reunión especial de noviembre. Ella describió el proceso de AB 617, resumió los comentarios hechos en la última reunión regular del Comité y dio una descripción general de la agenda. Ella describió específicamente las siguientes prioridades clave y mejoras de procesos relacionadas con la gobernanza del comité en el futuro:

- Explicó y reiteró el proceso de desarrollo y aprobación del CERP
- Hacer las agendas más específicas; resaltar elementos de acción (como votar) en la agenda
- Sea claro sobre los horarios de las reuniones y las posibles compensaciones de dedicar más tiempo a temas específicos de la agenda
- Si la reunión durará más de 2 horas, envíe una invitación actualizada con anticipación
- Proporcionar materiales para la reunión con 72 horas de anticipación, si es posible
- Permita el tiempo adecuado durante la reunión para deliberar y discutir
- ¡Por favor terminar a tiempo!

Ryan dio la bienvenida al Comité Directivo y presentó a un nuevo miembro del Comité, Matt Holmes.

Comentarios del Coanfitrión de la Comunidad

Catherine Garoupa White, Coanfitrión de la Comunidad

Catherine brindó una bienvenida a la comunidad, agradeció al Comité Directivo por unirse a la reunión y reconoció la resistencia de la comunidad para seguir avanzando con el proceso de AB 617 a pesar de un año desafiante. Luego compartió una presentación sobre el trabajo de la

Coalición de Calidad del Aire del Valle Central y su perspectiva sobre la calidad del aire en Stockton en relación con justicia ambiental.

Comentario: Esta reunión tiene una agenda formal y no creo que esta presentación refleje el núcleo de por qué se convocó esta reunión. La presentación fue redundante y no cumplió con el plazo asignado, por lo que no podré quedarme en la línea para discutir el CAMP. Le di al Distrito una carta con comentarios relacionados con el CAMP y no obtuve una respuesta completa. Votaré no en el CAMP porque no creo haber recibido una respuesta completa a mi carta.

Respuesta de ILG: Gracias por sus comentarios sobre la presentación del coanfitrión de la comunidad. Constantemente hemos proporcionado tiempo durante cada reunión para que el coanfitrión de la comunidad comparta ideas con el Comité Directivo. Entendemos que esta presentación duró más de lo programado y se han tomado nota de sus inquietudes. Lamentamos que no pueda participar en el resto de la reunión.

El Comité Directivo participó en una actividad virtual, que fue solicitada por el coanfitrión de la comunidad.

Resumen de la Carta Estatutaria del Comité Directivo para el Proceso de Consenso y Votación

Erica Manuel, Facilitadora y Directora Ejecutiva, ILG

Erica le recordó al Comité Directivo sobre algunos elementos clave de la carta estatutaria que se desarrolló cuando el Comité Directivo se reunió inicialmente. La carta especifica el deseo de lograr un consenso sobre temas clave, pero en ausencia de consenso, se tomará una mayoría de votos (50% + 1) de todos los miembros del Comité Directivo presentes. Luego, Erica explicó el protocolo de votación virtual en preparación para discutir el CAMP.

Acción: Discusión y Votación del Plan de Monitoreo del Aire de la Comunidad

Jon Klassen, Director de Estrategias e Incentivos, Distrito del Aire

Jon repasó el plan de monitoreo del aire de la comunidad (CAMP) y cómo ha evolucionado para reflejar el aporte del Comité Directivo. Puntos importantes de la presentación:

- El Comité Directivo puede acceder a los comentarios y respuestas del CAMP en la página web de la comunidad
- La red de monitoreo del aire de la comunidad proporcionará una comprensión espacial de la calidad del aire en Stockton y los datos estarán disponibles en tiempo real
- El Distrito ha realizado algunos cambios en el CAMP en base a los comentarios del Comité Directivo
- El Distrito conectará el equipo de monitoreo y los datos en la página web de la comunidad una vez que esa función esté disponible. El Distrito quisiera avanzar con las áreas sugeridas para el monitoreo en el CAMP, para poder identificar ubicaciones específicas
- El CAMP no es un documento estático y el equipo se puede mover incluso después de haber sido aprobado

Comentario: Creo que deberíamos tener un recuento manual para medir las prioridades del Comité. Además, la Junta de Educación de San Joaquín incluyó en su presupuesto fondos para investigaciones relacionadas con el Distrito. ¿Tiene alguna documentación de ese proyecto?

Respuesta del Distrito: No estamos familiarizados con ese proyecto, tal vez podría enviarnos alguna información y podemos investigar eso.

Pregunta: ¿Qué está considerando “datos en tiempo real”?

Respuesta del Distrito: De la forma en que lo configuramos en Shafter, los datos en tiempo real significan mediciones por hora.

Comentario de seguimiento: El monitoreo es útil para mostrar que las emisiones se reducen de manera efectiva, pero creo que es más útil para modificar el comportamiento, específicamente para que el público se proteja. Para hacer esto, las personas necesitan acceso. ¿Está realizando algún modelado con acceso en tiempo real que el público pueda utilizar? Creo que este plan del CAMP es bueno y creo que el modelado y el seguimiento pueden ser complementarios. El monitoreo puede generar confianza y la participación del Comité no solo en la ubicación y el emplazamiento, sino también en el monitoreo a largo plazo generará mucha más buena voluntad. Con ajustes adicionales, este CAMP podría ser aún mejor y deberíamos considerar cómo mover partes hacia adelante mientras arreglamos las partes que necesitan refinamiento.

Comentario de ILG: Parafraseando, está diciendo que el plan es sustancialmente bueno y su experiencia en cambio de comportamiento y organización comunitaria lo ha llevado a darse cuenta de lo útil que es continuar infundiendo el valor y la experiencia de este Comité Directivo a medida que evolucionamos ese plan. Incluso si hay una aprobación para continuar, no es una aprobación sellar el plan sin ajustes.

Comentario: Mi mayor preocupación es que estamos retrasando el inicio del monitoreo. Parece que el Distrito del Aire quiere que se apruebe el mapa para que podamos comenzar con las ubicaciones en lugar de retrasar el monitoreo al redactor de palabras del CAMP. Apoyo votar por el mapa en el entendimiento de que la redacción del CAMP aún puede perfeccionarse.

Respuesta de ILG: Correcto.

Comentario del Distrito: Cuando el Distrito recibió nominaciones de AB 617 para Stockton de los residentes de la ciudad y otros, la solicitud recibida fue para el programa de monitoreo de aire y reducción de emisiones de la comunidad combinados. Esto hace que completar el trabajo en los plazos legislativos sea aún más difícil y desafiante. Sin embargo, el Distrito apoya la incorporación de la ubicación conjunta de diferentes tipos de monitores, como interiores y exteriores en las escuelas. Continuará la conversación sobre el control del aire que puede realizar la comunidad.

Respuesta de ILG: El Comité tiene tres opciones a considerar para avanzar con el CAMP: una luz verde completa para continuar, una amarilla para aprobar el mapa y comenzar a obtener las aprobaciones de los propietarios de la tierra para el equipo mientras se trabaja en el lenguaje CAMP, y un punto final para revisar y restablecer.

Pregunta: ¿Qué significa aprobar el mapa en términos de recursos? ¿Dónde estamos en la línea de tiempo general?

Respuesta del Distrito: Si el Comité Directivo está de acuerdo con que el Distrito siga adelante con las ubicaciones que usted recomendó, eso no significa que no podamos hablar sobre cómo la comunidad puede participar y monitorear el aire ellos mismos para complementar estos esfuerzos en el CAMP.

Voto: El Comité Directivo llegó a un consenso y aprobó la parte del mapa del CAMP. Solicitaron una agenda adicional y/o tiempo del comité para refinar el lenguaje en el CAMP.

Comentario del Distrito: Gracias por su aprobación. El Distrito espera establecer los sitios y presentar informes.

La facilitadora, Erica, repasó el cronograma y el proceso de AB 617. El Comité Directivo se encuentra actualmente en la etapa de selección de medidas individuales para incluir en el CERP final. El CERP debe entregarse a CARB antes de fin de año, pero CARB ha indicado que el Comité de Stockton puede solicitar una extensión.

Concluir/Próximos Pasos

Erica Manuel, Facilitadora, ILG

Erica agradeció a Catherine por ser coanfitrión y preparar el camino para la reunión y enfatizó la importancia del aporte de la comunidad en procesos como AB 617. Catherine agradeció al Comité Directivo y felicitó a todos por su progreso.

Stacey Panyasee se ofreció como voluntaria para ser la próxima coanfitrión de la comunidad.

Pregunta: ¿Cuáles son los próximos pasos para el proceso del CAMP ya que el Comité Directivo solo votó en el mapa?

Respuesta del Distrito: El Distrito del Aire formalizará todos los cambios que repasamos y los enviará al Comité Directivo. Esta será una conversación continua. Trabajaremos con el Comité Directivo en los sitios específicos para los monitores.

Comentario: Me enteré de un programa de vehículos compartidos de la Autoridad de Vivienda y espero que trabajemos en colaboración con todas las demás entidades que realizan un trabajo similar y complementario.

Respuesta del Distrito: Los escuchamos y estamos de acuerdo.

Recordatorios

La próxima reunión regular del Comité Directivo es el 2 de diciembre en Zoom. Todas las presentaciones, los puntos importantes de las reuniones, las transcripciones y la grabación de la reunión de Zoom se publicarán en línea.

**Consulte el audio de la reunión para repasar todos los detalles y comentarios de la reunión.*

Agenda for Stockton Community Steering Committee Meeting #11

Wednesday, November 18, 2020 – 5:00 pm - 7:00 pm

Public Participation: Join via *Facebook Live* - www.facebook.com/valleyair

Comments and questions posted on Facebook or submitted to ab617@valleyair.org during the meeting will be addressed during the meeting's public comment period.

- 5:00 p.m. Welcome, Introductions**
Erica Manuel, Facilitator, Institute for Local Government
Ryan Hayashi, Deputy Air Pollution Control Officer, Valley Air District
Catherine Garoupa White, Community Co-host, CVAQ
- 5:15 p.m. Meet and Greet Breakout Activity**
A quick chance to meet and reconnect
- 5:25 p.m. Overview of CSC Charter for Consensus Process and Voting**
Erica Manuel, Facilitator, Institute for Local Government
- 5:40 p.m. Action: Community Air Monitoring Plan – Discussion & Vote**
Discuss the proposed Stockton Community Air Monitoring Plan and comments received. Potentially **VOTE** on approval.
Jon Klassen, Director of Air Quality Science and Planning, Valley Air District
- 6:00 p.m. Community Emission Reduction Program (CERP) Strategies**
Review draft list of CERP strategies: continue discussion of individual measures and work toward developing a final list of CERP strategies.
Community Steering Committee
- 6:50 p.m. Wrap Up/Next Steps**
Additional CSC Meetings
Erica Manuel, Facilitator
- 6:55 p.m. Public Comment**

REMINDERS

- Next meeting December 2, via Zoom for CSC members and Facebook Live for public.

To request Spanish interpreting services, please contact Jaime Holt or Heather Heinks at (559) 230-6000 or AB617@valleyair.org at least 7 days prior to the meeting date.

VEGETATIVE BARRIERS

Incentive program for the installation of vegetative barriers (and sound walls) around/near sources of concern (Interstate 5, schools, truck routes, near Port of Stockton, rail routes, Charter Way, Boggs Tract and El Dorado). Leverage with city, county, state funds given significant scale and infrastructure costs.

Comments received prior to Oct. 31

- A >High priority in combination with physical barrier as most effective, wherever possible, especially along Interstate 5.
- R >For this to be sustainable will require some kind of maintenance trust. I think more may be necessary to involve veg barrier associated with rail routes.
- B >Vegetative barriers should also include walls at the Highway
- R >Trees and plants are much needed
- R >This is an area of high priority for the community for the long term benefits. Interstate 5 is where I would recommend.
- R >Very high priority in combination with physical barriers as most effective, wherever possible, especially along Interstate 5.
- A >High priority in combination with physical barrier as most effective, especially along Interstate 5 and crosstown freeway. Where residential homes are less than 1000 ft. away.
- R > All potential strategies acceptable as ranked.
- Need clarity on where this would be on Charter Way since most of Charter Way is occupied by business fronts.
- G >High, Seems like several vegetation barriers could be provided for \$500,000. I am suggesting here that we consider up to 10 new barriers. I don't suggest that we spend \$5 million on these barriers. If possible, perhaps \$1 million and not more than \$3 million here. Sound walls help with noise but not air. I would suggest not funding that and merge line item 25 with this one which appear to be duplicate.
- A/R/A/A/R >Highest priority: Add more \$\$\$
- R > Very high priority for VEGETATIVE BARRIERS, not for sound walls. Vegetative barriers should dampen sound, beautify, and provide environmental benefits of cooling, absorbing pollutants, and producing oxygen for the air. Sounds walls partially dampen sound, and do little else, except to become ugly and attract graffiti. Benefits may not be completely quantifiable but the public will like this and agree with vegetative barriers and this use of money to improve the environment.
- R > incentive program for installation of vegetative barriers should be a very high priority. With a \$35 million budget, the allocation to this number one priority should be significantly higher than \$1 million, perhaps 25% of total budget or \$8.8 million.
- R > High Priority, Work together / plan with other comm groups working on this. Include ongoing maintenance trust with the city.
- R > Highest priority: This needs to include rail lines particularly relating to sound wall for the low income neighborhoods most impacted by sound and train exhaust.
- R > There is an area of I-5 by Smith Canal that could use some new trees and around Monte Diablo. I-5 is much more needy for trees than 99

Original Proposed Funding Amount:

\$500,000

Units: n/a

Updated Proposed Funding Amount:

\$1,000,000

Units: n/a

Nov. 4th Comments

- Spend funds judiciously;
- Consider roles/responsibilities of water and maintenance issues;
- Vegetative barriers:
 - Ensure they mitigate or reduce pollution
 - Taller, denser and placed perpendicular to prevailing winds are most successful at lofting emissions
 - Arizona cypress—one of a few options
- Have strong, proactive partner discussions
- Caltrans has a list of vegetative barriers with the pro and cons of each
- Is there an initiative similar to Tree Fresno in Stockton?

TREES AND URBAN GREENING

Increased urban greening and forestry to improve air quality. The goal is to identify and support efforts to increase urban greening and forestry to improve air quality and overall quality of life for residents in the community while keeping in mind water and maintenance issues. Focus areas include Charter Way, Boggs Tract and El Dorado. Leverage with city, county, state funds given significant scale and infrastructure costs. TCC grant includes tree planting and maintenance for new trees.

Comments received prior to Oct. 31

- R >For this to be sustainable will require some kind of maintenance trust. I think more may be necessary to involve veg barrier associated with rail routes. Include Hazelton Ave
- B >Potential long term reductions and development of a more pleasing environment
- R >Cost can be reduced by growing trees instead of buying trees...example: from seeds like avocados and from trimmings. Pine cones are everywhere
- R >Urban greenery - much needed
- R > Very High Priority
- G > Increasing the number from 1 site up to 5. Is there any data that shows whether vegetative barriers are as effective as tree canopy? Might help reduce ongoing maintenance costs.
- A/R/A/A/R >Highest priority: Add more \$\$\$
- R > Very High Priority. To be a vibrant urban area, there must be urban greening to beautify, reduce GHG & heat, and to provide oxygen to our air. Careful and detailed analysis should quantify benefits both materially and economically.
- R > increased urban greening, should be a very high priority. The budget should be much higher than \$600,000, again perhaps 25% of the total budget or \$8.8 million.
- R > High Priority, Include an ongoing maintenance trust Also connect with CalTrans and rail for increased sound walls. For areas that don't have them along freeways and rail.
- R > Highest priority: Urban greening is necessary for our community healing:
https://www.youtube.com/watch?v=IYhuiP43lp0&feature=emb_logo, Develop conservancy organization for long term maintenance perhaps a special district?
- R > We need to identify trees that don't take mistletoe, and fit this area. Give trees to residents to plant only in front yards. If put along streets also, city must agree to care for them with add'l employee if necessary funded for first year by this.

Original Proposed Funding Amount:

\$500,000

Units: n/a

Updated Proposed Funding Amount:

\$600,000

Units: n/a

-

TRUCK ROUTES

Work with City and County to assess current truck routes (potential impact of speed bumps). CSC suggested Boggs Tract as an area of concern.

Comments received prior to Oct. 31

- R >This is the Port of Stockton's response to an inquiry that the Commissioners deemed worthy of a response: When will the Port conduct a traffic study to help with idling trucks and traffic in the residential neighborhoods related to Port operations or the operations of their leaseholders? The Port has completed several Port-wide traffic improvement projects to reduce congestion both in the Port and in adjacent areas. Over the past few years, the Port has pursued a program of improvements to facilitate a more direct connection to the West Complex from the new Crosstown Freeway ramps. The Port has recently replaced the Navy Drive Bridge and completed widening of Navy Drive to improve traffic flow, avoid neighborhood impacts, decrease idle times, and improve safety between the SR-4 Crosstown Freeway extension and the Port's West Complex. Construction of a grade separation and signalized intersection to improve traffic flow onto the West Complex is also planned. The Port has also undertaken other traffic improvements on West Washington Street to improve traffic flow, and installed signage throughout its property to instruct trucks on which routes to travel and to convey requirements for minimizing idling. In addition, traffic studies have been undertaken for specific Port-led CEQA documents on both the East and West Complexes when required per City of Stockton traffic impact assessment guidelines. The Port will continue to comply with City and San Joaquin Council of Governments requirements related to traffic management and vehicle miles traveled assessments in its role as CEQA lead agency. Recent CEQA documents prepared by the Port have included requirements for minimizing idling of trucks on terminal and use of clean trucks. These types of requirements encourage the development of truck management systems to reduce truck queuing at the gates, which has the potential for spilling over to area neighborhoods. And an FYI there is a major transportant project up for a categorical exemption - Monday 10.20.2020
- B >Very Important
- R >Very High
- R >It is an area of concern. No question about it.
- R >High Priority
- G >Would be helpful to line up our air monitoring results with this strategy. The City of Stockton will be ready and available to work with the air district or other stakeholders as needed. Any supporting information is appreciated.
- A/R/A/A/R > What is "assess" current truck routes? Is a technical study required, or can the city and county develop and implement a plan? What is the timeframe? (1 year?) CLARIFY to establish what the money is needed for. For example, could this money be used to actually add speed bumps and signs directing trucks rather than just studying? Traffic signals could be adjusted to improve traffic flow. Study should be comprehensive. Dollar amount should change based on this information.
- R > Very High Priority. Port operations can be more efficient, less polluting, and economically beneficial.
- R > Work with the city and County to assess current truck routes. I am not sure what that means. For any budget amount, there should be a specific goal of reducing truck traffic that results in direct and measurable reduction in air pollution to Boggs Tract. AB 6 1 7 funds should not be used to pay for another study as opposed to implementing steps to move more truck traffic away from the Boggs Tract neighborhood.

- R > What is "assess" current truck routes? Is a technical study required, or can the city and county develop and implement a plan? What is the timeframe? (1 year?) CLARIFY to establish what the money is needed for. For example, could this money be used to actually add speed bumps and signs directing trucks rather than just studying? Traffic signals could be adjusted to improve traffic flow. Study should be comprehensive. Targeted truck routes that are enforced will enable the community to focus appropriate mitigation measures. Please ask the county's consultant to give an update on the Boggs Tract Sustainability Plan. AECOM is contracted by San Joaquin County to develop the Boggs Tract Sustainability Plan for the areas in Boggs Tract within the County's jurisdiction.
- R > Concerned, but also worried about the Port's actions on this.

Original Proposed Funding Amount:

\$500,000

Units: n/a

Updated Proposed Funding Amount:

\$1,000,000

Units: n/a

Nov. 4th Comments

-

AIR FILTRATION IN SCHOOLS

Incentive program to install advanced air filtration systems in 33 community schools.

Comments received prior to Oct. 31

- R > This should be done with health studies to determine actual health benefits
- R > I think there should be some monitoring data to show that 33 schools are in need. What are these schools?
- B > For schools near transportation corridors
- R > Very High
- R > High Priority
- A/R/A/A/R > Clarify: Are these schools in the boundaries? Is this upgrading the system plus a supply of filters? Needs more detail on where the money goes.
- R > This program should begin as a pilot on selected campuses, carefully studied, and expanded when data justifies it.
- R > I strongly support this measure especially if it can be joined with health studies so to determine the actual health benefits of advanced air filters. There is a high incidence of childhood asthma, and it is possible that air filtration systems in the schools may help address that problem. Again it should be done in conjunction with high-quality health studies. Given a \$35 million budget, the allocation should be far more funds than \$2,640,000. Again, 25% or \$8.8 million.
- R > Highest priority. Should cover full cost for schools to transition. As well as support for ongoing maintenance. Should start this implementation as soon as approved.
- R > Clarify: Are these schools in the boundaries? Is this upgrading the system plus a supply of filters? Needs more detail on where the money goes. These schools must be identified before final budget approval and should include public and private schools and daycare facilities within the AB617 boundary.
- R > I think all schools could use this, but only those built oldest should get it first.

Original Proposed Funding Amount:

\$2,640,000

Units: n/a

Updated Proposed Funding Amount:

\$2,640,000

-

BIKE PATHS AND INFRASTRUCTURE

Work with City, County, and San Joaquin Council of Governments to assess current bike path infrastructure (including bike racks) and look for matching funding to make community more bike and walk friendly.

Comments received prior to Oct. 31

- R >Please do not let this money get sucked up with planning. You have no idea how many plans have yielded zero fruit because it is not a priority.
- B >OK
- R >Have you considered Van Buskirk Golf Course. Plenty of room, needs tree, plants, etc.
- R >If this is done which is great, it should be promoted often to encourage the community to ride a bike. Also this is south side so then it'd be something else, but we have to ensure the community's safety.
- R >Low Priority
- R >I am not in favor of electric bikes - conflicts with pedestrians and interfere with traffic flow having seen some used by Stockton residents.
- G >These are great one-time investments that serve communities for years. Just as a thought, taking this number up to 10 as we have a very large city and a significant need for zero-emission strategies. Cycling and trails is awesome.
- A/R/A/A/R > Safety first: Where is this realistic? How far out are infrastructure changes to make this safe? If several years
- R > Funding should be applied directly to construction recommended by most recent study and not used for planning!
- R > These funds should not be used solely for planning. If there is \$500,000 allocated, there should be a tangible proposal that will show significant benefit and use by residents of the AB 6 1 7 area. 500k is 1.41% of the total budget which is OK.
- R > I like the idea of focusing on Van Buskirk--it's a beautiful area. Should also connect with the city and surrounding areas and connect with other organizations working on this. Don't want SW Stockton to stay an "island".
- R > Safety first: Where is this realistic? How far out are infrastructure changes to make this safe? If several years out, money should be reduced or go to items above. Also need to assess overlap with other efforts like Transformative Climate Communities, etc. This money can be used for matching funds relating to safe routes to school, bicycle helmets, bicycle safety education, bicycle physical projects not to "assess" with another plan. In consultation with the City of Stockton and Council of Governments develop a list of projects prior to final budget approval.
- R > What has previous plans said? If previous plans have been done, it wasn't done for some reason. Why? If run out of money, then

-

TRUCKS

Incentive program for heavy-duty truck replacement with zero and to a lesser extent near zero emission technology.

Comments received prior to Oct. 31

- A >Use existing funds. These trucks will likely travel well outside the boundary.
- R >Make a fixed proportional commitment say 60% zero and 40% near zero. Any money can be spent on zero infrastructure.
- B >Electric grid not supportive yet for all electric. We have some vehicles but poor charging options
- R >Very High
- R >High Priority
- G > This strategy is quite significant. I'm interested to learn how we designate the 50 trucks, and ensure they are part of the local solution.
- A/R/A/A/R > Too much \$\$\$: Should be ONLY Zero Emissions. Do NOT support "near" zero. Large operators should pay this cost or apply to other funding sources. IF incentive funding is used, it should only go to low income independent owner operators.
- R > Should be implemented at this level only with robust charging infrastructure.
- R > incentive program for heavy duty truck replacement. \$10 million is outrageous. Not one dollar of AB 617 funds should be used for this strategy. There are other programs available and issues relating to mobile source pollution arising from diesel trucks and other transportation is a responsibility of car. AB 617 community fund should not be used for this strategy, not one dollar.
- R > Very high priority. If used for trucks that are to be used in within the boundaries. Also need to incorporate more charging areas.
- R > Too much \$\$\$: Should be ONLY Zero Emissions. Do NOT support "near" zero. Large operators should pay this cost or apply to other funding sources. IF incentive funding is used, it should only go to low income independent owner operators. Additionally, this money could be spent on charging infrastructure if low income independent owner operators obtain funding for truck replacement elsewhere.

Original Proposed Funding Amount:

\$10,000,000

-

CHARGING STATIONS FOR ELECTRIC VEHICLES

Incentive program for the installation of charging stations for electric vehicles in public spaces.

Comments received prior to Oct. 31

- A >Especially for electric upgrade for residents if necessary
- R >More money
- B > Important part of long term solutions
- R > High
- R > High Priority
- G > Made a modest increase to charging stations, as we likely need dozens more in the next 3-5 years.
- A/R/A/A/R > Where is VW settlement funding being spent? Fees and fines from local facilities? Other sources of money?
- R > Money should be transferred from # 18 to # 19 (this measure). Reliable and comprehensive charging is necessary for ZEVs.
- R > There should be no funding for this strategy. There other sources of funding. We should be concerned about strategies that resulted direct and material benefits to the AB 617 residence.
- R > Very high Priority. More money. Outreach to business that would install stations. Assistance with accessing incentives especially with households that receive vehicle incentives.
- R > Where is VW settlement funding being spent? Fees and fines from local facilities? Other sources of money? This should be an ongoing program as we transition from fossil fuels to electrification.
- R > Very important part of an updated community! Help low income residents with a proven need first. Also help some small businesses to make an upgrade.

Original Proposed Funding Amount:

\$250,000

Units: n/a

Updated Proposed Funding Amount:

\$375,000

-

TRAINING FOR ELECTRIC VEHICLE MECHANICS

Incentive program for educational training for electric vehicle mechanics.

Comments received prior to Oct. 31

- R >This type of job training should be emphasized and encouraged and implemented soon.
- A >Two Mechanics training is not enough to keep up with growth in EVs, it seems cost efficient to invest more here and bring green jobs to the AB 617 community
- R >Triple at least
- B >Connect with Delta College vocational training
- R >Very High
- R > High Priority
- A/R/A/A >This should be increased.
- A/R/A/A/R >What would this money be used for? (Scholarships, hiring staff, etc.) Is it enough? A laudable goal that lacks concrete details. Add \$\$\$ to provide a foundation for this program to be comprehensive and sustainable.
- R > Electric and Zero Emission Vehicles must have trained mechanics in order to convert a critical mass of vehicles to produce quantifiable results.
- R > Very high priority. Should check on feasibility at SJDC or find the nearest opportunity to be available for potential residents of our area.
- R >What would this money be used for? (Scholarships, hiring staff, etc.) Is it enough? A laudable goal that lacks concrete details. Add \$\$\$ to provide a foundation for this program to be comprehensive and sustainable. Our community could become a training hub with an expansion of Delta College's electrical technical program. I think this money should be spent on a "graduate" stipend including tuition for Delta College electrical technical program (\$1800/mo) for the training program and a commitment to work in the community for three years
- R > High! I would give those mechanics whose business does not include electric vehicles first. Work w/Delta to offer?

Original Proposed Funding Amount:

\$30,000

Units: 2 Students

Updated Proposed Funding Amount:

\$150,000

SCHOOL BUSES

Incentive program for replacing older diesel school buses with zero or to a lesser extent near zero emission buses.

Comments received prior to Oct. 31

- A >How much are school buses still used?
- R >Less money only 7 and commitment that these 7 will be dedicated to AB617 area only
- B >School dists. Need emergency charging opportunities
- R > High
- R >Low Priority
- G >Buses are great, however, due to COVID-19 I might suggest we invest these dollars in more immediate
- A/R/A/A/R >Still wondering how many of these buses are in use in the community. Be clear on need before earmarking so much money.
- R > Nice program, but more bang for buck can be derived in other programs of heavy equipment.
- R > High priority. Are there other grants to access?
- R > Still wondering how many of these buses are in use in the community. Be clear on need before earmarking so much money. A list of the educational transportation companies and routes must be included in the final budget before approval
- R > Low priority to half as much, as they don't use busses much any more. Maybe check on disabled busses.

Original Proposed Funding Amount:

\$5,600,000

Units: n/a

Updated Proposed Funding Amount:

\$2,800,000

Units: 10 buses

Nov. 4th Comments

-

LARGE CLEAN FUEL INFRASTRUCTURE

Incentives for planning and implementation of clean fuel infrastructure such as large-scale electric, hydrogen and other clean fuels.

Comments received prior to Oct. 31

- A >What is "clean fuel" here? Need to clearly define.
- R> Not quite sure again don't spend it all on planning pick a smaller footprint to plan in. Recall the goals of the TCC are not the same as the City of Stockton - I heard with my own ears.
- B >this should blended into HD.1
- R >High
- R >Need More Information
- G >In general, seems appropriate. Require additional information to assess what else can be done in this strategy
- A/R/A/A/R > What are "other" clean fuels? We need to ensure we're not incentivizing dirty forms of upstream energy, like biomass/biogas/biomethane. Difficult to support money going here unless we know exactly what it will be spent on. Only in support of funding for electric infrastructure.
- R > Program is vague and hydrogen is very expensive to develop and years away to be developed on a large scale.
- R > Large scale options are important Hydrogen could be an important option for confined businesses such as the Port.
- R > For Electric only What are "other" clean fuels? We need to ensure we're not incentivizing dirty forms of upstream energy, like biomass/biogas/biomethane. Difficult to support money going here unless we know exactly what it will be spent on. Only in support of funding for electric infrastructure. Already large facilities under construction and development to support importation of renewable diesel. The use of food crops for fuel development is not sustainable. Planning here should include partnering with the City of Stockton to update the Climate Action Plan with an assessment of progress of implementation. Particularly relating to their existing housing stock retrofit and transportation related emissions.
- R > I don't know if this is for "planning" or actually planning and doing.

Original Proposed Funding Amount:

\$1,000,000

Units: n/a

Updated Proposed Funding Amount:

\$1,000,000

Units: n/a

-

NEW ELECTRIC VEHICLES, PLUG-IN EVs, AND HOME CHARGERS FOR RESIDENTS

Incentive program for the replacement of passenger vehicles with battery electric or plug-in electric hybrid vehicle with an additional rebate option for those residents installing a Level 2 charger in their home.

Comments received prior to Oct. 31

- A >And include assistance to facilitate homeowners in finding the rebates and being able to utilize.
- B >very important in the initial growth of electrical
- R >High
- R >Low Priority
- A >This should be increased
- G >Throwing some interest to see more local investment into this area.
- A/R/A/A > Metrics: In what timeframe? Who implements this program?
- R > Good program to encourage households to add an electric car. Plug-in is the immediate future to near-term electric car usage.
- R > High Priority. This amount should be doubled or tripled. Must include assistance to seek these incentives and how to utilize.
- R >Low Priority
- R > Metrics: In what timeframe? Who implements this program? Outreach must be targeted to residents living within the boundary of AB617.
- R > High! I would take more money for this! We need people to either purchase and install charging, or just purchase

Original Proposed Funding Amount:

\$800,000

Units: 100 cars and chargers

Updated Proposed Funding Amount:

\$800,000

Units: 100 cars and chargers

Nov. 4th Comments

-

TRAINS AND OTHER RAIL EQUIPMENT OPERATING IN THE COMMUNITY

Incentive program for replacing older diesel railcar movers, switcher locomotives and diesel locomotives primarily operating in the community with new clean-engine technology.

Comments received prior to Oct. 31

- R >too much money the port has to do some of this by regulatory decree I believe. This is really hard when we don't have the ability to hide cells
- B >opportunity to reduce rail emissions immediately
- R >High
- R >Low Priority
- G >No change
- A/R/A/A > In what timeframe? This is a lot of money - What are the estimated emission reductions?
- R > High Priority. This category is more than just the port, it includes all of the mainline railroad switching and intermodal yards that operate locally 24/7. Incentives will nudge railroads towards this technology.
- R > High priority because this will affect local air quality. But should first be using all other grant options.
- R >Very Low Priority
- R > In what timeframe? This is a lot of money - What are the estimated emission reductions?
- R > Low priority if at Port, as they may have to do it themselves.

Original Proposed Funding Amount:

\$3,000,000

Units: n/a

Updated Proposed Funding Amount:

\$8,000,000

Units: n/a

-

TRUCKS AND OTHER HEAVY DUTY EQUIPMENT OPERATING AT THE PORT

Incentive program for heavy-duty vehicle with zero, and where zero emissions technology is not available, near zero emission technology, including Transport Refrigeration Units (TRUs), Drayage Trucks, etc. with a focus on equipment in Port.

Comments received prior to Oct. 31

- A >Only zero emission, not "near zero" Only if limited to equipment primarily used within Stockton.
- R >too much money the port has to do some of this by regulatory decree I believe. This is really hard when we don't have the ability to hide cells
- B >good opportunity
- R >High
- R >Low Priority
- G >Modest increase here.
- A/R/A/A > How many? In what timeframe? This is a lot of money - What are the estimated emission reductions? Only zero, not near zero. Large operators should pay this cost or apply to other funding sources. IF incentive funding is used, it should only go to low income independent owner operators.
- R > High Priority. The TRUs are very numerous and often operate 24/7 while sitting in rail yards, loading terminals, and ports.
- R > Important, for vehicles that will be in area >75% of time.
- R >Only Zero emission technology used primarily within Stockton
- R > How many? In what timeframe? This is a lot of money - What are the estimated emission reductions? Only zero, not near zero. Large operators should pay this cost or apply to other funding sources. IF incentive funding is used, it should only go to low income independent owner operators.
- R > Only zero emission, not "near zero". I would like to see the Port more involved in this issue. If they really want the money.

Original Proposed Funding Amount:

\$2,000,000

Units: n/a

Updated Proposed Funding Amount:

\$2,000,000

Units: N/A

Nov. 4th Comments

- 'Trucks idling plug-in' measure can be incorporated into this measure
- There is a flexibility with the measure and the funding amount
- Funding is targeted for fleets that operate within the Stockton community boundaries
- How can the trucking industry be managed to follow our expectations
- Consider the Boggs Tract community and document their perspectives in the port's strategic planning process
- Incorporate CSC input on proposed port projects

REPAIR CARS TO PASS SMOG CHECK

Incentive program to host a local Tune In Tune Up event to reduce emissions from older, high polluting cars through providing an incentive for individuals to get their cars repaired to pass smog check.

Comments received prior to Oct. 31

- C >Would like to see these events allow for the replacement of vehicles newer than 1999.
- R >Would like to see these events hosting in smaller communities such as Boggs tract or Conway Homes
- A >Use existing funds
- R >More money
- R >i received \$500 for repairs so my car can pass smog repair cost was higher. Did not help. limited to certain mechanics also not good
- B >needed support for the community
- R >Isn't existing program adequate?
- R > High
- R > Low Priority
- G> Increased this since not all residents can support 100% electric.
- A/R/A/A > Metrics: How many events? What timeframe? How many cars, how many emission reductions? Existing District program. Would rather fund new approaches and immediate protections.
- R > Very High Priority. Auto use is universal, cars are often in use that are not properly tuned and are polluting. The public neglects to and/or cannot afford tune ups. Programs that provide benefits directly to the public and are beneficial & quantifiable will be popular. Increase funding and incentives.
- R > Important. Increase the amounts of incentives.
- R >Very Low Priority
- R > Mixed reviews – please provide summaries of existing programs with as much detail as possible regarding effectiveness and public reviews of the program collected.
- R > More money for this to possibly expand mechanics/program. Double?

Original Proposed Funding Amount:

\$120,000

Units: 2 Events

Updated Proposed Funding Amount:

\$120,000

Units: 2 Events

-

CAR SHARE PROGRAM

Incentive program to launch a car share program to help residents share clean electric cars in community.

Comments received prior to Oct. 31

- C >Housing Authority of San Joaquin is currently applying for EV car share through Clean Mobility Option grant.
- A >What does this cost cover? Wouldn't the company want to come in to get more customers?
- R >I think this a really good idea but probably transit could be harmed.
- B >OK
- R >High
- R >Low Priority
- R >Include the ability to rent a 4wd to go to winter sports opportunities
- A/R/A/A > Still not clear what this money is going toward or when emission reductions are likely to result. Hard to assess
- R > Medium Priority. Car share programs are useful and feel good. Ultimately they must, however, be profitable on their own.
- R > Interesting. An update on programs that are already in place, how it works. (Interesting idea to offer for specialty outings such as 4W drive.) And would it be strictly for residents in the area?
- R >Very Low Priority
- R > Still not clear what this money is going toward or when emission reductions are likely to result. Hard to assess the value. Five neighborhood car pilot study to gauge impact on transit, trip reductions, and community benefits including sustainable funding sources to expand the program if successful.
- R > I think the vehicles should be a truck, as everyone needs a truck at some time or another and it may reach more people that way. Very High priority

Original Proposed Funding Amount:

\$1,000,000

Units: Add'l Cars & Chargers

Updated Proposed Funding Amount:

\$1,000,000

Units: Add'l Cars & Chargers

-

TUG BOATS

Incentive program for tug boat replacement/repower.

Comments received prior to Oct. 31

- R >I think the port should let us know what their options are--perhaps other grants or opportunities.
- A >Port and operators should pay these costs.
- R >too much money the port has to do some of this by regulatory decree I believe. This is really hard when we don't have the ability to hide cells
- B >Let's see how Omnibus changes emissions
- R >High
- R >Very Low Priority
- A/R/A/A > Not in support of incentives for the port. Reallocate money elsewhere.
- R > Medium Priority. Tugboat use at the port should be compared to larger benefits of other programs such as TRUs.
- R > Important. Port should seek all options for grants. And Port should cover most costs if it is already a regulation.
- R > Not in support of incentives for the Post. Reallocate money elsewhere
- R > Not in support of incentives for the Post. Reallocate money elsewhere
- R > Not sure we should be determining what the PORT needs. I think more investigation must be done IF we want to give them all this \$

Original Proposed Funding Amount:

\$1,000,000

Units: One Boat

REPLACE WOOD BURNING FIREPLACE, STOVES AND INSERTS

Incentive program for the replacement of existing residential wood burning devices (fireplaces, stoves and inserts) and pellet stoves with natural gas or electric technologies.

Comments received prior to Oct. 31

- A >Use existing funds.
- B >OK
- R >Very High
- R >Low Priority
- A/R/A/A > In what timeframe? What are the reductions per device replaced? NOT in support of "cleaner" devices that use natural gas and pellets. Should be all electric; heat pumps. If all electric is not an option, use money elsewhere.
- R > Low Priority. Good idea, however, many residents will never convert from wood and will resent and fight mandates.
- R > High Priority. Enforcement should focus on assistance with options to replace.
- R > Low Priority
- R > In what timeframe? What are the reductions per device replaced? NOT in support of "cleaner" devices that use natural gas and pellets. Should be all electric; heat pumps. If all electric is not an option, use money elsewhere.
- R > Very High Priority! I would like to know how much each type are and how much does the resident pay or is it based on need/income?

Original Proposed Funding Amount:

\$300,000

Units: 100 devices

Updated Proposed Funding Amount:

-

AIR FILTRATION IN HOMES

Incentive program to install advanced air filtration systems in homes within the community.

Comments received prior to Oct. 31

- A >Please ADD based on estimates of houses in the highest polluting zones.
- A >Need funding that immediately protects residents in the danger zones closest to major polluting sources.
- R >Very High
- A/R/A/A/R > High priority: Increase funding. Use fines from polluters in the area to create a fund to support long term. Can someone use GIS to analyze how many homes and sensitive sites are within danger zones? Or what is the unit allocation estimated from? Could use some data analysis.
- R > Good to begin project for Disadvantaged Communities.
- R > air filtration for homes may be considered as with the strategy for advanced air filtration systems for schools. Again this should be done in conjunction with proper health studies, but if we indeed have a \$35 million budget, then perhaps we should allocate 20% or \$7 million to this strategy since it has the prospect of possibly reducing the incidence of childhood asthma.
- R > Very important. Might consider more money. Filtration as well as air purifier.
- R >High priority: Increase funding. Use fines from polluters in the area to create a fund to support long term. Can someone use GIS to analyze how many homes and sensitive sites are within danger zones? Or what is the unit allocation estimated from? Could use some data analysis. Clarify what constitutes electrification – replacing natural gas appliances, how this incentive program will work with existing PGE and Energy Commission programs.
- R > Add more \$ to this!! VERY IMPORTANT! Determined by income and need! Especially in area of need!

-

The objective of “Project Mobility” at the Housing Authority is to increase access to transportation (EV car share and van pool) options for residents of the Housing Authority of San Joaquin County.

In 2019, the Housing Authority of the County of San Joaquin received a Jobs Plus Grant from HUD (US Department of Housing and Urban Development). It was 1 of only 4 to be awarded across the country. This \$2.3-million-dollar grant focuses on helping residents get and keep jobs. As part of that grant, community meetings were held and residents addressed the biggest barriers to getting and keeping a job. Transportation was identified as one of the most significant barriers. It was then that car-sharing and other innovative transportation options were considered. After much research, including a survey with over 170 residents responses, car-sharing, van pooling and ride sharing were chosen as the best mobility options to meet the needs of 827 households in Conway Homes and Sierra Vista Homes.

Below are the primary reasons and percentages for which the 170 residents would use program:

Use of EV car share	% of people who will use it	Use of EV car share	% of people who will use it
Groceries & errands	91.4%	Medical appointments	87.5%
Social / recreation	44.7%	Pick up / drop of children	42.8%
Commute to / from school or work	42.8%	Job interviews	32.2%

Currently, we have \$544,000 committed toward an estimated project cost of \$1.6 million over four years. This money is to offset the installation of the chargers at the various locations.

The Housing Authority had unsuccessfully applied for the CMO (Clean Mobility Options) grant. The \$1M award was intended to pay for the cars, vans, further building the charging stations, as well as upkeep and insurance for the vehicles. This would have also included providing discount codes for residents to rent the cars at a reduced rate. Conway Homes, Sierra Vista 1, and Sierra Vista 2 will each ultimately get 6 Level 2 chargers, 2 fast chargers, 3 electric vehicles for car sharing and an electric vehicle for van pooling.

The normal rate for an EV car share is \$11 per hour. With discounts, that could drop to \$5 an hour. This reduced rate will allow residents to be able to afford to utilize a reliable vehicle for shopping, medical appointments and job interviews. The van pooling will be a reliable transportation option to work at such places as the logistics warehouses in Tracy.

To demonstrate the financial benefit for the residents of Conway and Sierra Vista, the cost of car sharing was compared to Uber. Using Uber Estimator (<https://www.uber.com/us/en/price-estimate/>), we calculated trips from each location to Walmart.

Conway to Walmart

Uber price estimator

741 Flint Ave, Stockton, CA ✕
 Walmart Supercenter, 3223 E Hamme... ✕

Your options

<input checked="" type="radio"/> UberX	\$16.57	i
<input type="radio"/> Comfort	\$21.47	i
<input type="radio"/> UberXL	\$22.76	i

Sierra Vista to Walmart

Uber price estimator

2436 Belleview Ave, Stockton, CA ✕
 Walmart Supercenter, 3223 E Hamme... ✕

Your options

<input checked="" type="radio"/> UberX	\$16.17	i
<input type="radio"/> Comfort	\$21.12	i
<input type="radio"/> UberXL	\$22.05	i

The estimated cost via Uber is calculated one way. So, a round trip to Walmart is over \$32. That same trip could be completed for less money with the car share program. For the same amount of money as a single trip to Walmart, our residents could take multiple trips over a 6-hour period. In addition, it would enable residents to have a dedicated car for that six hours that is solely theirs to use for that time period - an important consideration for those with groceries and children.

The EPA National Walkability Index ranks Conway Homes and Sierra Vista, which comprise the total project area, as above average walkable and most walkable, respectively. However, this parameter does little to indicate residents' ability to connect to jobs; over 96% of residents within half a mile of the Conway and Sierra Vista portions of the project area are employed outside of it. According to AllTransit Metrics only 1.32% of Conway residents commute by walking, while 0% of Sierra Vista residents do.

Without the ability to walk, residents require other options to get around. Unfortunately, their public transportation options are severely limited. The data below was gathered from AllTransit Metrics:

- Conway - 0% of households near high frequency transit, at any time of day
- Sierra - 28.1% of households near high frequency transit during rush hour 0% all day

Although the H+T Index indicates that Conway and Sierra Vista residents spend 35% of their income on average, the annual transportation cost is nearly equal to the median household income. The average income at Conway Homes is \$19,931. The average income at Sierra Vista is \$19,129. From this, we can assume that only residents with incomes substantially higher than the median can actually afford reliable transportation, while the rest of the area's residents are left with relatively few mobility options. This provides even more support for the need of reliable affordable transportation. The use of the AB 617 funds for this program fills a major need for the residents of both Conway and Sierra Vista.

Comments/Responses to Draft Community Air Monitoring Plan for Stockton
November 17, 2020

Commenter: Margo Praus

I vote Yes to approve the CAMP and the map for air monitoring placement as indicated on pg. 15. I would like to hear of any concerns that other CSC voters might have. Maybe you could compile and email to the group.

Thank you for your review and input. The District will compile the comments and response and provide them to the CSC.

I don't see info about fugitive dust which has come up in our other discussions. Is it something that could be part of air monitoring?

Fugitive dust could be measured with PM10 analyzers, which could be operated within the proposed air monitoring van. Although the entire San Joaquin Valley has been determined to be in attainment of the federal health-based PM10 air quality standard (including the Stockton area), the air monitoring van can be used to respond to community requests and take measurements of PM10 in areas where localized fugitive dust could be a concern.

Are there any updates on a location for the main stable air monitor that is currently at Hazelton? pg 21 still indicates the proposed stable location around University Park area.

As the Stockton-Hazelton air monitoring site is operated by CARB, they have been working through a process to solicit feedback on where this site could move. CARB will continue to update the CSC on the status of this site move. Thank you for noting that the draft document shows the University Park area is a potential area for the site move, we will update the map on Page 21 accordingly.

I would like an update on the various possible monitoring locations for the network. Might the CSC assist in some way with contacting possibilities for placement? Are there any difficulties the District is having?

Once we have consensus from the Stockton CSC to move forward with our CAMP, we'll then begin thinking about specific locations for each area that will have a monitor placed. Specific recommendations from the committee on locations within each of these areas would be very helpful. Any assistance from the committee in getting permission and leases secured for these locations will be very much welcomed appreciated to ensure that air monitoring equipment is deployed as soon as possible. We'll continue to keep the committee updated as we find places that could work, and as we move through the leasing process.

Also a brief report on how the decision for Agilaire's software and monitoring systems came about. What other software possibilities were considered? Has this system had any concerns where it has been used before?

The Agilaire software is extensively used across California and the nation for the management of air monitoring data. The District has been using it for 5+ years for our regulatory network, and is already using it to manage our South Central Fresno and Shafter community air monitoring data. This system will be needed to ensure that the Stockton community has access to reliable real-time data.

The Appendix A maps for disease indicators all seem to be at least 7 years old. Is there more up to date info?

The maps from Appendix A were based on data from the CalEnviroScreen (CES) 3.0 tool. This statewide tool provided by the California Office of Environmental Health Hazard Assessment (OEHHA), on behalf of the California Environmental Protection Agency, is currently the best available resource. The OEHHA report on CES 3.0 (<https://oehha.ca.gov/media/downloads/calenviroscreen/report/ces3report.pdf>) provides some more background on the health studies used to develop the health indicators. As CES continues to be updated, more recent health studies will be likely be incorporated into this tool.

Commenter: Nate Knodt

This monitoring plan appears to be detailed, accurate, and an excellent reflection of the comments made by community participants at the meetings that I participated in. I like the Monitoring Location Map and have no suggestions, revisions or comments to provide you. I like the report and the map as they are described and displayed in this report.

Thank you for your comments and support.

Commenter: Ned Leiba

I believe the plan should be refocused to ensure that meaningful data is captured relevant to health effects of air pollution. We should focus specifically on air pollution that may relate to the incidence and severity of childhood asthma in the Stockton AB 617 area.

The purpose of the CAMP is to detect and measure pollutants that may have a variety of health effects, including asthma. The equipment is designed to detect a comprehensive suite of pollutants, including those that may relate to the incidence and severity of childhood asthma. As community-level air monitoring data is collected in Stockton, a valuable dataset will be built from which researchers and academic institutions could use to build correlations between Stockton air quality data and the incidences and severity of childhood asthma. The District will be updating the Stockton

CAMP document to include more information on the health-impacts, including asthma, from being exposed to high concentrations of the pollutants to be measured in the community air monitoring network.

Air monitoring devices should be established in closely located pairs to measure (1) outside air quality and (2) inside air quality. We need monitors inside structures where people reside, work and study. As a practical matter, I believe the air monitoring plan should have such paired outdoor and indoor monitors associated with the following schools: Washington, St. George, Edison, Hazelton, Spanos, and Huerta. I believe such tests should include the effect of advanced air filtration systems in some of the schools. Advanced air filtration systems are a highly ranked AB 617 incentive program, and accordingly, the CAMP should provide for monitors that help measure the benefits from the air filtration systems.

Thank you for your comments on indoor air quality. The District will work with the CSC on the implementation the air filtration measure through deploying paired outdoor and indoor monitors to assess the impact of outdoor air quality on indoor air quality and the effectiveness of advanced air filtration systems.

We should seek to learn the relationship between outside and indoor air pollution, and the relationship to childhood asthma. The District indicated it wanted to facilitate health studies for our area that would involve randomized controlled tests of the effect of various pollutants and remedial measures.

This study is beyond the scope of the CAMP. However, the District will work with the CSC to assess potential opportunities.

We want to know the potentially toxic constituent such as organic carbon and elemental carbon (Black Carbon). It does not seem the draft CAMP provides for such monitoring of PM0.1 and I cannot determine if the potentially toxic components of PM2.5 will be separately detected and reported.

The District plans on conducting PM2.5 speciation analysis, which will provide for a summary of various toxic constituents, including organic carbon and elemental carbon. The Stockton CAMP does not propose to monitor ultra-fine PM, but rather focuses on criteria pollutants and toxics.

We need to know the specific costs of the various proposed air monitoring equipment; the cost to operate and maintain those devices. And we need to know the cost to remove, if necessary, those devices once studies are completed.

Based on the District's experience with implementation of community air monitoring networks in the communities of South Central Fresno and Shafter, the District is confident that there is sufficient funding to provide the necessary equipment and resources to ensure that the proposed community air monitoring network, fully based on CSC input, satisfies the needs of the community. This budget is dedicated for air

monitoring and will not impact funding for the implementation of the measures being developed for the Community Emissions Reduction Program.

Commenter: Jonathan Pruitt

The community investment in this plan isn't fully there and needs to be addressed. When comparing to Richmond's CAMP, they have a robust plan that includes community ownership and training. I understand they have more capacity with community partners helping with their own air monitoring and community engagement but I feel Stockton's CAMP could supplement some aspects to that. Due to the Stockton steering committee not provided the chance to hear about Richmond's CAMP, the steering committee wouldn't have imagined opportunities like community trainings, workforce development, and citizen science. It is cases like this where I feel the residents and community-based organizations are not given all the options that are out there.

The development of the CAMP was completely community driven and is a culmination of all the extensive collaborative work that the CSC has done with the District over the past few months, and is focused specifically on the community of Stockton to address its unique needs. The process started in May 2020 with an introduction of the concept of a CAMP. In June 2020, the District worked with the CSC to identify pollution sources of concern throughout the community. In July 2020, the District and the CSC reviewed and discussed maps showing impacts of various pollutions and health indicators, including asthma, throughout the community to identify areas needing air monitoring. Based on these discussions and assessments, and based on the direct recommendations from the CSC, the District developed a draft air monitoring network design that includes the general areas of the Stockton community where air monitoring equipment should be placed, type of pollutants to be monitored, and potential equipment types. This draft community air monitoring network design was reviewed with the CSC in August 2020, and based on the input received, the current draft Stockton CAMP was developed.

The Stockton CSC can continue to discuss how community-based organizations (CBOs) could do additional air monitoring work in Stockton to supplement the work that the District will be conducting. Grant opportunities are available with CARB to help fund CBOs to conduct this type of work. This Stockton CAMP document is focused on the air monitoring work that the District will be conducting in the community.

I want to echo Neb Leiba's comment on looking to pair indoor and outdoor air monitors in schools. The following schools are perfect examples because they are either near a stationary pollution source or a mobile pollution source (i.e. highways and freeways):

- Washington Elementary
- St. George Parish School
- Edison High School
- Spanos Elementary School
- King Elementary School

- Huerta Elementary School

Thank you for your comments on indoor air quality. The District will work with the CSC on the implementation the air filtration measure through deploying paired outdoor and indoor monitors to assess the impact of outdoor air quality on indoor air quality and the effectiveness of advanced air filtration systems.

When looking at XIV. Communicate Results to Support Action, there a few things I'd like to recommend to be added:

- 1) Is there another way to share the real time data that doesn't just involve going through a website? Is it possible that we can utilize the RAAN app and include the data from the different monitoring sites from there? This could potentially help residents have a one stop app to get all information instead of having to remember going to a website. It would also be helpful for residents to be able to view air quality data that is from a monitor close to them.

To make air quality data accessible and easy to use, the District is continually enhancing the way information is provided to the public. This includes the District's current effort in integrating the community air monitoring data with the existing regulatory air monitoring data in RAAN. Once completed, the public will be able to access real-time air quality data based on location that includes both community and regulatory air monitors in one seamless application through the District's RAAN web and mobile app. The Stockton CSC will be updated as this continues to be developed.

- 2) Including: "Shared to the public through social media, e-blasts, press releases, etc."

The District is currently already sharing air quality information, including alerts, through a variety of platforms, including social media, e-blasts, and press releases. The District will share community air monitoring information through these platforms as appropriate.

- 3) Look to find ways for City of Stockton, SJCOG, and San Joaquin County to share this data too through their social medias/websites.

The District will work with the City of Stockton, SJCOG, San Joaquin County, and other organizations to explore potential ways to share this data.

- 4) Distribution of multilingual factsheets.

The District will work with the Stockton CSC to develop multilingual factsheets as needed.

- 5) Training sessions familiarizing steering committee members with reports.

The District will provide trainings session to the steering committee members upon request as needed.

- 6) Looking at coordinating with other non-Valley Air District monitoring initiatives to ingest their data into reports.

The District will work with the Stockton CSC to address this as appropriate.

- 7) Looking at community workshops for the public to attend virtually or in-person (subject to state guidelines). We can look to providing a workshop every four months and a bigger Summit once every year.

The District will be providing community air monitoring updates and other presentations as needed through regular Stockton CSC meetings and other venues, which are open to the public.

Commenter: Cynthia Pinto-Cabrera

Overall the plan has some great components, however, the execution, the timeline, and the participation of the CSC remain very vague and unclear.

The development of the CAMP was completely community driven and is a culmination of all the extensive collaborative work that the CSC has done with the District over the past few months, and is focused specifically on the community of Stockton to address its unique needs. The process started in May 2020 with an introduction of the concept of a CAMP. In June 2020, the District worked with the CSC to identify pollution sources of concern throughout the community. In July 2020, the District and the CSC reviewed and discussed maps showing impacts of various pollutions and health indicators, including asthma, throughout the community to identify areas needing air monitoring. Based on these discussions and assessments, and based on the direct recommendations from the CSC, the District developed a draft air monitoring network design that includes the general areas of the Stockton community where air monitoring equipment should be placed, type of pollutants to be monitored, and potential equipment types. This draft community air monitoring network design was reviewed with the CSC in August 2020, and based on the input received, the current draft Stockton CAMP was developed.

The execution and timeline of the CAMP is highly dependent on a number of variables, including obtaining authorization to install air monitoring equipment at various locations and the associated logistics to implement the necessary infrastructure to support the air monitoring equipment. The District will continue to routinely update the CSC on the process and timeline.

Since this air monitoring network is indented to be community-driven, more clarity on the role that the CSC will be playing is needed. This should include the process for

moving monitors, the process for presenting information to the CSC, as well as the notification process for the community.

As this is a community driven program, the District will continue to provide routine air monitoring updates to the CSC and seek input as needed to ensure that the CSC is aware and can provide feedback for proposed changes to the air monitoring network. This will be clarified in the Stockton CAMP document.

Section VIII. Monitoring methods and equipment. "Community air monitoring network will be re-evaluated on a regular basis to determine changes needed". What does consultation with the CSC look like? Will, there be a subcommittee to assist the running, if so will they received adequate training for this equipment? Can the CSC determine the re-evaluation schedule and process?

The District will provide routine updates to the Stockton CSC and will seek input for any changes to the community air monitoring network. Operation and maintenance of the equipment outlined in the Stockton CAMP will be operated by the District. However, the District can provide an overview of how this equipment is maintained and operated if requested by the CSC. The Stockton CSC can continue to discuss how community-based organizations (CBOs) could do additional air monitoring work in Stockton to supplement the work that the District will be conducting. Grant opportunities are available with CARB to help fund CBOs to conduct this type of work.

Section X: Data Management. Data Review and Flagging process - I initially believed this section was for flagging violations for community members. While I do think it is important to flag readings due to malfunctions to ensure proper data. I believe it will also be important to add a section for flagging violations for CSC members and the Stockton Community. This section should include a timely procedure for notifying residents of any violations captured by the air monitors being used for this CAMP as well as a clear indication of what pollutants are being flagged.

Flags are intended to assist with data review and validation to ensure accurate data is made available to the public. Flags are applied to data when regular maintenance activities are performed, or when the equipment is malfunctioning. These flag notifications help ensure that District staff can quickly respond to equipment that may not be operating properly. During the data validation process, District staff then closely review this flagged data to ensure that accurate data is displayed for public viewing. The CAMP document will be updated to reflect this further information.

With respect to notifying the CSC when the air quality in Stockton violates the federal air quality standards, the air monitoring data will be graphed with references to relevant air quality standards in weekly and quarterly reports to help identify where exceedances occurred. In addition, the air monitoring data will be integrated with the District's Real-Time Air Advisory Network (RAAN) which will provide the necessary mechanisms to inform Valley residents.

RAAN is a free, state of the art system specifically designed to inform Valley residents about local air quality based on the following tools:

- *Online, 24/7 access to the most up-to-date hourly air quality information for your neighborhood*
- *Automated email or text notification whenever air quality is poor in your area*
- *Specific health guidelines for outdoor exercise based on 5 different air quality levels*

The near Port monitor has the potential to not capture or only partly capture the port emissions based on the wind patterns. The Edison high and Dorado monitors might capture some of the port emissions but how can we guarantee port emissions are captured? I would point to the Port of LA that has 3 monitors, 1) community-facing, 2) source determined station 3) coastal bounty station.

The air monitoring site proposed to be placed at Washington Elementary School near the port will be there for a sufficient amount of time to capture all daily and seasonal wind variations to provide a full understanding of potential air quality impacts in this nearby community. This air monitoring location near the Port of Stockton was identified based on recommendations and exercises with the Stockton CSC over this past year. The District's mobile air monitoring van is another resource that can be used to measure air quality in other areas of interest around the Port of Stockton area.

Commenter: Ann Rogan

Will the data collected in the CAMP be correlated to hospitalization rates? (or relevant proxy healthcare data). Recommend alignment that CAMP is aligned to stricter air quality standards (i.e., the World Health Organization's ambient outdoor air quality standards). Referenced here: <https://www.who.int/news-room/fact-sheets/detail/ambient-%28outdoor%29-air-quality-and-health>

According to the California Air Resources Board (CARB), the objectives for community air monitoring include identifying and characterizing areas experiencing disproportionate air pollution impacts in the community, identification of emissions sources and assessing their impact on air quality, assessing progress in improving community air quality, and providing real-time air quality information to inform community members of current conditions within the community. As community-level air monitoring data is collected in Stockton, a valuable data set will be built from which researchers and academic institutions will be able to use the data to build correlations between Stockton air quality data and health impacts, including hospitalization rates. In addition, the air quality data collected will be presented in context with relevant federal health-based air quality standards, and relevant Office of Environmental Health Hazard Assessment (OEHHA) reference exposure levels.

We noticed that black carbon (a short-lived climate pollutant) is being captured in the proposed system. What types of black carbon are being captured - elemental and combustion? In what concentrations? What proportion of funding is being used to monitor black carbon?

Various air monitoring platforms to be used for the Stockton CAMP, including the air monitoring van, compact multi-pollutant system, and air monitoring trailer, include black carbon analyzers that are capable of measuring black carbon at various wavelengths. The draft CAMP includes the use of PM2.5 speciation analyses to provide an estimate of elemental and organic carbons.

What would it take to monitor the other short-lived climate pollutants, like methane, tropospheric ozone and fluorinated gases?

Tropospheric ozone is already planned to be measured in the Stockton community air monitoring network. The canister sampling proposed in the draft CAMP that is planned to be conducted by the District, and the subsequent laboratory analysis, will be able to isolate several fluorinated gases and compounds with methane. It should be noted that AB 617 is intended to reduce criteria and toxic air pollutants that are known to have serious health impacts, such as PM2.5. Methane is not a criteria or a toxic air pollutant and is not a focus area for AB 617 work, however. Many of the criteria and toxic air pollution reduction measures currently being evaluated by the CSC may have a co-benefit in also reducing methane emissions.

For the current pollutants mentioned (PM2.5, ozone, black carbon, carbon monoxide, VOCs, nitrogen oxides, BTEX, hydrogen sulfide, toxic air contaminants), where is there any mention of the health effects associated with ambient exposure to each of these pollutants?

The District has updated Section V - Community Air Monitoring Objectives, in the draft Stockton CAMP document to include more information on the health-impacts from exposure to high concentrations of the pollutants to be measured in the community air monitoring network.

Has the CSC considered implementation structures where parts of the CAMP are operated or monitored by community-based organizations?

The Stockton CSC and District can continue to discuss how community-based organizations (CBOs) could do additional air monitoring work in Stockton to supplement the work outlined in the draft Stockton CAMP. To date, this work has been done through grants from CARB to CBOs to perform this monitoring and have been included in CAMPs due to having an established network at the time the CAMP was developed. With Stockton being recommended by the community as an air monitoring and CERP community, there is an understanding of significant air pollution burden in the community and a need to have equipment that can be used to develop long-term strategies to reduce pollution in the community.

This document requires clarity and definition around a governance structure for current and future decision making pertaining to the CAMP. If a governing charter exists for 617 work, this should be linked to that. Is that available for review?

The charter to govern the activities of the Stockton CSC was reviewed approved by the CSC at the March 4, 2020 meeting. The charter is available for review at http://community.valleyair.org/media/1616/03042020_stockton-charter.pdf. Section I of the draft Stockton CAMP document has been updated to include provisions for discussion of and inclusion of changes into the CAMP in adherence to the CSC Charter.

In the current proposal, it appears as though a vendor has been identified. Would recommend greater transparency around the procurement process - and whether it's intended to be competitive? If not, why? That may have implications for cost-effectiveness. For any future vendor selection, who are the responsible parties for making vendor decisions around hardware procurement and associated activities?

Air monitoring equipment is very specialized and customized and there are a very limited vendors that provide the equipment. In the procurement of the equipment being used for Year 1 AB 617 communities in the San Joaquin Valley, the District used a competitive process and identified few vendors with the knowledge and experience to provide the types of equipment needed. The District worked with a number of potential vendors to understand their capabilities of providing specialized services to build the needed air monitoring assets. Through this analysis, the vendor with the most direct experience in providing these specialized assets was selected. Based on the successful delivery of the assets for Year 1, the District is working again with the same vendor to build air monitoring platforms to be used in the Stockton CAMP.

Based on the CSC conversations to date, have they outlined a preference as to whether they would prefer data to be community-owned vs community-accessible?

As discussed at previous CSC meetings, the Stockton CAMP is community-owned in that the CSC identified the sources of concern and the specific locations where air monitoring needs to be conducted. Additionally, the CSC will also be decision makers in that they will be directly involved in decision making based on the air monitoring information collected from the air monitoring network once deployed. The air monitoring data collected will be posted to a Stockton specific air monitoring page where the public can access and download data directly from the website. The District also plans on providing weekly summaries, and more comprehensive quarterly summary reports to the CSC and discuss the meaning and importance of the data collected and how this information can be used to help inform decisions being made by the CSCs. Towards this end, the District will work to compile and present the data in an understandable and user-friendly manner, taking ongoing suggestions from CSC.

Based on their SJ Air map, can the Central California Asthma Collaborative (CCAC) present their map and work to the CSC, to identify potential for collaboration in the CAMP? Need additional on the CCAC deployment strategy for Stockton.

Should it be requested by the Stockton CSC for CCAC to present at an upcoming steering committee meeting, the District will help facilitate this presentation.

What are the local workforce opportunities available through the CAMP system? Seems like there should be more of an emphasis here, given the potential to increase community engagement through the process and within the project boundary area.

The Stockton CSC and District can continue to discuss how community-based organizations (CBOs) could do additional air monitoring work in Stockton to supplement the work that the District will be conducting. Grant opportunities are available with CARB to help fund CBOs to conduct this type of work. The draft Stockton CAMP document is focused on the air monitoring work that the District will be conducting in the community.

We did not see mention of how the CAMP data will inform the future prioritization of CERP strategies. The CSC should ideally be able to shift prioritization of CERP based on real-time CAMP data that is gathered (because this relates to decision-making, this point links to governance structure).

Based on this feedback, the District updated Section V - Community Air Monitoring Objectives, to better explain how the information collected will be used to help with the CERP implementation process, including ongoing evaluation of CERP strategies.

There seems to be a budget missing from the CAMP proposal around the allocations for specific categories.

The draft Stockton CAMP includes the required elements in accordance with CARB's AB 617 Blueprint, as the CAMP is designed to be the tool that explains the reason for air monitoring, the scope of actions, air monitoring objectives, how monitoring will be conducted, data quality objectives, monitoring equipment to be used, data management, how data will be used to take action, how to analyze and interpret data, and how to communicate results to support action.

During the August CSC, the District had a discussion with the CSC about the need to move forward with the purchase of air monitoring equipment to support the draft CAMP including the trailer and multi-pollutant compact monitors, and that the District would be taking a Governing Board item to approve the purchase of this equipment later that month provided there were no concerns raised by the CSC.

(https://www.valleyair.org/Board_meetings/GB/agenda_minutes/Agenda/2020/August/final/10.pdf)

The District has allocated necessary funding for the equipment and staffing to support the proposed draft Stockton CAMP, including the purchase of air monitoring equipment as stated above and the staffing necessary to complete the work outlined in the draft CAMP. Should the CSC elect to modify the draft Stockton CAMP, any changes that would result in reduced levels or type of air monitoring and staffing needs would be re-allocated to support the implementation of AB 617 programs throughout the Valley.

VISION: CVAQ envisions a healthy, safe, and economically prosperous San Joaquin Valley where chronic air pollution and epidemic sickness due to poor air quality is eliminated.

MISSION: To raise awareness, act as a watchdog, advocate for policy, and mobilize communities to create clean air in the San Joaquin Valley.

Ozone Pollution

Why smog is harmful

Ozone, the main ingredient in smog, is one of the most widespread air pollutants and among the most dangerous.

Effects on health

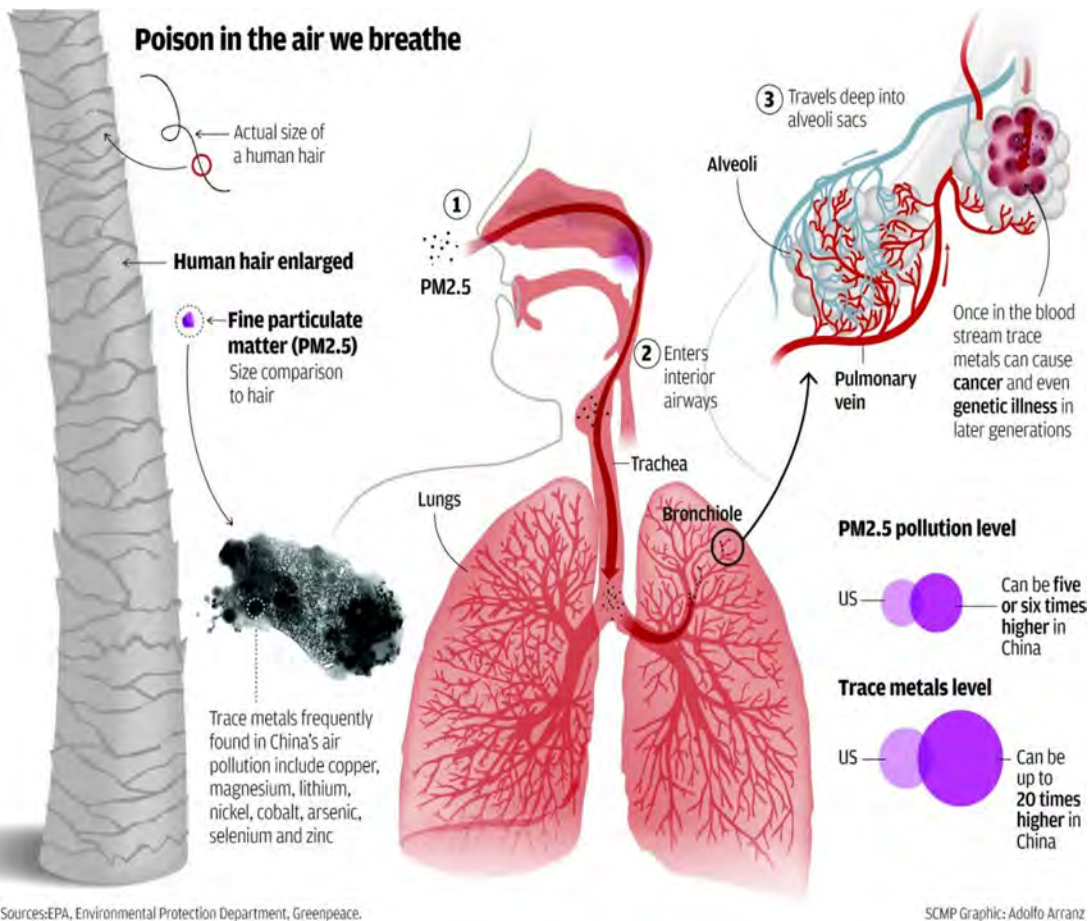

How ozone forms

- 1 Oxygen in the atmosphere O2
- 2 Nitric oxide, byproduct of combustion NO
- 3 Sunlight breaks up nitric oxide
- 4 Ozone formed by three oxygen atoms O3

Most Polluted Cities for Ozone

1. Los Angeles-Long Beach
2. Visalia
3. Bakersfield
4. Fresno-Madera-Hanford
5. Sacramento-Roseville
6. San Diego-Ch. Vista-Carlsbad, CA
7. Phoenix-Mesa, AZ
8. **San Jose-San Francisco-Oak., CA**
9. Las Vegas-Henderson, NV
10. Denver-Aurora, CO

Particulate Matter (PM) Pollution

Most Polluted Cities for Year-Round Particle Pollution Levels

1. Bakersfield
2. Fresno-Madera-Hanford
3. Visalia
4. Los Angeles-Long Beach (incl. Inland Empire)
5. ***San Jose-San Francisco-Oakland (incl. Stockton)***

Most At Risk: "Sensitive Populations" = 40-50% of people in the San Joaquin Valley

Heart & Lung Diseases

Children under the age of 18

People who work outdoors

Pregnant Women

Adults 65 +

Health Impacts & Inequities

- **1 out of 4 children** in the San Joaquin Valley have **asthma**.
- Compared to the national average, children in the San Joaquin Valley are **twice as likely** to be diagnosed with asthma before the age of 18.
- **Emergency room and hospital visits** for ailments like asthma and heart attacks spike during days of unhealthy air pollution.
- **Communities of color and low income communities are disproportionately exposed to air pollution.**
 - ***Pandemic, Climate change = worsening impacts***

Meeting Highlights*

AB 617 Stockton Community Steering Committee Meeting #10

November 4, 2020 | 5:00 pm - 7:00 pm

Virtual Zoom Meeting

Action items for the Stockton Community Steering Committee (CSC):

- Email District if you do NOT want to receive hard copies of all documents
- Email District if you are interested in being a community co-host

Action items for San Joaquin Valley Air Pollution Control District (District):

- Post the incentive measures and CSC comments on the community webpage
- Email a new version of the measures to the CSC with the original funding amounts and the new funding amounts based on recent discussions
- Send the CSC the air monitoring plan and all the comments received; add the voting item to the next meeting agenda
- Send a Doodle poll with dates of availability for extra meetings between now and the week before Christmas to work on the CERP
- Send electronic versions of documents at least 72 hours before any meetings when the materials will be discussed
- Denote any agenda items that will require CSC voting or consensus

Welcome and Introductions

Erica Manuel, Facilitator & CEO, Institute for Local Government (ILG)

Ryan Hayashi, Deputy Air Pollution Control Officer, District

Noehmi Garcia Jauregui, Community Co-host

Erica welcomed the Stockton CSC participants, introduced the ILG facilitation team, and thanked everyone for attending. She gave an overview of the agenda and explained that the meeting would involve reviewing CERP measures and voting on them. The goal was to review as many measures as possible and give general feedback but the agenda would be flexible. Additional meetings would be scheduled to address budget allocations and other specific wordsmithing that may be needed.

Hanna presented the Zoom controls for voting. Community co-host, Noehmi, welcomed everybody and expressed concerns about voting on the CERP measures at this particular meeting and commented that the CSC probably needs more time for discussion of the measures.

Ryan stated the District is flexible and amenable to granting more time for discussion.

Erica agreed that it would be easy to adjust the meeting agenda structure to accommodate committee preferences.

Ryan clarified that there will be numerous meetings over the course of the next several months to discuss the CERP. The document won't be considered final until the CSC has a document that reflects its priorities and feedback. Until then, the CERP will be a work in progress.

The CSC expressed gratitude for that flexibility.

AB 617 Stockton Funding

Ryan Hayashi, Deputy Air Pollution Control Officer, District

Ryan updated the CSC on the funding available to Stockton for incentives and implementation of measures. Presentation highlights:

- There are two pots of funding: incentive funding and implementation funding to implement the AB 617 program in Stockton
- The District has set aside approximately \$35-\$42 million dollars of total state funding provided to the District for incentive measures to be used for emission reduction and exposure reduction measures provided measures can be developed to be able to spend the funding within the legislative timeframes; the District received \$12 million to implement the AB 617 program for 3 selected communities in the Valley
- There were questions about whether money used for implementing the program can be shifted from the implementation to the incentive side, to which the District explained cannot be done

Community Co-Host Remarks

Noehmi Garcia Jauregui, Community Co-host

Noehmi provided a community co-host welcome and shared photos from the St. George Parish School (where she is Principal) and the surrounding community, which are all within the AB 617 boundary. She shared photos of the children at the school and the location of the neighborhood, which lies southeast of the Port and close to many sources of pollution.

Community Emission Reduction Program (CERP) Strategies

Erica Manuel, Facilitator, ILG

Erica shared a list of all incentive strategies, as prioritized by the CSC through online surveys and other assessments since July. Robust discussion on certain measures followed.

General CERP Development Notes from the Discussion:

- The CERP development is just one stage of the AB 617 process
- Once the CERP is developed implementation can begin
- If the measures are too specific now and require significant modification later, the District may need to go back to its Governing Board, which will delay the process
- We can have as many meetings as the CSC feels is necessary to accomplish this stage of the process. It is a balancing act, especially with the holidays coming soon

- The CSC requested more formality with meetings, such as receiving agendas and paperwork at least 72 hours in advance and for action items to be specifically stated on the agenda. Items to be voted on should be specified in the agenda and in advance

Measure: Vegetative Barriers

Jaime Holt with the District provided an overview of the vegetative barriers measure, a draft of what the strategy might say, as well as all the comments received from CSC members on the measure. Discussion highlights:

- District received numerous questions about vegetative barriers and is researching what they cost, the time frame for installation, and what the air quality benefit would be based on vegetative barriers with sound walls versus just sound walls
- The funding for the incentives has to have a nexus to either mitigating or reducing pollution

Comment: Arizona cypress creates a vegetative barrier like a natural fence and helps with sound.

District Response: The District will note the different types of vegetative barrier options.

Comment: Based on our experience with the Fresno Trees Initiative, we know that the budget will need to be handled cautiously and respectfully so we get the best results for our investment. We should look at places where we can work with people who are already doing things like the Fresno Trees Initiative. Caltrans has lists of vegetation and the pros and cons of each.

District Response: Puentes is on the CSC and has already volunteered to meet with us about their ongoing efforts and potential new opportunities.

Comment: Who would be responsible for acquiring the list of vegetative barriers from Caltrans? District staff or the CSC?

District Response: There are some experts in this group and we are happy to accept any information you give to us. The District is already reaching out to the organizations that do this type of work.

CARB Response: There are a lot of studies, but the one consistency among them is that if the vegetation is taller, denser, and perpendicular to the prevailing winds, it will do the best job at lifting any emissions from the freeway or stationary source of concern.

Comment: One of the things the CSC should leverage is discussion with the leadership of those projects for vegetative barriers. We have the rail project coming up. Much of the rail parallels the highway, so maybe there is a dual role that we can play with the BNSF and UP as the project develops further.

District Response: We should have proactive partner discussions to make sure that the money is being utilized as effectively as possible.

Port Discussion

NOTE: The CSC requested that the agenda be adjusted to discuss the Port, and specifically to discuss an email that was sent out immediately prior to the meeting. The discussion included

broad overviews of the Port and specific comments about Port-related measures. Many questions were asked and answered in the chat.

Jeff Wingfield with the Port of Stockton gave an overview of an email that the Port sent to the CSC shortly before the meeting. Discussion highlights:

- The Port is always interested in community concerns and is more than happy to work with the CSC
- It has been difficult to remove traffic from the existing Boggs Tract neighborhood and the Port is continuing to work on moving traffic away from that neighborhood
- Penny Newman Grain is a competitor of the Port and they are the group that occupies parts of the channel—some of the traffic in that area gets attributed to the Port
- The Port is working on emissions inventory so we can be more proactive with mitigation
- The Port is forming a community outreach group so stakeholders that want to be involved in the Port planning efforts can advise and engage with us

Question: Is it possible for a few of us to come out and actually see what the Port is doing? To visualize it and see what would be important to you and see how what we are proposing would affect the Port?

Port of Stockton Response: Absolutely. A lot of the communication opportunities have been lost with the transition to virtual, but the Port is more than happy to host a small tour group to come see what we're doing and talk about different ideas.

Question: Was a copy of that email sent to every single commissioner that the city and the county have appointed?

Port of Stockton Response: Not yet, but it can definitely be circulated to them. I can make sure it gets to the Port director and commissioners this week.

Measure: Trucks and Other Heavy Duty Equipment Operating At the Port

Measure discussion highlights:

- This AB617 grant program is about taking those heavy duty mobile vehicles operating around the Port. Some are owned by companies that have operations at the Port and some are owned by the Port itself. We would replace them with zero and near zero emission technology.
- One of the major focuses of AB 617 is to reduce emissions in the community in a quick and expeditious manner. Some of the comments the District received were to force people to replace existing equipment. However, without having mandates to do that, it is difficult. This is an opportunity to provide incentive funding to encourage owners of the equipment to replace their existing equipment with cleaner equipment.
- District staff wrote a new strategy and called it “plug-ins for trucks” as they wait to get into the Port, and included it in this strategy. If the CSC is open to it, the District can actually incorporate that into this strategy or can be left separate.

Comment: We should incorporate that because it is a zero emission strategy.

Port of Stockton Response: There are some expansion opportunities. The Port took over Rough and Ready Island from the Navy, which tripled the size of the Port. There are about 600 acres that is still developable. There are some projects that we are working through, but the Port wants to sit and talk with the community outreach group and ensure we are growing the Port as mindful as we can and we are implementing measures that reduce emissions. The Port is trying to eliminate truck traffic moving to the east on Washington Street. One of the things being considered is closing that road off and relocating one of our main entrances to the East Complex. That could eliminate 95% of traffic going through that area.

Question: How much money that could be used for residents would go to this entity and how much is the Port willing to make it happen with or without the CSC? I also don't see anything that explains how much authority that community group would have over Port decisions. How would the Port encourage the trucking industry to these AB 617 guidelines?

Port of Stockton Response: The Port is forming another group internally with our tenants. We can incentivize some of our tenants by putting in lease measures and specific benefits for them if they use zero or near zero emission equipment where available.

Question from Public: Isn't diesel replacement funding existing funding or are we funding existing programs with AB 617 dollars?

District Response: There are various programs that fund diesel replacement and the District does take advantage of those. This would be targeted funding for fleets that operate and are housed within the Stockton community boundaries. Generally speaking, the District's programs are severely over-subscribed. This money would be designated for the community, so they would have immediate access to these funds. These are community-designed programs.

Question: If there is an expansion at the Port, is there an environmental impact report or a study conducted before a new company comes in? Who is involved in those environmental impact reports?

Port of Stockton Response: In the mid-2000s, the Port did a programmatic environmental impact report for the entire development of Rough and Ready Island and looked at the full build out. Now, if we analyze a project, we compare those impacts to what was analyzed in that environmental impact report. If the new project fits within the parameters of what was analyzed previously, then the Port certifies what is called an addendum to that environmental impact report. If the project doesn't fit, the Port does a supplemental environmental impact report that goes out for public review. Environmental analyses are done for every Port project. The Port did not hear from the community previously, but is excited to be able to work with them moving forward to get community input on specific projects.

Question: Do CEQA reports get published? How does the Port let Boggs Tract residents know that there is something to review? How soon will you conduct the re-routing on Washington?

Port of Stockton Response: The reports are published and filed with the county and the state. We promise to get them on our website. The Port is hoping to do the re-routing very soon. It is currently being administered by with our real estate team and may be complete in 2021.

Question: There is \$8 million available for this measure. Does that budget pay for all of one item or all five items?

District Response: That hasn't been decided yet. The CSC can say what they specifically want to work on related to this measure and where the funds should be allocated. As the CSC continues to discuss all the measures, we'll refine the budgets accordingly.

Question: The Port made a promise to post reports on their website. I would like to see them not only posted, but noticed in a Port meeting agendas so there is no confusion about the possibility that a port director may be uninformed. The Port is doing a strategic plan and I would like to propose that the consultant that has been hired to prepare the plan meet with the community members and get their perspectives. That feedback should be documented within the strategic planning process.

Port of Stockton Response: I will follow up with you on the noticing. It's a good idea to hear from the community on the strategic plan. It is good timing to incorporate a lot of our emission reduction goals into the big picture of what we are aiming to do at the Port.

Question: Can you confirm that the Port boundaries are where it meets the security line and that the competitors are outside of the Port?

Port of Stockton Response: Correct.

Monitoring Plan Update

Chay Thao, Program Manager, District

Chay reviewed the community air monitoring plan and showed the map. Presentation highlights:

- District would like to start implementing air monitoring plan as soon as possible, which includes finding the locations and getting permission to install equipment, etc
- There is some flexibility in the plan in its current draft. For example, if we find there is another location we really need to monitor, we can adjust that the plan as needed
- District has received some comments from the CSC members, but not any significant requests to fundamentally change the plan
- If there are no major objections from the CSC, District would like to move forward with the initial efforts

Question: How often are we going to have data to be responding to?

District Response: We use various types of equipment with different monitoring timeframes. The van goes to locations for a couple hours or overnight and captures data. The trailer and smaller compact systems are semi-portable. The monitoring timeframes are based upon whatever the needs are for the community. The plan is a dynamic document and the CSC can modify and update it as the needs arise.

Question: What exactly is that data going to be used for? Will it influence the budget? If the CSC knows who is going to use the data sets and how it has driven decisions in the past, it will give us more context about why it is important. Based on the image shown on the screen, there are about 20-30 different sites. The report says that upon approval, the District will reach out to property owners/managers to set up a testing module on their property. If the District talks to all

30 property owners, but only gets five of those sites, that makes the map look different than the initial plan. How do we ensure that the end result looks similar to the original plan approved?

District Response: The data has a wide variety of uses. Originally, it was intended to help support the community on these issues. The District needs to understand what the emissions concerns are and validate them. The goal is to get all these air monitors in all these locations. There are certain areas that are more difficult to get monitors to. In that case, the District will use the van temporarily in that area and then look at other potential areas around that site.

Question: What is being flagged, one pollutant or all of them? Will all the monitors have flagging capabilities? What is the timeline when a flag is triggered—how quickly will residents be notified?

District Response: Data is flagged for several reasons, including when the equipment is being calibrated or maintenance is being performed or when there are questions about the validity of the data.

Erica asked the CSC if the group would feel comfortable voting on the air monitoring plan at the next meeting in November. The CSC said yes and the District agreed to add that voting item to the next agenda.

Wrap Up/Next Steps

Erica Manuel, Facilitator, ILG

Erica asked the CSC how best to refine the CERP development process moving forward and how best to review the draft measures as a group in a virtual environment.

Comment: We should pick out four or five dates in the next month in a half to work on the measures

Comment: If someone can't make it to a meeting, maybe another member on the CSC can voice their concerns or opinions at that time

The District agreed to send out Doodle polls for additional meeting dates.

Erica reiterated to the CSC that they will be voting on the air monitoring plan at the next special November meeting and that the District will continue to refine the process of the CERP review to ensure the CSC has adequate time for review, deliberation and response.

Erica thanked Noehmi for co-hosting and noted that Catherine will be the next community co-host. She thanked the CSC members and District staff for the input and productive meeting.

Noehmi closed out the meeting and thanked everyone for participating in difficult but important discussions.

Reminders

There will be a second CSC meeting on November 18. All the presentations, meetings highlights, transcripts and the Zoom meeting recording will be posted online.

**Refer to meeting audio to review the full details and comments from the meeting.*

No public comment.

Puntos Importantes de la Reunión*
Comité Directivo de la Comunidad AB 617 de Stockton Reunión #10

4 de noviembre de 2020 | 5:00 pm - 7:00 pm

Reunión Virtual a través de Zoom

Artículos de Acción para el Comité Directivo Comunitario de Stockton (Comité):

- Envíe un correo electrónico al Distrito si NO desea recibir copias impresas de todos los documentos
- Envíe un correo electrónico al Distrito si está interesado en ser coanfitrión de la comunidad

Artículos de Acción para el Distrito del Aire del Valle (Distrito):

- Publique las medidas de incentivo y los comentarios del Comité en la página web de la comunidad
- Envíe por correo electrónico una nueva versión de las medidas al Comité con los montos de financiación originales y los nuevos montos de financiación basados en discusiones recientes
- Enviar al Comité el plan de monitoreo del aire y todos los comentarios recibidos; agregar el elemento de votación a la agenda de la próxima reunión
- Envíe una encuesta de Doodle con fechas de disponibilidad para reuniones adicionales entre ahora y la semana antes de Navidad para trabajar en el CERP
- Enviar versiones electrónicas de documentos al menos 72 horas antes de cualquier reunión en la que se discutirán los materiales
- Indique cualquier tema de la agenda que requiera votación o consenso del Comité

Bienvenida e Introducciones

Erica Manuel, Facilitadora y Directora Ejecutiva, Institute for Local Government (ILG)

Ryan Hayashi, Oficial Adjunto de Control de la Contaminación del Aire, Distrito

Noehmi Garcia Jauregui, Coanfitrión de la Comunidad

Erica dio la bienvenida a los participantes del Comité de Stockton, presentó al equipo de facilitación de ILG y agradeció a todos por asistir. Dio una descripción general de la agenda y explicó que la reunión implicaría revisar las medidas del CERP y votarlas. El objetivo era revisar tantas medidas como fuera posible y dar comentarios generales, pero la agenda sería flexible. Se programarán reuniones adicionales para abordar las asignaciones presupuestarias y otras redacciones específicas que puedan ser necesarias.

Hanna presentó los controles de Zoom para votar. El coanfitrión de la comunidad, Noehmi, dio la bienvenida a todos y expresó su preocupación por votar sobre las medidas del CERP en esta reunión en particular y comentó que el Comité probablemente necesite más tiempo para discutir las medidas.

Ryan dijo que el Distrito es flexible y dispuesto a otorgar más tiempo para la discusión.

Erica estuvo de acuerdo en que sería fácil ajustar la estructura de la agenda de la reunión para acomodar las preferencias del Comité.

Ryan aclaró que habrá numerosas reuniones en el transcurso de los próximos meses para discutir el CERP. El documento no se considerará definitivo hasta que el Comité tenga un documento que refleje sus prioridades y comentarios. Hasta entonces, el CERP será un trabajo en progreso.

El Comité expresó su gratitud por esa flexibilidad.

Financiación de AB 617 en Stockton

Ryan Hayashi, Oficial Adjunto de Control de la Contaminación del Aire, Distrito

Ryan actualizó el Comité sobre los fondos disponibles para Stockton para incentivos e implementación de medidas. Puntos importantes de la presentación:

- Hay dos fuentes de financiación: financiación de incentivos y financiación de implementación para implementar el programa AB 617 en Stockton
- El Distrito ha reservado aproximadamente \$35-\$42 millones de dólares de fondos estatales totales proporcionados al Distrito para medidas de incentivo que se utilizarán para la reducción de emisiones y medidas de reducción de exposición siempre que se puedan desarrollar medidas para poder gastar los fondos dentro de los plazos legislativos; el Distrito recibió \$12 millones para implementar el programa AB 617 para 3 comunidades seleccionadas en el Valle
- Hubo preguntas sobre si el dinero utilizado para implementar el programa se puede cambiar de la implementación al lado de los incentivos, a lo que el Distrito explicó que no se puede

Comentarios del Coanfitrión de la Comunidad

Noehmi Garcia Jauregui, Coanfitrión de la Comunidad

Noehmi brindó una bienvenida a la comunidad como coanfitrión y compartió fotos de la escuela parroquial de St. George (donde es Directora) y la comunidad circundante, que se encuentran dentro del límite de AB 617. Ella compartió fotos de los niños en la escuela y la ubicación del vecindario, que se encuentra al sureste del Puerto y cerca de muchas fuentes de contaminación.

Estrategias del Programa de Reducción de Emisiones en la Comunidad (CERP)

Erica Manuel, Facilitadora y Directora Ejecutiva, Institute for Local Government (ILG)

Erica compartió una lista de todas las estrategias de incentivos, según las prioridades del Comité a través de encuestas en línea y otras evaluaciones desde julio. Siguió una discusión sobre ciertas medidas.

Notas Generales de la Discusión del Desarrollo del CERP:

- El desarrollo del CERP es solo una etapa del proceso AB 617
- Una vez que se desarrolle el CERP, la implementación puede comenzar

- Si las medidas son demasiado específicas ahora y requieren una modificación significativa más adelante, es posible que el Distrito deba volver a su Mesa Directiva, lo que retrasará el proceso
- Podemos tener tantas reuniones como el Comité considere necesario para lograr esta etapa del proceso. Es un acto de equilibrio, especialmente con las próximas días feriados
- El Comité solicitó más formalidad con las reuniones, como recibir agendas y trámites con al menos 72 horas de anticipación y que los puntos de acción se establezcan específicamente en la agenda. Los temas a votar deben especificarse en el orden del día y con anticipación

Medida: Barreras Vegetativas

Jaime Holt del Distrito brindó una descripción general de la medida de barreras vegetativas, un borrador de lo que podría decir la estrategia, así como todos los comentarios recibidos de los miembros del Comité sobre la medida. Puntos importantes de la discusión:

- El Distrito recibió numerosas preguntas sobre barreras vegetativas y está investigando cuánto cuestan, el período de tiempo para la instalación y cuál sería el beneficio de la calidad del aire basado en barreras vegetativas con paredes de sonido en lugar de solo paredes de sonido
- La financiación de los incentivos debe tener un vínculo con la mitigación o la reducción de la contaminación

Comentario: El ciprés de Arizona crea una barrera vegetativa como una cerca natural y ayuda con el sonido.

Respuesta del Distrito: El Distrito notará los diferentes tipos de opciones de barreras vegetativas.

Comentario: Basándonos en nuestra experiencia con la Iniciativa de Árboles de Fresno, sabemos que el presupuesto deberá manejarse con cautela y respeto para que obtengamos los mejores resultados para nuestra inversión. Deberíamos buscar lugares donde podamos trabajar con personas que ya están haciendo cosas como la Iniciativa de Árboles de Fresno. Caltrans tiene listas de vegetación y los pros y los contras de cada una.

Respuesta del Distrito: Puentes está en el Comité y ya se ha ofrecido como voluntario para reunirse con nosotros sobre sus esfuerzos continuos y nuevas oportunidades potenciales.

Comentario: ¿Quién sería responsable de adquirir la lista de barreras vegetativas de Caltrans? ¿El personal del Distrito o el Comité?

Respuesta del Distrito: Hay algunos expertos en este grupo y nos complace aceptar cualquier información que nos brinde. El Distrito ya se está hablando a las organizaciones que realizan este tipo de trabajo.

Respuesta de CARB: Hay muchos estudios, pero la única consistencia entre ellos es que si la vegetación es más alta, más densa y perpendicular a los vientos predominantes, hará el mejor trabajo para eliminar las emisiones de la autopista o fuente estacionaria de preocupación.

Comentario: Una de las cosas que el Comité debería aprovechar es la discusión con el liderazgo de esos proyectos sobre las barreras vegetativas. Tenemos el proyecto ferroviario en camino.

Gran parte del ferrocarril es paralelo a la carretera, por lo que quizás haya un papel doble que podamos desempeñar con el BNSF y el UP a medida que el proyecto se desarrolle más.

Respuesta del Distrito: Deberíamos tener discusiones proactivas con los socios para asegurarnos de que el dinero se utilice de la manera más eficaz posible.

Discusión del Puerto

NOTA: El Comité solicitó que se ajustara la agenda para discutir el Puerto, y específicamente para discutir un correo electrónico que se envió inmediatamente antes de la reunión. La discusión incluyó amplias descripciones del Puerto y comentarios específicos sobre las medidas relacionadas con el Puerto. Se hicieron y respondieron muchas preguntas en el chat.

Jeff Wingfield del Puerto de Stockton dio una descripción general de un correo electrónico que el Puerto envió al Comité poco antes de la reunión. Puntos importantes de la discusión:

- El Puerto siempre está interesado en las preocupaciones de la comunidad y está más que feliz de trabajar con el Comité
- Ha sido difícil eliminar el tráfico del vecindario existente de Boggs Tract y el Puerto continúa trabajando para alejar el tráfico de ese vecindario
- Penny Newman Grain es un competidor del Puerto y es el grupo que ocupa partes del canal—parte del tráfico en esa área se atribuye al Puerto
- El Puerto está trabajando en el inventario de emisiones para que podamos ser más proactivos con la mitigación
- El Puerto está formando un grupo de alcance comunitario para que las partes interesadas que deseen participar en los esfuerzos de planificación del Puerto puedan asesorarnos y participar con nosotros

Pregunta: ¿Es posible que algunos de nosotros salgamos y veamos realmente lo que está haciendo el Puerto? ¿Para visualizarlo y ver qué sería importante para ti y ver cómo afectaría al Puerto lo que te proponemos?

Respuesta del Puerto de Stockton: Absolutamente. Muchas de las oportunidades de comunicación se han perdido con la transición a lo virtual, pero el Puerto está más que feliz de albergar un pequeño grupo para que vengan a ver lo que estamos haciendo y hablen sobre diferentes ideas.

Pregunta: ¿Se envió una copia de ese correo electrónico a cada uno de los comisionados que la ciudad y el condado han designado?

Respuesta del Puerto de Stockton: Todavía no, pero definitivamente se les puede distribuir. Puedo asegurarme de que llegue al director del Puerto y a los comisionados esta semana.

Medida: Camiones y Otros Equipos de Servicio Pesados que Operan en el Puerto

Puntos importantes de la discusión:

- Este programa de subvenciones de AB 617 trata de llevar los vehículos móviles de servicio pesado que operan en el Puerto. Algunas son propiedad de empresas que operan en el Puerto y otras son propiedad del propio Puerto. Los reemplazaríamos con tecnología de emisión cero o casi cero.

- Uno de los enfoques principales de AB 617 es reducir las emisiones en la comunidad de una manera rápida y expedita. Algunos de los comentarios que recibió el Distrito fueron para obligar a las personas a reemplazar el equipo existente. Sin embargo, sin tener mandatos para hacer eso, es difícil. Esta es una oportunidad para proporcionar financiamiento de incentivo para alentar a los propietarios del equipo a reemplazar su equipo existente con equipo más limpio.
- El personal del Distrito redactó una nueva estrategia y la llamó "enchufes para camiones" mientras esperaban para entrar al Puerto, y la incluyó en esta estrategia. Si el Comité está abierto a ello, el Distrito puede incorporarlo en esta estrategia o puede dejarse por separado.

Comentario: Deberíamos incorporar eso porque es una estrategia de cero emisiones.

Respuesta del Puerto de Stockton: Hay algunas oportunidades de expansión. El Puerto tomó el control de *Rough and Ready Island* de la Marina, que triplicó el tamaño del Puerto. Hay alrededor de 600 acres que aún se pueden desarrollar. Hay algunos proyectos en los que estamos trabajando, pero el Puerto quiere sentarse y hablar con el grupo de extensión comunitaria y asegurarse de que estamos haciendo crecer el Puerto de la manera más consciente posible y estamos implementando medidas que reducen las emisiones. El Puerto está tratando de eliminar el tráfico de camiones que se mueven hacia el este por Washington Street. Una de las cosas que se están considerando es cerrar esa carretera y reubicar una de nuestras entradas principales al Complejo Este. Eso podría eliminar el 95% del tráfico que pasa por esa área.

Pregunta: ¿Cuánto dinero que podría usarse para los residentes iría a esta entidad y cuánto está dispuesto el Puerto a hacer que suceda con o sin el Comité? Tampoco veo nada que explique cuánta autoridad tendría ese grupo comunitario sobre las decisiones del Puerto. ¿Cómo alentaría el Puerto a la industria del transporte por carretera a estas pautas de AB 617?

Respuesta del Puerto de Stockton: El Puerto está formando otro grupo internamente con nuestros inquilinos. Podemos incentivar a algunos de nuestros inquilinos mediante la implementación de medidas de arrendamiento y beneficios específicos para ellos si utilizan equipos de cero emisiones o casi cero cuando estén disponibles.

Pregunta del Público: ¿No existe financiamiento para el reemplazo de diésel o estamos financiando programas existentes con dólares de AB 617?

Respuesta del Distrito: Hay varios programas que financian el reemplazo de diésel y el Distrito los aprovecha. Este sería un financiamiento específico para las flotillas que operan y están alojadas dentro de los límites de la comunidad de Stockton. En términos generales, los programas del Distrito están muy suscritos. Este dinero se destinaría a la comunidad, por lo que tendrían acceso inmediato a estos fondos. Estos son programas diseñados por la comunidad.

Pregunta: Si hay una expansión en el Puerto, ¿hay un informe de impacto ambiental o un estudio realizado antes de que ingrese una nueva empresa? ¿Quién está involucrado en esos informes de impacto ambiental?

Respuesta del Puerto de Stockton: A mediados de la década de 2000, el Puerto realizó un informe de impacto ambiental programático para todo el desarrollo de *Rough and Ready Island* y analizó la construcción completa. Ahora, si analizamos un proyecto, comparamos esos impactos con lo que se analizó en ese informe de impacto ambiental. Si el nuevo proyecto se ajusta a los

parámetros de lo analizado anteriormente, el Puerto certifica lo que se denomina un apéndice a ese informe de impacto ambiental. Si el proyecto no ajusta, el Puerto realiza un informe de impacto ambiental complementario que se somete a revisión pública. Se realizan análisis ambientales para cada proyecto portuario. El Puerto no tuvo noticias de la comunidad anteriormente, pero está emocionado de poder trabajar con ellos en el futuro para obtener comentarios de la comunidad sobre proyectos específicos.

Pregunta: ¿Se publican los informes CEQA? ¿Cómo informa el Puerto a los residentes de Boggs Tract que hay algo que revisar? ¿Qué tan pronto llevará a cabo el cambio de ruta en Washington?

Respuesta del Puerto de Stockton: Los informes se publican y se archivan con el condado y el estado. Prometemos tenerlos en nuestro sitio web. El Puerto espera realizar el cambio de ruta muy pronto. Actualmente está siendo administrado por nuestro equipo de bienes raíces y puede estar completo en 2021.

Pregunta: Hay \$8 millones disponibles para esta medida. ¿Ese presupuesto cubre todo un artículo o los cinco?

Respuesta del Distrito: Eso aún no se ha decidido. El Comité puede decir en qué quieren trabajar específicamente en relación con esta medida y dónde se deben asignar los fondos. A medida que el Comité continúe discutiendo todas las medidas, refinaremos los presupuestos en consecuencia.

Pregunta: El Puerto se comprometió a publicar informes en su sitio web. Me gustaría verlos no solo publicados, sino también notados en las agendas de una reunión del Puerto para que no haya confusión sobre la posibilidad de que un director del Puerto no esté informado. El Puerto está haciendo un plan estratégico y me gustaría proponer que el consultor que ha sido contratado para preparar el plan se reúna con los miembros de la comunidad y obtenga sus puntos de vista. Esa información debe documentarse dentro del proceso de planificación estratégica.

Respuesta del Puerto de Stockton: Me pondré en contacto con usted para informarme. Es una buena idea escuchar a la comunidad sobre el plan estratégico. Es un buen momento para incorporar muchos de nuestros objetivos de reducción de emisiones en el panorama general de lo que pretendemos hacer en el Puerto.

Pregunta: ¿Puede confirmar que los límites del Puerto están donde se encuentra con la línea de seguridad y que los competidores están fuera del Puerto?

Respuesta del Puerto de Stockton: Correcto.

Actualización del Plan de Monitoreo

Chay Thao, Gerente de Programas, Distrito

Chay repasó el plan de monitoreo del aire de la comunidad y mostró el mapa. Puntos importantes de la presentación:

- El Distrito quisiera comenzar a implementar el plan de monitoreo del aire lo antes posible, lo que incluye encontrar las ubicaciones y obtener permiso para instalar el equipo, etc.

- Existe cierta flexibilidad en el plan en su borrador actual. Por ejemplo, si encontramos que hay otra ubicación que realmente necesitamos monitorear, podemos ajustar el plan según sea necesario
- El Distrito ha recibido algunos comentarios de los miembros del Comité, pero ninguna solicitud significativa para cambiar fundamentalmente el plan
- Si no hay objeciones importantes del Comité, al Distrito le gustaría seguir adelante con los esfuerzos iniciales

Pregunta: ¿Con qué frecuencia tendremos datos a los que responder?

Respuesta del Distrito: Utilizamos varios tipos de equipos con diferentes marcos de tiempo de monitoreo. La camioneta va a ubicaciones durante un par de horas o durante la noche y captura datos. El remolque y los sistemas compactos más pequeños son semiportátiles. Los plazos de seguimiento se basan en las necesidades de la comunidad. El plan es un documento dinámico y el Comité puede modificarlo y actualizarlo a medida que surjan las necesidades.

Pregunta: ¿Para qué se utilizarán exactamente esos datos? ¿Influirá en el presupuesto? Si el Comité sabe quién va a utilizar los datos y cómo ha impulsado las decisiones en el pasado, nos dará más contexto sobre por qué es importante. Según la imagen que se muestra en la pantalla, hay entre 20 y 30 sitios diferentes. El informe dice que una vez aprobado, el Distrito se comunicará con los propietarios/administradores de propiedades para configurar un módulo de prueba en su propiedad. Si el Distrito habla con los 30 propietarios, pero solo obtiene cinco de esos sitios, eso hace que el mapa se vea diferente al plan inicial. ¿Cómo nos aseguramos de que el resultado final sea similar al plan original aprobado?

Respuesta del Distrito: Los datos tienen una amplia variedad de usos. Originalmente, tenía la intención de ayudar a apoyar a la comunidad en estos temas. El Distrito necesita entender cuáles son las preocupaciones sobre las emisiones y validarlas. El objetivo es conseguir todos estos monitores de aire en todos estos lugares. Hay ciertas áreas a las que es más difícil acceder a los monitores. En ese caso, el Distrito usará la camioneta temporalmente en esa área y luego buscará otras áreas potenciales alrededor de ese sitio.

Pregunta: ¿Qué se está marcando, un contaminante o todos? ¿Todos los monitores tendrán capacidades de marcado? ¿Cuál es el cronograma cuando se activa una bandera? ¿Con qué rapidez se notificará a los residentes?

Respuesta del Distrito: Los datos se marcan por varias razones, incluso cuando el equipo se está calibrando o se está realizando el mantenimiento o cuando hay preguntas sobre la validez de los datos.

Erica preguntó al Comité si el grupo se sentiría cómodo votando sobre el plan de monitoreo del aire en la próxima reunión de noviembre. El Comité dijo que sí y el Distrito acordó agregar ese tema de votación a la próxima agenda.

Concluir/Próximos Pasos

Erica Manuel, Facilitadora, ILG

Erica preguntó al Comité cuál es la mejor manera de refinar el proceso de desarrollo del CERP en el futuro y cuál es la mejor manera de revisar el borrador de las medidas como grupo en un entorno virtual.

Comentario: Deberíamos elegir cuatro o cinco fechas en el próximo mes en medio para trabajar en las medidas

Comentario: Si alguien no puede asistir a una reunión, tal vez otro miembro del Comité pueda expresar sus preocupaciones u opiniones en ese momento.

El Distrito acordó enviar encuestas de Doodle para fechas de reuniones adicionales.

Erica reiteró al Comité que votarán sobre el plan de monitoreo del aire en la próxima reunión especial de noviembre y que el Distrito continuará refinando el proceso de revisión del CERP para garantizar que el Comité tenga tiempo suficiente para la revisión, deliberación y respuesta.

Erica agradeció a Noehmi por ser coanfitrion y señaló que Catherine será la próxima coanfitrion de la comunidad. Agradeció a los miembros de Comité y al personal del Distrito por la contribución y la reunión productiva.

Noehmi cerró la reunión y agradeció a todos por participar en discusiones difíciles pero importantes.

Recordatorios

La próxima reunión regular del Comité Directivo es el 18 de noviembre en Zoom. Todas las presentaciones, los puntos importantes de las reuniones, las transcripciones y la grabación de la reunión de Zoom se publicarán en línea.

**Consulte el audio de la reunión para repasar todos los detalles y comentarios de la reunión.*

Agenda for Stockton Community Steering Committee Meeting #10

Wednesday, November 4, 2020 – 5:00 pm - 7:00 pm

Public Participation: Join via *Facebook Live* - www.facebook.com/valleyair

Comments and questions posted on Facebook or submitted to ab617@valleyair.org during the meeting will be addressed during the meeting's public comment period.

- 5:00 p.m. Welcome, Introductions**
Hanna Stelmakhovych, Facilitator, Institute for Local Government
Ryan Hayashi, Deputy Air Pollution Control Officer, Valley Air District
Noehmi Garcia Jauregui, Community Co-host, St. George Parish School
- 5:10 p.m. Community Emission Reduction Program (CERP) Strategies**
Review draft list of CERP strategies: discussion of individual measures and work toward developing a final list of CERP strategies.
Community Steering Committee
- 6:45 p.m. Monitoring Plan Update**
Discuss the next steps for the Stockton Community Air Monitoring Plan
Chay Thao, Program Manager, Valley Air District
- 6:50 p.m. Wrap Up/Next Steps**
Additional November CSC Meeting: Proposed date of Nov 18
Hanna Stelmakhovych, Facilitator
- 6:55 p.m. Public Comment**

REMINDERS

- Additional November meeting recommended, TBD, via Zoom for CSC members and Facebook Live for public.

To request Spanish interpreting services, please contact Jaime Holt or Heather Heinks at (559) 230-6000 or AB617@valleyair.org at least 7 days prior to the meeting date.

AB 617 Stockton Community Steering Committee

November 4, 2020

Discussion Document regarding potential INCENTIVE CERP measures

VEGETATIVE BARRIERS

Incentive program for the installation of vegetative barriers (and sound walls) around/near sources of concern (Interstate 5, schools, truck routes, near Port of Stockton, rail routes, Charter Way, Boggs Tract and El Dorado). Leverage with city, county, state funds given significant scale and infrastructure costs.

Comments received prior to Oct. 31

- A >High priority in combination with physical barrier as most effective, wherever possible, especially along Interstate 5.
- R >For this to be sustainable will require some kind of maintenance trust. I think more may be necessary to involve veg barrier associated with rail routes.
- B >Vegetative barriers should also include walls at the Highway
- R >Trees and plants are much needed
- R >This is an area of high priority for the community for the long term benefits. Interstate 5 is where I would recommend.
- R >Very high priority in combination with physical barriers as most effective, wherever possible, especially along Interstate 5.
- A >High priority in combination with physical barrier as most effective, especially along Interstate 5 and crosstown freeway. Where residential homes are less than 1000 ft. away.
- Need clarity on where this would be on Charter Way since most of Charter Way is occupied by business fronts.
- G >High, Seems like several vegetation barriers could be provided for \$500,000. I am suggesting here that we consider up to 10 new barriers. I don't suggest that we spend \$5 million on these barriers. If possible, perhaps \$1 million and not more than \$3 million here. Sound walls help with noise but not air. I would suggest not funding that and merge line item 25 with this one which appear to be duplicate.
- A/R/A/A/R >Highest priority: Add more \$\$\$
- R > Very high priority for VEGETATIVE BARRIERS, not for sound walls. Vegetative barriers should dampen sound, beautify, and provide environmental benefits of cooling, absorbing pollutants, and producing oxygen for the air. Sounds walls partially dampen sound, and do little else, except to become ugly and attract graffiti. Benefits may not be completely quantifiable but the public will like this and agree with vegetative barriers and this use of money to improve the environment.
- R > incentive program for installation of vegetative barriers should be a very high priority. With a \$35 million budget, the allocation to this number one priority should be significantly higher than \$1 million, perhaps 25% of the total budget or \$8.8 million.
- R > High Priority, Work together and plan with other community groups working on this. Include an ongoing maintenance trust with the city.
- R > Highest priority: This needs to include rail lines particularly relating to sound wall for the low income neighborhoods most impacted by sound and train exhaust.
- R > There is an area of I-5 by Smith Canal that could use some new trees and around Monte Diablo. I-5 is much more needy for trees than 99

Updated Proposed Funding Amount: \$1,000,000

Units: n/a

Today's Comments

-

TREES AND URBAN GREENING

Increased urban greening and forestry to improve air quality. The goal is to identify and support efforts to increase urban greening and forestry to improve air quality and overall quality of life for residents in the community while keeping in mind water and maintenance issues. Focus areas include Charter Way, Boggs Tract and El Dorado. Leverage with city, county, state funds given significant scale and infrastructure costs.

Comments received prior to Oct. 31

- R >For this to be sustainable will require some kind of maintenance trust. I think more may be necessary to involve veg barrier associated with rail routes. Include Hazelton Ave
- B >Potential long term reductions and development of a more pleasing environment
- R >Cost can be reduced by growing trees instead of buying trees...example: from seeds like avocados and from trimmings. Pine cones are everywhere
- R >Urban greenery - much needed
- R > Very High Priority
- G > Increasing the number from 1 site up to 5. Is there any data that shows whether vegetative barriers are as effective as tree canopy? Might help reduce ongoing maintenance costs.
- A/R/A/A/R >Highest priority: Add more \$\$\$
- R > Very High Priority. To be a vibrant urban area, there must be urban greening to beautify, reduce GHG & heat, and to provide oxygen to our air. Careful and detailed analysis should quantify benefits both materially and economically.
- R > increased urban greening, should be a very high priority. The budget should be much higher than \$600,000, again perhaps 25% of the total budget or \$8.8 million.
- R > High Priority, Include an ongoing maintenance trust Also connect with CalTrans and rail for increased sound walls. For areas that don't have them along freeways and rail.
- R > Highest priority: Urban greening is necessary for our community healing:
https://www.youtube.com/watch?v=IYhuiP43lp0&feature=emb_logo, Develop conservancy organization for long term maintenance perhaps a special district?
- R > We need to identify trees that don't take mistletoe, and fit this area. Give trees to residents to plant only in front yards. If put along streets also, city must agree to care for them with add'l employee if necessary funded for first year by this.

Updated Proposed Funding Amount: \$600,000

Units: n/a

-

TRUCK ROUTES

Work with City and County to assess current truck routes (potential impact of speed bumps). CSC suggested Boggs Tract as an area of concern.

Comments received prior to Oct. 31

- R >This is the Port of Stockton's response to an inquiry that the Commissioners deemed worthy of a response: When will the Port conduct a traffic study to help with idling trucks and traffic in the residential neighborhoods related to Port operations or the operations of their leaseholders? The Port has completed several Port-wide traffic improvement projects to reduce congestion both in the Port and in adjacent areas. Over the past few years, the Port has pursued a program of improvements to facilitate a more direct connection to the West Complex from the new Crosstown Freeway ramps. The Port has recently replaced the Navy Drive Bridge and completed widening of Navy Drive to improve traffic flow, avoid neighborhood impacts, decrease idle times, and improve safety between the SR-4 Crosstown Freeway extension and the Port's West Complex. Construction of a grade separation and signalized intersection to improve traffic flow onto the West Complex is also planned. The Port has also undertaken other traffic improvements on West Washington Street to improve traffic flow, and installed signage throughout its property to instruct trucks on which routes to travel and to convey requirements for minimizing idling. In addition, traffic studies have been undertaken for specific Port-led CEQA documents on both the East and West Complexes when required per City of Stockton traffic impact assessment guidelines. The Port will continue to comply with City and San Joaquin Council of Governments requirements related to traffic management and vehicle miles traveled assessments in its role as CEQA lead agency. Recent CEQA documents prepared by the Port have included requirements for minimizing idling of trucks on terminal and use of clean trucks. These types of requirements encourage the development of truck management systems to reduce truck queuing at the gates, which has the potential for spilling over to area neighborhoods. And an FYI there is a major transportant project up for a categorical exemption - Monday 10.20.2020
- B >Very Important
- R >Very High
- R >It is an area of concern. No question about it.
- R >High Priority
- G >Would be helpful to line up our air monitoring results with this strategy. The City of Stockton will be ready and available to work with the air district or other stakeholders as needed. Any supporting information is appreciated.
- A/R/A/A/R >What is "assess" current truck routes? Is a technical study required, or can the city and county develop and implement a plan? What is the timeframe? (1 year?) CLARIFY to establish what the money is needed for. For example, could this money be used to actually add speed bumps and signs directing trucks rather than just studying? Traffic signals could be adjusted to improve traffic flow. Study should be comprehensive. Dollar amount should change based on this information.
- R > Very High Priority. Port operations can be more efficient, less polluting, and economically beneficial.
- R > Work with the city and County to assess current truck routes. I am not sure what that means. For any budget amount, there should be a specific goal of reducing truck traffic that results in direct and measurable reduction in air pollution to Boggs Tract. AB 6 1 7 funds should not be used to pay for another study as opposed to implementing steps to move more truck traffic away from the Boggs Tract neighborhood.

- R > What is "assess" current truck routes? Is a technical study required, or can the city and county develop and implement a plan? What is the timeframe? (1 year?) CLARIFY to establish what the money is needed for. For example, could this money be used to actually add speed bumps and signs directing trucks rather than just studying? Traffic signals could be adjusted to improve traffic flow. Study should be comprehensive. Targeted truck routes that are enforced will enable the community to focus appropriate mitigation measures. Please ask the county's consultant to give an update on the Boggs Tract Sustainability Plan. AECOM is contracted by San Joaquin County to develop the Boggs Tract Sustainability Plan for the areas in Boggs Tract within the County's jurisdiction.
- R > Concerned, but also worried about the Port's actions on this.

Updated Proposed Funding Amount: \$1,000,000

Units: n/a

Today's Comments

-

AIR FILTRATION IN SCHOOLS

Incentive program to install advanced air filtration systems in 33 community schools.

Comments received prior to Oct. 31

- R > This should be done with health studies to determine actual health benefits
- R > I think there should be some monitoring data to show that 33 schools are in need. What are these schools?
- B > For schools near transportation corridors
- R > Very High
- R > High Priority
- A/R/A/A/R > Clarify: Are these schools in the boundaries? Is this upgrading the system plus a supply of filters? Needs more detail on where the money goes.
- R > This program should begin as a pilot on selected campuses, carefully studied, and expanded when data justifies it.
- R > I strongly support this measure especially if it can be joined with health studies so to determine the actual health benefits of advanced air filters. There is a high incidence of childhood asthma, and it is possible that air filtration systems in the schools may help address that problem. Again it should be done in conjunction with high-quality health studies. Given a \$35 million budget, the allocation should be far more funds than \$2,640,000. Again, 25% or \$8.8 million.
- R > Highest priority. Should cover full cost for schools to transition. As well as support for ongoing maintenance. Should start this implementation as soon as approved.
- R > Clarify: Are these schools in the boundaries? Is this upgrading the system plus a supply of filters? Needs more detail on where the money goes. These schools must be identified before final budget approval and should include public and private schools and daycare facilities within the AB617 boundary.
- R > I think all schools could use this, but only those built oldest should get it first.

Updated Proposed Funding Amount: \$2,640,000

Units: 33 Schools

-

BIKE PATHS AND INFRASTRUCTURE

Work with City, County, and San Joaquin Council of Governments to assess current bike path infrastructure (including bike racks) and look for matching funding to make community more bike and walk friendly.

Comments received prior to Oct. 31

- R >Please do not let this money get sucked up with planning. You have no idea how many plans have yielded zero fruit because it is not a priority.
- B >OK
- R >Have you considered Van Buskirk Golf Course. Plenty of room, needs tree, plants, etc.
- R >If this is done which is great, it should be promoted often to encourage the community to ride a bike. Also this is south side so then it'd be something else, but we have to ensure the community's safety.
- R >Low Priority
- R >I am not in favor of electric bikes - conflicts with pedestrians and interfere with traffic flow having seen some used by Stockton residents.
- G >These are great one-time investments that serve communities for years. Just as a thought, taking this number up to 10 as we have a very large city and a significant need for zero-emission strategies. Cycling and trails is awesome.
- A/R/A/A/R > Safety first: Where is this realistic? How far out are infrastructure changes to make this safe? If several years
- R > Funding should be applied directly to construction recommended by most recent study and not used for planning!
- R > These funds should not be used solely for planning. If there is \$500,000 allocated, there should be a tangible proposal that will show significant benefit and use by residents of the AB 6 1 7 area. 500k is 1.41% of the total budget which is OK.
- R > I like the idea of focusing on Van Buskirk--it's a beautiful area. Should also connect with the city and surrounding areas and connect with other organizations working on this. Don't want SW Stockton to stay an "island".
- R > Safety first: Where is this realistic? How far out are infrastructure changes to make this safe? If several years out, money should be reduced or go to items above. Also need to assess overlap with other efforts like Transformative Climate Communities, etc. This money can be used for matching funds relating to safe routes to school, bicycle helmets, bicycle safety education, bicycle physical projects not to "assess" with another plan. In consultation with the City of Stockton and Council of Governments develop a list of projects prior to final budget approval.
- R > What has previous plans said? If previous plans have been done, it wasn't done for some reason. Why? If run out of money, then

Updated Proposed Funding Amount: \$500,000

Units: n/a

-

TRUCKS

Incentive program for heavy-duty truck replacement with zero and to a lesser extent near zero emission technology.

Comments received prior to Oct. 31

- A >Use existing funds. These trucks will likely travel well outside the boundary.
- R >Make a fixed proportional commitment say 60% zero and 40% near zero. Any money can be spent on zero infrastructure.
- B >Electric grid not supportive yet for all electric. We have some vehicles but poor charging options
- R >Very High
- R >High Priority
- G > This strategy is quite significant. I'm interested to learn how we designate the 50 trucks, and ensure they are part of the local solution.
- A/R/A/A/R > Too much \$\$\$: Should be ONLY Zero Emissions. Do NOT support "near" zero. Large operators should pay this cost or apply to other funding sources. IF incentive funding is used, it should only go to low income independent owner operators.
- R > Should be implemented at this level only with robust charging infrastructure.
- R > incentive program for heavy duty truck replacement. \$10 million is outrageous. Not one dollar of AB 617 funds should be used for this strategy. There are other programs available and issues relating to mobile source pollution arising from diesel trucks and other transportation is a responsibility of car. AB 617 community fund should not be used for this strategy, not one dollar.
- R > Very high priority. If used for trucks that are to be used in within the boundaries. Also need to incorporate more charging areas.
- R > Too much \$\$\$: Should be ONLY Zero Emissions. Do NOT support "near" zero. Large operators should pay this cost or apply to other funding sources. IF incentive funding is used, it should only go to low income independent owner operators. Additionally, this money could be spent on charging infrastructure if low income independent owner operators obtain funding for truck replacement elsewhere.

Updated Proposed Funding Amount: \$10,000,000

Units: 50 Trucks

-

CHARGING STATIONS FOR ELECTRIC VEHICLES

Incentive program for the installation of charging stations for electric vehicles in public spaces.

Comments received prior to Oct. 31

- A >Especially for electric upgrade for residents if necessary
- R >More money
- B > Important part of long term solutions
- R > High
- R > High Priority
- G > Made a modest increase to charging stations, as we likely need dozens more in the next 3-5 years.
- A/R/A/A/R > Where is VW settlement funding being spent? Fees and fines from local facilities? Other sources of money?
- R > Money should be transferred from # 18 to # 19 (this measure). Reliable and comprehensive charging is necessary for ZEVs.
- R > There should be no funding for this strategy. There other sources of funding. We should be concerned about strategies that resulted direct and material benefits to the AB 617 residence.
- R > Very high Priority. More money. Outreach to business that would install stations. Assistance with accessing incentives especially with households that receive vehicle incentives.
- R > Where is VW settlement funding being spent? Fees and fines from local facilities? Other sources of money? This should be an ongoing program as we transition from fossil fuels to electrification.
- R > Very important part of an updated community! Help low income residents with a proven need first. Also help some small businesses to make an upgrade.

Updated Proposed Funding Amount: \$375,000

Units: 15 Stations

Today's Comments

-

TRAINING FOR ELECTRIC VEHICLE MECHANICS

Incentive program for educational training for electric vehicle mechanics.

Comments received prior to Oct. 31

- R >This type of job training should be emphasized and encouraged and implemented soon.
- A >Two Mechanics training is not enough to keep up with growth in EVs, it seems cost efficient to invest more here and bring green jobs to the AB 617 community
- R >Triple at least
- B >Connect with Delta College vocational training
- R >Very High
- R > High Priority
- A/R/A/A >This should be increased.
- A/R/A/A/R >What would this money be used for? (Scholarships, hiring staff, etc.) Is it enough? A laudable goal that lacks concrete details. Add \$\$\$ to provide a foundation for this program to be comprehensive and sustainable.
- R > Electric and Zero Emission Vehicles must have trained mechanics in order to convert a critical mass of vehicles to produce quantifiable results.
- R > Very high priority. Should check on feasibility at SJDC or find the nearest opportunity to be available for potential residents of our area.
- R >What would this money be used for? (Scholarships, hiring staff, etc.) Is it enough? A laudable goal that lacks concrete details. Add \$\$\$ to provide a foundation for this program to be comprehensive and sustainable. Our community could become a training hub with an expansion of Delta College's electrical technical program. I think this money should be spent on a "graduate" stipend including tuition for Delta College electrical technical program (\$1800/mo) for the training program and a commitment to work in the community for three years
- R > High! I would give those mechanics whose business does not include electric vehicles first. Work w/Delta to offer?

Updated Proposed Funding Amount: \$150,000

Units: 10 Students

Today's Comments

-

SCHOOL BUSES

Incentive program for replacing older diesel school buses with zero or to a lesser extent near zero emission buses.

Comments received prior to Oct. 31

- A >How much are school buses still used?
- R >Less money only 7 and commitment that these 7 will be dedicated to AB617 area only
- B >School dists. Need emergency charging opportunities
- R > High
- R >Low Priority
- G >Buses are great, however, due to COVID-19 I might suggest we invest these dollars in more immediate
- A/R/A/A/R >Still wondering how many of these buses are in use in the community. Be clear on need before earmarking so much money.
- R > Nice program, but more bang for buck can be derived in other programs of heavy equipment.
- R > High priority. Are there other grants to access?
- R > Still wondering how many of these buses are in use in the community. Be clear on need before earmarking so much money. A list of the educational transportation companies and routes must be included in the final budget before approval
- R > Low priority to half as much, as they don't use busses much any more. Maybe check on disabled busses.

Updated Proposed Funding Amount: \$2,800,000

Units: 7 Buses

Today's Comments

-

LARGE CLEAN FUEL INFRASTRUCTURE

Incentives for planning and implementation of clean fuel infrastructure such as large-scale electric, hydrogen and other clean fuels.

Comments received prior to Oct. 31

- A >What is "clean fuel" here? Need to clearly define.
- R> Not quite sure again don't spend it all on planning pick a smaller footprint to plan in. Recall the goals of the TCC are not the same as the City of Stockton - I heard with my own ears.
- B >this should blended into HD.1
- R >High
- R >Need More Information
- G >In general, seems appropriate. Require additional information to assess what else can be done in this strategy
- A/R/A/A/R > What are "other" clean fuels? We need to ensure we're not incentivizing dirty forms of upstream energy, like biomass/biogas/biomethane. Difficult to support money going here unless we know exactly what it will be spent on. Only in support of funding for electric infrastructure.
- R > Program is vague and hydrogen is very expensive to develop and years away to be developed on a large scale.
- R > Large scale options are important Hydrogen could be an important option for confined businesses such as the Port.
- R > For Electric only What are "other" clean fuels? We need to ensure we're not incentivizing dirty forms of upstream energy, like biomass/biogas/biomethane. Difficult to support money going here unless we know exactly what it will be spent on. Only in support of funding for electric infrastructure. Already large facilities under construction and development to support importation of renewable diesel. The use of food crops for fuel development is not sustainable. Planning here should include partnering with the City of Stockton to update the Climate Action Plan with an assessment of progress of implementation. Particularly relating to their existing housing stock retrofit and transportation related emissions.
- R > I don't know if this is for "planning" or actually planning and doing.

Updated Proposed Funding Amount: \$1,000,000

Units: n/a

Today's Comments

-

NEW ELECTRIC VEHICLES, PLUG-IN EVs, AND HOME CHARGERS FOR RESIDENTS

Incentive program for the replacement of passenger vehicles with battery electric or plug-in electric hybrid vehicle with an additional rebate option for those residents installing a Level 2 charger in their home.

Comments received prior to Oct. 31

- A >And include assistance to facilitate homeowners in finding the rebates and being able to utilize.
- B >very important in the initial growth of electrical
- R >High
- R >Low Priority
- A >This should be increased
- G >Throwing some interest to see more local investment into this area.
- A/R/A/A > Metrics: In what timeframe? Who implements this program?
- R > Good program to encourage households to add an electric car. Plug-in is the immediate future to near-term electric car usage.
- R > High Priority. This amount should be doubled or tripled. Must include assistance to seek these incentives and how to utilize.
- R >Low Priority
- R > Metrics: In what timeframe? Who implements this program? Outreach must be targeted to residents living within the boundary of AB617.
- R > High! I would take more money for this! We need people to either purchase and install charging, or just purchase

Updated Proposed Funding Amount: \$800,000

Units: 100 Cars and Chargers

Today's Comments

-

TRAINS AND OTHER RAIL EQUIPMENT OPERATING IN THE COMMUNITY

Incentive program for replacing older diesel railcar movers, switcher locomotives and diesel locomotives primarily operating in the community with new clean-engine technology.

Comments received prior to Oct. 31

- R >too much money the port has to do some of this by regulatory decree I believe. This is really hard when we don't have the ability to hide cells
- B >opportunity to reduce rail emissions immediately
- R >High
- R >Low Priority
- G >No change
- A/R/A/A > In what timeframe? This is a lot of money - What are the estimated emission reductions?
- R > High Priority. This category is more than just the port, it includes all of the mainline railroad switching and intermodal yards that operate locally 24/7. Incentives will nudge railroads towards this technology.
- R > High priority because this will affect local air quality. But should first be using all other grant options.
- R >Very Low Priority
- R > In what timeframe? This is a lot of money - What are the estimated emission reductions?
- R > Low priority if at Port, as they may have to do it themselves.

Updated Proposed Funding Amount: \$8,000,000

Units: N/A

Today's Comments

-

TRUCKS AND OTHER HEAVY DUTY EQUIPMENT OPERATING AT THE PORT

Incentive program for heavy-duty vehicle with zero, and where zero emissions technology is not available, near zero emission technology, including Transport Refrigeration Units (TRUs), Drayage Trucks, etc. with a focus on equipment in Port.

Comments received prior to Oct. 31

- A >Only zero emission, not "near zero" Only if limited to equipment primarily used within Stockton.
- R >too much money the port has to do some of this by regulatory decree I believe. This is really hard when we don't have the ability to hide cells
- B >good opportunity
- R >High
- R >Low Priority
- G >Modest increase here.
- A/R/A/A > How many? In what timeframe? This is a lot of money - What are the estimated emission reductions? Only zero, not near zero. Large operators should pay this cost or apply to other funding sources. IF incentive funding is used, it should only go to low income independent owner operators.
- R > High Priority. The TRUs are very numerous and often operate 24/7 while sitting in rail yards, loading terminals, and ports.
- R > Important, for vehicles that will be in area >75% of time.
- R >Only Zero emission technology used primarily within Stockton
- R > How many? In what timeframe? This is a lot of money - What are the estimated emission reductions? Only zero, not near zero. Large operators should pay this cost or apply to other funding sources. IF incentive funding is used, it should only go to low income independent owner operators.
- R > Only zero emission, not "near zero" . I would like to see the Port more involved in this issue. If they really want the money.

Updated Proposed Funding Amount: \$8,000,000

Units: N/A

Today's Comments

-

REPAIR CARS TO PASS SMOG CHECK

Incentive program to host a local Tune In Tune Up event to reduce emissions from older, high polluting cars through providing an incentive for individuals to get their cars repaired to pass smog check.

Comments received prior to Oct. 31

- C >Would like to see these events allow for the replacement of vehicles newer than 1999.
- R >Would like to see these events hosting in smaller communities such as Boggs tract or Conway Homes
- A >Use existing funds
- R >More money
- R >i received \$500 for repairs so my car can pass smog repair cost was higher. Did not help. limited to certain mechanics also not good
- B >needed support for the community
- R >Isn't existing program adequate?
- R > High
- R > Low Priority
- G> Increased this since not all residents can support 100% electric.
- A/R/A/A > Metrics: How many events? What timeframe? How many cars, how many emission reductions? Existing District program. Would rather fund new approaches and immediate protections.
- R > Very High Priority. Auto use is universal, cars are often in use that are not properly tuned and are polluting. The public neglects to and/or cannot afford tune ups. Programs that provide benefits directly to the public and are beneficial & quantifiable will be popular. Increase funding and incentives.
- R > Important. Increase the amounts of incentives.
- R >Very Low Priority
- R > Mixed reviews – please provide summaries of existing programs with as much detail as possible regarding effectiveness and public reviews of the program collected.
- R > More money for this to possibly expand mechanics/program. Double?

Updated Proposed Funding Amount: \$120,000

Units: 2 Events

-

CAR SHARE PROGRAM

Incentive program to launch a car share program to help residents share clean electric cars in community.

Comments received prior to Oct. 31

- C >Housing Authority of San Joaquin is currently applying for EV car share through Clean Mobility Option grant.
- A >What does this cost cover? Wouldn't the company want to come in to get more customers?
- R >I think this a really good idea but probably transit could be harmed.
- B >OK
- R >High
- R >Low Priority
- R >Include the ability to rent a 4wd to go to winter sports opportunities
- A/R/A/A > Still not clear what this money is going toward or when emission reductions are likely to result. Hard to assess
- R > Medium Priority. Car share programs are useful and feel good. Ultimately they must, however, be profitable on their own.
- R > Interesting. An update on programs that are already in place, how it works. (Interesting idea to offer for specialty outings such as 4W drive.) And would it be strictly for residents in the area?
- R >Very Low Priority
- R > Still not clear what this money is going toward or when emission reductions are likely to result. Hard to assess the value. Five neighborhood car pilot study to gauge impact on transit, trip reductions, and community benefits including sustainable funding sources to expand the program if successful.
- R > I think the vehicles should be a truck, as everyone needs a truck at some time or another and it may reach more people that way. Very High priority

Updated Proposed Funding Amount: \$1,000,000

Units: Additional Cars and Chargers

-

REPLACE COMMERCIAL LAWN CARE EQUIPMENT

Incentive program for the replacement of commercial lawn and garden equipment.

Comments received prior to Oct. 31

- R >How do we determine if to be used widely within the boundaries.
- A >Use existing funds. No guarantee these stay within the boundary.
- B >OK
- R > High
- R >Very Low Priority
- G >Took unit count up on this as well.
- A/R/A/A > Why more funding for commercial replacement? Wouldn't replacement for residents be more likely to benefit the area? Shift funds to community based rather than commercial. For commercial, focus should be on small, locally owned businesses.
- R > Very High Priority. Will reduce pollution directly in residential areas. Independent contractors may convert to electric equipment with incentives.
- R > Important if the machinery is used >75% within the boundaries.
- R >Wouldn't replacement for residents be more likely to benefit the area? Shift funds to community based rather than commercial.
- R >Why more funding for commercial replacement? Wouldn't replacement for residents be more likely to benefit the area? Shift funds to community based rather than commercial. For commercial, focus should be on small, locally owned businesses. This must be for ELECTRIC only.
- R > Very High Priority! I would like to know how much each type are and how much does the resident pay or is it based on need/income?

Updated Proposed Funding Amount: \$100,000 Units: 5 Large Commercial Devices

Today's Comments

-

REPLACE HOME LAWN CARE EQUIPMENT

Incentive program for the replacement of residential lawn and garden equipment.

Comments received prior to Oct. 31

- R >Would like to see this widely introduced.
- A >Only for people who live in the boundary. Not a high priority.
- R >High
- B >OK
- R >replacement to electric? Residents already have high electric bills
- R >Low Priority
- G >Took this up some for units/distribution. Seems like a great local solution.
- A/R/A/A > flip allocations so residents get most of the funding; commercial likely goes outside the community
- R > As with fireplace conversions, many people will resent mandates, will not convert, and may provide loud public resistance.
- R > High importance. Education important. Need to investigate options if would create high electric bills. We haven't talked about assistance with rooftop solar. That might be a good option for residences.
- R >Low Priority
- R >flip allocations so residents get most of the funding; commercial likely goes outside the community
- R > Same comment as above but add: Extremely High Priority add more money to this!!

Updated Proposed Funding Amount: \$12,500

Units: 50 Home Units

Today's Comments

-

MARINE EXHAUST

Incentive program to install marine exhaust intake bonnet emission control technology.

Comments received prior to Oct. 31

- A/R/A/A > Not in support of incentives for the port. They should pay for clean up. Reallocate money elsewhere.
- R > Good to reduce stationary pollution source.
- R > is this something required by regulation? If so, the Port should be covering.
- R >Reallocate money elsewhere
- R > Not in support of incentives for the port. They should pay for clean-up. Reallocate money elsewhere. Partner funds for feasibility study that assesses emission reduction and ability to implement.

Updated Proposed Funding Amount: \$1,000,000

Units: Unknown

Today's Comments

-

AIR FILTRATION IN HOMES

Incentive program to install advanced air filtration systems in homes within the community.

Comments received prior to Oct. 31

- A >Please ADD based on estimates of houses in the highest polluting zones.
- A >Need funding that immediately protects residents in the danger zones closest to major polluting sources.
- R >Very High
- A/R/A/A/R > High priority: Increase funding. Use fines from polluters in the area to create a fund to support long term. Can someone use GIS to analyze how many homes and sensitive sites are within danger zones? Or what is the unit allocation estimated from? Could use some data analysis.
- R > Good to begin project for Disadvantaged Communities.
- R > air filtration for homes may be considered as with the strategy for advanced air filtration systems for schools. Again this should be done in conjunction with proper health studies, but if we indeed have a \$35 million budget, then perhaps we should allocate 20% or \$7 million to this strategy since it has the prospect of possibly reducing the incidence of childhood asthma.
- R > Very important. Might consider more money. Filtration as well as air purifier.
- R >High priority: Increase funding. Use fines from polluters in the area to create a fund to support long term. Can someone use GIS to analyze how many homes and sensitive sites are within danger zones? Or what is the unit allocation estimated from? Could use some data analysis. Clarify what constitutes electrification – replacing natural gas appliances, how this incentive program will work with existing PGE and Energy Commission programs.
- R > Add more \$ to this!! VERY IMPORTANT! Determined by income and need! Especially in area of need!

Updated Proposed Funding Amount: \$1,000,000

Units: Unknown

Today's Comments

-

HOME WEATHERIZATION AND ELECTRIFICATION

IAQ.1 Incentive program to bring a partner to expand home weatherization and electrification within the community.

Comments received prior to Oct. 31

- A/R/A/A/R > Highest priority: Add more \$\$\$ Focus of funding should be protecting and benefitting people living in the community. Ask entities like CA Public Utilities Commission and groups like GRID Alternatives to support. Use fines from polluters in the area to create a fund to support long term.
- R > Good to begin project for Disadvantaged Communities.
- R > Home weatherization and electrification probably should not be an AB 617 project. PG&E has a low income energy efficiency program (Energy Savings Assistance Program) that would provide these types of benefits.
- R > High priority. connect with other agencies working on this. And again, more focus on solar rooftops. In fact, what would 100% rooftop solar look like in these charts? And would be good assistance for residents.
- R > Clarify what constitutes electrification – replacing natural gas appliances, how this incentive program will work with existing PGE and Energy Commission programs.
- R > Add more \$ to this!! VERY IMPORTANT! Determined by income and need!

Updated Proposed Funding Amount: \$1,000,000

Units: Unknown

Today's Comments

AB 617 STOCKTON FUNDING

AB 617 Funded by Greenhouse Gas Reduction Funds provided through CARB

Incentive Funding \$35-42 Million (Stockton Only)	2020 Implementation Funding \$12 Million (Valley-wide)
Trees and Urban Greening	Meeting interpretation, facilitation, stipends, other meeting costs
Mobile Source Reductions	Enforcement
School and Home Filtration	Outreach and Education
Bike Paths	Regulatory Work
Electric Vehicle Projects	Working with City, County, CARB, Schools, Port, COG and other Partners
Projects at Rail Yard	Air Monitoring
Other Grant Projects	
Truck Reroute Study	

Meeting Highlights*

AB 617 Stockton Community Steering Committee Meeting #9

October 20, 2020 | 5:00 pm - 7:00 pm

Virtual Zoom Meeting

Action items for the Stockton Community Steering Committee (CSC):

- Send any comments on draft CERP measures to the District by Oct. 30
- Submit any recommendations about voting on the CERP measures to the Air District

Action items for San Joaquin Valley Air Pollution Control District (District):

- Invite the San Joaquin Regional Rail Commission to present again at a future meeting
- Make sure Jeff Wingfield receives a transcript of the meeting chat so he can answer questions related to the port
- Re-send both draft CERP spreadsheets to CSC for additional feedback

Welcome and Introductions

Erica Manuel, Facilitator and Executive Director, Institute for Local Government (ILG)

Ryan Hayashi, Deputy Air Pollution Control Officer, the District

Mary Elizabeth, Community Co-host, Stockton Resident, Sierra Club

Erica welcomed the Stockton CSC participants to the additional October meeting, went over Zoom etiquette and gave an overview of the agenda.

Ryan thanked the CSC and acknowledged the additional work and commitment of the CSC. Ryan introduced Mary Elizabeth for community co-host remarks.

Delta-Sierra Group's Conservation Work

Mary Elizabeth, Stockton Resident, Sierra Club

Mary thanked the CSC and explained her role in the Delta-Sierra Group. She presented on the group's conservation work and how it affects the City of Stockton, including housing, the Port of Stockton, and algal blooms. Presentation highlights include:

- Delta-Sierra Group works in the San Joaquin County around water and land conservation, air, transportation and housing as it relates to the land use
- Some of the Delta-Sierra work includes groundwater sustainability planning, integrated regional water management planning, etc.; members serve on a variety of local and regional advisory groups, committees, and commissions
- Delta-Sierra Group has been reaching out to the Port of Stockton about toxic coal dust concerns, increased traffic and coal shipments, truck idling, projects adoption and public participation processes, as well as commenting on EIR and other public documents
- Sierra Club emphasizes member education about racial justice

Port of Stockton Discussion

Jeff Wingfield, Environmental and Public Affairs Director, Port of Stockton

Jeff presented on the Port of Stockton's air quality monitoring and emission reduction projects. Presentation highlights include:

- The Port is a state agency that distributes mainly non-containerized construction materials and agricultural products and generates its revenue via leases and shipments
- The Port shares CARB's concerns about impacts on neighboring communities and strives to go beyond regulatory requirements to minimize environmental impacts
- Some of the current Port projects include development of a port-wide emissions inventory, retrofitting and replacing current cargo handling equipment with zero and near-zero equipment and charging infrastructure, and exploring hydrogen powered technology options
- The Port will engage an internal port tenants group to explore additional emission reduction strategies, funding and partnership opportunities
- The Port will also form an EJ working group to receive feedback about projects, understand local concerns, and identify alternative solutions
- The Port is seeking more community input and engagement in the future and welcomes participation from the CSC and other members of the community

In the interest of time, Erica Manuel directed CSC members to ask questions in the chat box and asked Jeff to stay online to answer all questions, if possible, in the chat.

Question: How often does the Port provide maintenance on the water hyacinth?

Port Response: Water hyacinth are the responsibility of the Department of Boating and Waterways; they typically maintain it by spraying (and doing mechanical harvesting when conditions worsen). While the Port can get involved upon request, it has to operate under the existing Department of Boating and Waterways' permits.

Stockton Diamond Grade Separation Project

Rene Gutierrez, Associate Planner, San Joaquin Regional Rail Commission

Rene gave an update on the Stockton diamond grade separation. Presentation highlights:

- The project EIR is currently underway
- The Commission will release the draft EIR in Winter 2021
- The project will separate two rail lines, the most congested rail bottleneck in California
- Estimated to cost \$230 million

Update on CARB Regulation Timelines

Skott Wall, Community Liaison, Office of Community Air Protection, CARB

Skott gave an overview of CARB regulation timelines. Presentation highlights include:

- There is a five year timeline for implementation of AB 617 (2021-2025)

- The time frame should allow significant time to implement all of the measures, develop annual reports each year, and make adjustments as priorities change
- There is a five year lookback to make sure the emissions reductions for the measures are long-lasting

Community Emissions Reduction Program (CERP) Strategies

Jaime Holt, Chief Communications Officer, the District

Jaime thanked CSC members for responding to the CERP worksheets. She presented on the input received:

- District has begun to update the potential strategies and incorporate CSC comments into the CERP worksheets
- The highest priority based on the CSC ranking and feedback is vegetative barriers and urban greening; the Air District has increased the recommended dollar amount for that measure to reflect the high priority
- Truck routes are another high priority

Comment: We should research any existing programs with funding for heavy-duty vehicles, so we are not using AB 617 funding unnecessarily. I agree with the air filtration for schools. The buses do not travel as far, so there is not a huge need.

District Response: We will explore that. There are definitely existing programs, but they are typically over-subscribed.

Question: Aren't the buses privately owned?

District Response: The school buses are owned by Stockton Unified School District.

Question: Was this list of initiatives developed based on the CARB brainstorming ideas and community recommendations?

District Response: The strategies come from comments the District has received from the CSC, but they also include recommendations from both CARB and the District based on emissions reductions, and measures that the District has seen work well in other communities.

Follow-up comment: In terms of the enforcement measures, my decision to give call-outs or support certain measures came from the unintended consequences to the demographics that this population serves. My approach was to focus on industrial sources.

District Response: I agree and the District heard that.

Question: During the implementation phase, will the District try to identify a single point person at the District for certain communities?

District Response:: Right now, the communities have several point people. If the District gets another community, there are discussions taking place about how best to divide that workload for maximum impact and support.

Question: Regarding enforcement, it was said the District and Port of Stockton would work together. Why would that discussion only take place between those two?

District Response:: In the strategies, it does include specific CARB enforcement of measures related to regulations about equipment and ships. CARB has committed to enforcing those at the port as well.

Wrap Up/Next Steps

Erica Manuel, Facilitator and Executive Director, ILG

Erica thanked the CSC members and thanked Mary Elizabeth for volunteering her time and presenting. Mary Elizabeth thanked the Air District and closed out the meeting.

Reminders

Next regularly scheduled CSC meeting is Nov. 4 via Zoom. All the presentations, meetings highlights, transcripts and the Zoom meeting recording will be posted online.

**Refer to meeting audio to review the full details and comments from the meeting.*

Public Comment

No public comment.

Agenda for Stockton Community Steering Committee Meeting #9

Tuesday, October 20, 2020 – 5:00 pm - 7:00 pm

Public Participation: Join via *Facebook Live* - www.facebook.com/valleyair

Comments and questions posted on Facebook or submitted to ab617@valleyair.org during the meeting will be addressed during the meeting's public comment period.

- 5:00 p.m. Welcome, Introductions**
Hanna Stelmakhovych, Facilitator, Institute for Local Government
Ryan Hayashi, Deputy Air Pollution Control Officer, Valley Air District
Mary Elizabeth, Community Co-host, Stockton Resident, Sierra Club
- 5:15 p.m. Delta-Sierra Group's Conservation Work**
Presentation: Delta-Sierra Group's conservation work being done in the Stockton community
Mary Elizabeth, Stockton Resident, Sierra Club
- 5:30 p.m. Port of Stockton Discussion**
Presentation: Port of Stockton Overview
Jeff Wingfield, Port of Stockton
- 5:50 p.m. Stockton Diamond Grade Separation Project**
TBD
- 5:55 p.m. Update on CARB Regulation Timelines**
CARB Staff
- 6:00 p.m. Community Emission Reduction Program (CERP) Strategies**
Review draft list of CERP strategies: continue discussion of measures in more detail and further refine draft list of measures
Valley Air District Staff
- 6:50 p.m. Wrap Up/Next Steps**
Hanna Stelmakhovych, Facilitator
- 6:55 p.m. Public Comment**

REMINDERS

- Next meeting Nov. 4, 2020, via Zoom for CSC members and Facebook Live for public.

To request Spanish interpreting services, please contact Jaime Holt or Heather Heinks at (559) 230-6000 or AB617@valleyair.org at least 7 days prior to the meeting date.

[Notice of Preparation Comment Letter DSG \(Amend\)](#)

Delta-Sierra Group Port of Stockton Work

I learned about the Port as a small child from my Grandfather who was a retired longshoreman. My environmental awakening occurred while working as a quality control chemist for McCormack and Baxter Creosoting Company located on Washington Ave. I switched careers and became a REHS working on environmental cleanup sites.

Back in Stockton, I was wondering what was going on but no Port minutes. Then the DSG, Mother Lode Chapter, Redwood Chapter, and Bay Chapter began talks about a Coal Organizer first Terilynn Chen and now Jacob Klein. My commitment to the cause was to go to each meeting and provide comments.

Delta-Sierra Group Port of Stockton COAL Work

Available information is updated when as available on the [DSG Port of Stockton Overview and Historic Documents](#) webpage. [Toxic Coal Dust](#) is one of our concerns.

Up until 2011 shipments of coal from the port were negligible then quickly maxed in 2014 was the maximum shipped- 2.3 million tons.

<u>Commodity Tonnages</u>	<u>2019</u>	<u>2018</u>
---------------------------	-------------	-------------

Low Sulfur Coal dry bulk	1,584,111	1,636,116
--------------------------	-----------	-----------

This year's Port report did not separate Coal from other bulk commodities.

The Coal stored and shipped out of the Port of Stockton comes from Utah mines. In 2011, when rail provider Union Pacific and Metro Ports completed a \$1.2 million rail line expansion into the port doubling the coal and iron ore capacity from 3 to 6 trains a week w/unknown environmental analysis.

Delta-Sierra Group NuStar Marine Terminal Approved by Port Commissioners April 2020.

[Delta Sierra Group DEIR NuStar Comment Letter Jan 2020](#)

Table 1
Expected Maximum Proposed Project Throughput Compared to Existing Levels (Annual)

	Baseline (2018)		Project Year 10 (Expected Maximum)	
	Mode (annual moves)	Tons of Product	Mode (annual moves)	Tons of Product
Truck ¹	16,730	459,484	42,000	1,100,000
Rail Cars	534	56,057	4,700	500,000
Rail Trips ²	27	--	300	--
Ships Calls	20	287,907	50	1,700,000
Barges Calls	0	0	40	200,000
Total Tons	--	803,448	--	3,500,000

Notes:

1. Truck calls are expressed in one-way moves.
2. Assumes an average of 20 cars per train
3. Current throughput permitted by the SJVAPCD is 2,628,000 tons per day receiving into and 6,000 tons per day shipping out of the terminal.

The NuStar final EIR was not made available until after the Port of Stockton Commissioners adopted and only upon release of public information request.

Delta-Sierra Group Lehigh Cement

According to Port staff the Lehigh Health Risk Assessment is to be underway soon as part of development of the Lehigh Southwest Stockton Terminal Project Final EIR and to be complete in early 2021.

[DSG Comments Lehigh Cement Initial Study/Notice of Preparation November 2019](#)

[DSG Comments Lehigh Cement Draft Environmental Impact Report](#)

[DSG Attorney Letter](#)

Delta-Sierra Group Cottonseed Stockpile Comments

According to Port Staff: the CVAG Bulk Whole Cottonseed Transload Facility Final IS/MND is anticipated to be completed in late 2020.

How has this facility operated for a year on property under the Port of Stockton's jurisdiction, without an SJVAPCD permit or Port of Stockton lease and stormwater management approval?

Air Pollution – Harmful Algal Blooms

[Facts about Cyanobacterial Harmful Algal Blooms for Poison Center Professionals: CDC;](#) [Algae Blooms Affect Air Quality;](#)
[Research Shows Harmful Algal Blooms Can Become Airborne](#)

Blue green algae are a group of bacterial organisms that are among the oldest (Archaeobacteria) on Earth. They can live in freshwater, salt water, or in mixed “brackish” water. Cyanobacteria can be many colors including green, red, orange, or brown.

Cyanobacteria, can multiply quickly with high nutrient levels, particularly when the water is warm and the weather and flows are calm. This population explosion causes “blooms” of blue-green algae that turn the water green.

[Increased aeration can reduce the blooms](#)

For more information on how to protect yourself and your family from algal blooms, [visit Restore the Delta’s website.](#)

Sierra Club Acknowledgment
that our Founder John Muir was

Zip code is the most powerful indicator for health and all zip codes are not created equal. Clean Air for ALL!

Presentation to AB617 Working Group

Jeffrey D. Wingfield
Director of Environmental & Public Affairs

Background

The Port's Function & Focus

- A public agency, an ideal position for domestic and international distribution
- Created by the State to create jobs and economic activity
- Situated in the hub of four major freeways, two transcontinental railroads, an international waterway and a regional airport
- We are not POLA, POLB, or POAK

POS and AB617 Working Group

Environmental Justice Initiatives at POS

- Sharing CARB's concern about neighboring communities
- POS striving to go beyond regulatory requirements
 - Identifying and reduce environmental impacts from Port operations
 - Assessing and disclosing environmental impacts through the CEQA process
 - Completing health risk assessments (HRAs) as part of CEQA processes
 - Promoting community engagement and education
 - Providing economic opportunities
 - Additional actions in progress
- Working with San Joaquin Valley Air Pollution Control District (SJVAPCD), U.S. Environmental Protection Agency, City of Stockton, and the community

Ideas In Action at POS

Past, Current, & Planned Projects

- **Air Quality Monitoring and Emissions Reductions**
 - Developing plans and strategies to reduce development emissions
 - Conducting a Port-wide criteria pollutant and greenhouse gas emission inventory (Starcrest Consulting, LLC and Technical Working Group)
 - Ensuring new tenant development projects comply with environmental sustainability goals

Ideas In Action at POS

Past, Current, & Planned Projects

- **Air Quality Monitoring and Emissions Reductions (cont.)**
 - Retrofitting existing cargo handling equipment with lower emissions engines for improved air quality. Projects with direct emissions reductions:
 - Replacing gasoline powered trucks with zero-emission electric vehicles; adding 30+ EV charging stations
 - Acquiring zero-emission, multi-use DANNAR mobile power sources
 - Awarded grant funding to receive 34 forklifts from XL Lifts (zero- and near-zero-emissions forklifts)
 - Making annual improvements across applicable resource categories through the Green Marine Environmental Program

Ideas In Action at POS (cont.)

Past, Current, & Planned Projects

- **Community Outreach Initiatives**
 - Two key community engagement groups
 - **Group 1:** Formed to improve communication, identify information gaps, facilitate opportunities for collaboration and problem solving, and define key strategies to reduce emissions and improve air quality
 - **Group 2:** Formed to amplify local voices, create a communication channel between concerned citizens, community groups, environmental justice organizations
 - Rebuilding website and outward-facing communications
 - Incorporated submission forms for comments, questions, and complaints

Ideas In Action at POS (cont.)

Past, Current, & Planned Projects

- **Green Marine Program and Environmental Programs**

Green Marine Program

- **Annual incremental improvements & achievements in 7 categories:**

Aquatic Invasive Species, Greenhouse Gases and Air Pollutants, Spill Prevention, Dry Bulk Handling, Community Impacts, Environmental Leadership, and Waste Management

Incorporation of Environmental Programs

- **TEAM (tenant group), EJ working group,**

Delta Tours, Shoreline Cleanups, Boggs Tract Community Farm

What's Next?

Upcoming Initiatives

- Open lines of communication
- Sustainability Report or Enviro Annual Report
- Tree initiatives
- Quarterly newsletters and updates

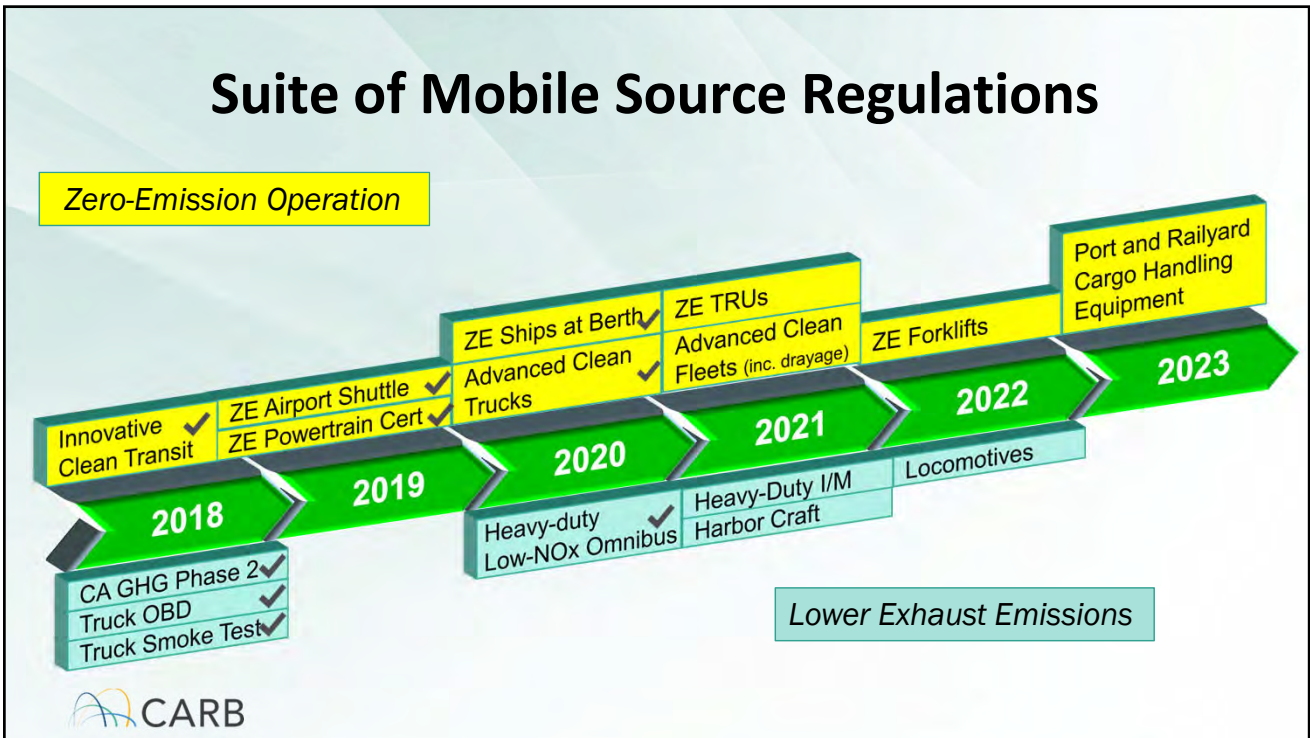

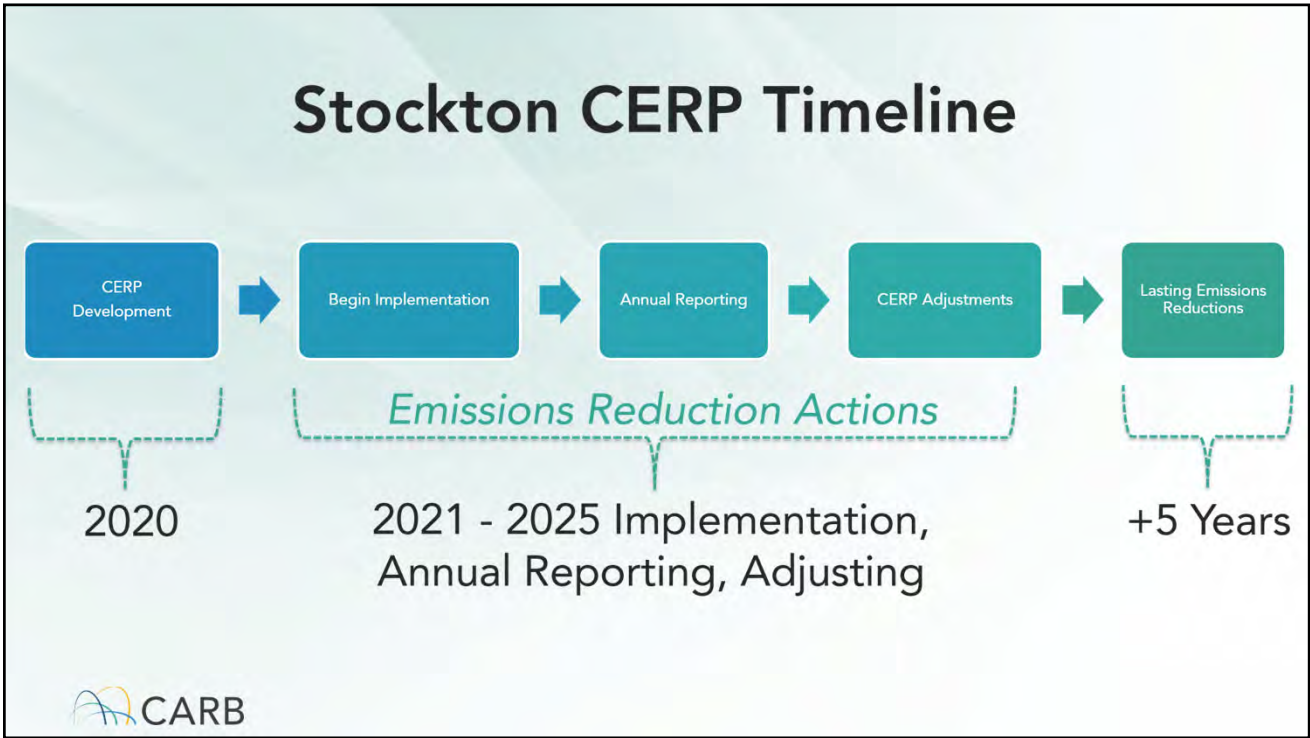

THANK YOU!

Jeffrey D. Wingfield

Director, Environmental & Public Affairs

jwingfield@stocktonport.com

Innovative Clean Transit

- Approved 2018
- Goal for full ZE fleet transition by 2040
- Percentage of transit agency new bus purchases must be ZE
 - 25% starting 2023
 - 50% starting 2026
 - 100% starting 2029
- Delayed start for small fleets
- Built in exemptions and credit for innovative mobility

ZE Airport Shuttle Buses

- Approved 2019
- Requires full ZE fleet transition by 2035
- Public and private airport shuttle bus fleets
- No backsliding from ZEVs starting 2023
- ZEV milestone requirements
 - 33% of fleet by 2027
 - 66% of fleet by 2031
 - 100% of fleet by 2035

Advanced Clean Trucks

- Approved June 2020
- Percent of manufacturer sales in California must be ZEV
 - Partial credit for plug-in hybrids (NZEV)

Model Year (MY)	Class 2b-3	Class 4-8	Class 7-8 Tractors
2024	5%	9%	5%
2025	7%	11%	7%
2026	10%	13%	10%
2027	15%	20%	15%
2028	20%	30%	20%
2029	25%	40%	25%
2030	30%	50%	30%
2031	35%	55%	35%
2032	40%	60%	40%
2033	45%	65%	40%
2034	50%	70%	40%
2035+	55%	75%	40%

California Vehicle Populations

Source: EMFAC2017, 2020 Calendar Year

Advanced Clean Fleets

- Zero-emission fleet rule
- Support transition to zero-emission where feasible
 - 2035 – Drayage, public fleets, last mile delivery
 - 2040 – Refuse, buses, utility fleets (may include NZEVs)
 - 2045 – For all other trucks and buses where feasible
- Rule recommendation to Board in December 2021
 - Implementation starts 2023

Commercially Available ZEVs

Commercial Vehicles Today	2B-3 (8,501 – 14,000lbs.)	4-5 (14,001 – 19,500lbs.)	6-7 (19,501 – 33,000lbs.)	8 (33,000 lbs. and over)

Note: Excludes transit buses and all models not shown. Updated Sept. 2020.

Meeting Highlights*

AB 617 Stockton Community Steering Committee Meeting #8

October 7, 2020 | 5:00 pm - 7:00 pm

Virtual Zoom Meeting

Action items for the Stockton Community Steering Committee (CSC):

- Provide feedback on the incentive and implementation measures worksheets by Friday, Oct. 16
- Contact the Air District if interested in joining the leadership group for the CSC, which helps plan meetings and discuss progress
- Reply to Air District email asking whether CSC members would like their email addresses shared publicly on the website

Action items for San Joaquin Valley Air Pollution Control District (District):

- Email two worksheets (incentives and implementation) after the meeting
- Send out a Doodle poll with dates for an additional October CSC meeting to go over incentive and implementation measures
- Add time to a future meeting agenda so CARB can present on upcoming legislation
- Provide more details about incentive measures costs and budgets at a future CSC meeting
- Provide a draft of the Stockton Community Air Monitoring Plan
- Email all CSC members about the leadership and logistics planning meeting
- Explore possibility of adding agenda items that include presentations from the city, county, COG and Port of Stockton

Welcome and Introductions

Hanna Stelmakhovych, Facilitator, Institute for Local Government (ILG)

Ryan Hayashi, Deputy Air Pollution Control Officer, District

Regina Griffin, Community Co-host

Hanna welcomed the Stockton CSC participants, went over Zoom etiquette and thanked everyone for attending. She gave an overview of the agenda and thanked the community co-host for her volunteer service.

Hanna then turned it over to Ryan Hayashi for a host welcome on behalf of the District and Regina Griffin for community co-host remarks.

Transformative Climate Communities

Grant Kirkpatrick, Fellow, Stockton City Manager's Office

Grant presented on the Transformative Climate Communities (TCC) work in Stockton. Presentation highlights:

- TCC supports community-led development and infrastructure projects to achieve environmental, health, and economic benefits in California’s most disadvantaged communities
- Stockton’s project area is five square miles
- The three overall program objectives are:
 - GHG reduction
 - Public health and environmental benefits, and
 - Economic opportunity and shared prosperity
- Stockton came up with a vision of transformation that explains how it will achieve all three of the program objectives

Question: Will the proposed strategies be incorporated into the Stockton General Plan Update so there is long-term implementation?

City of Stockton Response: We aren’t sure which strategies will be incorporated in the General Plan; they broadly speak to climate change, so there may be some similar goals in mind.

Question: What is the weighting for each of the objectives? Is it an even split? What is the time horizon for each?

City of Stockton Response: The scoring was based on different criteria. GHG was 30 points out of 200. Stockton originally applied for a 5-year grant period, but we are now looking at a 2.5-year timeline for implementation. The benefits will continue to be measured for one year after that.

Question: Could TCC projects and our AB 617 projects overlap?

City of Stockton Response: There are opportunities to make sure we are being mindful of where TCC is going and where AB 617 is going. There is a lot happening in the city around climate, so we want to make sure those efforts are coordinated.

Question: Do the three objectives determine what kind of projects can be bid on?

City of Stockton Response: Those are the objectives of the program overall. It is not necessarily that projects descend directly from there, as much as projects are supposed to show GHG reduction. For example, if we switch to a green source of energy, reducing those GHG emissions also has a public health benefit.

Pollution Concerns and Urban Greening

Regina Griffin, Community Co-host

Regina presented on the air pollution concerns and urban greening efforts in Stockton.

Presentation highlights:

- In 2012, Stockton cut its Tree Maintenance Program to maintain budget spending.
- To date, it has been difficult for Stockton to acquire sustainable funding for tree maintenance and tree planting
- South Stockton has been hit incredibly hard; one way to help the area recover is community gardens

- Stockton’s Urban Agriculture Ordinance was passed in September 2020 and allows residents to have ducks, chickens, hives for bee keeping, and allows residents to sell their own produce from their private food garden

Community Emissions Reduction Program (CERP) Strategies

Ryan Hayashi, Deputy Air Pollution Control Officer, District

Todd DeYoung, Director of Grants and Incentives, District

Jaime Holt, Chief Communications Officer, District

Ryan thanked Stockton CSC members for responding to the CERP prioritization surveys. CSC responses were used to develop the worksheets for the CSC to develop the CERP. Next steps in the CERP development process are as follows:

- District will use the survey responses to identify the measures the CSC feels most strongly about and will add more detail to those measures
- District will add more descriptions to each measure and identify the agencies and organizations necessary to partner with
- District will present the draft CERP to the CSC before taking it to the governing board for adoption
- There will be opportunity for CSC input until the CERP is taken to the District’s Governing Board for approval
- The CSC has expressed interest in knowing what measures may cost; District will provide that information
- District has begun having conversations with agencies that may play some role in funding, and has also looked at how much budget may be available to fund incentive measures
- District is developing a draft budget for the CERP and will share with the CSC at an upcoming meeting

Todd outlined the CERP measure development process. Presentation highlights:

- Funding must be liquidated by June 2025
- The Stockton CERP should include incentive measures will address community members sources of concern; many of which will be unique to Stockton do to their unique circumstances and challenges, which differ from the AB 617 communities in the Valley
- District can prioritize these measures based on multiple factors, like cost-effectiveness (amount of emission reductions vs cost), exposure reductions, availability of potential projects, willingness of partners to participate and provide cost-share, timeframe for project completion, and overall project cost
- The overall allocation of funding for incentive measures is dependent on CSC evaluation and prioritization, demonstrated air quality, District and CARB board approval, identification of sufficient projects, and expected timeframe for completion.
- Based on surveys, Stockton CSC has already begun prioritizing several measures for inclusion in the CERP, like heavy duty mobile sources, transportation sources, Port of Stockton sources, and community-level sources

- District has developed a worksheet table with measures listed by committee ranking, number of units and the total necessary funding to implement it; this worksheet will be the starting document for the CERP

Jaime presented on the CERP implementation strategies worksheets. Presentation highlights:

- Non-incentive based strategies do not impact the incentive-based strategy funding amount
- District is giving the CSC two air quality improvement strategy worksheets; one a list of incentive based strategies and the other focused on non-incentive based strategies
- Both worksheets list the strategies in order of the priority provided by the CSC
- The cost-effectiveness column is not quantifiable yet
- Once District receives CSC feedback on the spreadsheets, the CSC will be given an updated document reflecting all suggestions
- District is proposing to host another official CSC meeting near the end of October to give the CSC more opportunity to refine these worksheets in a group setting
- CSC members should provide written feedback on the first draft of worksheets by Friday, Oct. 16 if they want their input reflected in the worksheet drafts discussed at the 2nd CSC meeting in October.

Question: If the CSC needs more time to look over the CERP, can we extend the deadline for submission?

CARB Response: There is a statutory deadline in December, but if District and the CSC determine that they need some additional flexibility, CARB can certainly discuss options. This Stockton CERP is actually much closer to being complete than the CSC may realize. If you can make the deadline, that would be great. If not, we have options.

District Response: The CSC should know that the CERP that gets taken to the District Governing Board is not the last opportunity this CSC has to provide feedback on the CERP. We are going to have five years to refine these strategies during the implementation phase. The goal is to ensure that the CSC is satisfied with the CERP. The document can be changed and adjusted within reason to reflect CSC priorities and goals.

Air Monitoring Plan Update

Jon Klassen, Director of Strategies and Incentives, District

Jon provided an update on Stockton air monitoring. Presentation highlights:

- Throughout the summer, District received great feedback about where the CSC thinks monitoring should happen and what pollutants should be measured
- Based on this feedback, staff drafted the Stockton Community Air Monitoring Plan, which included a map, developed based on the guidance provided by CSC members regarding locations and sources of concern. Based on this information, the District developed the map that shows approximate locations where air monitoring is proposed to take place. The map also included the type of air monitoring equipment recommended to

be used and the type of pollutants will be monitored, which were based on the sources of concern identified by the CSC members

- District will share this draft to get CSC feedback and comments, then will work with the CSC to identify specific locations to look to get lease agreements set up, so the program can be deployed quickly

Question: Is this CSC going to last one year or two years? Will there be other leadership committees?

District Response: The schedule is determined by the CSC, but we anticipate at least 1-2 years of meetings after the CERP is approved. The leadership team is an ad hoc group, so anyone can participate at any time. It is a small subsection of the full CSC made up of people willing to meet and help set the agenda and chat about meeting logistics.

District Response: District is still meeting with Year One communities monthly in Fresno and Shafter, whereas some Year One steering committees in other air districts across the state have transitioned to quarterly meetings. Once the CERP is approved by the District's Governing Board, we can discuss the frequency of meetings.

Wrap Up/Next Steps

Hanna Stelmakhovych, Facilitator, ILG

Erica Manuel, CEO & Executive Director of ILG, presented major takeaways from the CERP measures discussion.

- District will share the two worksheets with the CSC members later this week. They will email it or mail the Excel spreadsheet, or provide a PDF if Excel is not preferred
- The worksheets can be edited; CSC members can add notes, change amounts, etc. The budget will change automatically when you change quantities
- These worksheets reflect the current ranking of the measures based on the committee feedback as indicated by the survey responses from last month
- There will be an additional working meeting in late October where the CSC can talk as a group, share ideas, and explain reasoning for your prioritization
- District will send out a Doodle poll to determine a date that works for most CSC members.
- There is still PLENTY OF TIME TO WORK ON THE CERP!
- The goal is to make sure the CSC feels comfortable with the approach and the progress
- If additional time is needed to complete the CERP beyond the deadline, CARB may be able to help with an extension

Erica then reminded residents about the stipend program and encouraged eligible CSC members to sign up for the stipend program.

Hanna noted that Catherine and Noehmi volunteered to be future community co-hosts. Hanna thanked the CSC members and District staff and adjourned the meeting.

Reminders

Next regularly scheduled CSC meeting is Nov. 4 via Zoom, though a special meeting will be scheduled in late October. All the presentations, meetings highlights, transcripts and the Zoom meeting recording will be posted online.

**Refer to meeting audio to review the full details and comments from the meeting.*

Agenda for Stockton Community Steering Committee Meeting #8

Wednesday, October 7, 2020 – 5:00 pm - 7:00 pm

Public Participation: Join via *Facebook Live* - www.facebook.com/valleyair

Comments and questions posted on Facebook or submitted to ab617@valleyair.org during the meeting will be addressed during the meeting's public comment period

Stockton Community Status Update:

http://community.valleyair.org/media/1982/stockton-status-update_10022020.pdf

- 5:00 p.m. Welcome, Introductions**
Hanna Stelmakhovych, Facilitator, Institute for Local Government
Ryan Hayashi, Deputy Air Pollution Control Officer, Valley Air District
Regina Griffin, Community Co-host, Stockton Community Resident
- 5:15 p.m. Pollution Concerns and Urban Greening**
Presentation by *Regina Griffin*
- 5:25 p.m. Transformative Climate Communities (TCC) Presentation**
Presentation: an overview of the grant and how the CSC can leverage those funds
Grant Kirkpatrick, Fellow, Stockton City Manager's Office
- 5:45 p.m. Community Emission Reduction Program (CERP) Strategies**
Review draft list of CERP strategies: go over survey results and refine priority measures
Valley Air District Staff
- 6:45 p.m. Wrap Up/Next Steps**
Hanna Stelmakhovych, Facilitator
- 6:50 p.m. Public Comment**

REMINDERS

- Next meeting Nov. 4, 2020, via Zoom for CSC and Facebook Live for public.

To request Spanish interpreting services, please contact Jaime Holt or Heather Heinks at (559) 230-6000 or AB617@valleyair.org at least 7 days prior to the meeting date.

OCTOBER 7TH, 2020

Urban Greening and Pollution Sources in My Community

Presentation by Regina Griffin: Resident of
Stockton's AB 617

&

Jonathan Pruitt:

EJ Advocate of Stockton's AB 617

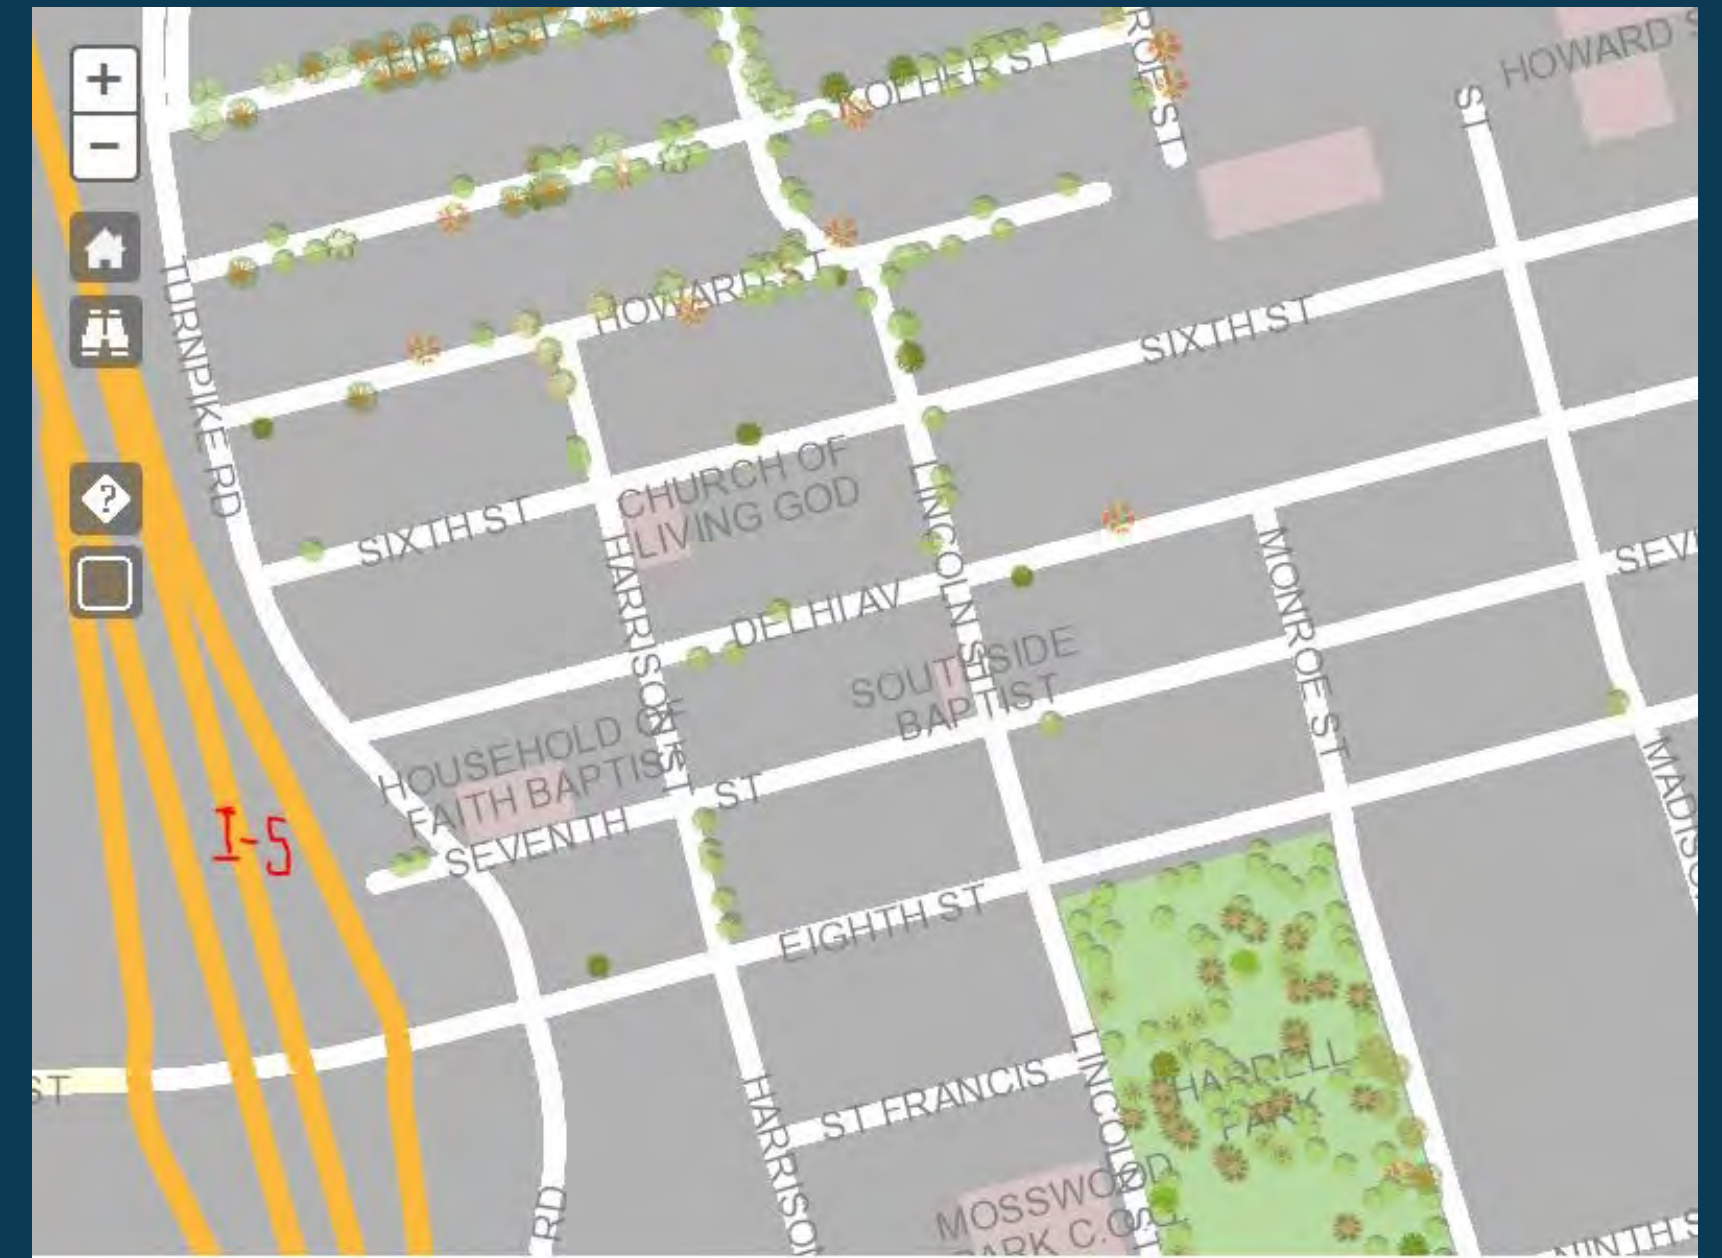

Urban Greening in South Stockton

- In 2012, Stockton filed for bankruptcy and cut programs to maintain budget spending.
- One of those programs was Tree Maintenance under Stockton Public Works.
- After getting out of bankruptcy, it has been a challenge for City of Stockton to acquire sustainable funding for tree maintenance and the tree planting.
- South Stockton has been impacted the most because of it.

North Stockton

South Stockton

- This is a 2011 Tree Census from the City of Stockton.
<http://www.stocktongov.com/discover/treemap.html>
- Both are near main corridors but look at the difference in trees.

A need for urban greening in South Stockton!

Let's start with Community Gardens

Benefits to Community Gardens

- Benefit # 1: Access to fresh, health food
- Benefit # 2: Help minimize food deserts
- Benefit # 3: Reduce car travel to grocery stores
- Benefit # 4: Increase environmental stewardship/education
- Benefit # 5: Build engagement from community

My Community

Peri Park based on
Google Maps

Peri Park on the City of Stockton
2011 Tree Census Map

<http://www.stocktongov.com/discover/treemap.html>

Clearly it's not green!

This is my view everyday. A community garden would be a positive addition to this community.

Stockton's URBAN AGRICULTURE ordinance

- Passed on September 15th, 2020 by City Council
- In this ordinance, residents are able to have ducks and chickens- absolutely no roosters.
- Residents can also have at most 2 hives for bee keeping.
- All of the maximum number of chickens, ducks, and hives are depended on a set lot size.
- It also allows residents to sell their own produce form their private food garden.

Now, it's time to provide the proper education for our community to build private/public food gardens.

POLLUTION SOURCES in my community

Peri Park

- worried about all the ag land and the chemicals used for herbicides and pesticides. She notices that with the San Joaquin River adjacent to her community, there is a breeze. Concerned that the breeze from the river pushes the chemicals to her community.

Pollution sources in my community

Illegal dumping in my community in Peri Park. Worried about someone burning the trash to just take care of it.

Pollution sources in my community

Traffic in the mornings and evenings every day going into and out of Stockton from Highway 4. Notice the only form of protection from noise is this little wall. That's my community.

Let's bring CLEAN AIR to our South Stockton
commUNITY.

Thank you

Transformative Climate Communities (TCC)

Presentation to AB 617 Community Steering Committee

October 7, 2020

What is TCC?

- Community-led development and infrastructure projects that achieve major environmental, health, and economic benefits in CA's most disadvantaged communities.
- Long-term, large-scale, and place-based strategy.
- Projects must be implemented within a 5 square mile area.
- Communities articulate their vision through TCC strategies and projects to enact transformational change.
- Shared Governance via a collaborative stakeholder structure is required to promote shared decision-making between lead and co-applicants.

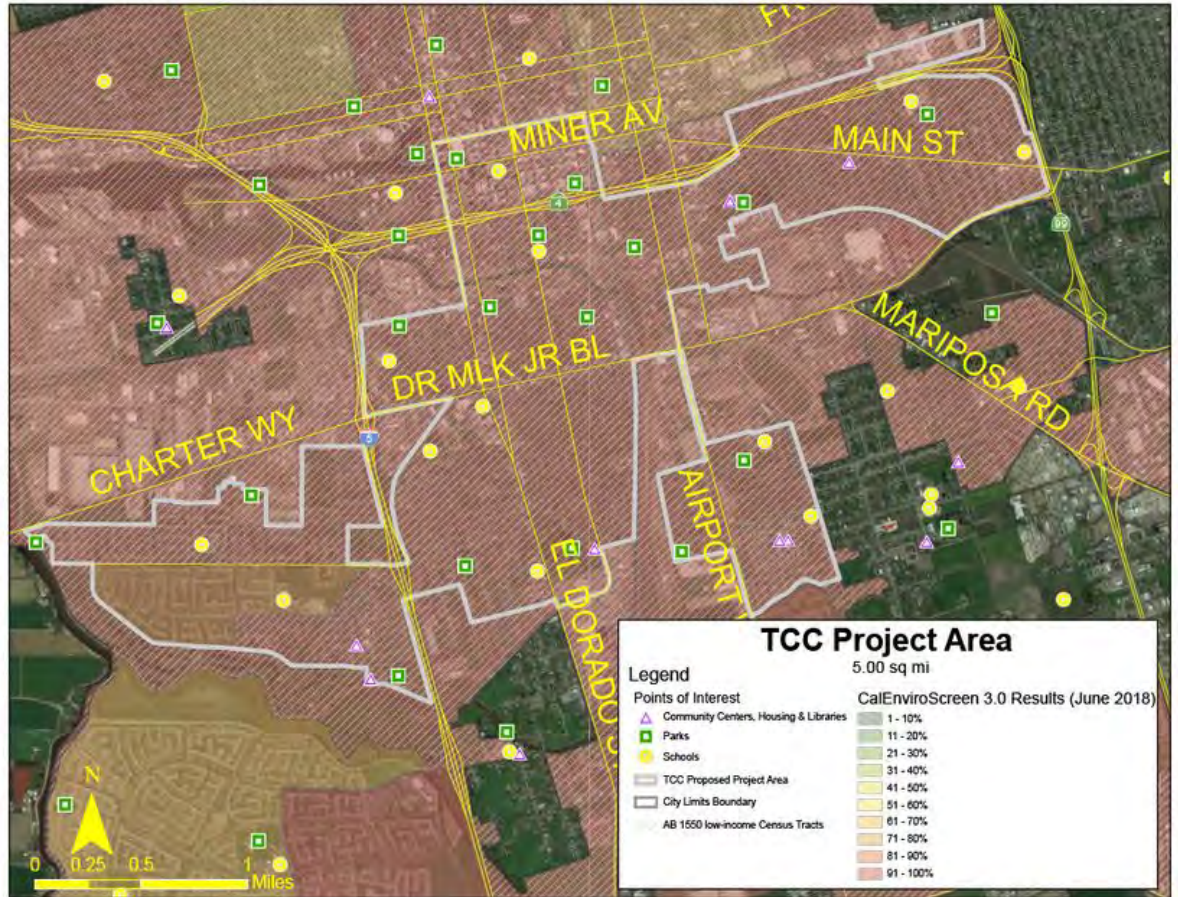

TCC Strategies

- 1 Equitable Housing and Neighborhood Development
- 2 Land Acquisition for Affordable Housing
- 3 **Transit Access and Mobility**
- 4 **Solar Installation and Energy Efficiency**
- 5 **Water Efficiency**
- 6 Recycling and Waste Management
- 7 **Urban Greening and Green Infrastructure**
- 8 **Health and Well-Being**

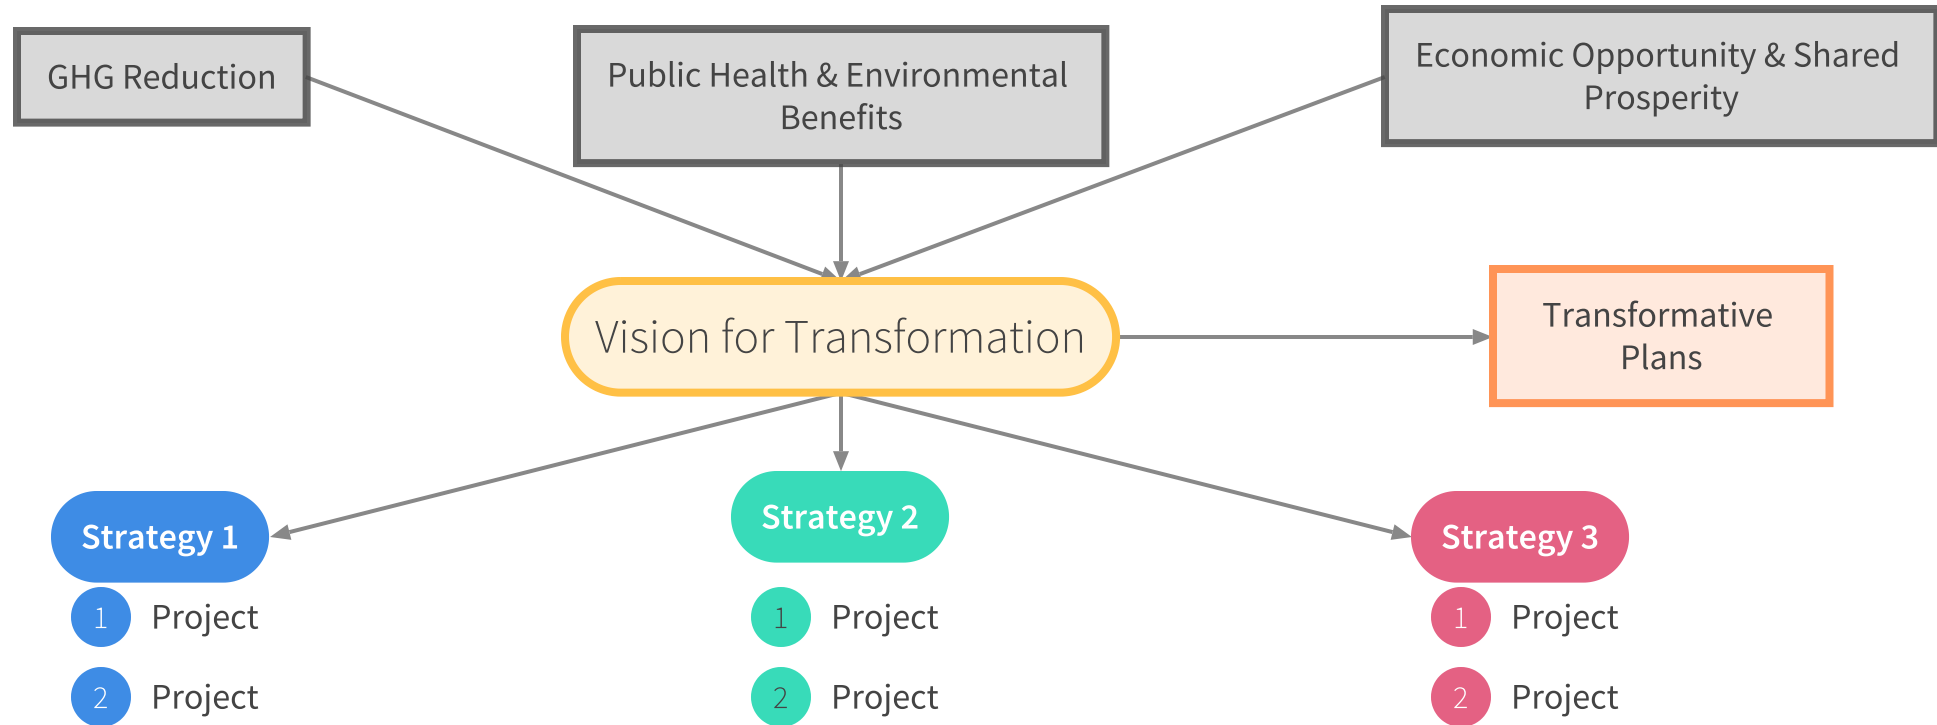

TCC Transformative Plans

- 1 Community Engagement Plan
- 2 Displacement Avoidance Plan
- 3 Workforce Development & Economic Opportunities Plan
- 4 Indicator Tracking Plan
- 5 Climate Adaptation and Resiliency Plan

TCC Project Area (5sq. mi.)

Structure of TCC Implementation Proposals

Stockton's Timeline

Planning Grant - Sustainable Neighborhood Plan

Community-identified Priorities:

- **Energy**

- Reduce utility bills
- Single- and Multi-Family Rooftop Solar
- Community Choice Aggregation
- Energy Efficient affordable housing (i.e. appliances)

- **Health**

- Large-scale community agriculture
- Open food cooperatives in food deserts

- **Parks**

- Maintain tree canopy
- Increase resident participation in maintenance and safety of parks
- Establish new parks and green community spaces

- **Safety**

- Community environmental stewardship programs for youth and currently or formerly incarcerated individuals
- Improve street lighting

Planning Grant - Sustainable Neighborhood Plan

Community-identified Priorities (Continued):

- **Transportation**

- Safe Routes to School
- Longer bus hours and more bus routes in South & East Stockton
- Electric Vehicle Car Share

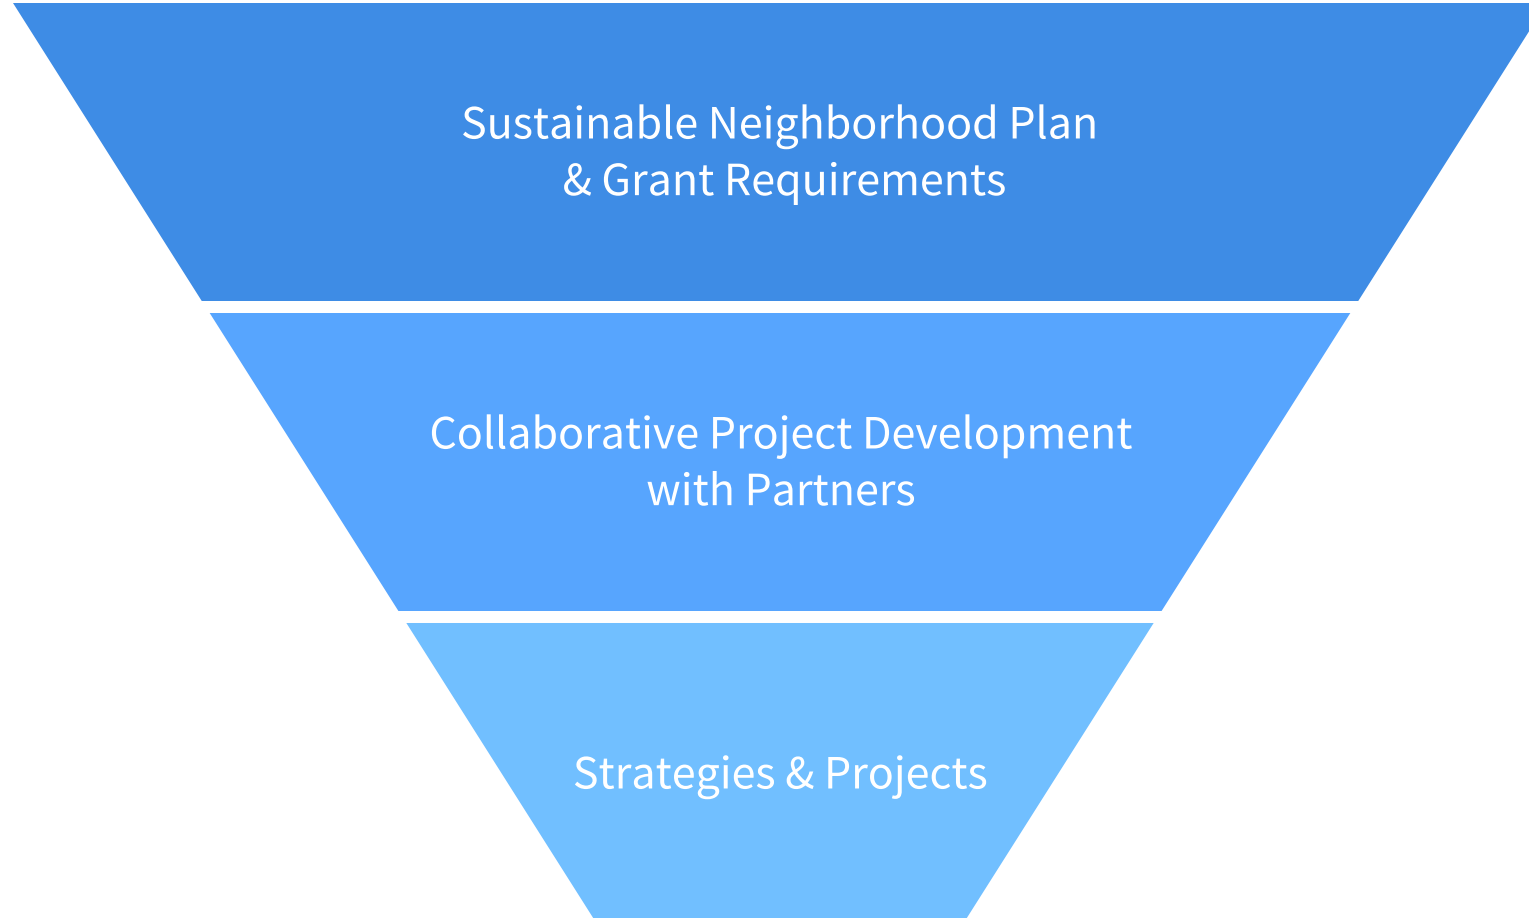

- **Waste**

- Green waste / composting program & education
- Improve recycling program for businesses and residences

- **Water**

- Household-level support for pipe and water quality testing, replacement, or retrofitting
- Water efficient irrigation and landscaping
- Install water efficient appliances

Stockton Rising Development

Stockton Rising Projects

1 Miner Avenue - **Public Works**

Transforming a ten-block thoroughfare, incentivizing active transportation and improving connectivity to downtown. Includes an urban greening component.

2 Climate Careers Energy & Water - **Rising Sun Center for Opportunity**

Installing energy- and water- saving devices in households, achieving a reduction in utility costs for residents and significant GHG reductions. Project Area youth will be recruited for employment to implement the project.

3 Stockton Energy for All - **GRID Alternatives**

Installing single- and multi-family solar systems through out the Project Area, reducing utility costs for residents and generating clean power. This project will also achieve significant GHG reductions.

4 Urban Forest Renovation Project - **Public Works, FFSJ, PUENTES**

Planting 1,750 trees throughout the project area to rebuild the urban canopy. Associated benefits include carbon sequestration, urban heat island mitigation, and workforce development opportunities.

5 Edible Education at Home - **Edible Schoolyard Project**

Distributing Community Supported Agriculture (CSA) boxes on a weekly basis to residents within the Project Area. These boxes contain seasonal, fresh, and organic produce for families, as well as education materials on the importance of healthy eating for children and instructions to cook with the ingredients.

Opportunities for Collaboration: TCC & AB 617

Transit Access & Mobility

Solar Installation & Energy
Efficiency

Urban Greening

CERP Measure Development

Stockton Steering Committee Meeting
October 7, 2020

Funding to Support Valley Communities

- State funding recently made available to support air quality improvements in low-income and disadvantaged communities throughout the state, with focus on AB 617 communities
- \$50 million currently available (AB 74)
- Subject to CARB Community Air Protection (CAP) Guidelines
- Achieve air quality benefits through:
 - Existing state emission reduction grant programs
 - Community-identified projects/programs outside of guidelines with demonstrated air quality benefits that meet stringent process requirements
- Funding subject to strict state-mandated deadlines (must be liquidated by 6/30/25)

Community Air Protection Incentives 2019 Guidelines

Approved by the Board: May 23, 2019

California Air Resources Board
California Environmental Protection Agency
1001 I Street
Sacramento California 95814

Process for Developing CERP Clean Air Grant Measures

- Community-driven process to identify, prioritize and address sources of air pollution within the community
- List of measures developed with community input based on unique characteristics of the community
- Measures prioritized based on multiple factors:
 - Cost-effectiveness (biggest bang for the buck)
 - Exposure reduction for sensitive populations (school filtration/vegetative barriers, etc.)
 - Availability of potential projects
 - Willingness of partners to participate and provide cost-share (voluntary)
 - Timeframe for project completion (legislative deadlines)
 - Overall project cost

Process for Developing CERP Clean Air Grant Measures

- Overall allocation of funding for incentive measures included in CERP dependent on multiple factors:
 - Results of steering committee evaluation and prioritization of individual measures
 - Demonstrated air quality benefit or exposure reduction potential of each proposed measure
 - District and CARB Board approval of proposed CERP measures and ongoing availability of funding
 - Identification (or reasonable expectation) of sufficient projects within each proposed measure
 - Expected timeframe of completion of projects (statutory deadlines)
- Incentive measures in adopted Shafter/Fresno CERPs include funding allocations of \$36 million and \$42 million, respectively
- Preliminary allocation for Stockton CERP Incentive measures could be reasonably anticipated to be within similar range

Process for Developing CERP Clean Air Grant Measures

- Based on initial survey results, CSC has prioritized several incentive measures for inclusion in the CERP
- These measures can be broadly categorized into the following groups:
 - **Heavy-Duty Mobile Sources** (e.g. - trucks, fueling infrastructure, school buses, locomotives, etc.)
 - **Transportation Sources** (e.g. – electric vehicles, vehicle repair, car/bike sharing, mechanic training, etc.)
 - **Port of Stockton Sources** (e.g. – heavy-duty port equipment, cranes, yard trucks, tug boats, etc.)
 - **Community-level Sources** (e.g. – lawn and garden equipment replacement, residential woodstove replacement)
- Based on initial Committee survey feedback, following slides can be used as a guide to assist in allocating funding to individual incentive measures or categories

Community-Level Incentive Measures

#	Measure	Committee Ranking	Incentive per Unit	Cost-Effectiveness (\$/ton)	Number of Units	Total Funding Necessary
TR.2	vegetative barriers	1	\$500,000	N/A	1	\$500,000
TR.1	Urban Greening	2	\$500,000	N/A	1	\$500,000
RB.1	Incentives to replace wood burning devices	39	Up to \$3,000	\$8,000 to \$25,000	100	\$300,000
SC.1	Air filtration in schools	4	80,000	N/A	33	\$2,640,000
LG.1	Incentives for residential lawn care equipment replacement	44	\$50 to \$250	\$200,000	100	\$25,000
LG.2	Incentives for commercial lawn care equipment replacement	43	Up to \$20,000	\$80,000	10	\$200,000
LU.2	Funding for bike paths and racks	8	100,000	\$40,000	5	500,000
					Total :	\$4,665,000

Heavy-Duty Incentive Measures

#	Measure	Committee Ranking	Incentive per Unit	Cost-Effectiveness (\$/ton)	Number of Units	Total Funding Necessary
HD.1	Incentives for zero/near zero emission truck replacement	18	\$100,000 to \$200,000	\$16,000 to \$44,000	50	\$5,000,000 to \$10,000,000
HD.2	Incentives for Clean Fueling Infrastructure	27	\$1,000,000	N/A	1	\$1,000,000
HD.4	School Bus Replacement	25	\$400,000	\$250,000 to \$300,000	14	5,600,000
HD.5	Locomotive Replacement	28	\$2,600,000	\$10,000 to \$30,000	3	7,800,000
HD.6	Railcar Movers/Switcher Replacement	31	\$1,000,000	\$10,000 to \$30,000	3	3,000,000
HD.7	Truck Rerouting Study	3	\$500,000	N/A	1	500,000
					Total :	\$27,900,000

Port of Stockton Incentive Measures

#	Measure	Committee Ranking	Incentive per Unit	Cost-Effectiveness (\$/ton)	Number of Units	Total Funding Necessary
PO.1	Incentives for zero/near zero emission HD on-road and off-road equipment	32	\$75,000 to \$200,000+	\$25,000 to \$50,000+	10	\$750,000 to \$2,000,000
PO.2	Incentives for tug boat replacement or repower	38	Needs Additional Research			\$1,000,000
NEW	Marine Exhaust Intake Bonnet	N/A	Needs Additional Research			\$1,000,000
					Total :	\$4,000,000

Transportation Sources Incentive Measures

#	Measure	Committee Ranking	Incentive per Unit	Cost-Effectiveness (\$/ton)	Number of Units	Total Funding Necessary
TP.1	Electric Bike Sharing	42	Needs Additional Research			50,000
TP.2	Host Tune In Tune Up Event(s)	33	\$60,000 per event	\$40,000 to \$60,000	2	\$120,000
TP.3	Incentives for Electric or Plug-In Hybrid Vehicles	29	\$8,000	\$150,000 to \$850,000	100	\$800,000
TP.4	Incentives for Electric Vehicle Charging Infrastructure	19	\$5,000 to \$25,000	N/A	10	\$50,000 to \$250,000
TP.5	Educational Training for EV Mechanics	21	\$15,000	N/A	2	\$30,000
TP.6	Car Sharing Program	36	Up to \$1,000,000	N/A	1	\$1,000,000
					Total :	\$2,250,000

Meeting Highlights*

AB 617 Stockton Community Steering Committee Meeting #7

September 2, 2020 | 5:00 pm - 7:00 pm

Virtual Zoom Meeting

Action items for the Stockton Community Steering Committee (CSC):

- CSC members should review and prioritize the draft list of CERP measures based on instructions provided by District
- CSC members should contact District staff if interested in being a community co-host at a future meeting

Action items for San Joaquin Valley Air Pollution Control District (District):

- District will send out specific instructions for review and prioritization of CERP measures
- For future meetings, District will denote who is a CSC member and who is a CSC resident member

Welcome and Introductions

Hanna Stelmakhovych, Facilitator, Institute for Local Government (ILG)

Jessica Olsen, Program Manager, District

Gloria Alonso Cruz, Community Co-host, Stockton Community Resident

Glenabel Toreno, Community Co-host, Stockton Community Resident

Hanna welcomed the Stockton CSC participants, went over Zoom etiquette, and thanked everyone for attending. She gave an overview of the agenda and thanked the community co-hosts.

Hanna then turned it over to Jessica for a host welcome on behalf of the District and then Gloria Alonso Cruz and Glenabel Toreno provided co-host remarks.

Icebreaker Activity

Hanna Stelmakhovych, Facilitator, ILG

Hanna explained the breakout group icebreaker activity for CSC members to get to know each other better. Committee members met in breakout groups until 5:30pm.

Technology Update

Jaime Holt, Chief Communications Officer, District

Upon return, Jaime announced that the other two AB 617 communities have technology support programs to ensure the CSC residents have access to the tools that allow them to participate in meetings virtually. Jaime asked committee members to email District staff if additional technology help is needed.

Southside Stockton Youth Air Quality Presentation

Page 1

**This is a meeting summary. Please refer to the meeting recording and/or audio to review the full details and comments from this meeting.*

Gloria Alonso Cruz, Community Co-host, Stockton Community Resident
Glenabel Toreno, Community Co-host, Stockton Community Resident

Gloria and Glenabel presented on the air quality in South Stockton. Presentation highlights:

- 1 in 4 children have asthma in the San Joaquin Valley
- Knife River has the highest percentiles for pollution burden, according to CalEnviroScreen
- Charter Way and Fresno Avenue are within the 95-100% percentile for pollution burden, according to CalEnviroScreen
- Several truck companies are situated along Charter Way and Fresno Avenue, idling often
- DTE Energy produces 428,743 metric tons of carbon dioxide equivalent, making it the largest greenhouse gas producer in Stockton

Question: Do you have plans to get this information out to the youth of Stockton?

Southside Stockton Youth Answer: We are planning to host workshops with Little Manila Rising, so please follow our work and share with anybody who might be interested in getting involved with us.

Question: Where did you get this information?

Southside Stockton Youth Answer: We researched the information through software on our phone, and with tools like CalEnviroScreen, which can be found online.

Question: You expressed a concern about unscheduled monitoring. One of the things that's important is real time monitoring of pollution sources and issues. Would records from the unscheduled monitoring you propose be available publicly in real time?

Southside Stockton Youth Answer: The importance of having an unscheduled monitor is to get access to more data that is not manipulated.

Comment: The data can't be argued. Our responsibility is to empower our communities to advocate. I want to thank you and our leaders and recommend going outside the box; not just talking to youth, but to everybody.

Community Emissions Reduction Program (CERP) Measures

Todd DeYoung, Director of Grants and Incentives, District

Jessica Olsen, Program Manager, District

Todd and Jessica presented on the CERP measure development and discussed strategy funding. Presentation highlights included:

- There is a significant interest and focus on using funding to support the measures that are proposed by AB 617 communities like Stockton
- District received \$50 million in funding to be spent towards grant funding in disadvantaged
- Community Air Protection Program (CAPP) guidelines have expanded on base programs and include additional elements that are not included in the normal state-wide programs
- Funding has to be liquidated by June 30, 2025
- The CSC will have the opportunity to prioritize emission reduction measures, based on which are most important to the community and which are most health protective

- Shafter’s CERP was allocated \$36 million for the incentive measures they prioritized; Fresno’s was \$42 million—Stockton can expect funding to be within that range

Question: Projects are expensive, are you looking for non-profit partners or government agency partners to share costs or leverage funding?

Air District Response: When using the term “partners” the Air District is usually thinking about residents or businesses, city, county, and other agencies that can take advantage of grants made available to reduce air pollution and resident exposure to it.

Question: I looked at some of the projects in the other two communities and trees have been a big topic of conversation. Stockton is worried about maintenance of trees. Can we put money into the CERP that will fund future care of trees?

Air District Response: Possibly. It depends on the design of the project plan required by CARB for community identified projects and approval by CARB. Projects could potentially cover this provided the money is spent by the legislative deadline, the work can potentially be continue past the five-year period.

Question: The city has plans to do things like bike paths, but there has always been a funding issue. You mentioned residents and businesses are eligible for partnerships and funding. Would bike paths projects be eligible?

Air District Response: Yes. Actually, the District has an existing grant program for bike paths outside of this process.

Jessica presented the draft list of CERP incentive measures. Presentation highlights:

- The list of incentive measures is based on the sources of concern raised by the CSC members during meetings, comments provided, and suggestions made in the chat boxes
- District will send out a formal request and instructions for how to review and prioritize all of the measures
- The measures are numbered and any quantifiable emissions reductions are denoted

Question: Can one of the projects be the installation of new CARB-quality monitoring equipment downwind of the Port? From what we understand, CARB is hesitant to put the site air monitoring there because it doesn’t represent regional air quality. The AB 617 monitoring is supposed to be very short term. We need to discuss and identify a permanent station that drives down emissions for the next 5-10 years.

Air District Response: The monitoring measures are actually separate from these measures. However, District has suggested that we place a trailer in Boggs Tract directly south to southeast of the Port to capture that local emissions source. The air monitoring campaign for AB 617 is a minimum of five years.

Question: Have any studies yet revealed any change in the pollution or air factors around Boggs Tract now that the elevated freeway has been in effect for approximately 2-3 years? It carries the majority of truck traffic to and from the Port.

Air District Response: District is not aware of a specific campaign that has studied that. We will start to understand a lot more about the community impacts with some of our monitoring campaigns.

Question: What is the maximum budget allocation amount for major categories?

Air District Response: At this point, there is no cap. But budgeting will be a big part of this exercise.

Question: How much of the budget do we need to keep in mind as we're going through this prioritization exercise?

Air District Response: It is about \$38-\$42 million range. The committee gets to provide comment and to help develop the budget.

Other Updates

Karen Buckley from California Air Resources Board (CARB) summarized a recent monitoring meeting the CSC had with CARB.

She explained that CARB staff understood the concerns and frustration expressed during the meeting. She thanked the CSC for their assistance and patience in helping to develop a list of potential sites for the monitoring team to research. CARB understands the CSC's interest in monitoring at the Port. The team is working on a list now and will report back ASAP.

Erica Manuel (ILG) gave an update about stipends for CSC resident members. She announced that the program has been launched. The CSC residents should have received an email with instructions and an application. If there are any questions about how the program works or whether you can apply, please email at any time. ILG will issue the first round of checks for everything retroactive from January-August this week.

Wrap Up/Next Steps

Hanna Stelmakhovych, Facilitator, ILG

Gloria and Glenabel thanked everyone for listening to their presentation and participating in the meeting. Hanna thanked the CSC members and District staff and adjourned the meeting.

Reminders

Next CSC meeting is Oct. 7 via Zoom. All the presentations, meetings highlights, transcripts and the Zoom meeting recording will be posted online.

Public Comment

Facebook comment: My friend wants to know how many students have portable air monitors and what kind. She says that TemTop air monitors are good. Thank you.

Agenda for Stockton Community Steering Committee Meeting #7

Wednesday, September 2, 2020 – 5:00 pm - 7:00 pm

Public Participation: Join via *Facebook Live* - www.facebook.com/valleyair

Comments and questions posted on Facebook or submitted to ab617@valleyair.org during the meeting will be addressed during the meeting's public comment period

Stockton Community Status Update:

<http://community.valleyair.org/media/1752/stockton-status-update.pdf>

- 5:00 p.m. Welcome, Introductions**
Hanna Stelmakhovych, Facilitator, Institute for Local Government
Ryan Hayashi, Deputy Air Pollution Control Officer, Valley Air District
Gloria Alonso Cruz, Community Co-host, Stockton Community Resident
Glenabel Toreno, Community Co-host, Stockton Community Resident
- 5:15 p.m. Icebreaker Activity**
Breakout group icebreaker to help us get better acquainted and to facilitate meaningful interactions between committee members
Hanna Stelmakhovych, Facilitator, Institute for Local Government
- 5:35 p.m. Community Emission Reduction Program (CERP) Strategies**
Introduction to Draft CERP strategies: Presentation and discussion with Gloria Alonso Cruz and Glenabel Toreno about community resident perspectives on air pollution affecting the Stockton community
Community Co-hosts
Review draft list of CERP strategies: go over next steps for prioritization and refinement
Valley Air District Staff
- 6:45 p.m. Wrap Up/Next Steps**
Hanna Stelmakhovych, Facilitator
- 6:50 p.m. Public Comment**

REMINDERS

- Workshop on Regulatory and Enforcement efforts at District and CARB on September 9, 2020, via Zoom
- Next meeting October 7, 2020, via Zoom for CSC members and Facebook Live for public

To request Spanish interpreting services, please contact Jaime Holt or Heather Heinks at (559) 230-6000 or AB617@valleyair.org at least 7 days prior to the meeting date.

Stockton Draft Strategies 9/02/2020

Priority (Please Select)	#	Category	Community Suggested Measures	Type of Program	Partner or Implementing Agency	Description	Quantifiable Emissions Reduction	Pollutants Reduced	Estimated Incentive per Unit	Cost Effectiveness Range (Incentive Funding per Tons of Emissions Reduced) \$/ton
High Medium Low	C.1	Cooking	Develop Strategies for Addressing Emissions from Outdoor Charbroiling	Regulatory	City of Stockton	Work with City of Stockton and other community partners to develop strategies for addressing community concerns about impacts of outdoor commercial cooking emissions, including siting considerations near sensitive receptors and areas of concern (e.g. El Dorado)		PM2.5		
High Medium Low	HD.1	Heavy Duty Mobile Sources	Incentives for Zero and Near-Zero Emission Technology for Heavy Duty Trucks	Incentives	District	Incentive program for heavy duty truck replacement with zero and near zero emission technology.	x	Diesel PM, NOx, PM2.5, VOCs	\$100,000 Near Zero Class 7-8 \$200,000 Zero Emission Class 7-8	\$16,000 avg for New Purchase \$44,000 avg for Replacement
High Medium Low	HD.2	Heavy Duty Mobile Sources	Support Planning and Development of Clean Fueling Infrastructure: Alternative Fuel Fueling Station	Incentives	District	Support planning and development of clean fuel infrastructure (natural gas and electric charging)		Diesel PM, NOx, PM2.5, VOCs		
High Medium Low	HD.3	Heavy Duty Mobile Sources	Enhanced Enforcement of Statewide Anti-Idling Regulation	Enforcement	CARB District	Enhanced enforcement of the statewide anti-idling regulation.		Diesel PM, NOx, PM2.5, VOCs		
High Medium Low	HD.4	Heavy Duty Mobile Sources	Incentive Funding for New School Buses	Incentives	District	Incentive program for replacing older diesel school buses with zero or near zero emission buses.	x	Diesel PM, NOx, PM2.5, VOCs	\$400,000	\$250,000-\$300,000
High Medium Low	HD.5	Heavy Duty Mobile Sources	Incentives for Locomotives	Incentives	District	Incentive program for replacing older diesel locomotives with new clean engine technology.	x	Diesel PM, NOx, PM2.5, VOCs	\$2,600,000	\$10,000 to \$30,000
High Medium Low	HD.6	Heavy Duty Mobile Sources	Incentives for Railcar Movers/Switchers	Incentives	District	Incentive program for replacing older diesel railcar movers and switcher locomotives with new clean-engine technology.	x	Diesel PM, NOx, PM2.5, VOCs	\$1,000,000	\$10,000 to \$30,000
High Medium Low	HD.7	Heavy Duty Mobile Sources	Heavy Duty Truck Rerouting	Land Use Agency Partnership	City of Stockton San Joaquin County	Work with City and County to assess current truck routes CSC suggested Boggs Tract.		Diesel PM, NOx, PM2.5, VOCs		
High Medium Low	LG.1	Lawn and Garden	Incentives for Replacement of Residential Lawn and Garden Equipment	Incentives	District	Incentive program for the replacement of residential lawn and garden equipment.	x	NOx, PM2.5, VOCs	\$50.00 (New Purchase) \$250 (Replacement)	up to \$210,000
High Medium Low	LG.2	Lawn and Garden	Incentive Funding for Commercial Lawn and Garden Equipment	Incentives	District	Incentive program for the replacement of commercial lawn and garden equipment.	x	NOx, PM2.5, VOCs	\$20,000 (Riding Mower)	\$80,000
High Medium Low	LU.1	Land Use	Land Use/Sustainable Development: Support Projects that Reduce VMT	Land Use Agency Partnership	Local Transportation Agencies	Provide District support for projects that reduce VMT, including advocacy for competitive project proposals and potential match funding support to eligible projects, as appropriate, through existing District programs		NOx, PM2.5, VOCs		
High Medium Low	LU.2	Land Use	Bike Lanes and Walking Trails	Land Use Agency Partnership	Local Transportation Agencies	Work with City, County, and San Joaquin Council of Governments to assess current bike path and look for funding to make community more bike and walk friendly		NOx, PM2.5, VOCs		\$40,000-\$100,000+

Priority (Please Select)	#	Category	Suggested Measures	Type of Program	Partner or Implementing Agency	Description	Quantifiable Emissions Reduction	Pollutants Reduced	Estimated Incentive per Unit	Cost Effectiveness Range (Incentive Funding per Tons of Emissions Reduced) \$/ton
High Medium Low	O.1	Outreach	Outreach: Community Air Quality Outreach Strategy	Outreach	District	Multilingual effort: Increase community awareness of available tools to keep informed of real-time changes in air quality through social media campaigns and a series of partner workshops. Will explore text messaging, billboards, NextDoor, other unique outreach mechanisms as suggested by the committee. Would aim to focus outreach on Stockton CSC concerns, including fireworks, illegal burning, idling.				
High Medium Low	O.2	Outreach	Outreach: Sharing Clean Air Efforts and How Communities Can Get Involved	Outreach	District	Multilingual effort: Outreach to share clean air efforts and how communities can get involved. This strategy would increase awareness of programs by establishing a series of outreach events within community. Some ideas include educating truckers about idling, using direct mail where possible, and encouraging positive messaging.				
High Medium Low	PO.1	Port of Stockton	Incentives for Zero and Near-Zero Emission Technology for Heavy Duty On-Road and Off-Road Equipment Operating at Port of Stockton	Incentives	District Port of Stockton	Incentive program for heavy duty vehicle with zero and near zero emission technology, including Transport Refrigeration Units (TRUs), Drayage Trucks, etc. Focus on equipment in Port	x	Diesel PM, NOx, PM2.5, VOCs	Yard Trucks \$140,000 based on current program \$75,500 based on Moyer & Off-Road	\$25,000 to \$50,000+
High Medium Low	PO.2	Port of Stockton	Incentive Funding for Tug Boat Replacement/Repower	Incentives	District Port of Stockton	Incentive program for tug boat replacement/repower.		Diesel PM, PM2.5, NOx, Toxics		
High Medium Low	PO.7	Port of Stockton	Additional strategies for transitioning to cleaner vehicles, reducing congestion, and other strategies identified through the CERP development process	Partnership	Port of Stockton	Strategiesto be identified and developed in coordination with the Port of Stockton		Diesel PM, NOx, PM2.5, VOCs		
High Medium Low	RB.1	Residential and Illegal Burning	Incentives to Replace Wood Burning Devices	Incentives	District	Incentive program for the replacement of existing wood burning devices and pellet stoves with natural gas or electric technologies.	x	PM2.5	\$2,000.00 (Between 30-70% of total cost)	\$8,000-\$25,000 (13,800 Avg.)
High Medium Low	RB.2	Residential and Illegal Burning	Outreach to Reduce Illegal Burning Activity	Outreach	District	Reduce illegal burning through residential open burning education. Target CSC areas of concern		PM2.5, toxics		
High Medium Low	RB.3	Residential and Illegal Burning	Enhanced Enforcement to Reduce Illegal Burning of Residential Waste	Enforcement	District	Enhanced enforcement to reduce illegal burning of residential waste. Target CSC areas of concern		PM2.5, toxics		
High Medium Low	SC.1	Schools	Air Filtration Systems in Community Schools	Incentives Mitigation	District School Districts	Incentive program to install advanced air filtration systems in community schools.		PM2.5, Ozone		N/A
High Medium Low	SC.2	Schools	Healthy Air Living Schools: Increase Participation	Outreach	District	Reduce children's exposure through increased enrollment in the Healthy Air Living (HAL) Schools Program.				
High Medium Low	SS.1	Stationary Sources	Evaluation of BARCT Requirements for Rules that Apply to Cap and Trade Facilities	Regulatory	District	Regulatory actions: evaluation of BARCT requirements for rules that apply to Cap and Trade facilities. The District will examine a subset of stationary source rules to determine if they meet state BARCT requirements.		Diesel PM, NOx, PM2.5, VOCs, Toxics		
High Medium Low	SS.2	Stationary Sources	Evaluation of Rules to Determine Whether Additional Reductions are Possible for Sources of NOx and PM2.5	Regulatory	District	Regulatory actions: evaluation of rules to determine whether additional reductions are possible for sources of NOx and PM2.5. The District will analyze and amend eight District rules to pursue additional reduction opportunities beyond BARCT.		Diesel PM, NOx, PM2.5, VOCs, Toxics		
Priority (Please Select)	#	Category	Suggested Measures	Type of Program	Partner or Implementing Agency	Description	Quantifiable Emissions Reduction	Pollutants Reduced	Estimated Incentive per Unit	Cost Effectiveness Range (Incentive Funding per Tons of Emissions Reduced) \$/ton

High Medium Low	SS.3	Stationary Sources	Expedited Facility Risk Assessment And Risk Reduction Under District Implementation of the Air Toxics Hot Spots Information And Assessment Act (AB 2588)	Regulatory	District	Regulatory actions: expedited facility risk assessment and risk reduction under District implementation of the Air Toxics Hot Spots Information and Assessment Act (AB 2588). The District has put into effect a plan to expedite the AB 2588 reassessments for facilities located within the AB617 community		Diesel PM, NOx, PM2.5, VOCs, Toxics		
High Medium Low	TP.1	Transportation	Electric Bike Sharing Program	Incentives	San Joaquin Regional Transit District	Incentive program to bring a partner to launch a bike share program to help residents share clean cars in community. https://sjrtdbikeshare.altaprojects.net/		NOx, PM2.5, VOCs		
High Medium Low	TP.2	Transportation	Host Tune-In Tune-Up Events within Community	Incentives	District	Incentive program to host a local Tune In Tune Up event to reduce emissions from older, high polluting cars.	x	NOx, PM2.5, VOCs	\$600 (Between 70-100% of total cost)	\$40,000-\$60,000
High Medium Low	TP.3	Transportation	Incentives for Residents to Transition to Electric or Plug-in Hybrid Vehicles	Incentives	District	Incentive program for the replacement of passenger vehicles with battery electric or plug-in hybrid vehicles.	x	NOx, PM2.5, VOCs	\$8,000 (Between 30-70% of total cost)	\$150,000-850,000
High Medium Low	TP.4	Transportation	Incentives for Electric Vehicle Charging Stations	Incentives	District	Incentive program for the installation of charging stations for electric vehicles				
High Medium Low	TP.5	Transportation	Educational Training for Electric Vehicle Mechanics	Incentives	District Local Community College	Incentive program for educational training for electric vehicle mechanics.				
High Medium Low	TP.6	Transportation	Car Sharing Program	Incentives	District Car Share Partner	Incentive program to bring a partner (like Mio Car) to launch a car share program to help residents share clean cars in community.		NOx, PM2.5, VOCs		
High Medium Low	TR.1	Greening/Trees	Identify Opportunities for Increased Urban Greening in the Community	Mitigation	PUENTES City of Stockton San Joaquin County	Increased urban greening and forestry to improve air quality. The goal is to identify and support efforts to increase urban greening and forestry to improve air quality and overall quality of life for residents in the community. Keep in mind water issues.		Ozone, PM2.5, NOx, CO		
High Medium Low	TR.2	Greening/Trees	Incentives for Installation of Vegetative Barriers Around/Near Sources Of Concern	Incentives Mitigation	City of Stockton San Joaquin County Caltrans Port of Stockton	Incentive program for the installation of vegetative barriers around/near sources of concern (schools, along truck routes, near Port of Stockton, Charter Way and El Dorado)		Ozone, PM2.5, NOx, CO		

Priority (Please Select)	#	Category	Community Suggested Measures	Type of Program	Partner or Implementing Agency	Description	Quantifiable Emissions Reduction	Pollutants Reduced
High Medium Low	C.1	Cooking	Develop Strategies for Addressing Emissions from Outdoor Charbroiling	Regulatory	City of Stockton	Work with City of Stockton and other community partners to develop strategies for addressing community concerns about impacts of outdoor commercial cooking emissions, including siting considerations near sensitive receptors and areas of concern (e.g. El Dorado)		PM2.5
High Medium Low	HD.3	Heavy Duty Mobile Sources	Enhanced Enforcement of Statewide Anti-Idling Regulation	Enforcement	CARB District	The issue of exposure to diesel particulate matter (DPM) from vehicle idling has been raised frequently in communities. Concerns include bus idling near schools, truck idling in or around distribution centers or warehouses, and traffic congestion that can contribute to increased PM burden at sensitive receptors.		Diesel PM, NOx, PM2.5, VOCs
High Medium Low	PO.2	Port of Stockton	CARB Enforcement of Ocean Going Vessel Regulations	Enforcement	CARB	Ocean Going Vessel (OGV) Fuels Regulation. This regulation is intended to reduce particulate matter, diesel particulate matter, oxides of nitrogen, and sulfur oxide emissions from ocean-going vessels. Such vessels are required to switch to a low sulfur distillate fuel within 24 nautical miles of the California coast.		Diesel PM, PM2.5, NOx
High Medium Low	PO.4	Port of Stockton	CARB Enforcement of Cargo Handling Equipment Regulations	Enforcement	CARB	Mobile cargo handling equipment is any motorized vehicle used to handle cargo or perform routine maintenance activities at California's ports and intermodal rail yards. The type of equipment includes yard trucks (hostlers), rubber-tired gantry cranes, container handlers, forklifts, etc. The Mobile Cargo Handling Equipment (CHE) Regulation was adopted in 2005 to reduce toxic and criteria emissions to protect public health and was fully implemented by the end of 2017. CARB staff is currently assessing the availability and performance of zero-emission technology to further reduce emissions.		Diesel PM, PM2.5, NOx
High Medium Low	PO.5	Port of Stockton	CARB Enforcement of Commercial Harbor Craft Regulations	Enforcement	CARB	There are several types of harbor craft in California, including fishing vessels, ferries, excursion vessels, tug boats, tow boats, crew and supply boats, barges, dredges, and other vessel types. The Commercial Harbor Craft (CHC) Regulation was adopted in 2007 to reduce toxic and criteria emissions to protect public health. It was then amended in 2010 and will be fully implemented by the end of 2022. CARB is currently developing additional amendments to the CHC regulation. https://ww2.arb.ca.gov/our-work/programs/commercial-harbor-craft		Diesel PM, PM2.5, NOx, Toxics
High Medium Low	RB.3	Illegal Open Burning	Enhance Enforcement to Reduce Illegal Open Burning of Residential Waste	Enforcement	District	Enhanced enforcement to reduce illegal burning of residential waste. Target CSC areas of concern		PM2.5, toxics
High Medium Low	RB.4	Residential Wood Burning	Enhanced Enforcement for Residential Wood Burning	Enforcement	District	Enhanced enforcement of residential wood burning fireplace and outdoor wood burning heater curtailments under Rule 4901		PM2.5
High Medium Low	SS.1	Stationary Sources	Evaluation of BARCT Requirements for Rules that Apply to Cap and Trade Facilities	Regulatory	District	Regulatory actions: evaluation of BARCT requirements for rules that apply to Cap and Trade facilities. The District will examine a subset of stationary source rules to determine if they meet state BARCT requirements.		Diesel PM, NOx, PM2.5, VOCs, Toxics
High Medium Low	SS.2	Stationary Sources	Evaluation of Rules to Determine Whether Additional Reductions are Possible for Sources of NOx and PM2.5	Regulatory	District	Regulatory actions: evaluation of rules to determine whether additional reductions are possible for sources of NOx and PM2.5. The District will analyze and amend eight District rules to pursue additional reduction opportunities beyond BARCT.		Diesel PM, NOx, PM2.5, VOCs, Toxics
High Medium Low	SS.3	Stationary Sources	Expedited Facility Risk Assessment And Risk Reduction Under District Implementation of the Air Toxics Hot Spots Information And Assessment Act (AB 2588)	Regulatory	District	Regulatory actions: expedited facility risk assessment and risk reduction under District implementation of the Air Toxics Hot Spots Information and Assessment Act (AB 2588). The District has put into effect a plan to expedite the AB 2588 reassessments for facilities located within the AB617 community		Diesel PM, NOx, PM2.5, VOCs, Toxics
High Medium Low	SS.4	Stationary Sources	Enhanced Enforcement of Stationary Sources	Enforcement	District	Increasing inspection frequency to twice per year for any permitted stationary source that has had an emissions violation in the last three years		NOx, PM2.5, VOC, Toxics
High Medium Low	SS.5	Stationary Sources	Enhanced Enforcement of Fugitive Dust Requirements	Enforcement	District	Enhanced enforcement of District's Regulation VIII requirements at active construction projects and other sources of fugitive dust within the community		PM10
High Medium Low	SS.6	Stationary Sources	Self-Inspection Training for Gas Station Operators	Enforcement	District	New pilot training program for conducting self-inspections at gas stations		VOC
High Medium Low	CARB.1	Heavy Duty Mobile Sources	Enhanced Enforcement of CARB's HDVIP program	Enforcement	CARB	The Heavy-Duty Vehicle Inspection Program (HDVIP) and the Periodic Smoke Inspection Program (PSIP) are CARB's heavy-duty vehicle inspection programs for in-use trucks and buses. HDVIP consists of roadside testing by CARB enforcement personnel for excessive smoke, tampering, and Emission Control Label compliance, whereas the PSIP requires annual opacity self-testing for California fleets with two or more heavy duty vehicles. https://ww2.arb.ca.gov/our-work/programs/heavy-duty-diesel-inspection-periodic-smoke-inspection-program		Diesel PM, NOx, PM2.5, VOCs

Priority (Please Select)	#	Category	Community Suggested Measures	Type of Program	Partner or Implementing Agency	Description	Quantifiable Emissions Reduction	Pollutants Reduced
High Medium Low	CARB.2	Heavy Duty Mobile Sources	Enhanced Enforcement of CARB's Truck and Bus Regulation	Enforcement	CARB	The Truck and Bus regulation affects individuals, private companies, and Federal agencies that own diesel vehicles with a Gross Vehicle Weight Rating (GVWR) greater than 14,000 lbs. that operate in California. The regulation also applies to publicly and privately owned school buses; however, their compliance requirements are different and reporting is not required. The regulation does not apply to state and local government vehicles and public transit buses because they are already subject to other regulations. Vehicles that are exempt from other heavy duty diesel regulations, such as Cargo Handling Equipment, Drayage Truck, and Solid Waste Collection Vehicle regulations, may be subject to the Truck and Bus Regulation (regulation). Drayage and solid waste collection trucks with 2007 to 2009 model year engines must meet the requirements of the regulation by January 1, 2023. https://ww3.arb.ca.gov/msprog/onrdiesel/documents/fsregsum.pdf?_ga=2.47873445.387138016.1598888319-749989383.1524508813		Diesel PM, NOx, PM2.5, VOCs
High Medium Low	CARB.3	Heavy Duty Mobile Sources	Enhanced enforcement of CARB's TRU regulation	Enforcement	CARB	Transport Refrigeration Units (TRUs) are refrigeration systems powered by diesel internal combustion engines designed to refrigerate or heat perishable products that are transported in various containers, including semi-trailers, truck vans, shipping containers, and rail cars. Although TRU engines are relatively small, ranging from 9 to 36 horsepower, significant numbers of these engines congregate at distribution centers, truck stops, and other facilities, resulting in the potential for health risks to those that live and work nearby. https://ww3.arb.ca.gov/msprog/truckstop/trus/trus.htm		Diesel PM, NOx, PM2.5, VOCs
High Medium Low	CARB.4	Heavy Duty Mobile Sources	Enhanced enforcement of CARB's offroad equipment regulation	Enforcement	CARB	The California Air Resources Board (CARB) adopted the Regulation for In-Use Off-Road Diesel-Fueled Fleets (Off-Road Diesel Regulation) to reduce diesel particulate matter (PM) and oxides of nitrogen (NOx) emissions from in-use (existing) off-road heavy-duty diesel vehicles in California. These vehicles are used in construction, mining, industrial operations and other industries. https://ww3.arb.ca.gov/msprog/offroadzone/offroadzone.htm		Diesel PM, NOx, PM2.5, VOCs
High Medium Low	CARB.5	Area Sources	Enhanced enforcement of CARB's Consumer Products regulation	Enforcement	CARB	The Consumer Products Regulatory Program is an important part of the overall effort to reduce the amount of volatile organic compounds (VOCs), toxic air contaminants (TACs), and greenhouse gases (GHGs) that are emitted from using chemically formulated consumer products. https://ww2.arb.ca.gov/our-work/programs/consumer-products-program		VOCs, TACs, GHG

Southside Stockton Youth Air Quality Presentation

By: Glenabel Torenno and Gloria Alonso Cruz

Little Manila Rising

YOUTH ADVOCATES

For Social Justice

Outline

- Principles
- Field Observations:
 - Area by Knife River
 - Charter Way and Fresno Ave
 - Waste Incineration
 - Schools
 - Port

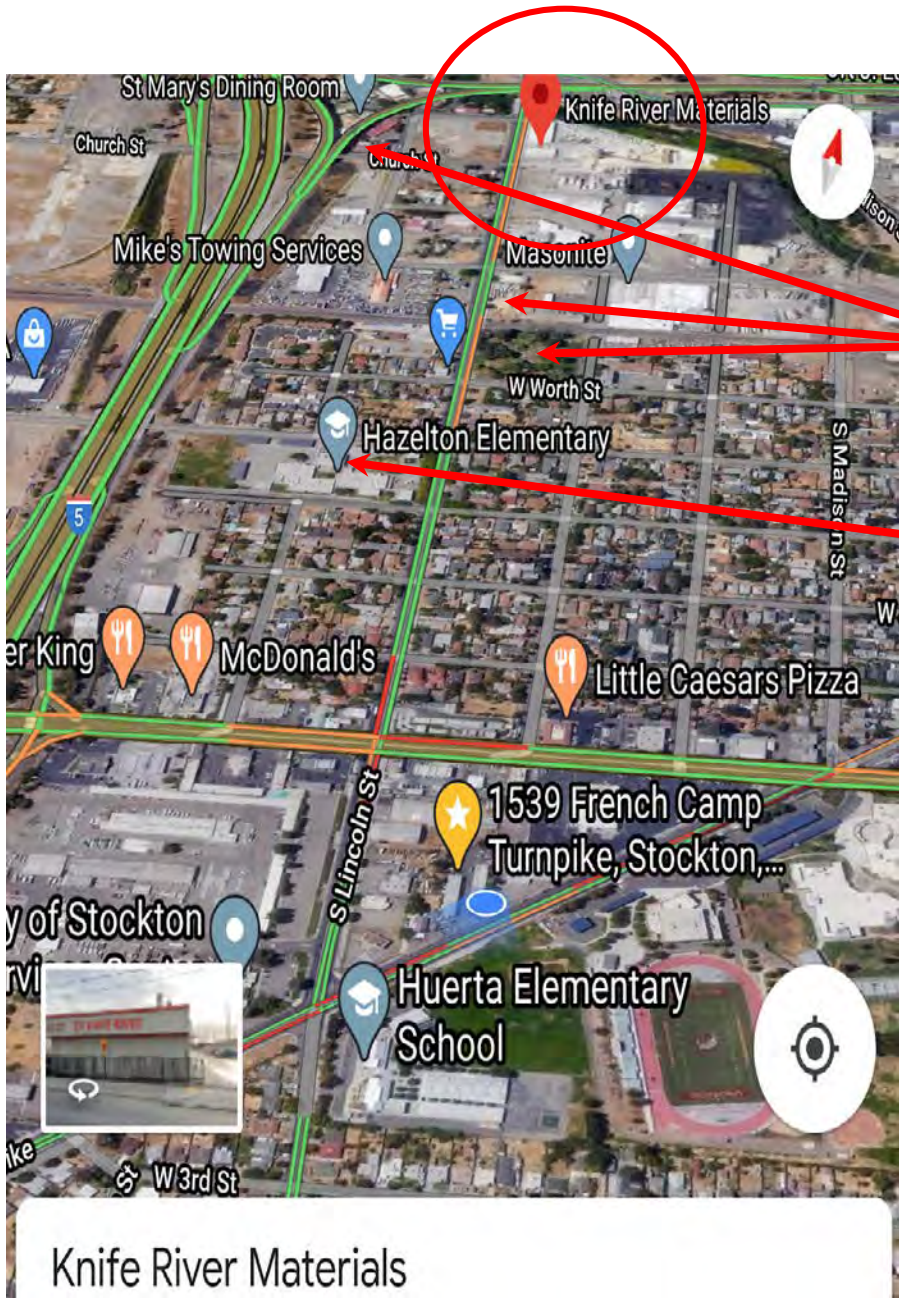

Principles: Equity, Education, and Air Pollution

- Air pollution is an underlying factor that impacts the future health of entire generations in EJ communities which cannot be fully protected where they benefit from public services and/or community resources.
- The air quality that surrounds South Stockton residents impacts public health and the environmental conditions around important services/infrastructure in EJ communities. These include schools, dining rooms, parks [...]
- For instance, about 1 in 4 children have asthma in the SJ valley. Environmental conditions impact existing respiratory problems in students which influence their school performance. EJ issues are intertwined with other social issues affecting young populations such as the school to prison pipeline.

Area by Knife River

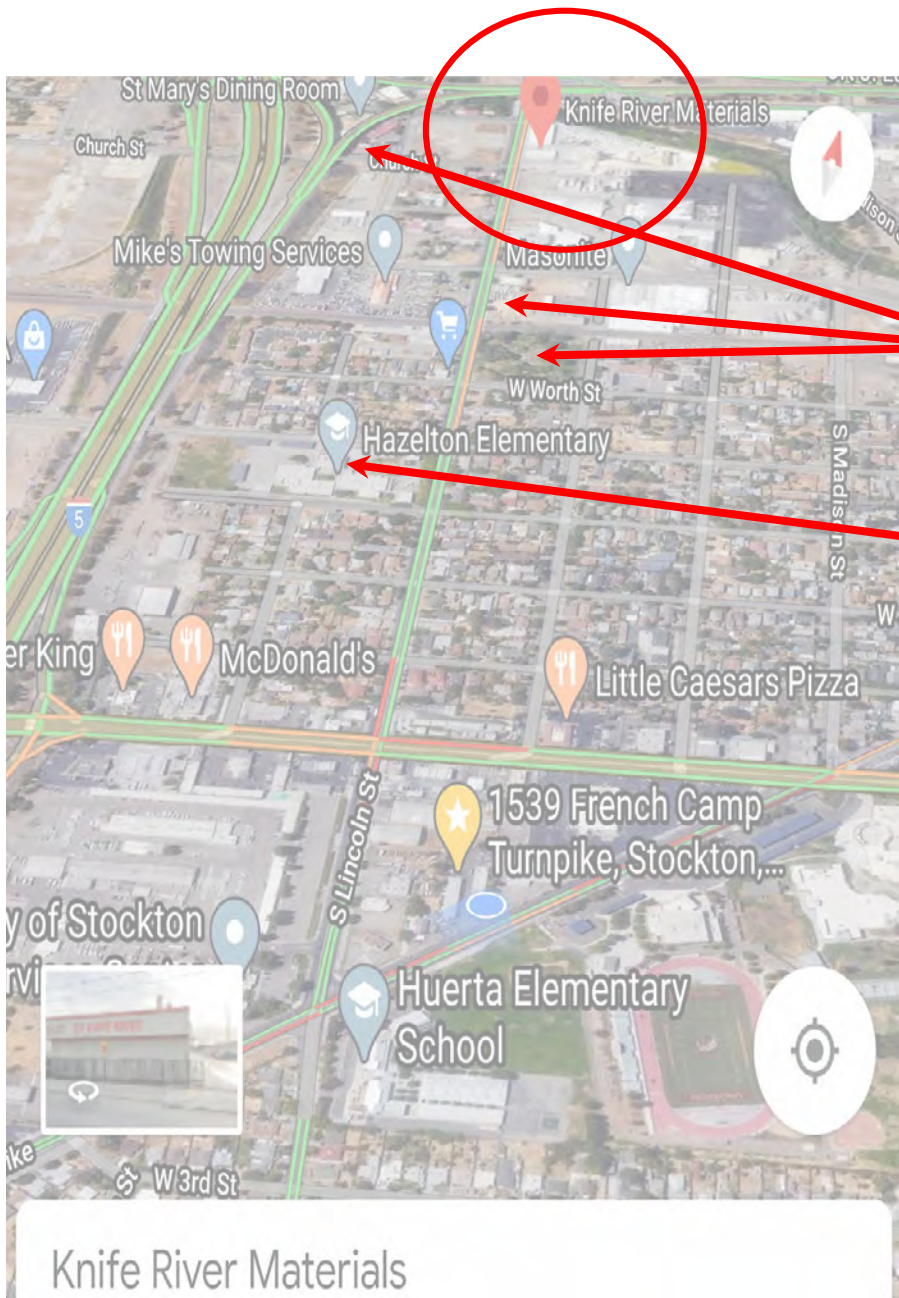

Knife River Materials

Knife River is in close proximity to other industries, public spaces, community resources, schools and residential areas.

All of which are within a mile radius from the said company site, including Hazelton Elementary school.

There is a park right next to a Tree cutting company called the West Coast Arborists and the train tracks. Next to that are residential homes.

Knife River is also in a very close proximity to other industries, public spaces, schools and residential areas.

All of which are within a mile radius from the said company site, including Hazelton Elementary school.

There is a park right next to a Tree cutting company called the West Coast Arborist and the train tracks. Next to that are residential homes.

The environmental conditions within this area have some of the highest percentiles. Pollution burden percentile of 99, including a 94 percentile in PM2.5

400 S Lincoln St, Stockton

Census Tract: 6077000700

Population:	5,269
CalEnviroScreen 3.0 Percentile:	95-100% (highest scores)
Pollution Burden Percentile:	99
Population Characteristics Percentile:	96
<u>Ozone:</u>	53
<u>PM 2.5:</u>	94
<u>Diesel:</u>	67
<u>Pesticides:</u>	74
<u>Toxic Releases:</u>	58
<u>Traffic:</u>	69
<u>Drinking Water:</u>	29
<u>Cleanups:</u>	98
<u>Groundwater Threats:</u>	97
<u>Hazardous Waste:</u>	43
<u>Impaired Water:</u>	94
<u>Solid Waste:</u>	94
<u>Asthma:</u>	97
<u>Low Birth Weight:</u>	32
<u>Cardiovascular Rate:</u>	95
<u>Education:</u>	97
<u>Linguistic Isolation:</u>	94
<u>Poverty:</u>	98
<u>Unemployment:</u>	89
<u>Housing Burden:</u>	91

Several trucks have also been observed to be idling right next to the said site.

Observation: Knife River materials has this **tall structure** in the center of their site, similar to a conveyor of some sort, where materials go down from the upper portion of the structure. **Once the materials reach the very bottom there are dust particles that are emitted to the air.**

Charter Way and Fresno Ave

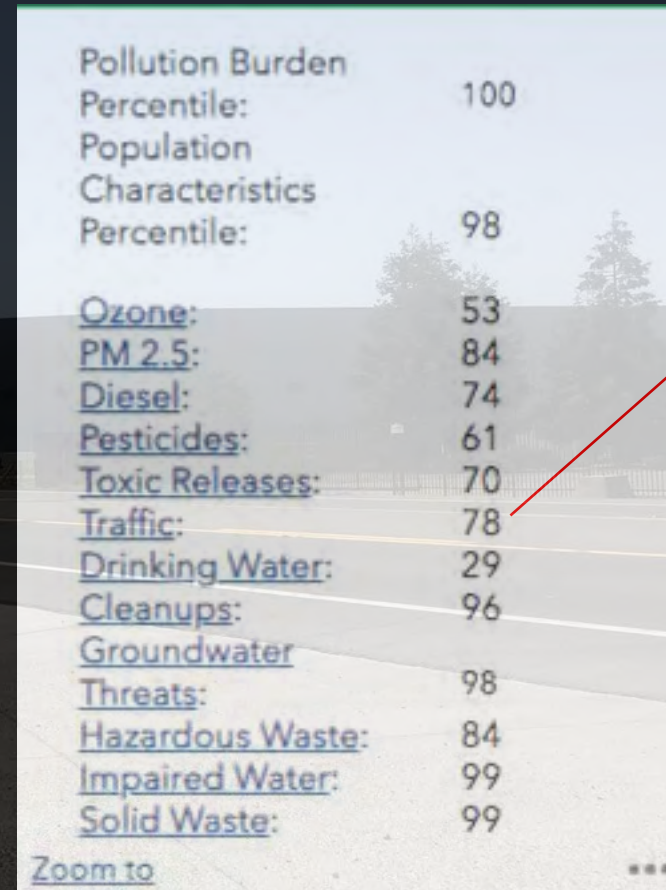

- All along Charter Way and Fresno Ave, several truck companies are present.
- 0.7 miles away is San Joaquin Elementary School.
- There are trucks idling within these streets and very close to residential areas.

- Some of the highest population characteristics percentile are: cleanups, PM 2.5, traffic and diesel.
- Based on CalEnviroScreen 3.0, this area is within the 95-100%

There are high levels of truck traffic in industrial areas.

Trucks contribute to pollution through the emission of carbon monoxide and are harmful to vulnerable environments such as residential areas.

Pollution Burden

TCI Transportation Commodities

Williams Tank Lines

American Building Supply Inc.

DTE Energy (electric generation utility company)

2526 W Washington St 95203

- The plant operates for 24 hrs. the whole seven days a week (Source: California Biomass Energy Alliance).
- There are multiple cylinder looking structures, with a white smoke coming out on one of those tubes.

- Based on CARB Pollution Mapping Tool, the total greenhouse gas (GHS) that DTE Energy produces is 428,743 metric tons CO₂e (carbon dioxide equivalent). This company has the highest GHS ranked in Stockton.
- Adding to DTE Energy, there are trains that pass by right next to the company; the Freeway; and the Port of Stockton is also in close proximity.

Fresno Ave
200

3105 El Dorado St
Stockton, California

Street View

South El Dorado California Tank Lines

Waste Incineration

Google

July 15th
12:03 PM

In the Southside of Stockton, there are a handful of businesses that reside right next to homeowners, one of which is California Tank Lines.

July 15th
12:03 PM

Having investigated the area over the course of a few days,

This property is being seen with full smokestacks, while being well within walking distance of homes as close as walking across the street.

	scores)
Pollution Burden Percentile:	90
Population Characteristics Percentile:	97
<u>Ozone:</u>	61
<u>PM 2.5:</u>	82
<u>Diesel:</u>	70
<u>Pesticides:</u>	0
<u>Toxic Releases:</u>	60
<u>Traffic:</u>	73
<u>Drinking Water:</u>	29
<u>Cleanups:</u>	79
<u>Groundwater Threats:</u>	75
<u>Hazardous Waste:</u>	0
<u>Impaired Water:</u>	94
<u>Solid Waste:</u>	00

This along with other businesses such as auto dismantlers along El Dorado and the edge of the AB 617 Air Monitor perimeter, while despite staying within law and regulation of emissions, will no doubt negatively affect the homes that live near them.

A city waterfront scene featuring a canal in the foreground, a paved walkway on the right, and various buildings and palm trees in the background under a cloudy sky. The text is overlaid on the image.

We have to see justice
for communities
through monitoring
the air of our most
notorious violators.

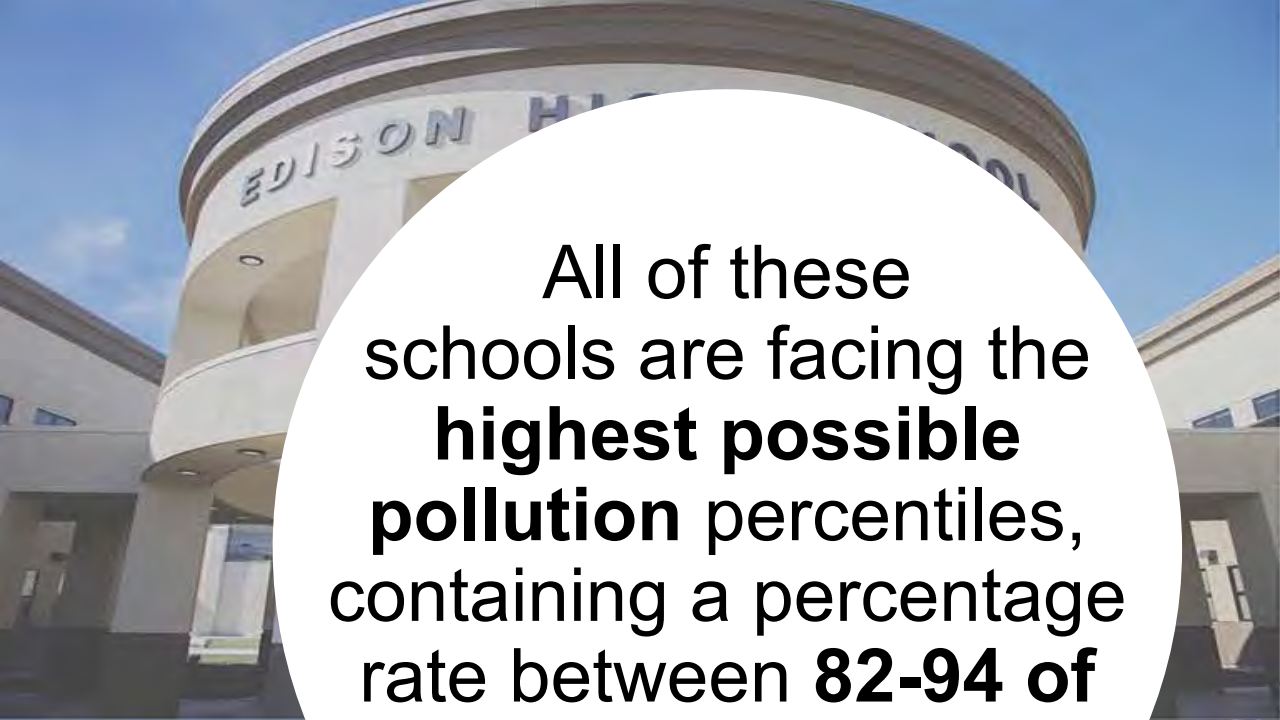

Mobile Monitors

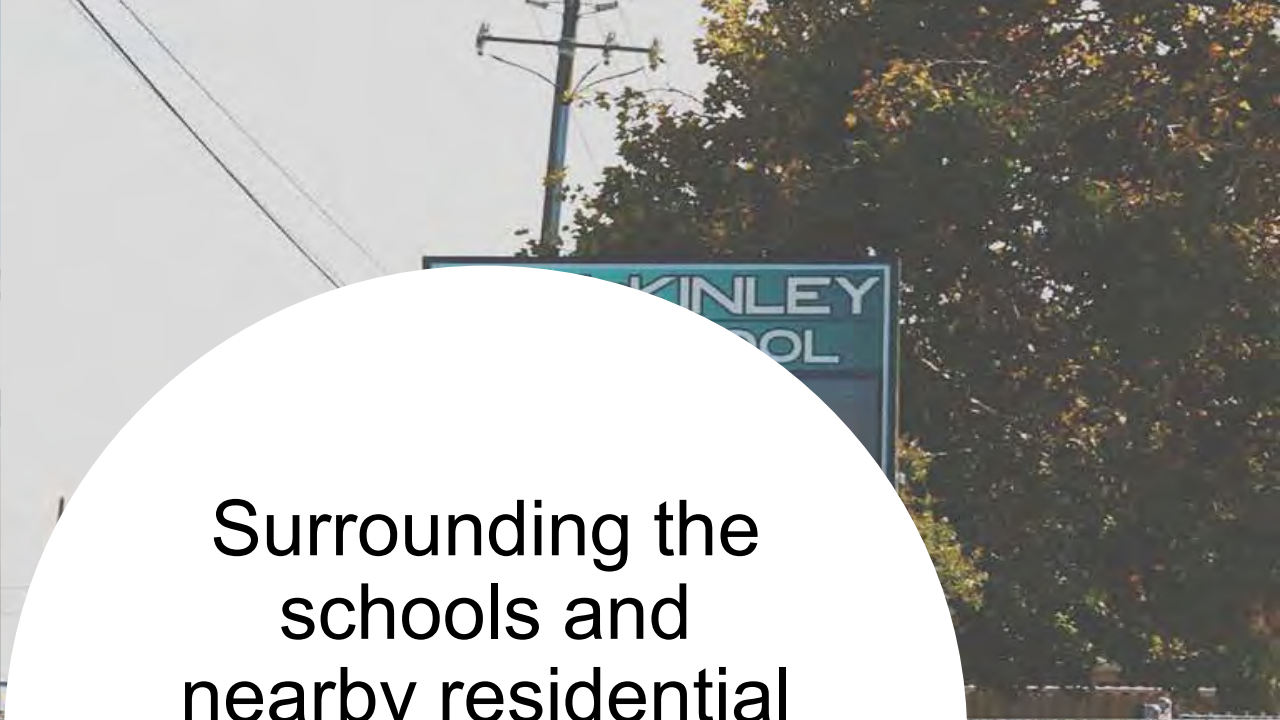

Cycling through SUSD Southside Schools

Some of the schools to consider monitoring:

Washington Elementary, McKinley Elementary, Edison High School, San Joaquin Elementary, Dolores Huerta Elementary, and Hazelton Elementary.

A photograph of a large, modern school building with a curved facade. The words "EDISON HIGH SCHOOL" are visible on the upper part of the building. A large white circle is overlaid on the image, containing text.

All of these schools are facing the **highest possible pollution** percentiles, containing a percentage rate between **82-94 of PM 2.5 concentrations.**

A photograph of a school building with a sign that says "KINLEY SCHOOL". A large white circle is overlaid on the image, containing text.

Surrounding the schools and nearby residential areas are trucking and manufacturing companies.

A photograph of a school sign for "Dolores Elementary School" with a "WELCOME" message. A large white circle is overlaid on the image, containing text.

Dolores Elementary School
WELCOME

A photograph of a school sign for "HAZELTON ELEMENTARY SCHOOL". A large white circle is overlaid on the image, containing text.

HAZELTON ELEMENTARY SCHOOL

McKinley Elementary is one prime example of the air disparities most of the SUSD Southside schools are having to endure.

- Located down the street is California Tank Lines, a lumbering production company and a truck company.
- These feed into the high pollution rates, including:
 - > Diesel PM percentile of 70
 - > Toxic Release percentile of 60
 - > PM 2.5 concentration

Conclusion - The What

We NEED **permanent** air monitors in the following areas:

PORT OF STOCKTON - downwind of Port of Stockton
TCI Transportation - Charter Way and Fresno Ave
WASTE INCINERATION - South El Dorado

We NEED **mobile** air monitors in the following areas:

Around schools
High areas of population density

The Why

The Port of Stockton is a high polluter and a major contributor to the air pollution, disproportionately affecting downwind areas.

Permanent air monitoring would give clarity to the actions needed to take and provide data for the future *development* of clean air.

Air monitoring the port **is our most pressing issue**, we would be taking a major step forward and making the biggest impact we can sooner.

Air monitors need to be where they will pick up the MOST DATA.

Anything less is an injustice to the community and a purposeful inaccuracy.

Conclusion - The What

We NEED **permanent** air monitors in the following areas:

PORT OF STOCKTON - downwind of Port of Stockton
TCI Transportation - Charter Way and Fresno Ave
WASTE INCINERATION - South El Dorado

We NEED **mobile** air monitors in the following areas:

Around schools
High areas of population density

The Why

Transforming industries to using clean technologies will *ultimately* make them more profitable in the long run while improving the surrounding community.

Recommendations

Having good monitoring in the right place also means at the right time.

We want the **mobile** monitors to be **rotated on a schedule, unknown to the public** so as to collect as much untampered data as possible.

PORT OF STOCKTON - downwind of Port of Stockton
TCI Transportation - Charter Way and Fresno Ave
WASTE INCINERATION - South El Dorado

Around schools
High areas of population density

Meeting Highlights*

AB 617 Stockton Community Steering Committee Meeting #6

August 5, 2020 | 5:00 pm - 7:00 pm

Virtual Zoom Meeting

Action items for the Stockton Community Steering Committee:

- Email District staff if interested in co-hosting a meeting

Action items for the District:

- Provide a succinct list of the 32 BARCT rules to the CSC; add to future agenda
- Work with community co-hosts to set agenda to cover rules and regulations and describe stationary sources in more detail
- Bring air monitoring plan budget info forward at the next meeting

Welcome and Introductions

Hanna Stelmakhovych, Institute for Local Government (ILG)

Ryan Hayashi, Deputy Air Pollution Control Officer, District

Douglas Vigil, Community Co-host

Hanna welcomed the Stockton CSC participants, went over Zoom etiquette, and thanked everyone for attending. She specifically acknowledged two new resident members, Nate Knodt and Victoria Moreno.

Hanna then turned it over to Ryan for a host welcome and Douglas Vigil for co-host remarks.

Community Emission Reduction Program (CERP) Strategies Exercise

Hanna Stelmakhovych, ILG

Jessica Olsen, District

Hanna described the CERP strategies exercise for the meeting, which was designed to provide an overview of CERP strategy components and a timeline for developing measures to reduce air pollution from community sources of concern.

Hanna turned it over to Jess, who covered the following:

- Overview of CERP strategies - existing and new
- Reminder of what needs to go into the CERP (measures, enforcement, compliance, collaboration with other agencies, etc.)
- Sources of concern that the District heard from the community

Jess explained that the purpose of the exercise was to begin developing a list of community-proposed strategies to address the main concerns heard throughout the community. Subject matter experts have been briefed to lead small group discussions on key topics.

Kim Danko (ILG) provided breakout room instructions. CSC members, CARB staff and District (AD) staff joined five small breakout groups to discuss: mobile sources, outreach/education, community sources, port sources, and stationary sources.

Hanna asked the subject matter experts to report back on their small group discussion and brainstorm briefly with the larger team.

Note: Zoom breakout room technology malfunctioned after the first breakout session. The meeting continued as a large group discussion.

Mobile Sources:

Aaron Tarango, District

Kyle Goff, California Air Resources Board (CARB)

Small Group Highlights:

- The community wants to know what the District is doing and what is happening in Stockton in terms of the incentives, the enforcement actions, etc.
- Public service announcements to the community may help residents learn to use the incentives offered
- Enhanced outreach is needed around the Port, as well as more electric trucks around the Port and electric school buses around the Stockton area
- There is interest in understanding how best to support independent truckers who cannot afford brand new trucks
- The last topic was replacing ag tractors in and around the Stockton area

Full Group Discussion (verbal and chat comments):

- CARB should come to a future CSC or subcommittee meeting to discuss truck rules, specifically in the Port area (refrigerants)
- Consider policies that will help small businesses with industrial pollutants (e.g. warehouses, trains, large vehicles)
- Find opportunities where electrical fleets can replace outdated fleets to reach current standards and lower emissions
- Add money to help educate the community about maintenance and repair of electric vehicles to increase community adoption and support
- Increase infrastructure for electric charging
- Add bike share in Downtown and South Stockton
- Provide more financial support for the rebates for replacing older cars with electric vehicles
- Electric drayage trucks at Port
- Electrify all rice trucks from Sacramento to Stockton
- Tug boat replacement/repower
- Electric landscaping, both commercial and residential
- Create low emission zones around schools

- Support land use policies that create a buffer zone between sensitive land uses (like homes) and major sources (like the freeway)
- More trees

Chat Question: What’s the difference between “enhanced enforcement” and just regular “enforcement”?

District Chat Answer: Enhanced Enforcement would be spending more time in a certain area, specifically looking at a certain emission source on a more regular basis, targeting enforcement on an area of concern. We are happy to mention strategies that are ongoing for any of these sources!

Chat Comment: It would be good to hear what other communities have done regarding AB 617. The issues of redlining and zoning have been pretty consistent statewide, so to hear what other communities have done should be extremely helpful. (*Answered below.*)

Chat Comment: Yes, learning from other communities and CERPs would help. Some ideas: closing the zone, or some roads in the zone, to all vehicles; car free days; reduce parking in certain areas; truck free hours, truck routes.

District Chat Answer: Some Mobile Source strategies that are in CERPs from Fresno and Shafter include replacing heavy duty trucks, helping public to replace older cars that might be gross polluters, providing Tune Up Events that help vehicles get repaired so they can pass smog, providing car share programs for public, electric school buses, clean up locomotives, and others.

Chat Comment: I'd liked to also look into an Alternate Truck Route Study for Boggs Tract. Fresno's AB 617 involves a Truck Route Study, correct?

District Chat Answer: You are correct! We are working with the City of Fresno on implementing that measure to study truck routes in their AB 617 boundary.

Chat Comment: What kind of verification is done on those voucher programs taking the money but not buying? We have a lot of diesel buses for schools public and private.

District Chat Answer: For vehicle replacement, we have a couple of check and balances in the program. Primarily we require a signed agreement with the resident and then the check actually goes to the dealership (say CarMax) for a pre-approved vehicle they plan to purchase. We walk them through the process and then require three years of follow up.

Chat Question: Does anyone know if delivery vehicles are already electric in this area? US Postal Service, UPS, FedEx, Amazon trucks....

District Chat Answer: Yes there are many EV light duty vehicles in the Stockton area (such as UPS) being used, but we are still far from having them all switch over. Definitely a good idea.

Chat Comment: Please include child care centers and private schools when allocating money for air filters.

Outreach/Education:

Heather Heinks, District

Jaime Holt, District

Small Group Highlights:

- We want to push out District messages in any way possible, such as state highway billboards
- The sky is the limit for the potential of outreach
- The District will work with the school districts to replace and install the highest rated school filters possible and see what other enhancements can come from the work already being done in schools
- The group discussed disseminating messages about no burn days or air quality alerts and ensuring that all communications are in both English and Spanish
- Suggestion to work with the Housing Authority and Citizen Science to have a portable air monitoring program as a way to get people more involved
- Focus on the farmworker community and make sure they have sufficient resources and knowledge

Full Group Discussion (verbal and chat comments):

- State highway billboards with messages around no burn days
- Spanish and other languages
- Using masks for promotional items
- Educating truckers about idling
- Try to reach the farmworker community
- Seek out unique outreach mechanisms (like parking lots) since COVID has changed patterns of travel
- Incorporate air filtration in schools
- Focus on positive messaging (incentive) vs. punitive
- Social media and real time outreach
- Use encouraging and positive messaging about what residents can do (e.g. carpooling, etc.)
- Utilize direct mail when possible, as well as electronic and digital (like text messaging)
- Utilize point of purchase marketing, retail, etc. vs. individual outreach (or in concert with it)
- Use Nextdoor app and local neighborhood watch Facebook groups
- Advertise in newspapers and on local radio stations
- Involve churches, mosques, temples, etc.
- Provide signage to businesses to ensure customers and employees are aware of concerns, issues, legally protected rights, etc.
- Educate the public to know what to watch out for in areas with lots of idling and how to file a complaint
- Talk about historical injustices that result in unjust policies in hopes of not repeating
- Insert in grocery ads
- Text message alerts
- Engage truck driver training companies to reach clients

Comment: Public education is one of the most cost effective ways we can have a positive impact. We can put together a strategic communications plan with key areas of what we think the community should know. Direct mail is an effective approach, our city council can help get positive messaging out.

Comment: We often hear employees or consumers are the last to get the information, so we should provide that at the top level.

Community Sources:

Jason Lawler, District

John Cadrett, District

Derek Winters, CARB

Small Group Highlights:

- Explored incentives for lawn mowers and types of yard care equipment
- Plastic and other materials used in cooking fires at homeless encampments are an issue; how can we find access to cleaner cooking alternatives?
- How can enhanced enforcement mitigate dust from traffic?
- Develop a research project to study air pollutions in Boggs Tract and how it impacts asthma rates, and from that develop an approach for going after the pollutants that trigger asthma

Full Group Discussion (verbal and chat comments):

- Increase incentives for lawn mowers and yard care equipment and increase outreach programs to expand awareness
- Asthma rates
- Cooking operations are an issue
- Trees are a major opportunity; lots of trees being destroyed
- Vegetative barriers on all roadways
- Ban fireworks
- More aeration to improve water quality from toxic blooms

Comment: The spike in the algal blooms near the Delta are a producer of methane, which is a concern for the community.

Question: Have we talked to any street corner chefs or food trucks? There must be other options for switching their equipment?

Answer: You have touched on a technologically challenging question. We are actively engaged in trying to find solutions for this, but there is not a way as of now to offer an incentive for new equipment. We are looking to see if there are ways to advance that technology and address that issue.

Question: Fresno had tree initiatives already—does Stockton have any tree initiatives?

Answer: Part of the problem is tree maintenance. We seem to have been able to move forward. We are relying on private spaces and private residences and business to maintain the trees we are currently planting. We will be doing limited planting in parks.

Port Sources:

John Stagnaro, District

Skott Wall, CARB

Small Group Highlights:

- A common theme that the Port had with the mobile source discussion was the traffic near the Port
- We want to electrify the fleet that comes and goes from the Port and we want to enforce or curtail the idling trucks
- Curious about the potential to use a different fuel type as ships come closer into the Port of Stockton; we can consider bio-diesel or renewable diesel as ships get within a mile of the Port
- Interest in electrifying boats and the charging of trucks as they queue up within the Port
- The Oakland Port has selected measures that might have some key learnings we can pull from. There are also examples from the Wilmington-Carson-West Long Beach Port that can be used as inspiration.

Full Group Discussion (verbal and chat comments):

- Lots of interest in other communities. West Long Beach/Wilmington/Carson has some examples from CARB research (e.g. outreach to shipping harbors; retrofit incentives, drayage truck regulations).
- Bicycle pathways, walking trails? What low cost opportunities exist? Smart technologies that make it easier for employers to telework, etc.
- The infrastructure side of this discussion is a critical piece, specifically with electrical and charging
- Work with community colleges
- Heavy duty to zero emission movers are all being considered; trying to bring everyone together and reduce emission across the Port
- Vegetative barriers around the Port
- Add another layer of review focused on the impact of development proposals and require additional mitigation measures
- Door to door carbon free supply chain from farm to Port
- Onshore power supply in the Port area for boats to plug in rather than idle
- FB Chat comment - provide free or discounted Wi-Fi so residents can hang air monitors from their homes
- Port traffic study to find out cumulative impacts
- Emission caps on various air pollution concerns with penalty fees for violations for stationary sources in Port
- Super Enhanced Enforcement on emissions from the Port of Stockton
- Transparency from Port on expansion projects
- Disallow use of mitigation banks or emission reduction credits that allow polluters to buy their way out of pollution instead of mitigate on site
- Compare on-site monitoring results to permitted pollution levels to ensure largest sources are compliant

Comment: Maybe some reasons we are seeing these mobile sources is that the right infrastructure is not in place. Maybe a bike exchange or bike program would incentivize the community to use bikes to get across town instead of vehicles. If we embrace the culture of zero emissions, we may help residents' lifestyles. Making sure there's adequate Wi-Fi service and smart technology makes it easier for employees to telework, which would be great.

Answer: This was the largest jump into electric equipment that the Port has ever made. I don't know if we were quite prepared, but the infrastructure side is a huge component of that and that is what we are learning right now, especially when working with PG&E to implement the charging stations. We do bounce a lot from other ports and try to learn from each other. We have a need in the workforce for electric vehicle technicians. We are in the middle of putting to use 36 pieces of zero emission equipment at the Port.

Stationary Sources:

Jake Felton, District

Arnaud Marjollet, District

Nick Peirce, District

Eric Bissinger, CARB

Small Group Highlights:

- The group discussed the Best Available Retrofit Control Technology (BARCT)
- A schedule has been approved and this BARCT analyses applies to those facilities that are subject to the cap and trade program
- There are over 100 facilities in the district subject to Cap and Trade and 32 rules will apply to those 100 facilities
- Out of those 32 rules that apply to those 100 facilities, 19 have demonstrated to satisfy the BARCT requirement
- Three more rules will be assessed in 2020
- Five rules that apply to oil and gas specifically will begin in 2020; two or three of these will be assessed ahead of the schedule that was adopted by our board a couple of years ago
- BARCT workshop hosted last week
- In 2018, they created a schedule to revisit each rule to ensure that they meet the BARCT requirements; if the rule needs to be revised, they will go through that process soon (like the 5 oil and gas rules to be considered in the near future)
- Assessments are ahead of schedule and everything is moving rapidly

Full Group Discussion (verbal and chat comments):

- Try to electrify equipment; efforts are currently underway
- Provide more explanation of Best Available Retrofit Control Technology (BARCT)
- We need electric public transportation for affordable housing communities
- We should still have the same approach as what was shared re: Port on enforcement on industries that are the top polluters with penalties and fines
- HVAC units and the running of AC is an issue; leverage technologies that use climate-friendly refrigerants

Question: What were the 32 rules that apply?

Answer: The 32 rules that apply are to very specific pieces of equipment, such as a combustion engine. 32 rules have been applied to those 100 facilities in the Valley. Under AB 617, a requirement applied to the district to put together a schedule with the intent of revisiting each of those rules under BARCT, in consideration of the cost and feasibility. Then a determination can be made on a rule by rule basis if it meets the state requirement of BARCT.

Answer: I think a more specific deep dive into the rules and regulations deserve more than just a couple of minutes on the agenda. We will work with the co-hosts to make sure that is on the agenda for the next meeting. We will bring a succinct list back to you and start identifying what kind of program it will be and what partners we'll need.

Community Air Monitoring Proposal

Jon Klassen, District

Jon presented a map of the proposed community air monitoring locations. Presentation highlights:

- We are proposing to put a PM 2.5 unit to measure PM 2.5 in real time, along with VOC measurements, just north of the Port of Stockton
- We are proposing to put an air monitoring trailer at the Port of Stockton—this would be the most comprehensive part of the air monitoring network
- We are proposing a PM 2.5 unit in Little Manila at the Crosstown Freeway because of all the traffic from diesel trucks and mobile exhaust
- We are proposing a PM 2.5 unit near Conway Homes and near El Dorado where there are a lot of emissions from cooking and barbecuing
- Last, we are proposing to put another compact multi-pollutant air monitoring system, which can measure PM 2.5, black carbon, oxides of nitrogen and VOC, downwind of the community
- This network design is not set in stone, but is a good start to implement; we can always shift some equipment during the monitoring campaign
- Our next step is to develop a community air monitoring plan, which will describe how the equipment will be operated and maintained
- Our goal is to have the air monitoring begin by January 2021

Question: Is there a reason why there is not a monitor in the Port versus across the street?

Answer: There are different fabrication shops in the area for cars and boats that produce VOCs and traffic types that cause PM 2.5, so we felt that measuring VOCs up there would be important.

Question: Does water algae get in the air as well and get monitored?

Answer: We will continue to do some research on this, but algae blooms cause different pollution levels of VOCs. We will have the ability to measure those samples and send them to a lab for more comprehensive analysis to break down if there are any impacts from algae in the area impacting air quality.

Chat Comment: A monitor near San Joaquin Elementary would be good. There's a lot of trucking companies in Charter Way and Fresno Ave.

Chat Comment: We need monitors that hold individual polluters accountable at the Port. I don't feel that the proposed monitors do that.

District Chat Answer: These are all regulatory grade monitors. As we collect the data, we can work to assess the source of pollution, respond to concerns, etc. Because these are of the highest quality, we can rely on the data.

Chat Comment: Will there be a short report out (document) of this proposed air quality monitoring work?

District Chat Answer: Yes! We will describe the details and purpose of the monitoring plan, the outreach plan, and quality control procedures.

Chat Comment: Big Concern: Community air monitoring plan but first you need to link to actual health outcomes. How much does the equipment cost? Should not move forward without knowing the economics and have some real cost benefit analysis.

Chat Comment: I'd like to request a budget be on the agenda next time. It's nice to think outside the box but we only have a few months so we will need to narrow down and cost is clearly a factor.

District Chat Answer: Yes, the plan is to bring budget info forward at the next meeting.

Chat Comment: When the CARB monitor moves, there will practically be no monitoring in East Stockton.

District Chat Answer: We can take that on as we continue our discussions with CARB. As the committee saw, CARB is planning to work with the CSC throughout the year to discuss the move and potential location. As we know more, we can work to supplement monitoring in that region after the move.

Wrap Up/Next Steps

Hanna announced that the next community co-hosts are Glenabel and Gloria. She thanked Douglas for being the community co-host. She sought volunteers for future co-host duties. Douglas expressed gratitude for everyone's participation.

There were no public comments via Facebook.

Agenda for Stockton Community Steering Committee Meeting #6

Wednesday, August 5, 2020 – 5:00 pm - 7:00 pm

Public Participation: Join via *Facebook Live* - www.facebook.com/valleyair

Comments and questions posted on Facebook or submitted to ab617@valleyair.org during the meeting will be addressed during the meeting's public comment period

Stockton Community Status Update (attached):

<http://community.valleyair.org/media/1752/stockton-status-update.pdf>

- 5:00 p.m. Welcome, Introductions**
Hanna Stelmakhovych, Facilitator, Institute for Local Government
Ryan Hayashi, Deputy Air Pollution Control Officer, Valley Air District
Douglas Vigil, Community Co-host, Stockton Community Resident
- 5:10 p.m. Introduction to Community Emission Reduction Program (CERP)**
Overview of CERP strategy components and timeline for developing measures to reduce air pollution from community sources of concern
Valley Air District Staff
- 5:20 p.m. Community Emission Reduction Program (CERP) Strategies Exercise**
Beginning the process to work with community on developing CERP strategies. Breakout discussions aimed at introducing and building upon strategies to reduce air pollution from the sources of concern discussed over the past several meetings.
Valley Air District Staff
- 6:35 p.m. Community Air Monitoring Proposal**
Community to consider air monitoring network design (attached) based on community input, looking to work with the committee to finalize plan.
Valley Air District Staff
- 6:50 p.m. Wrap Up/Next Steps**
Resident Community Steering Committee member stipends
Ryan Hayashi, Valley Air District
Hanna Stelmakhovych, Facilitator
- 6:55 p.m. Public Comment**

REMINDERS

- Next meeting September 2, 2020, via Zoom for CSC members and Facebook Live for public

To request Spanish interpreting services, please contact Jaime Holt or Heather Heinks at (559) 230-6000 or AB617@valleyair.org at least 7 days prior to the meeting date.

Proposed Stockton Community Air Monitoring Plan

-  **PM2.5 Monitor**
-  **Compact Air Monitoring System:**
 PM2.5
 Black carbon
 SO2
 NO2/NO
 VOC
-  **Trailer**
 PM2.5
 Black carbon
 Ozone
 CO
 NO2/NO
 H2S/SO2
 VOC
 Toxics
-  **CARB Monitor**
 PM2.5
 Ozone
 NO2/NO
 Toxics
-  **Mobile Monitoring Van**
 Drive on regular schedule throughout boundary and respond to community concerns

Summary of Stockton Proposed Air Monitoring

July 28, 2020

Section A

Monitoring Equipment:

- Real-time PM2.5 (**BAM 1022**)
- Toxics (VOC speciation sampling)

Comments:

- hard time breathing (VOC)
- nearby fabrication shops (cars, boats, etc) VOCs
- School near port.
- Another potential location for comparison monitoring. Lots of traffic on Acacia Street, east of hospital, lots of residential.
- Maybe a good occasional location for monitoring as we could compare with other more southern monitoring.
- I5 freeway, homeless encampment fires, dust (not sure where dust is from)

Section B

Monitoring Equipment:

- Real-time PM2.5, black carbon, ozone, CO, NO2/NO, and SO2/H2S (**Air Monitoring Trailer**)
- Toxics (VOC and PM2.5 Speciation Sampling)

Comments:

- Would like information from port pollution from the Port Authority
- Dust, Exhaust Emissions, What exactly goes through the port.
- Port, trucking and traffic pollution
- Charter way, truck idling, heavy industry in the area. High dust as well.
- Intermodal transport. Long wait times at traffic lights
- Intermodal transport. Can sit and idle for a few cycles
- see smoke from industrial facilities, smell seems to be from water and highway
- nearby biomass energy facility; nearby tomato drying operation
- Asthma concerns related to shipping emissions

- concerned with trucks getting on and off freeway
- VOC and NOx per District map
- Exhaust pollution from Port and Factories
- Would like two monitors in this area:
- One near the industrial area and one at the school
- aka Crosstown Freeway or Highway 4
- concern with entire freeway
- High diesel traffic, in the area.
- ask Stockton unified for monitoring site
- Past monitoring at this site, possible site for future monitoring.
- diesel particulates, VOC based on map data
- VOC: Darkest on Modeling Map Want to know where this is coming from
- Great area for a more permanent monitor, as near ports and freeways.
- Both A and B area Port Traffic:
- Cargo / Ships and Factories on Port Drive
- Diesel, Smoke, more widespread overarching monitoring.
- Toxic algae bloom as well as trucking routes

Section C

Monitoring Equipment:

- Real-time black carbon, NO/NO₂, SO₂, and total VOC (**Compact Air Monitoring System**)
- Real-time PM_{2.5} (**BAM 1022**)

Comments:

- Little Manila Community
- Lots of industry
- Lots of consistent traffic and DMW, Weber Institute HS and Children's Museum both in the area.
- Transmodal transportation. Long traffic light wait times
- Potential Good location, Traffic from cross-town, traffic from both BNSF and UP and the Slough.
- Eldorado truck route to Hwy 4
- Truck Exhaust
- UNIFIRST linen company does lots of industrial work, Cesar Chavez library also in this area and potentially a spot.
- Arena also driver for traffic as more activity.
- Seasonality related to baseball season
- At times very heavy traffic as is a hot spot for retail.
- Industry and trucking emissions
- Need a monitor for dark square PM_{2.5}

- Preschool, under freeway. Multiple schools in the area.
- High PM, large homeless populations

Section D

Monitoring Equipment:

- Real-time PM2.5 (**BAM 1022**), if CARB moves

Comments:

- Lots of traffic, close to the HWY 99 and HWY 4. Need one permanent station out in this area. Top pool building at the park might be a possibility.
- Current CARB site, possible site for monitoring as well.
- concern with emissions from busy street
- Intermodal transport and long wait times. Vehicle emissions.

Section E

Monitoring Equipment:

- Real-time PM2.5 (**BAM 1022**)

Comments:

- Down Wind from Industrial Area
- Not specific regarding location but need a monitor in this section.
- No Specific location: Along I-5 Corridor for road pollution
- School monitoring site.
- San Joaquin School might be another area to catch industrial source downwind issues.
- Need monitoring in this area, Waste Management, Republic Services and Van Co Truck Stop might be potential locations.
- Opportunity for monitoring here, but needs to be accompanied by a monitor close to industrial sources near Charter Way.
- Port emissions and industry emissions

Section F

Monitoring Equipment:

- Real-time PM2.5 (**BAM 1022**)

Comments:

- Taft Center: NOx and VOC's
- barbecue smoke
- Old waste landfill (methane?); I5 emissions
- Taft Elementary School. Also near truck traffic, trains, industrial sources.
- Just south of the outdoor BBQ places. Truck traffic, near trains, industrial area.
- Diesel and Smoke PM.
- Monitoring near school and neighborhood.
- Industry emissions
- lately a lot of homeless fire
- concern with PM2.5 based on District pollution map
- High diesel traffic.
- Freeway, truck washing, and trucking school near Huerta and Edison.
- Overall pollution
- Truck traffic:
- Char broilers
- We agree, on comment that it is indeed a hot stop.

Section G

Monitoring Equipment:

- Real-time black carbon, NO/NO2, SO2, and total VOC (**Compact Air Monitoring System**)
- Real-time PM2.5 (**BAM 1022**)

Comments:

- mariposa road traffic (using mariposa as bypass) and also Highway 4 (between 99 and I5); Stockton Dirt Track; high traffic on Charter way; emissions from Diamond Foods; also other smaller sources
- Lots of traffic from HWY 99.
- Eastern site for charter way monitoring.
- Transit and possibly airport pollution. Including the airport
- Industry south of area.
- Merlo School and CPFSJ Non-profit. Potential Locations as south of traffic corridors, trains, and fair grounds.
- Monitor everything from the community based on wind data.
- Low birth weight
- Air Port Fly Over area
- Idling trains
- port, airport, Trains

Mobile Monitoring Throughout Community

Monitoring Equipment:

- black carbon, NO/NO₂, SO₂/H₂S, and total VOC (mobile monitoring van)
- Mobile monitoring van will be used to provide early monitoring prior to implementation of stationary monitors and also to address other areas of concern within the community

Outside of Boundary

Monitoring Equipment:

- Impact to community already addressed by air monitoring within boundary

Comments:

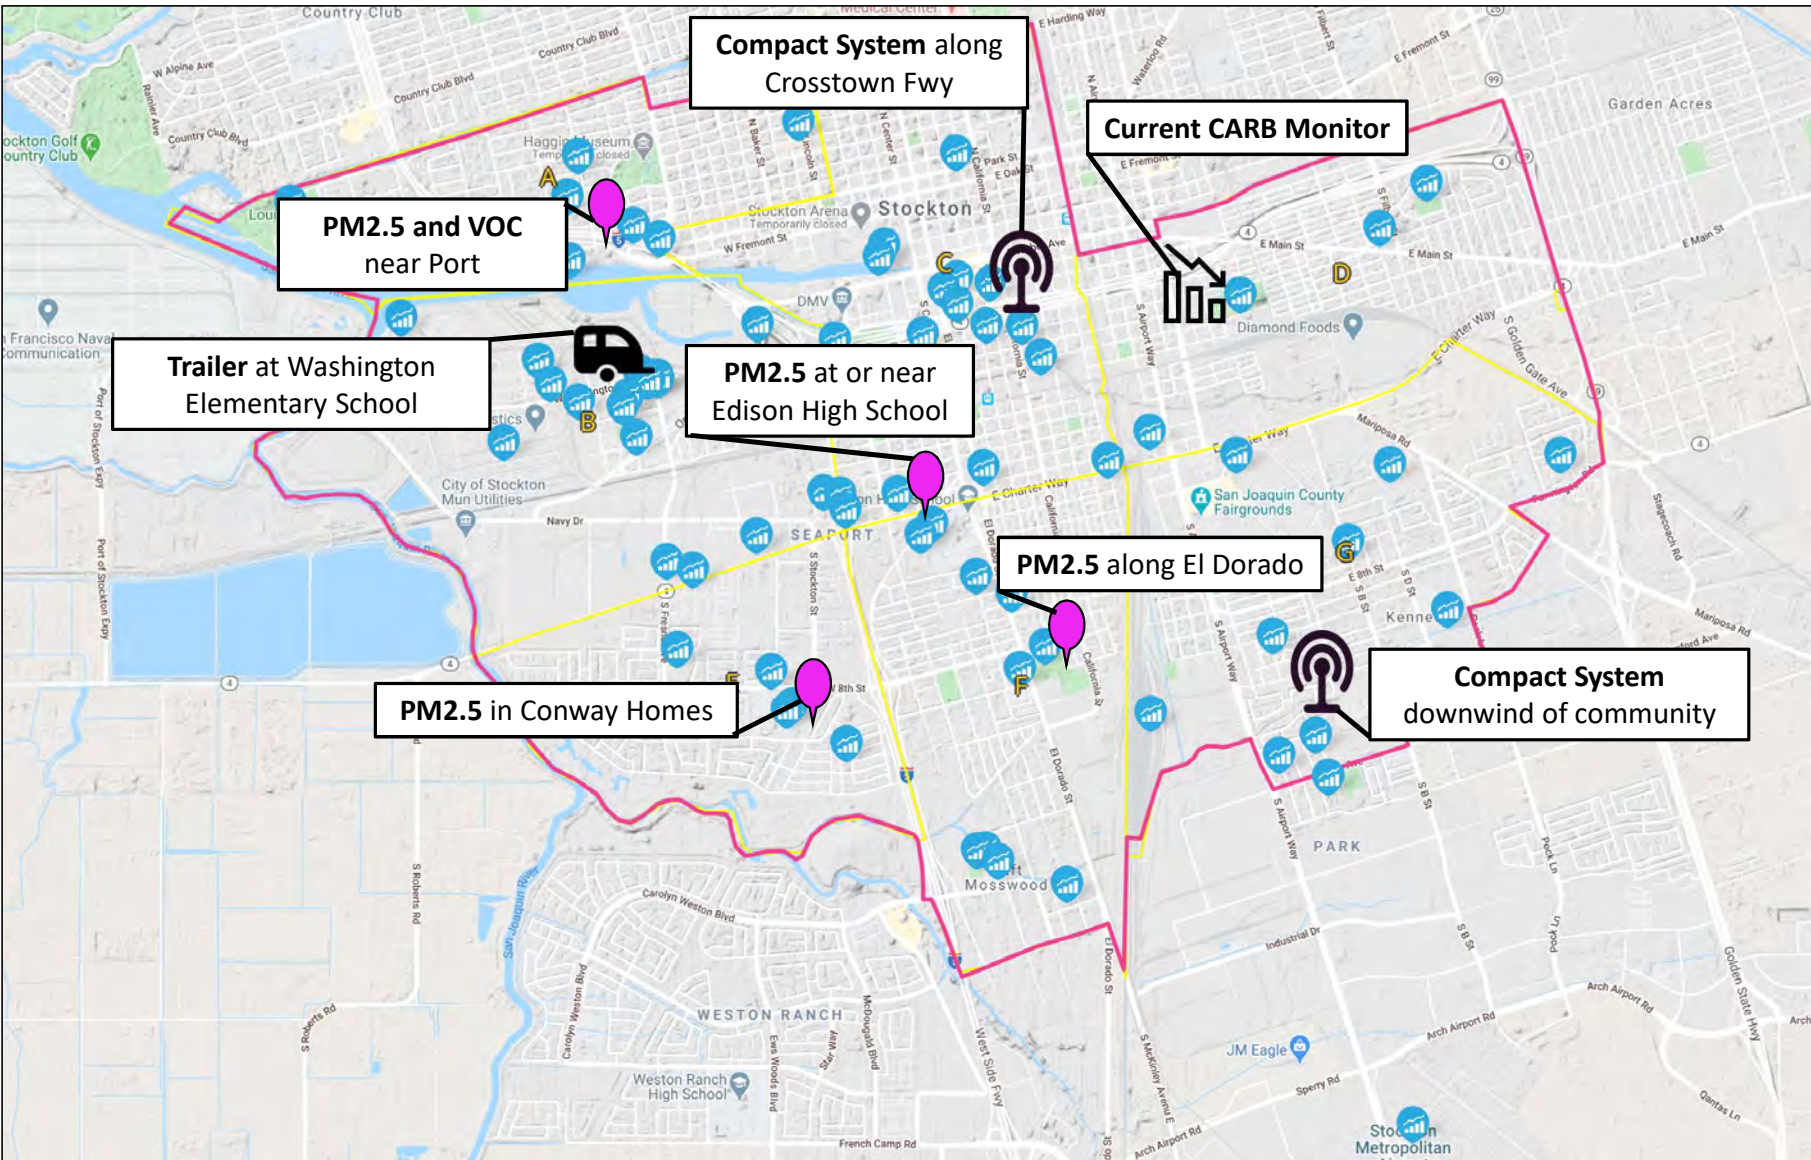

- Outside boundary, possible monitoring location. Heavy diesel traffic, food truck
- Community near distribution centers, heavy truck traffic.

- Past monitoring at this site, possible site for future monitoring.
- diesel particulates, VOC based on map data
- VOC: Darkest on Modeling Map Want to know where this is coming from
- Great area for a more permanent monitor, as near ports and freeways.
- Both A and B area Port Traffic:
- Cargo / Ships and Factories on Port Drive
- Diesel, Smoke, more widespread overarching monitoring.
- Toxic algae bloom as well as trucking routes

Section C

Monitoring Equipment:

- Real-time black carbon, NO/NO₂, SO₂, and total VOC (**Compact Air Monitoring System**)
- Real-time PM_{2.5} (**BAM 1022**)

Comments:

- Little Manila Community
- Lots of industry
- Lots of consistent traffic and DMW, Weber Institute HS and Children's Museum both in the area.
- Transmodal transportation. Long traffic light wait times
- Potential Good location, Traffic from cross-town, traffic from both BNSF and UP and the Slough.
- Eldorado truck route to Hwy 4
- Truck Exhaust
- UNIFIRST linen company does lots of industrial work, Cesar Chavez library also in this area and potentially a spot.
- Arena also driver for traffic as more activity.
- Seasonality related to baseball season
- At times very heavy traffic as is a hot spot for retail.
- Industry and trucking emissions
- Need a monitor for dark square PM_{2.5}

- Preschool, under freeway. Multiple schools in the area.
- High PM, large homeless populations

Section D

Monitoring Equipment:

- Real-time PM2.5 (**BAM 1022**), if CARB moves

Comments:

- Lots of traffic, close to the HWY 99 and HWY 4. Need one permanent station out in this area. Top pool building at the park might be a possibility.
- Current CARB site, possible site for monitoring as well.
- concern with emissions from busy street
- Intermodal transport and long wait times. Vehicle emissions.

Section E

Monitoring Equipment:

- Real-time PM2.5 (**BAM 1022**)

Comments:

- Down Wind from Industrial Area
- Not specific regarding location but need a monitor in this section.
- No Specific location: Along I-5 Corridor for road pollution
- School monitoring site.
- San Joaquin School might be another area to catch industrial source downwind issues.
- Need monitoring in this area, Waste Management, Republic Services and Van Co Truck Stop might be potential locations.
- Opportunity for monitoring here, but needs to be accompanied by a monitor close to industrial sources near Charter Way.
- Port emissions and industry emissions

Section F

Monitoring Equipment:

- Real-time PM2.5 (**BAM 1022**)

Comments:

- Taft Center: NOx and VOC's
- barbecue smoke
- Old waste landfill (methane?); I5 emissions
- Taft Elementary School. Also near truck traffic, trains, industrial sources.
- Just south of the outdoor BBQ places. Truck traffic, near trains, industrial area.
- Diesel and Smoke PM.
- Monitoring near school and neighborhood.
- Industry emissions
- lately a lot of homeless fire
- concern with PM2.5 based on District pollution map
- High diesel traffic.
- Freeway, truck washing, and trucking school near Huerta and Edison.
- Overall pollution
- Truck traffic:
- Char broilers
- We agree, on comment that it is indeed a hot stop.

Section G

Monitoring Equipment:

- Real-time black carbon, NO/NO2, SO2, and total VOC (**Compact Air Monitoring System**)
- Real-time PM2.5 (**BAM 1022**)

Comments:

- mariposa road traffic (using mariposa as bypass) and also Highway 4 (between 99 and I5); Stockton Dirt Track; high traffic on Charter way; emissions from Diamond Foods; also other smaller sources
- Lots of traffic from HWY 99.
- Eastern site for charter way monitoring.
- Transit and possibly airport pollution. Including the airport
- Industry south of area.
- Merlo School and CPFSJ Non-profit. Potential Locations as south of traffic corridors, trains, and fair grounds.
- Monitor everything from the community based on wind data.
- Low birth weight
- Air Port Fly Over area
- Idling trains
- port, airport, Trains

Mobile Monitoring Throughout Community

Monitoring Equipment:

- black carbon, NO/NO₂, SO₂/H₂S, and total VOC (mobile monitoring van)
- Mobile monitoring van will be used to provide early monitoring prior to implementation of stationary monitors and also to address other areas of concern within the community

Outside of Boundary

Monitoring Equipment:

- Impact to community already addressed by air monitoring within boundary

Comments:

- Outside boundary, possible monitoring location. Heavy diesel traffic, food truck
- Community near distribution centers, heavy truck traffic.

Stockton Community Emissions Reduction Program (CERP) Development

August 5, 2020
Community Steering Committee Meeting

Community Emissions Reduction Program (CERP)

CERP Guidance in CARB *Community Air Protection Blueprint*

<https://ww2.arb.ca.gov/capp-blueprint>

CERP Elements

Understanding the Community

Community partnerships and public engagement

What are the air pollution challenges facing the community?

What are solutions for these challenges?

Implementation schedule

Enforcement plan

Metrics to track progress over time

Upcoming CERP Development Process

TODAY (ongoing)

Measures and strategies brainstorm

September

Begin prioritizing CSC suggestions based on emissions reductions and cost

October

Results of prioritization, development of metrics

CERP Measures: Solutions to Air Quality Concerns

Incentives
Programs

Land Use and
Transportation

Enforcement

Enhanced
Outreach and
Mitigation

Future Meeting:
AB2588
(Facilities)

Future Meeting:
BARCT
(Rules)

CERP Measures Examples

Incentives Programs

District and CARB incentive funding exists to support expedited deployment of the cleanest technologies **beyond what is required by regulation**

Examples:

- Funding schools to replace old school buses with cleanest technology (i.e. electric)
- Funding to replace old, high-polluting locomotives with cleanest technology

CERP Measures Examples (cont'd)

Land Use and Transportation

District and CARB lack authority over land use or transportation plan development, therefore, these strategies focus on active engagement with these agencies to promote CSC clean air measures

Example:

-Work with City of Stockton planning department to include District and CSC in general plan updates

CERP Measures Examples (cont'd)

Enforcement

Enforcement of air quality rules and regulations is responsibility of the District and CARB (mobile sources). Identify and include near-term enforcement strategies to improve compliance with existing rules

Examples:

- Enhanced enforcement of illegal burning in community
- Enhanced enforcement of CARB anti-idling regulations for heavy-duty trucks

CERP Measures Examples (cont'd)

Enhanced Outreach and Mitigation

Despite some of the most stringent regulations in the nation and deployment of advanced emission reduction technologies, look to identify additional means to reduce localized air pollution exposure

Examples:

- Install vegetative barriers between a school and a nearby freeway
- Increased community education and outreach through multi-lingual fliers and workshops

CERP Strategies Brainstorm Exercise

Five breakout groups (focused on top concerns we've heard)

1. Mobile sources (trucks, cars, trains, etc.)
 2. Outreach/mitigation (vegetative barriers, more education, etc.)
 3. Community sources (cooking operations, road dust, etc.)
 4. Port of Stockton/ocean-going sources (trucks, boats, etc.)
 5. Stationary sources (facilities)
- Rotate through groups
 - Work with your host to discuss and brainstorm strategies in each of these groups
 - Strategies can be varied for each category

Meeting Highlights*

AB 617 Stockton Community Steering Committee Meeting #5

July 1, 2020 5-7 p.m.

Virtual Zoom Meeting

Action items for the Stockton Community Steering Committee:

- Email the Air District if interested in being a community co-host for a future meeting

Action items for San Joaquin Valley Pollution Control Air District:

- Bring to a future meeting any specific information about what types of monitors are available/being used and how many
- Post and share website information about fireworks and PM levels
- Consider updating the CSC roster and sharing with the group to help members connect and engage with each other despite COVID
- Before the next meeting, provide the CSC with information and/or a proposal about the cluster groups on the map reflecting feedback from the breakout groups
- Add truck routes and more information about where they are allowed to be to the agenda for the next meeting
- Add Future CARB monitor to the discussion agenda next month

Welcome and Introductions

Hanna Stelmakhovich, Institute for Local Government (ILG)

Ryan Hayashi, San Joaquin Valley Air Pollution Control District

Espe Vielma, Community Co-host

Hanna welcomed the Stockton CSC participants, went over Zoom instructions for participation, and thanked everyone for attending. Erica Manuel, CEO of ILG, handled the roll call. Ryan then thanked the attendees for participating in this important process and thanked Espe Vielma for volunteering to be the community co-host for the evening. Espe introduced herself, explained her role, and welcomed the community.

Introduction to Community Air Monitoring Exercise

Jessica Olsen, San Joaquin Valley Air Pollution Control District

Jessica explained that one of the two main components of the AB 617 program is to develop an air monitoring network, which will be part of a larger plan related to how the District is going to monitor on a community-wide scale. To begin this process, the District developed an exercise that builds on concerns already heard from the community. Presentation highlights:

- Every map has a breakout of sub-communities or community zones to help members envision different parts of the community
- The first map shows all the schools, medical facilities, and care facilities. The map has some wind direction information on it. The main wind direction is North West to South East, so pollution would likely travel in that direction
- The next three maps are a repeat of what was discussed at the last CSC meeting -- NOx, PM2.5, Diesel PM, and VOC emissions -- but this time the community zones are overlaid
- This is based on the inventory from all sources
- The next three maps show health indicators; the maps depict how the area ranks for asthma, cardiovascular disease, and low birth weight, based on the CalEnviroScreen tool
- The primary goal of the breakout groups is to look at the maps, talk amongst your groups, and start mapping monitoring suggestions with the help of the group facilitator

Hanna (facilitator) opened the discussion up for questions.

Chat Question: What is the potential future CARB monitor about on the first map?

Chat Answer: The first map depicts the potential future location of the CARB air monitoring station due to the demolition of the building where it is currently situated.

Chat Question: I am wondering why CARB decided to move it to that location, in NE part of the map.

Chat Answer: The location was chosen for several reasons, which include available power, site security, site access, in addition to several other factors.

Chat Question: I know that one of our buildings is getting demolished and rebuilt next door where the current monitor is. I know it is a trailer—does the community have input on the new location?

Chat Question: I saw the agenda and I hear you about placing the monitors, but HOW MANY monitors are we placing and what kind of monitors are they? What do they test?

Chat Question: How was the data collected? How were the zones divided (A-G)?

Chat Answer: The inventory is developed by collecting information from various facilities and models. This was based on 2018 data. The inventory development presentation from last meeting might help explain more. Located here:

http://community.valleyair.org/media/1710/final_tech-assessment-stationary-source-inventory-2020-06-03.pdf.

Chat Question: Is the future monitor something we can discuss further?

Chat Question: Are these updated current emission levels?

Chat Question: Moving the CARB air monitor to the North seems like a step backward since its current location is very close to the Crosstown Freeway. From what I understand, the CARB monitor is in a trailer. Why can't it be kept at the SJ Public Health facilities?

Chat Answer: We can definitely fill the gap if CARB decides to move that air monitor by placing a monitor nearby the old CARB monitor location. This will allow the committee (should you decide) to still have monitoring in that region. Let your facilitator know!

Chat Question: Is smoke always a good indicator of pollution? Because most of the map shows the most pollution at the Crosstown Freeway.

Chat Answer: Smoke is one indicator. You are correct in that the freeway is one of the largest sources, mostly due to heavy duty truck emissions.

Question: If we're talking about placing monitors, I'm wondering how many monitors and what kinds of monitors are they? How many of each kind do we have so we can have a more productive meeting and how is that determined? What is the budget we're working with? Are these donated to the state or this project? Do we have funding? I didn't see any data here about ozone. I am wondering what the priorities are?

Answer: We have a budget and we want to build where and what type of monitors based on the committee's feedback. The last time we did this, we kind of did it the other way around and it doesn't necessarily line up with what the committee is interested in. So today, the feedback we want is not just monitors placed, but if you can tell us where to place it and because of what concerns. That will help us develop what type of monitor will fit best there.

In terms of funding, we certainly have the funding for monitors big and small. The goal is to have the most refined, regulatory-grade monitors. No matter what comes of this, we will then develop our recommendations based on your specific locations and feedback and then we will come back to the committee with all of those specifics.

To your last point, we focused here on direct emissions, so things that we measure directly from a source --NOx, PM2.5, diesel PMs, VOCs -- those all have the ability to form ozone, so we didn't talk about ozone in particular, but what things form ozone. The easiest way to think about it is we are measuring stuff that comes out of a tail pipe, comes out of a smoke stack, comes off of a barbecue and ozone is not one of those things. Ozone has to be formed by those things. So we control those things by having an emissions reduction program and that would then limit the formation of ozone hopefully down the line.

Hanna (facilitator) gave thorough breakout group instructions for the CSC then handed off to Espe for any community co-host remarks.

Espe:

- You all are like captains and stewards of your communities, which is why you're on this committee
- The input you can provide is specifically where (in terms of the location) those direct emissions are coming from
- Focus on sharing where you have seen these potential emissions and staff will guide the mapping process
- For example, if you go down South El Dorado, there's a lot of smoke from a charbroiler, and that could be a location where a monitor could be. That is the type of input we need from you all
- Don't worry about all the other details, like the budget

Community Air Monitoring Exercise (Breakout Groups)

Participants were moved into five virtual breakout groups to discuss community air monitoring.

Breakout Group Debrief

Hanna (facilitator) asked the breakout groups to report back on their discussions.

Maps that had been updated in real time during the breakout groups were posted on the screen for everyone to see.

Group 1:

- Multiple people identified the Port and particularly Boggs Tract and Washington Elementary.
- Lots of people identified the cross town freeway, the Little Manila neighborhood, as well as in the southern border, especially public housing like Sierra Vista and Conway Homes.
- There was a concern that CalEnviroScreen data was from 2011 and 2013 and it might be much darker now given the passage of time.
- Some people noted concerns around I-5 and Charter Way as well.

Group 2:

- The Port and Washington School were a big focus of the discussion.
- Martin Luther King Boulevard along Charter Way to the west of I-5 is of interest because there's a lot of truck traffic on Highway 4 going east onto I-5.
- Charter Way near the fairgrounds has a lot of industry.
- Air monitoring as close to the airport, south of our area, but near the community center.
- Along I-5 South where Taylor School is and Conway Homes.
- El Dorado, where Espe took a video, has a lot of diesel trucks.

Group 3:

- The group identified everything from truck travel, ship travel, airplane travel, and more because there are lots of emissions in the area.
- Areas in section C and the middle section A and B.
- We have to have a safe place with electricity in order to have a monitoring site there.
- The group expressed some concerns about how the emissions maps were developed.

Group 4:

- The group began by exploring how to get a broad overview of the area for stationary monitors.
- Most pollution is pushing from the south, so we have to get coverage going from east to west; they looked at D and G quite a bit.
- They wanted to look at a differential; the hospital was an example as well as Cesar Chavez library.
- They found that there are quite a few school locations that could be secure sites and could be prime areas.

District:

- Lots of overlap with some of the challenges being seen at both Boggs Tract and Conway Homes, which is why a few locations were placed right on the south boundary.
- The Sierra Vista area with its railroad and truck traffic and the intersection of 99 and Highway 4 are all on the District radar.

Group 5:

- The group went through the whole map because the group had members that lived in different parts of the city.
- They began in A with I-5 and some possible fabrication north of the deep water channel. Definitely concerned about areas around Rough and Ready Island, Boggs Tract, and Washington Street. Some people mentioned Fresno Avenue to get into the Port area.
- Many are concerned with odors and dust so the group looked at East Main and Mariposa Road because there's a lot of truck traffic using that area as a bypass. They also discussed the Crosstown Freeway around 99, because there's a lot of backup and traffic there.

Espe:

- All of the groups had very robust discussions and were able to take deep dives into the areas.

- The community members are very familiar with the areas and the truck routes, fly-over zones, odors, cargo feed areas, etc.
- I'm excited that the blue dots can turn into an actual device that can help give us the data that we need and the kind of changes we want to move forward.

Jessica Olsen with the District:

- I took the map and designed cluster groups that represent a lot of the feedback we've received.
- The air monitoring team can really hone in on these clusters.
- Our plan is to take these specific comments and determine what types of monitoring we need. Before the next meeting, we will come back with a proposal based on these clusters.

Jaime Holt with the District: We socially distanced last Thursday and met in Stockton with several of you. We learned a little bit about the community and did some videotaping to put together a virtual tour. Thanks to all the people who took time out of their schedules to stand in the sun with us. Special shout out to Jonathan, who helped organize it. It will help educate our Air District team because we are not as familiar with this area and we want to better understand the issues and do as much as we can despite COVID.

Comment: Because of COVID, as a steering committee, we really aren't getting to know each other. Can the Air District update the roster and possibly add photos so we can know more about the participants and get to know each other even though we're only meeting once a month via Zoom?

Comment: I hope that at some point as we're going through this process that there's going to be an opportunity to have more education about how our stakeholders can get involved in reviewing projects and making comments. Our elected officials continue to approve projects that are adding to the air pollutants in our area. We need a next step nexus so we can have more activists involved in this issue.

Comment: In our small group, we talked about truck routes and getting more information about them and where they are allowed to be. I would like that in the next meeting.

Comment: In this meeting we did not have non-CSC members. How do the residents and CSC feel about having the public go on through Facebook?

Response: I think it's great to have the public involved as listeners. They can provide feedback to you guys that we haven't thought about.

Response: The St. George area is also my church and I represent many students who are residents. The breakout sessions were much more meaningful this time because we didn't have ten more participants in the group who were not actively participating.

Comment: I appreciated the swiftness of how the meeting was managed. The only place there was a little bit of a delay was the roll call. Can we make that section faster in the agenda in the future?

Question: How does everyone feel about fireworks coming out? I know there can be a lot of smoke and I wonder if the Air District will be able to monitor the atmosphere during the time of fireworks and fire crackers and illegal fire. Can we talk about it the following month if it happens?

Answer: I saw that Councilmember Fugazi just mentioned that Stockton is not doing fireworks this year, so that's good. We are very concerned about personal fireworks and their impact this year. We do think if you have health issues, your best bet is to be inside. We typically see a spike in our PM levels about 10 p.m. on July 4 and it stays up there until about midnight. While we can't outlaw fireworks, we do very much recommend that folks limit firework use and you can go to our website and see what the quality is like in your neighborhood.

Question: Fireworks have been happening in our area for two weeks already and it's hard on the animals. I would hope that in the next meeting we take 5-10 minutes for the whole group. I would like more information about the future CARB monitor. I think there are a lot of questions about the location that's being recommended.

Answer: I can briefly start to answer your question. The site is being closed and we have a search that we do to try to find a site that will accommodate the security and all the things you've become aware of. As we try to find a long-term lease, the site that is being proposed right now is the most viable site we were able to come up with at this point.

Comment: That's one of the cleanest areas in town--it kind of defeats the purpose in most of our minds.

Comment: I would like more information about the monitors; what type we will be getting and how many.

Chat Question: Why couldn't we put every type of monitor in every one of those sections?

Chat Question: How do we account for indoor pollution sources—smoking, dust, molds, BBQ? Are they in the same order of magnitude of external for resident's exposure? If so, we should spot monitor them too.

Wrap Up/Next Steps

Hanna: Our next community co-host is Douglas. If you are interested in being a future co-host, please type in the chat box to let us know. We would like to say thank you to Espe for being our community co-host this month. She took extra time to prepare for this meeting and to work with us. Much appreciated.

Espe: Thank you to everyone for your participation. Our input as community members is very important, so we can have input about what is taking place, what affects our air quality, our quality of life, and our health. For the commitment that you all have to this process, I applaud all of you. I think it is great to have such high interest across all of our geographic areas here in Stockton.

Hanna: The next meeting is August 5 via Zoom. All the presentations, meetings highlights, transcripts and the Zoom meeting recording will be posted online.

Public Comment

There were no public comments via Facebook Live.

**Refer to meeting audio to review the full details and comments from the meeting.*

Agenda for Stockton Community Steering Committee Meeting #5

Wednesday, July 1, 2020 – 5:00 pm - 7:00 pm

Public Participation: Join via *Facebook Live* - www.facebook.com/valleyair

Comments and questions posted on Facebook or submitted to ab617@valleyair.org during the meeting will be addressed during the meeting's public comment period

5:00 p.m.

Welcome, Introductions

Hanna Stelmakhovych, Facilitator, Institute for Local Government
Ryan Hayashi, Deputy Air Pollution Control Officer, Valley Air District
Espe Vielma, Community Co-host, Environmental Justice Coalition for Water

5:15 p.m.

Introduction to Community Air Monitoring Exercise

Review of monitoring exercise packets, explain upcoming exercise, and group Q&A
Valley Air District Staff

5:30 p.m.

Community Air Monitoring Exercise

Breakout discussions aimed at understanding individual monitoring priorities based on CSC member experience and the available technical information provided in packets.

Valley Air District Staff
California Air Resources Board Staff

Deliverable: Map of air monitoring location priorities in each group

6:25 p.m.

Breakout Group Debrief

1 min updates from each group, discussion of overall priority air monitoring locations
Hanna Stelmakhovych, Facilitator
Espe Vielma, Community Co-host

Deliverable: Map of collective monitoring location priorities from the whole committee

6:45 p.m.

Wrap Up/Next Steps

Hanna Stelmakhovych, Facilitator

6:50 p.m.

Public Comment

REMINDERS

- Next meeting August 5th via Zoom for CSC members and Facebook Live for public

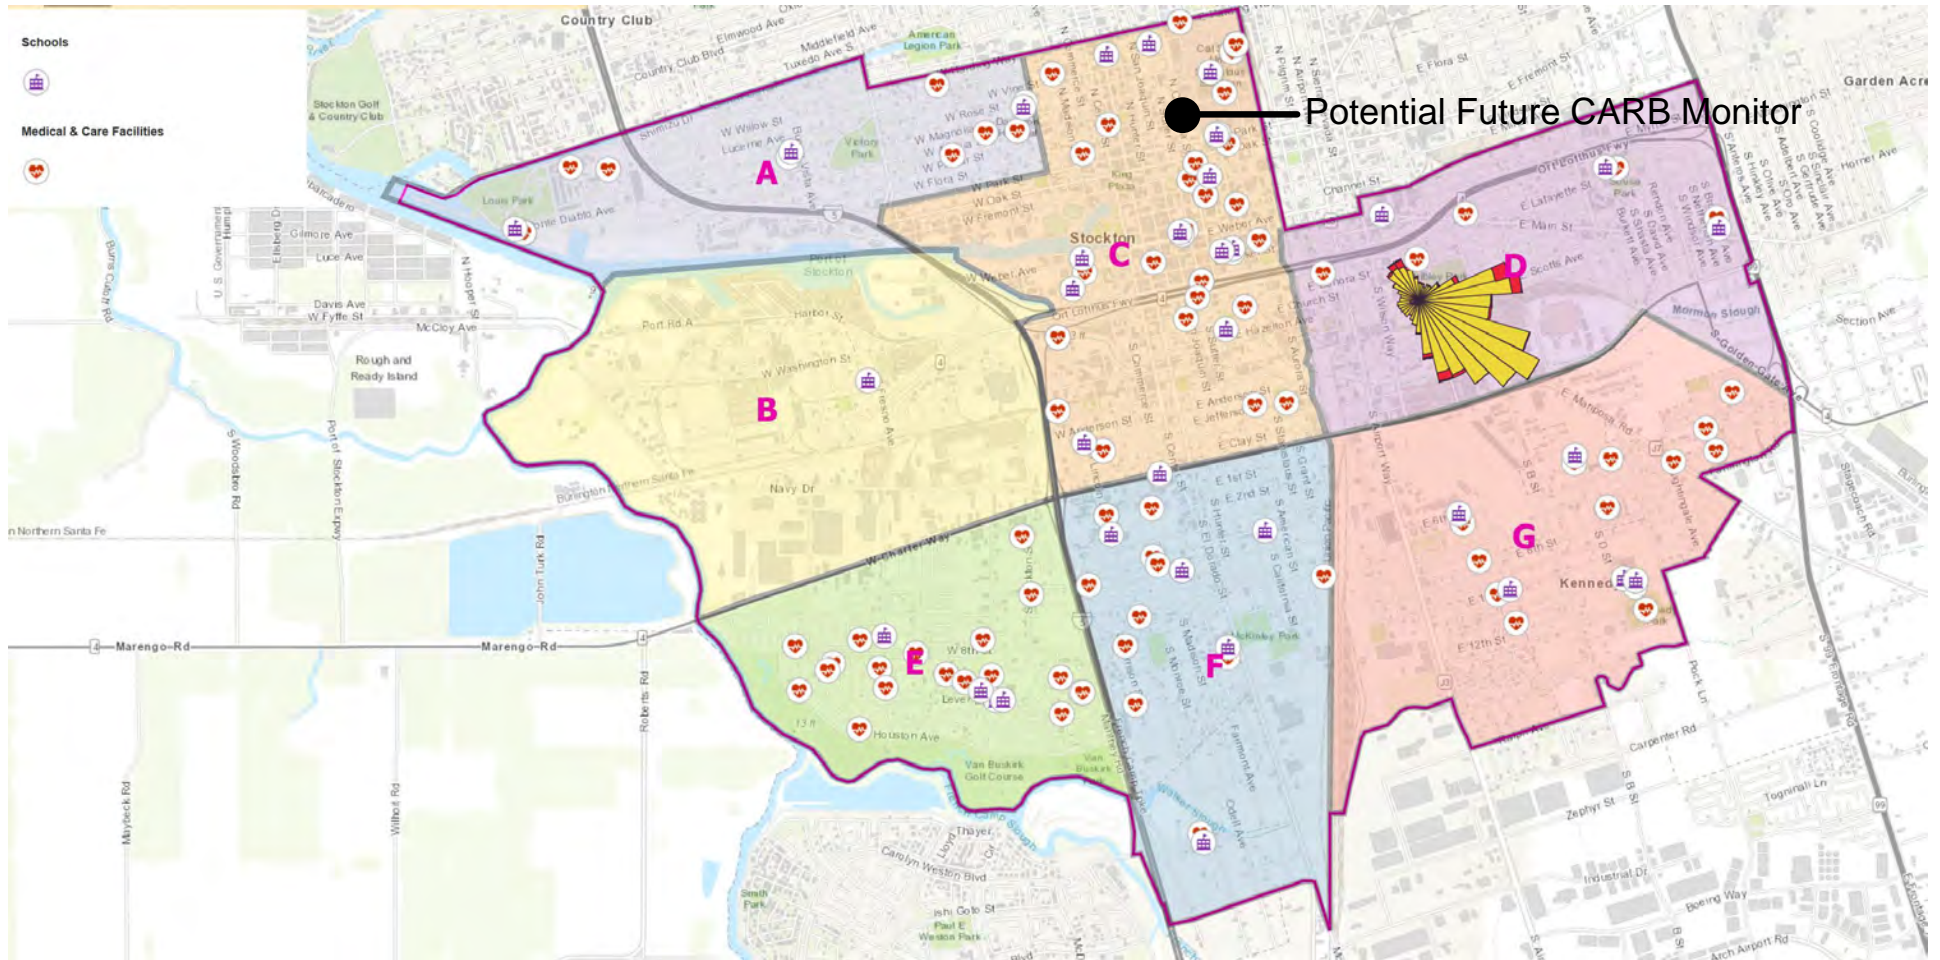

To request Spanish interpreting services, please contact Jaime Holt or Heather Heinks at (559) 230-6000 or AB617@valleyair.org at least 7 days prior to the meeting date.

Community Monitoring Zone	Mark Top 4 Priorities	Monitoring Type (select one)		Location	Sources	Pollutants (select any/all that apply)				
		Continuous Monitoring (all the time, everyday)	Intermittent Monitoring (certain times of day, or days a week)			Exhaust	Smoke	Dust	Odor	Other
10										
11										
12										
13										
14										
15										

Pollutant Descriptions:

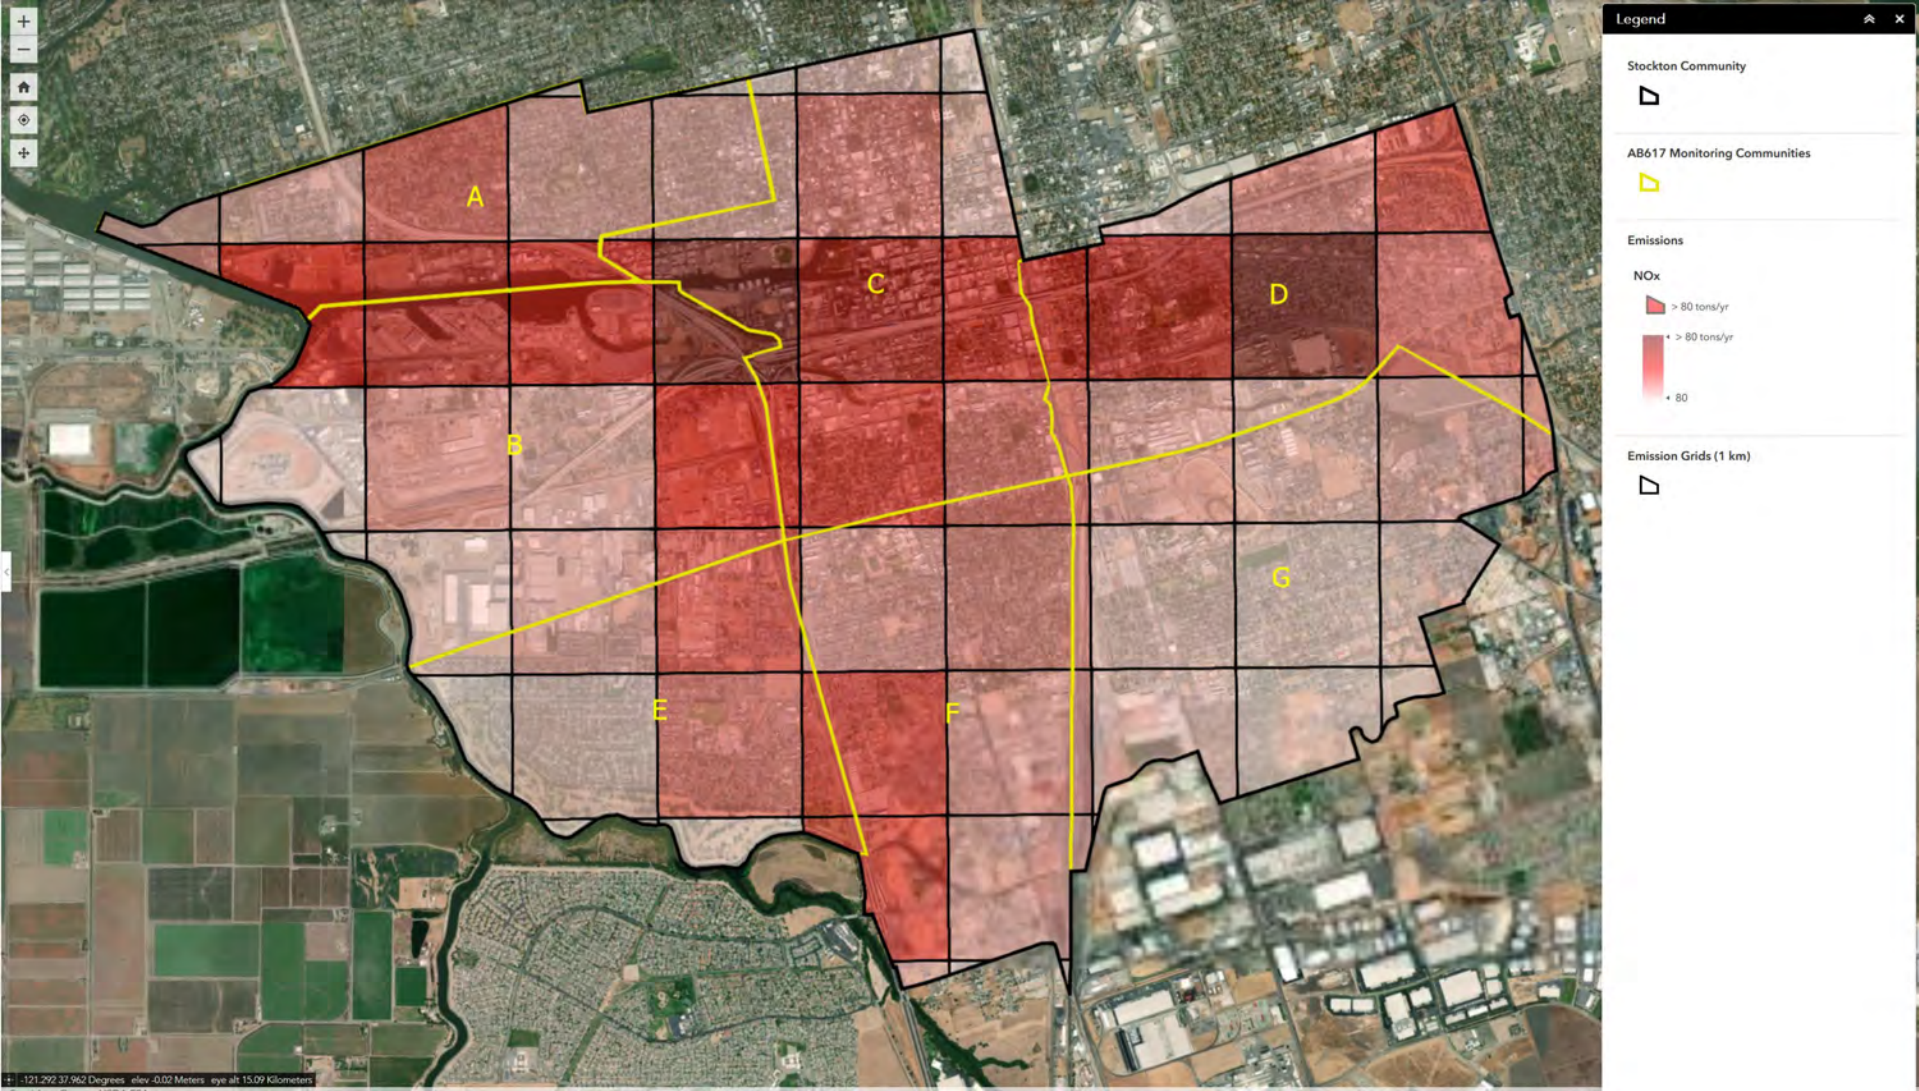

Exhaust	Can vary depending on fuel combusted (Natural Gas, Bio Mass, Bunker Fuel, Gasoline, Diesel) : Nitric Oxides (NO, NO ₂ , NO _x), Carbon Monoxide (CO), Sulfurs (SO ₂ & H ₂ S), Volatile Organic Compounds (VOCs), Benzene/Toluene/Ethylbenzene/ Xylenes (BTEX), PM2.5, Black Carbon (Diesel Particulate Smoke)
Smoke	Clean Dry Wood: PM10 & PM2.5 Trash or Other Materials: PM10 & PM2.5
Dust	PM10 & PM2.5
Odor	Volatile Organic Compounds (VOCs), Benzene/Toluene/Ethylbenzene/Xylenes (BTEX), Sulfurs (H ₂ S & SO ₂)
Other	Please be as descriptive as possible if not clearly identifiable. Smell, color, weather conditions when you notice it, time of day, etc. the more information the better.

Schools, Medical Facilities, and Care Facilities

5-year average Wind Speed and Direction
Wind is usually blowing from Northwest to Southeast
Wind rose on map at current CARB Stockton Monitor
Will move to new site due to planned building demolition

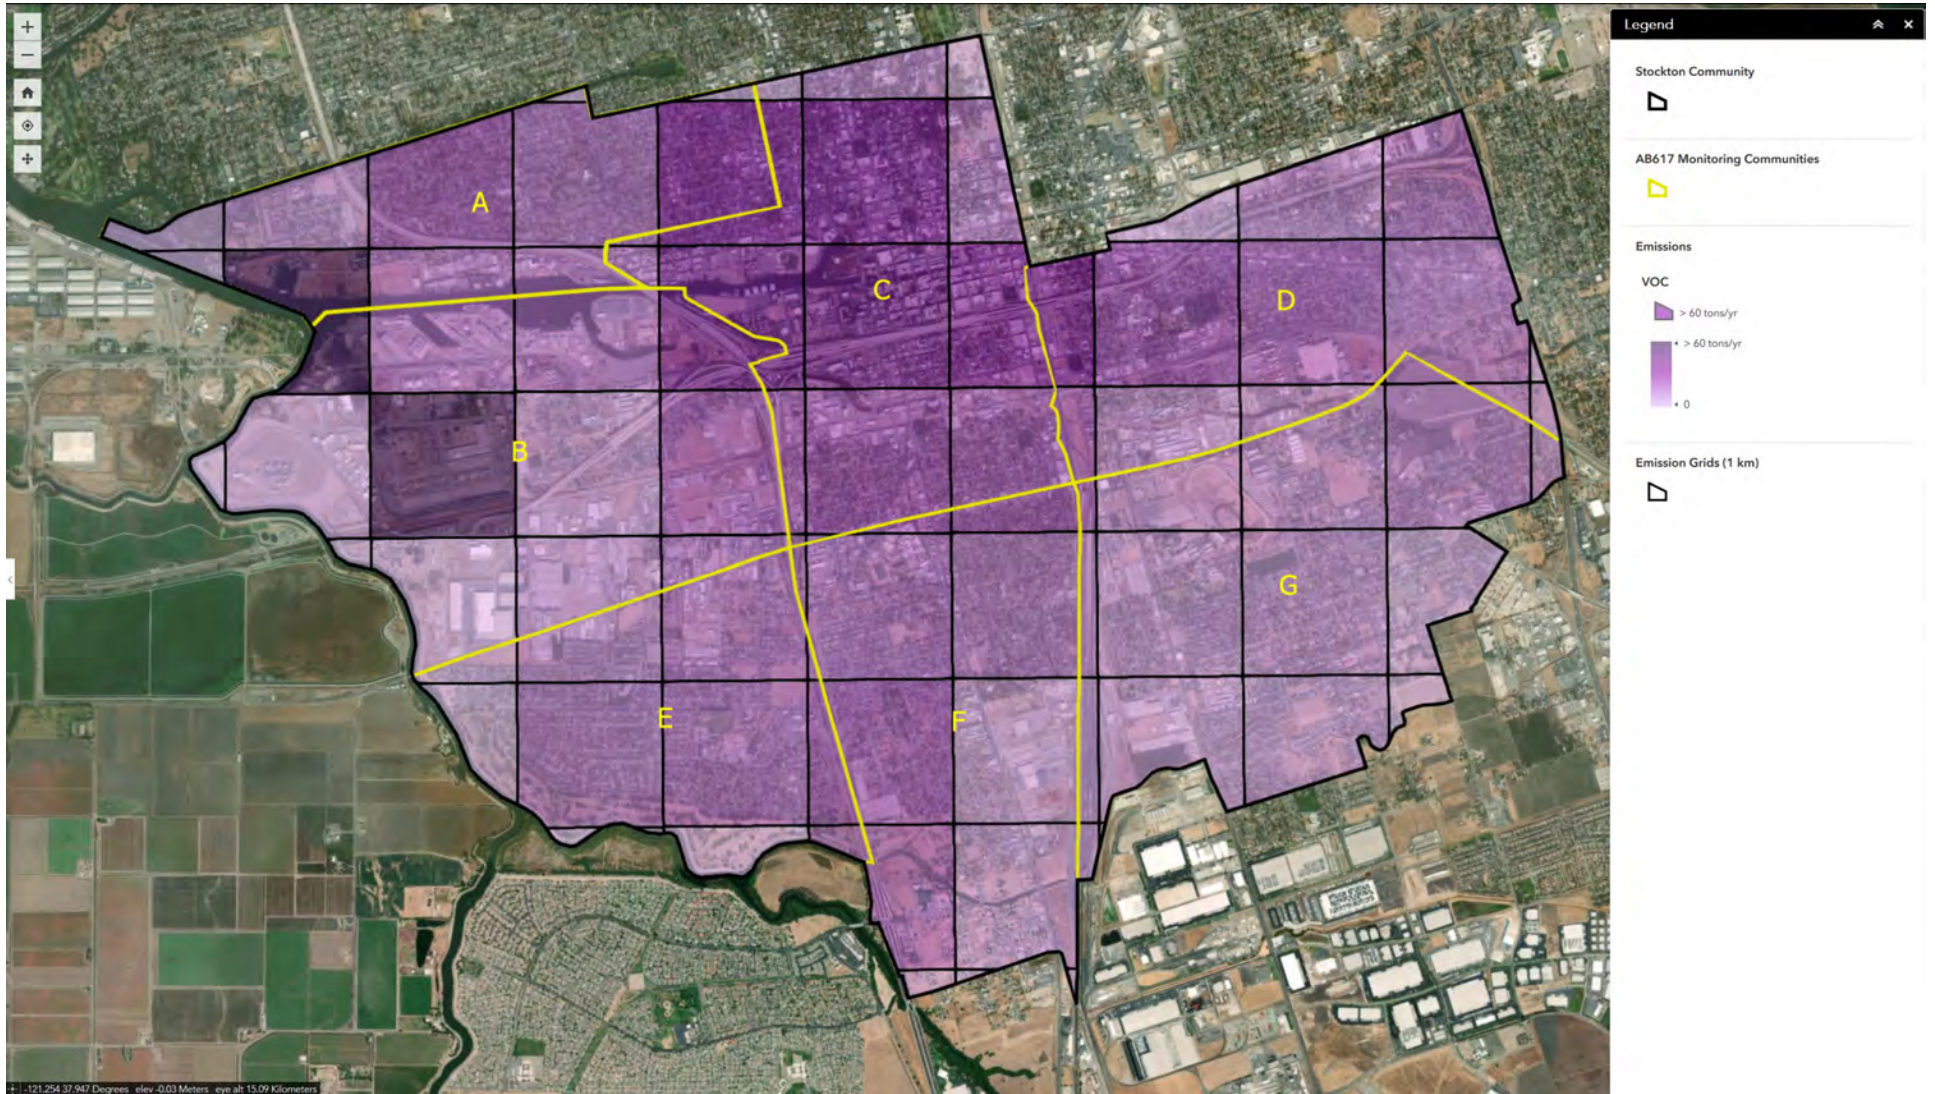

NOx Emissions

Diesel Particulate Emissions

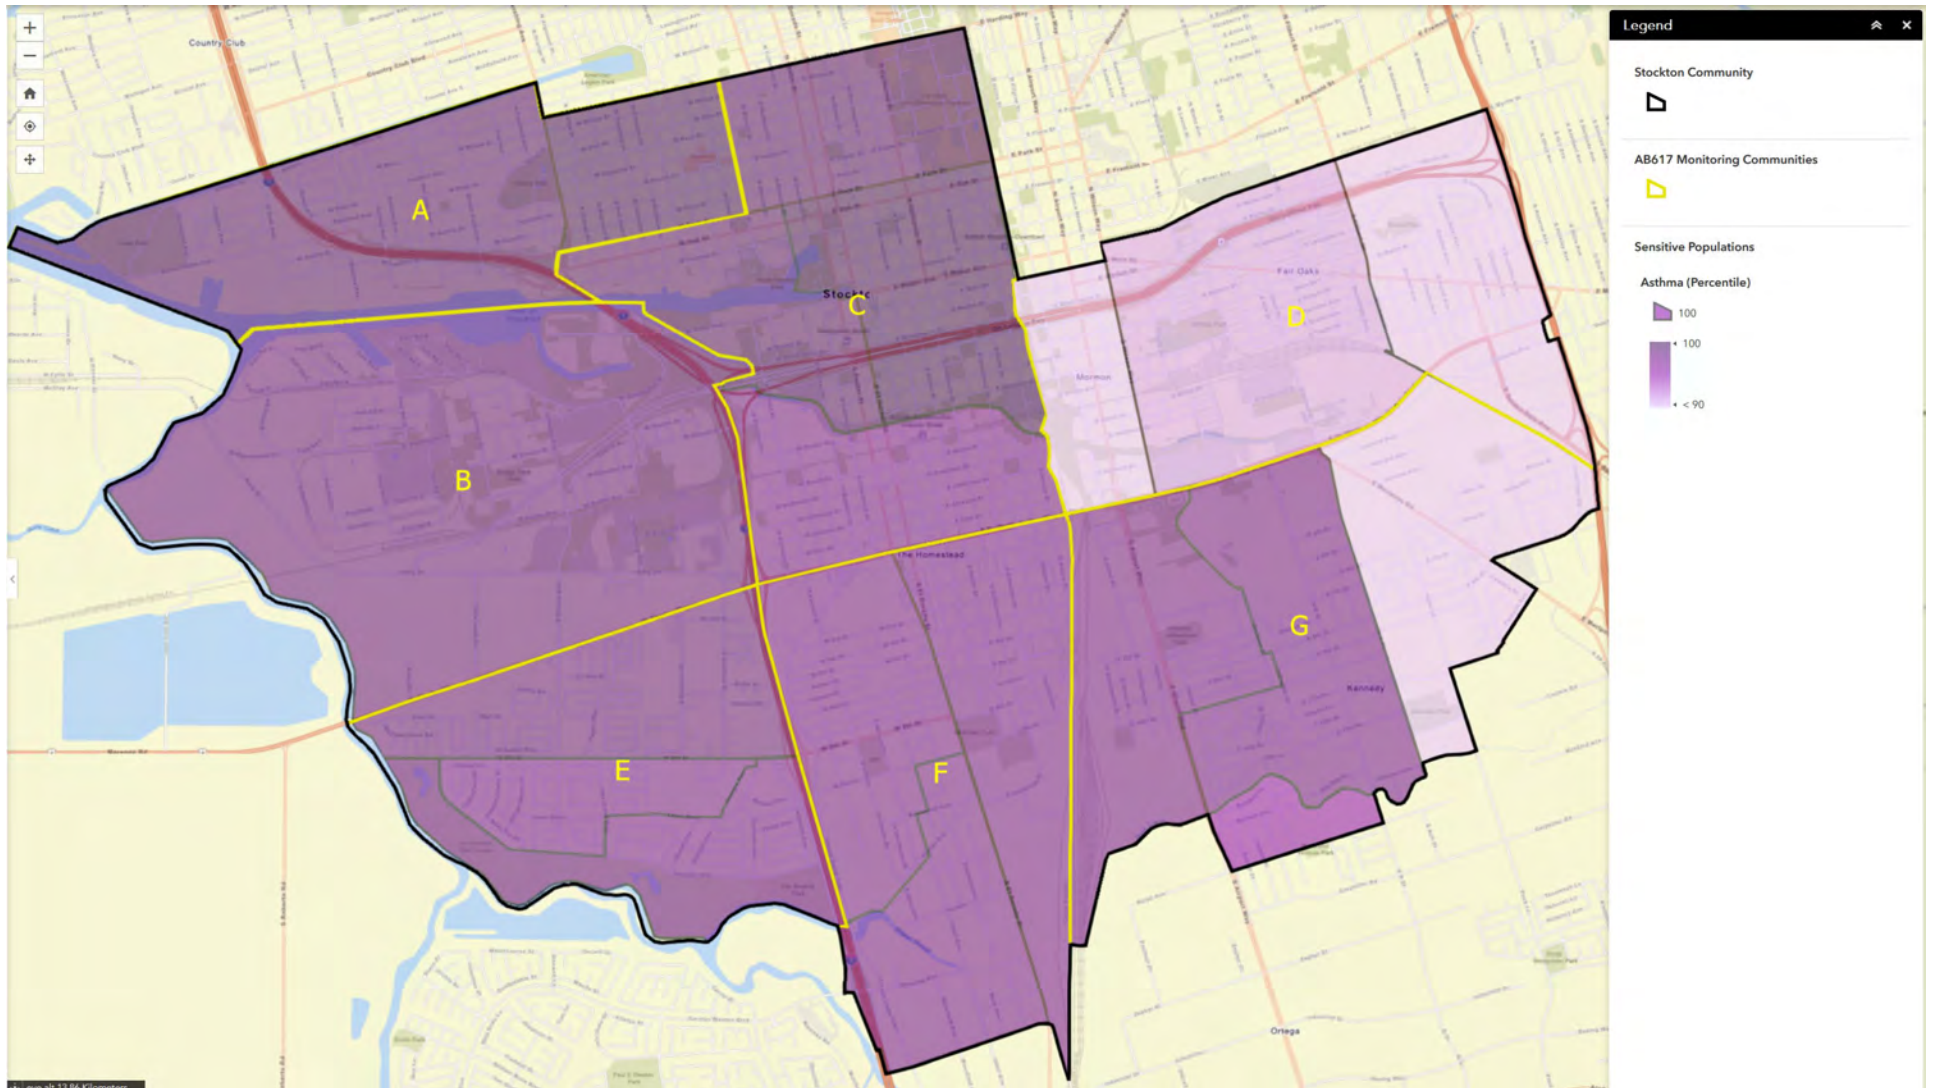

Volatile Organic Compound (VOC) Emissions

ASTHMA INDICATOR

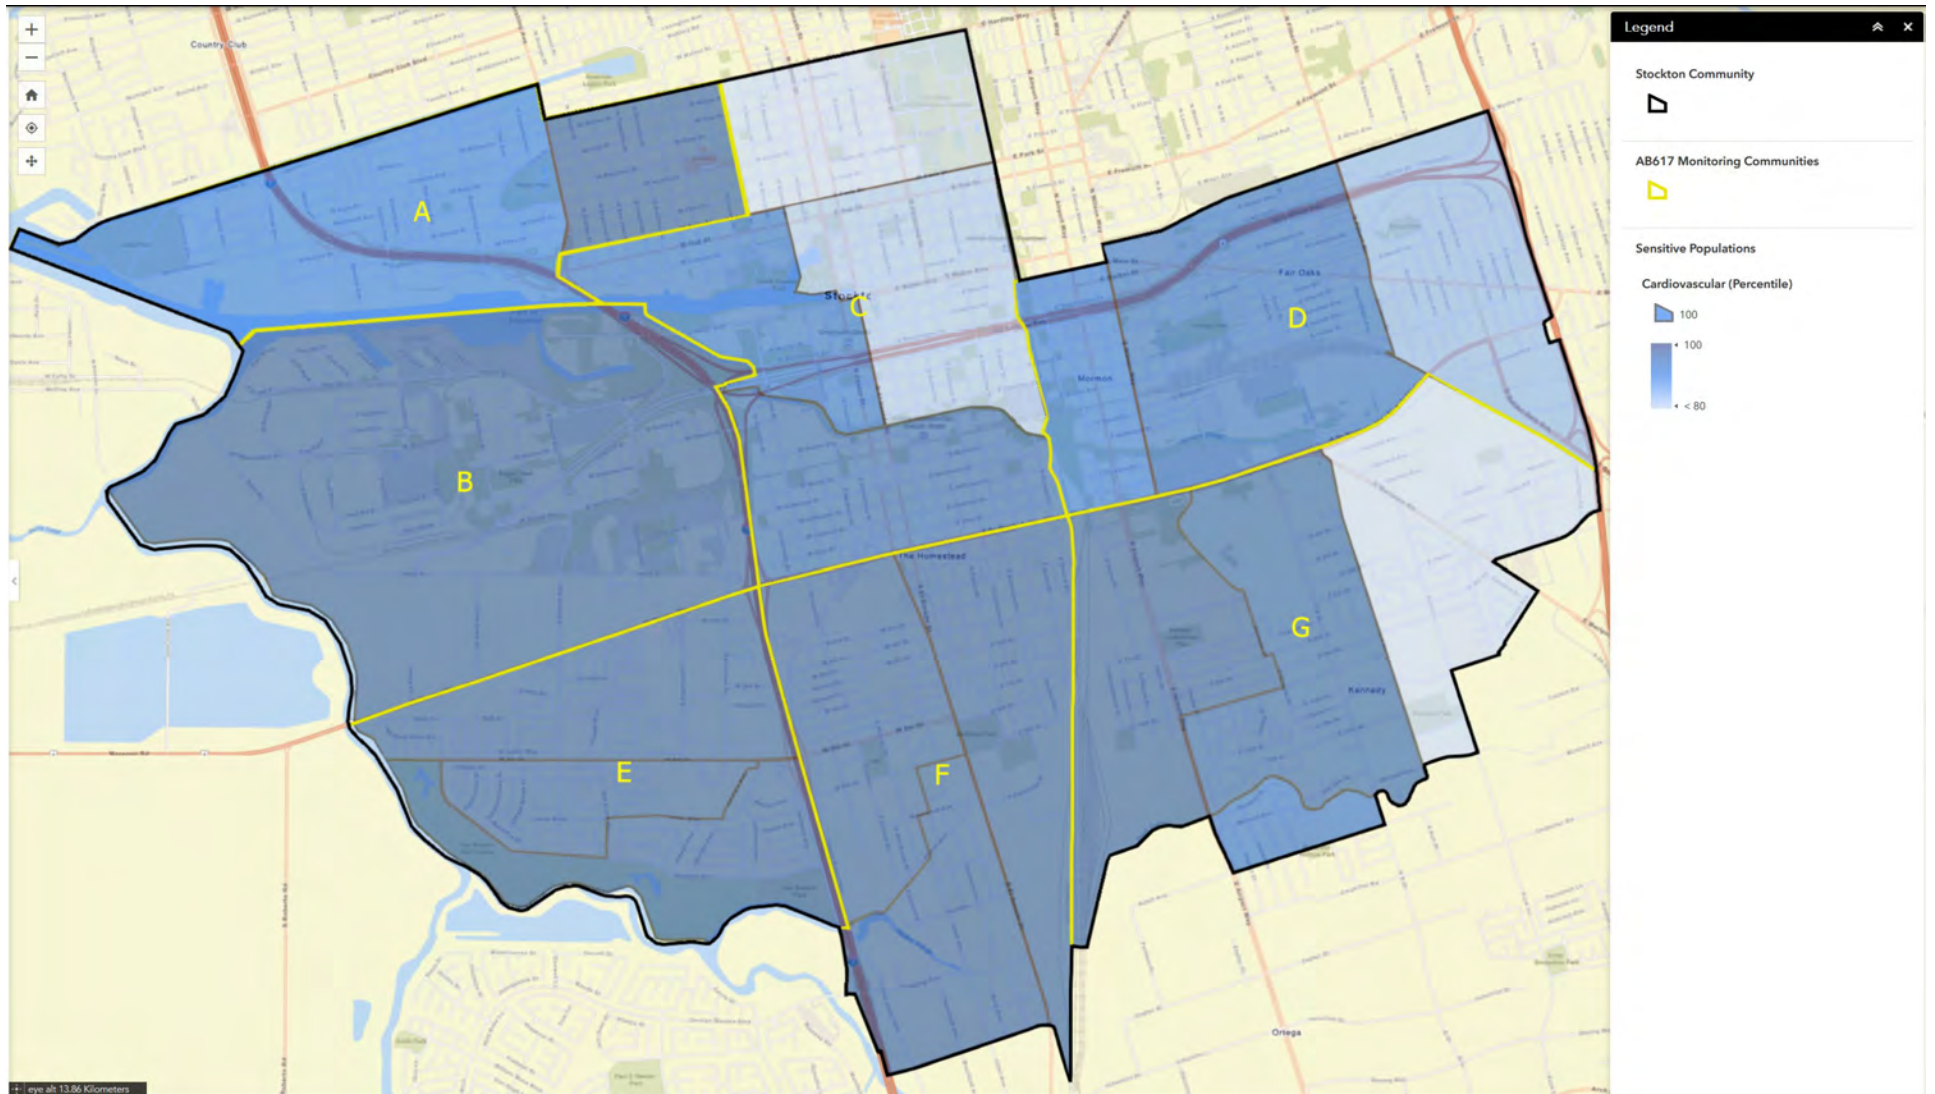

Spatially modeled, age-adjusted rate of emergency department visits for asthma. Averaged over 2011-2013. CalEnviroScreen 3.0, percentile compared to all of California

CARDIOVASCULAR DISEASE INDICATOR

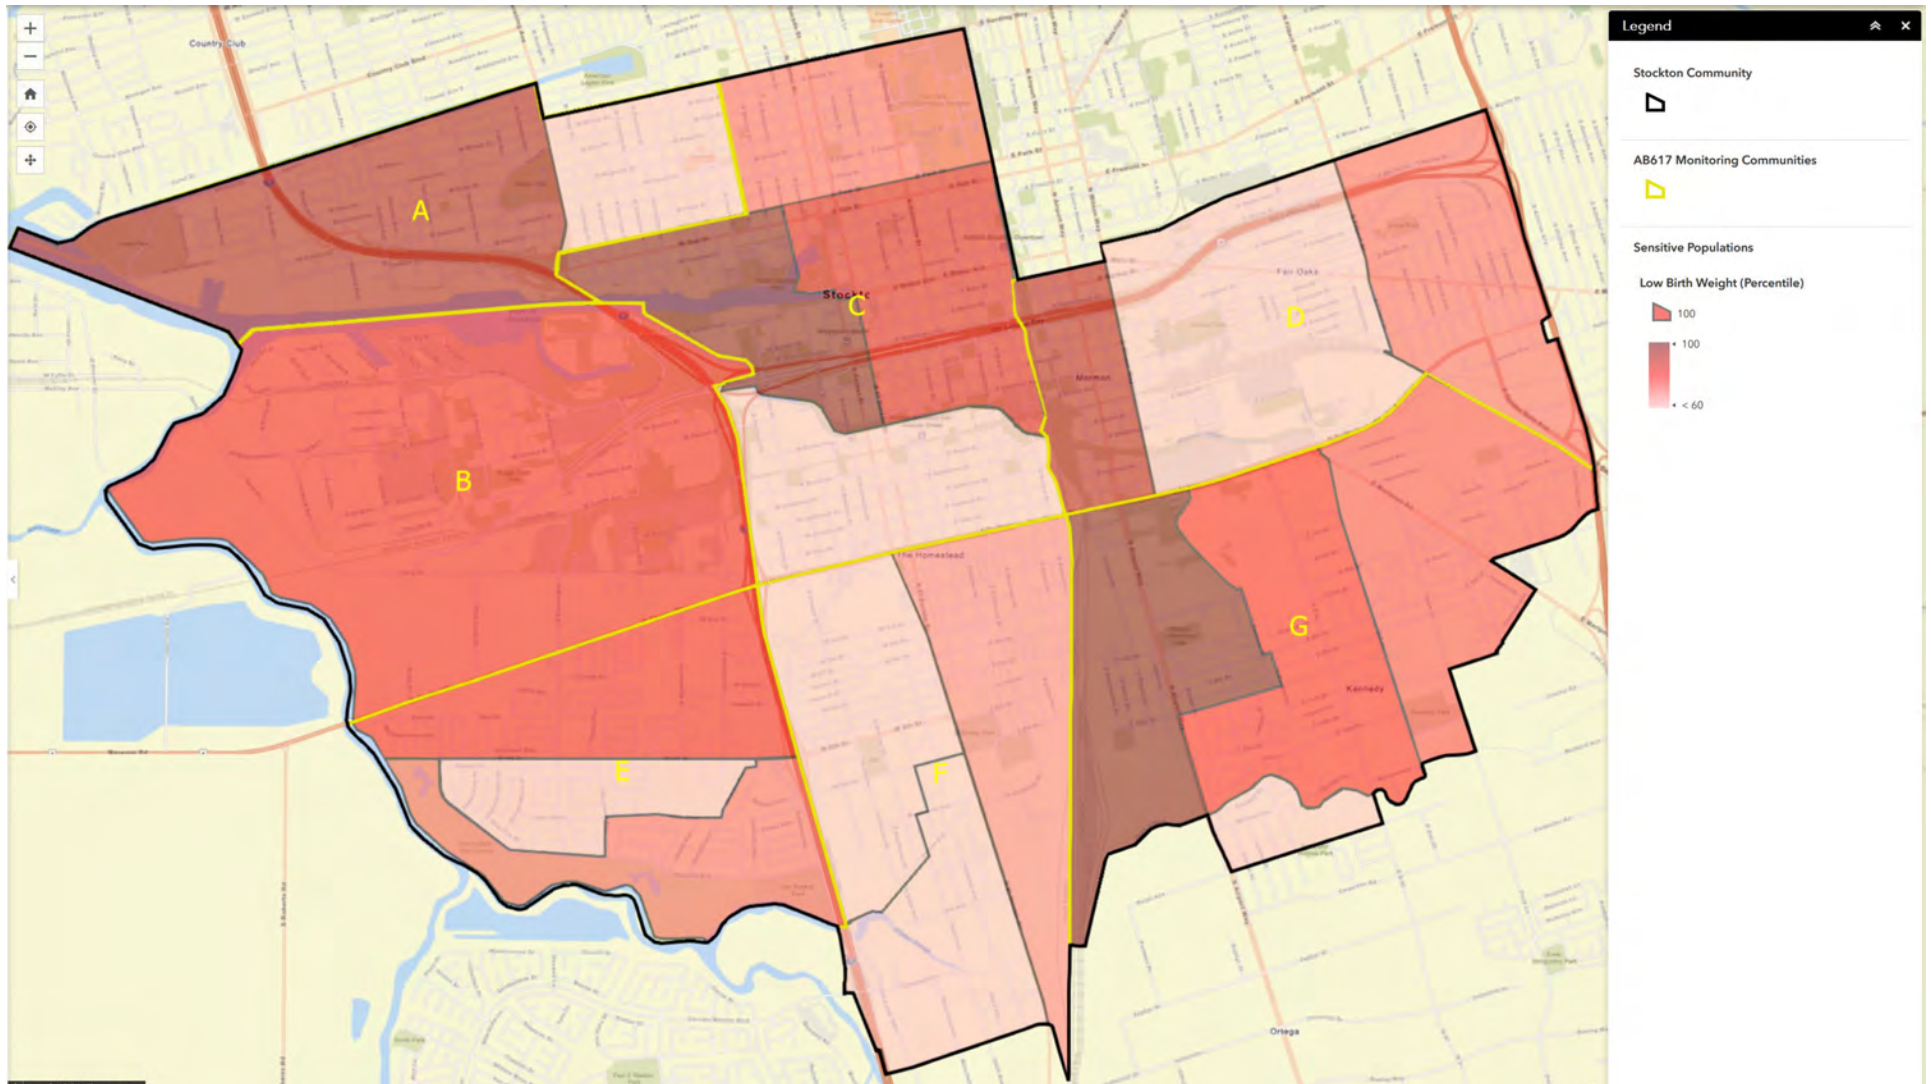

Spatially modeled, age-adjusted rate of emergency department visits for acute myocardial infarction (AMI).
Averaged over 2011-2013.

CalEnviroScreen 3.0, percentile compared to all of California

LOW BIRTH WEIGHT INDICATOR

Percent low birth weight. Averaged over 2005-2012.
CalEnviroScreen 3.0, percentile compared to all of California

Meeting Highlights*
AB 617 Stockton Community Steering Committee Meeting #4
Wednesday, June 3, 2020, 5 p.m.
Zoom Virtual Meeting

Action items for the Stockton Community Steering Committee (Committee):

- Share air pollution emission sources of concern with the Valley Air District and/or CARB to further improve the inventory.
- Committee members who have not yet shared their preferred meeting time preference should contact the Valley Air District ASAP.

Action items for the San Joaquin Valley Air Pollution Control District (Valley Air District):

- Compile information about air quality concerns shared by the Committee members and make the information publicly accessible.
- Strive to build in more time for Q&A after presentations and allocate additional time for the breakout group discussions in future meetings.

Welcome, Introductions

Christal Love Lazard, Facilitator, Institute for Local Government

Ryan Hayashi, Deputy APCO, San Joaquin Valley Air Pollution Control District

Mariah Looney, Community Co-host, Restore the Delta

Christal welcomed Committee members, members of the public, provided Zoom instructions for the meeting and did the roll call.

Committee members participated in the poll to identify their preferred meeting time. Those who did not have an opportunity to use the poll were invited to express their preference via the chat box or let the Valley Air District know so that the Valley Air District can follow up:

- 3:00pm-5:00pm – 8 votes
- 4:00pm-6:00pm – 8 votes
- 5:00pm-7:00pm – 10 votes

Ryan welcomed the participants and thanked everybody for working together to identify the sources of air quality concern using the online tool provided. Mariah thanked participants, CARB and Valley Air District for their support organizing these meetings, especially considering the state of the world.

Community Emissions Inventory/Historical Air Quality Overview

Jon Klassen, Director of Air Quality Science and Planning, Valley Air District

Alejandra Cervantes, Air Quality Planning and Science Division, CARB

Arnaud Marjollet, Director of Permit Services, Valley Air District

Valley Air District and CARB staff led the discussion to review emissions from mobile, area wide and stationary sources within the Stockton AB 617 boundary. Presentations highlights:

- Stockton-Hazelton site operated by CARB and is part of the Valley's regulatory air monitoring network. Ongoing air monitoring operations at this existing site provide valuable data that will be used to complement the community air-monitoring network under development with the Committee. Historical data for this site is available on the CARB website

<https://www.arb.ca.gov/aqmis2/aqmis2.php>

- Decades-long air quality trends in the Stockton community demonstrate continued reductions in concentrations of criteria pollutants (Ozone, PM2.5 Carbon Monoxide, Nitrogen Dioxide) and toxics (Benzene, 1,3-Butadiene, Lead). Through the AB 617 process, the Committee will work together to identify and address localized air quality issues through the development and implementation of various strategies.
- Top major contributors of emissions in South Stockton
 - Nitrogen Oxides: off-road equipment, heavy-duty vehicles, trains, manufacturing and industrial and ocean going vessels (source specific to the Stockton area);
 - Particulate Matter 2.5: off-road equipment, light-duty vehicles, cooking;
 - Reactive Organic Gases: consumer products, recreational boats, light-duty vehicles;
 - Diesel Particulate Matter: off-road equipment, heavy-heavy duty vehicles.
- Emission inventory data are made up of three major categories: mobile sources (trucks, cars, tractors, boats, off-roads), stationary sources (industrial sources, manufacturing facilities, food processors, and area wide sector (residential fireplace, consumer products).
- CARB collects and processes emissions inventory data from Mobile Sources and about area wide sectors. Valley Air District collects and processes emissions inventory data from Stationary Sources on a regular basis.
- Emissions inventory data for South Stockton is displayed on the Stockton Community website – <http://community.valleyair.org/selected-communities/stockton>

Chat Question: All the trends seem to show significant improvement, but subjectively, it does not seem to have improved that much. How do these measurements compare to other locations, i.e., Modesto or Merced?

Chat Answer: We have seen significant improvements in air quality across the Valley throughout the air quality data record, including Stockton. Although we have had great improvements, there is certainly still work to be done to continue improving air quality across the region.

Chat Question: Can you explain what architectural coating is?

Chat Answer: Architectural coatings include primarily a mix of paints, coatings, and lacquers as well as additives and cleaning solvents related to any housing or buildings.

Chat Question: Could you give more details on what goes in the off-road sources category?

Chat Answer: Other off-road mobile source examples are boats, port equipment, forklifts, trains, etc.

Chat Question: On the commercial cooking, how many facilities and is there a particular type of facility that has higher emissions?

Chat Answer: The Valley Air District has an inventory of certain types of restaurants, for example, restaurants with charbroilers, however, it is not comprehensive for all cooking emissions. For the information, the Valley Air District relies on the overall cooking emissions inventory for the community.

Chat Question: On the PM 2.5 graphs, area source shows 46% cooking & mobile sources, 39% off road equipment. However, this does not really tell us what percentage of total each contributes. Is there a graph that compiles them?

Chat Answer: The graph on the slide 4 of District's Update on Stationary Source Emissions Stockton

Community presentation will help clarify the relative contribution of all sources for each pollutant.

Chat Question: Since the COVID-19 and stay home, has there been any significant change in emissions?

Chat Question: Does the model include buildout of general plan?

Jessica Olsen emphasized that these presentations are just an introduction. She explained that additional discussions would take place in the breakout groups with CARB and District staff available in each group.

Sources of Air Quality Concern

Jessica Olsen, Program Manager, Analysis, Modeling, and Research, Valley Air District

Jessica reviewed the air quality concerns [map](#) and showed how to make a comment. Committee members were then moved into the breakout groups to discuss air quality concerns regarding mobile sources.

After the breakout group discussions, each group reported some of the local air quality concerns they discussed:

- Group 1 discussed truck idling in particular neighborhoods; PM2.5 spikes during the wildfire, weatherization opportunities, port activities (freight, sea and land transportation), and vegetative barriers for the air filtration.
- Group 2 had similar concerns. Additional concerns were burning (homeless encampments, illegal burning, and grass fields including those behind residential homes), Boggs Track area near the port and the school in that area (indoor and outdoor air quality as a lot of trucks drive by); airport traffic (trucks and planes) as Amazon is adding capacity.
- Group 3 discussed concerns related to the Boggs Track area, specifically the George Washington Elementary school in this area as well as the expansion of the port and increasing truck traffic and the wind blowing dust from unpaved areas.
- Group 4 talked about emission inventory and monitoring. One of the concerns identified was the lack of monitoring in the area, particularly in the areas with informal settlements by the railroad. Monitoring is needed by Lincoln street closer to DMV.
- Group 5 shared concerns about trucks idling overnight at the DMV parking lot (more often in the winter). The new City Hall will bring more traffic. The University of Pacific vehicles are older models. There are a lot of concerns about port activities and how they impact the Washington Elementary school. There was a question about cooking data as it relates to separating chain versus non-chain restaurants. Lawn equipment is another category. The group also discussed homeless fires and how to prevent them.
- Group 6 talked about truck emissions, idling at the truck wash and French Camp Turnpike, traffic near schools (St George) and the port of Stockton. The group indicated some odors from a company off Highway 5 and Highway 9. Another concern is open fire cooking emissions from an open BBQ trailer near the supermarket that affects the St George and McKinley Elementary school areas. There is open fire cooking occurring in a community of people experiences homelessness that is concentrated in the south and east area and right behind St George school. The group discussed potential measures such as urban greening, color panels, bike trails to improve air quality.
- Group 7 discussed air quality concerns associated with smoke from cooking, including in the South Stockton; idling trains and trucks; plastic pallet fires at the homeless encampments.

Mariah, community co-host, shared her excitement about small group conversations.

Comment: Down at the refinery in Lamont, there is a smell of a hydrogen sulfate gas or some kind of formaldehyde from the marshes.

Chat Comment: Trains idle for hours. We have one of the nation's most congested railways that causes a lot of air quality issues.

Chat Comment: Another concern is big semi's taking backroads to skip the traffic. The backroads are residential roads that are one lane.

Chat Comment: I agree on concerns regarding truck and train traffic and emissions related to goods movement around magnet sources like ports. I see the trucks as I drive to the CSU Stanislaus Stockton campus, and I hear trains often idling from my classroom.

Chat Comment: following up on tabulated. There are just three contaminants.

Chat Comment: There are more concerns on emissions from wildfires since climate change generally is making this part of the state hotter and drier.

Chat Answer: Even though both release pm 2.5 emissions, I am sure one is more prevalent than the other and the two pollution sources shouldn't be categorized too similarly.

Chat Answer: The biggest PM 2.5 from Diesel trucks is the dust they stir up from the road. Bigger source I measured is the cooking PM 2.5.

Chat Comment: Prevent fires by upgrading old electric lines and sealing gas leaks around meters to homes.

Chat Comment: Around a charcoal grill by store, I measured over 400 AQI, over 4x background. 400 PM 2.5 AQI.

Wrap Up/Next Steps

Christal Love Lazard, Facilitator, Institute for Local Government

Christal informed the group that Committee member Esperanza Vielma will co-host the July meeting. Meeting agendas include the timeline for the Committee work and progress towards developing the Community Emission Reduction Plan with the December deadline. On the Stockton community page, there are [links](#) to presentations and a record of all the communication that is going out to the Committee members.

Chat Comment: Thanks, everyone! More time for Q&A between presentations next time, please!

Comment: Thank you for the presentations and the breakout discussions. I learned a lot this evening.

There are no comments on Facebook Live. All the presentations, Zoom meeting recording, meetings highlights and transcripts will be posted online.

REMINDERS

- Next meeting July 1st via Zoom

**Refer to meeting recoding to review the full details and comments from the meeting.*

Agenda for Stockton Community Steering Committee Meeting #4

Wednesday, June 3, 2020 – 5:00 pm - 7:00 pm

Zoom Meeting: <https://zoom.us/j/91508201139>

Meeting ID: 915 0820 1139

Teleconference Dial In: **888 788 0099 US** (Toll-free)

5:00 p.m.

Welcome, Introductions

Christal Love-Lazard, Facilitator, Institute for Local Government
Ryan Hayashi, Deputy Air Pollution Control Officer, Valley Air District
Mariah Looney, Community Co-host, Restore the Delta

What meeting start time works for CSC members on July 1, 2020?
3-5pm, 4-6pm, or 5-7pm?

5:15 p.m.

Community Emissions Inventory and Historical Air Quality Overview

Review California Air Resources Board (CARB) and District emissions from mobile, area wide, and stationary sources within the Stockton AB 617 boundary. Discussion of what these emissions are, how these emissions are tracked, and where they are in the community. Review of historical air quality trends in Stockton and progress made.

Valley Air District Staff
CARB Staff

Breakout Discussions

6:00 p.m.

Sources of Air Quality Concern

Review air quality concerns map: <https://valleyair.mysocialpinpoint.com/ab-617-stockton>
Discuss community concerns as a group. Come prepared to discuss:

- Specific/general concerns regarding mobile sources (high polluting vehicles, truck traffic, idling of trucks, trains, buses, etc.)?
- Specific/general concerns regarding dust from traffic, construction, or other activities?
- Specific/general concerns regarding smoke in your community (from wood, cooking, trash burning, etc.)?
- Specific/general concerns regarding industrial sources?
- Other concerns?

Breakout Discussions

6:45 p.m.

Wrap Up/Next Steps

Christal Love-Lazard, Facilitator

6:50 p.m.

Public Comment

REMINDERS

- Next meeting July 1st via Zoom

To request Spanish interpreting services, please contact Jaime Holt or Heather Heinks at (559) 230-6000 or AB617@valleyair.org at least 7 days prior to the meeting date.

Historical Air Quality Trends in the Stockton Community

June 3, 2020

Jon Klassen

Director of Air Quality Science and Planning
San Joaquin Valley Air Pollution Control District

Current Air Monitoring in Stockton Community (cont'd)

- Stockton-Hazelton site operated by CARB and is part of the Valley's regulatory air monitoring network
 - Measures Ozone, NO/NO₂/NO_x, CO, PM_{2.5}, PM₁₀, Toxics, Meteorology
 - Located near Wilson and Hazelton Avenues at San Joaquin County Public Health building
- Ongoing air monitoring operations at this existing site provides valuable data that will be used to complement the community air monitoring network to be developed with Community Steering Committee
- Historical data for this site is available on CARB website
 - <https://www.arb.ca.gov/aqmis2/aqmis2.php>

Trend of 8-hour Ozone in Stockton

Trend of Annual PM2.5 in Stockton

Trend of 24-hour PM2.5 in Stockton

Trend of 8-hour Carbon Monoxide in Stockton

Trend of 1-hour Nitrogen Dioxide in Stockton

Trend of Peak Benzene in Stockton

Trend of Peak 1,3-Butadiene in Stockton

Trend of Peak Lead in Stockton

Ongoing Air Quality Progress

- Decades long air quality trends in Stockton community demonstrate continued reductions in concentrations of criteria pollutants and toxics
- Stockton community air quality already in attainment of numerous federal standards
 - Continued improvements are needed to meet remaining current federal standards
- AB 617 process to assist in identifying and addressing localized air quality issues through development and implementation of various strategies
 - Efforts will continue to improve air quality across the Stockton community

Update on Stationary Source Emissions Stockton Community

June 3, 2020

Arnaud Marjollet

Director of Permit Services

San Joaquin Valley Air Pollution Control District

Update of Emissions Inventory

- Emissions inventory data collected on an annual basis
- District collects and processes emissions inventory data from Stationary Sources (facilities)
- CARB collects and processes emissions inventory data from Mobile Sources and about Area Wide sectors
- District is currently processing the 2018-2019 emissions inventory data submitted by facilities

Emissions Source Summary

NOx

PM2.5

VOC

On-Road

Off-Road

Area-Wide

Stationary

Emissions Source Summary

NOx

PM2.5

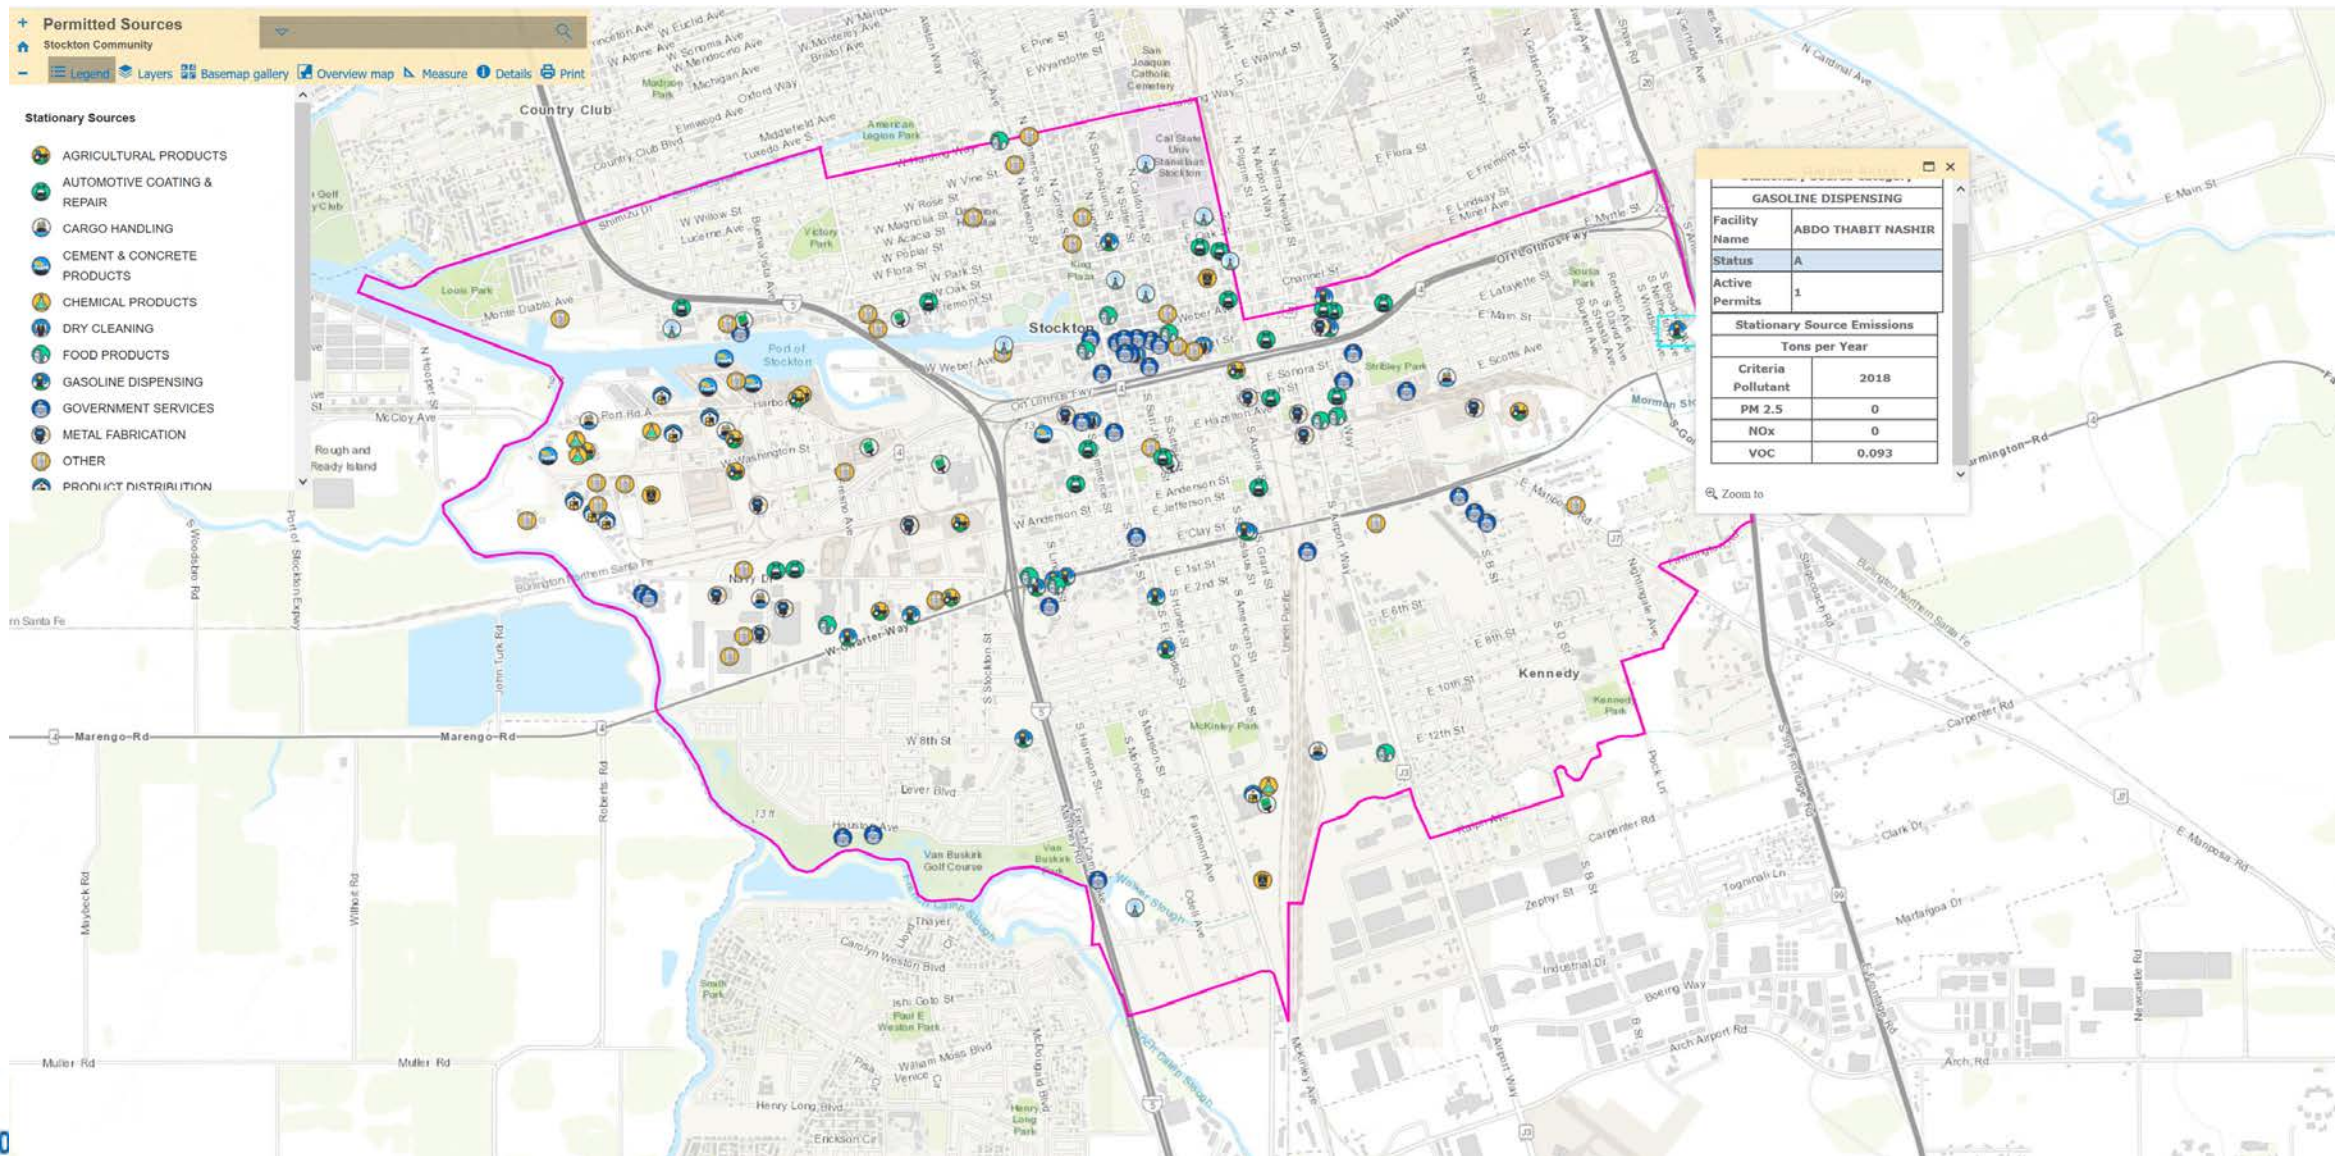

VOC

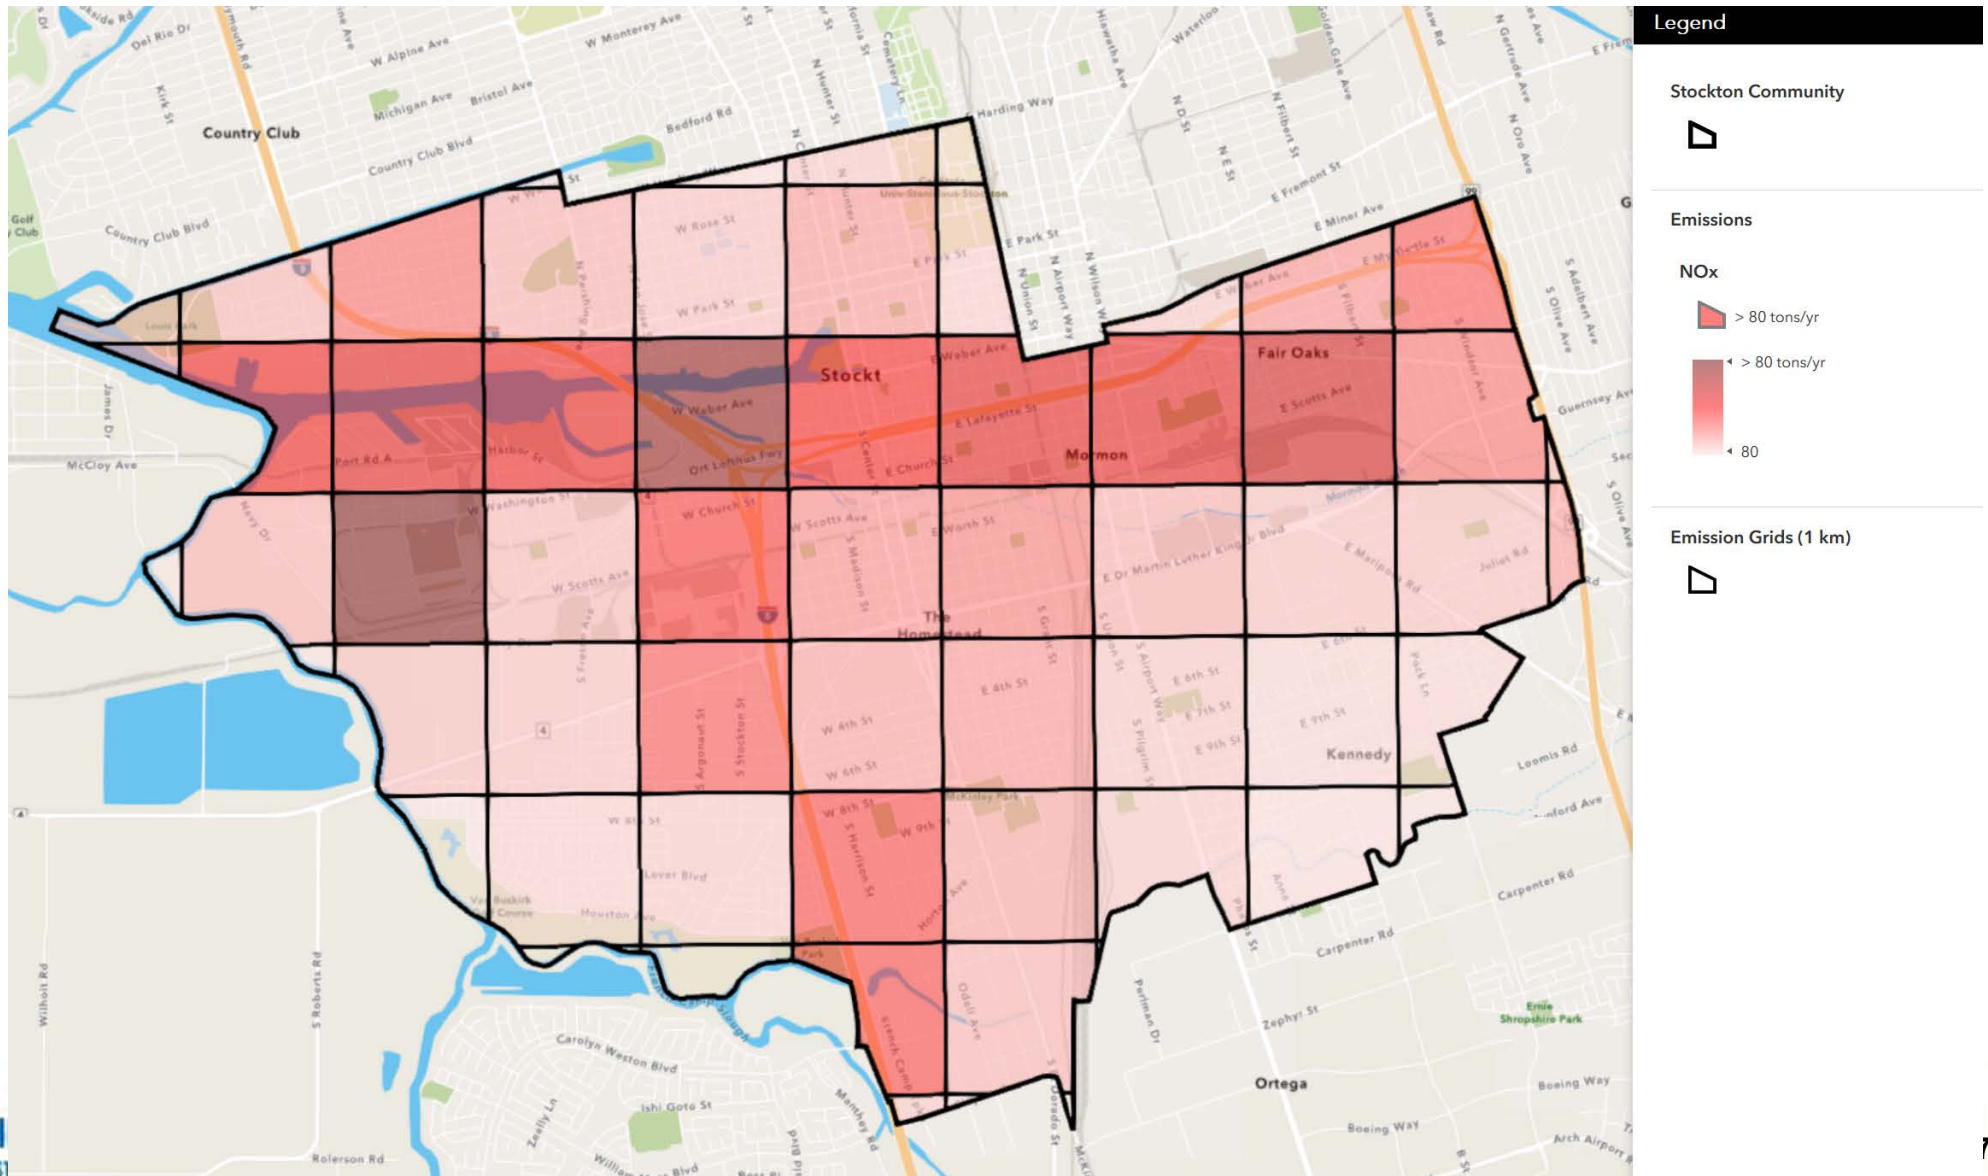

Maps and Tools Available on Website

- Emissions inventory data for South Stockton displayed on the Stockton Community website
 - <http://community.valleyair.org/selected-communities/stockton>
- Specific facility locations
- Mobile, Area, and Stationary Source emissions data in Stockton AB 617 Community
- Sensitive receptors
 - Public and Private Schools
 - Medical Facilities and Care Facilities

Emissions Sources

NOx Emissions from All Sources

Community Emission Inventory Update CARB Mobile and Area Source Emissions

**Stockton
AB 617 Community Steering Committee Meeting
June 3, 2020**

**Alejandra Cervantes, Adrian Cayabyab, Jenny Melgo, Abhishek Dhiman, Victoria Villa
Air Quality Planning and Science Division
California Air Resources Board**

Emission Inventories Foundation of Air Quality Programs

AB 617 calls for the use of emission inventories in community emissions reduction programs to:

- Identify emission sources
- Establish baseline emissions
- Set emission targets and reduction measures
- Track emission reductions in communities selected for a community emissions reduction programs

Air District & CARB Staff Collaboration

Stationary Sources:
Power Plants, Refineries, Industry

District

Area Sources:
Residential Wood Combustion, Consumer
Products, Pesticides

CARB/District

On-road Mobile Sources:
Cars, Trucks

CARB

Off-road Mobile Sources:
Forklifts, Tractors, Transport Refrigeration
Units

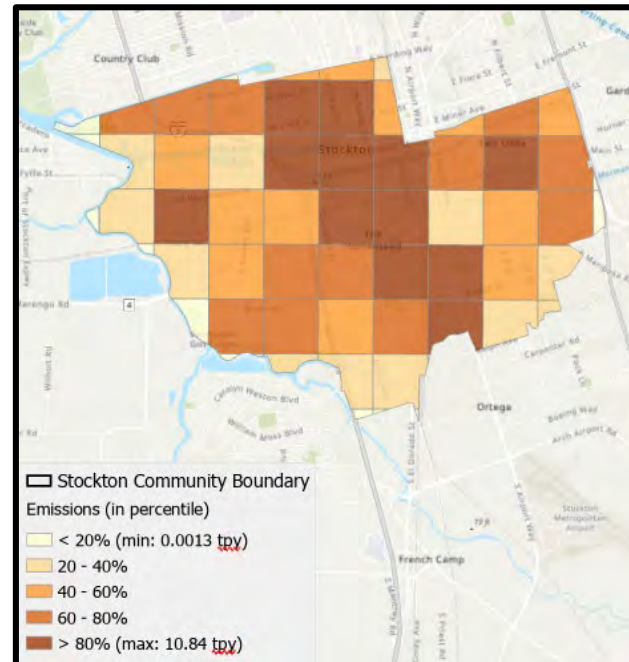

CARB

High Resolution 1-km Grid Approach

- Characterized community-specific emissions using 1x1 km grid
- Use spatial surrogates to allocate regional-level area source emissions to more specific locations
- Use resulting high-resolution 1x1 km grid to determine sources and allocate emissions by source category within each community

Example maps below show gridded PM2.5 emissions from area sources

** Map shows area-weighted emissions for grids that are only partially within the community boundary.*

Allows for better characterization of sources and emissions in communities

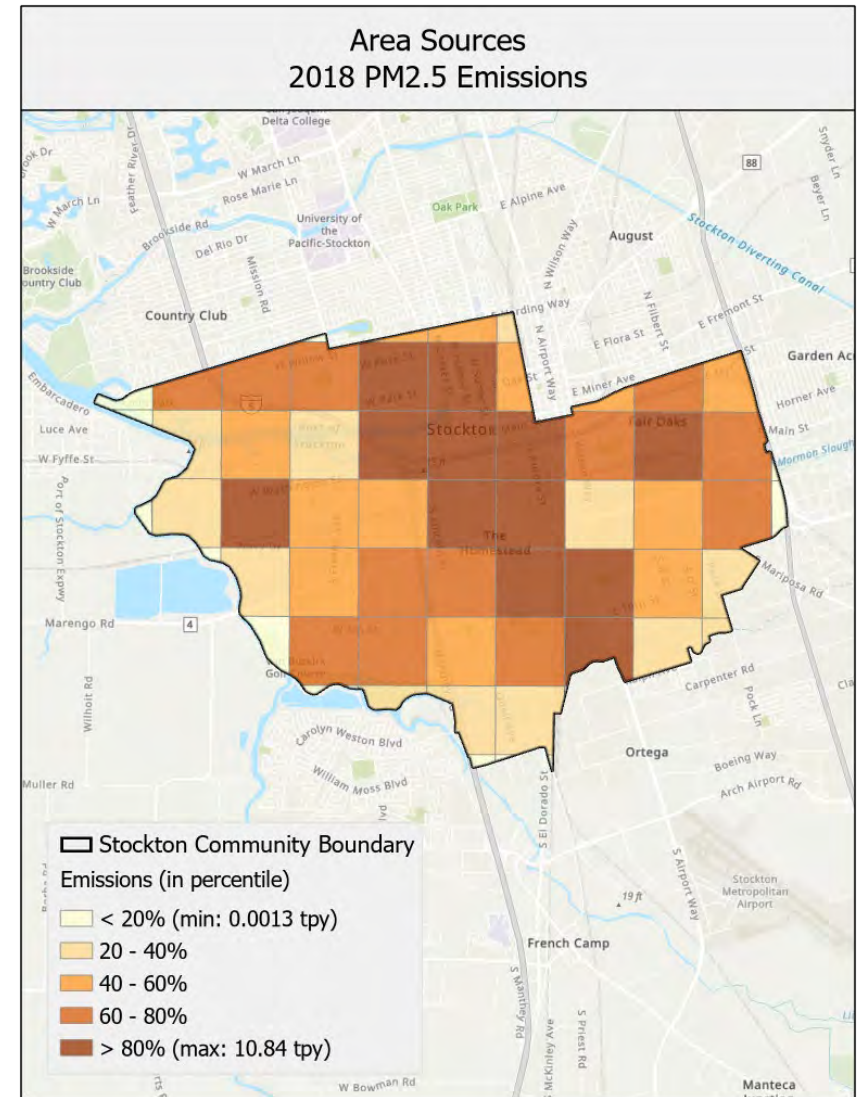

Area Sources

Sources that can be moved to actual emission location:
Small emission sources spread over an area, but with specific locations (e.g., gas stations, auto body shops, print shops)

Sources that operate and emit over large areas:
Emission sources that lack specific location detail (e.g., consumer products, road dust, architectural coating)

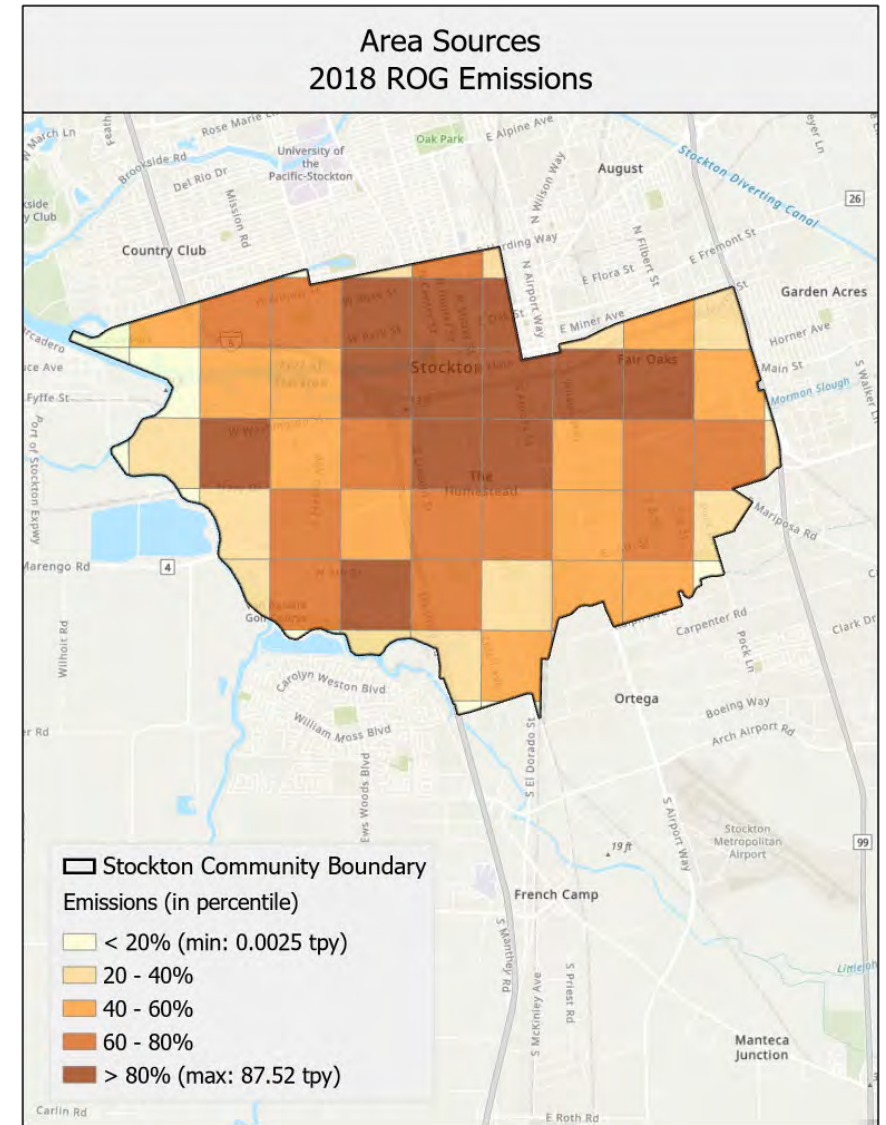

* Map shows area-weighted emissions for grids that are only partially within the community boundary.

DRAFT 2018 Area Source Emissions

NOx: Nitrogen Oxides
ROG: Reactive Organic Gases
PM2.5: Particulate Matter 2.5 Microns or Smaller

* Map shows area-weighted emissions for grids that are only partially within the community boundary.

Off-Road Mobile Sources

- **Facility Sources:**
(e.g., forklifts, cargo handling equipment, locomotives)
- Specific location of operation and facility level data

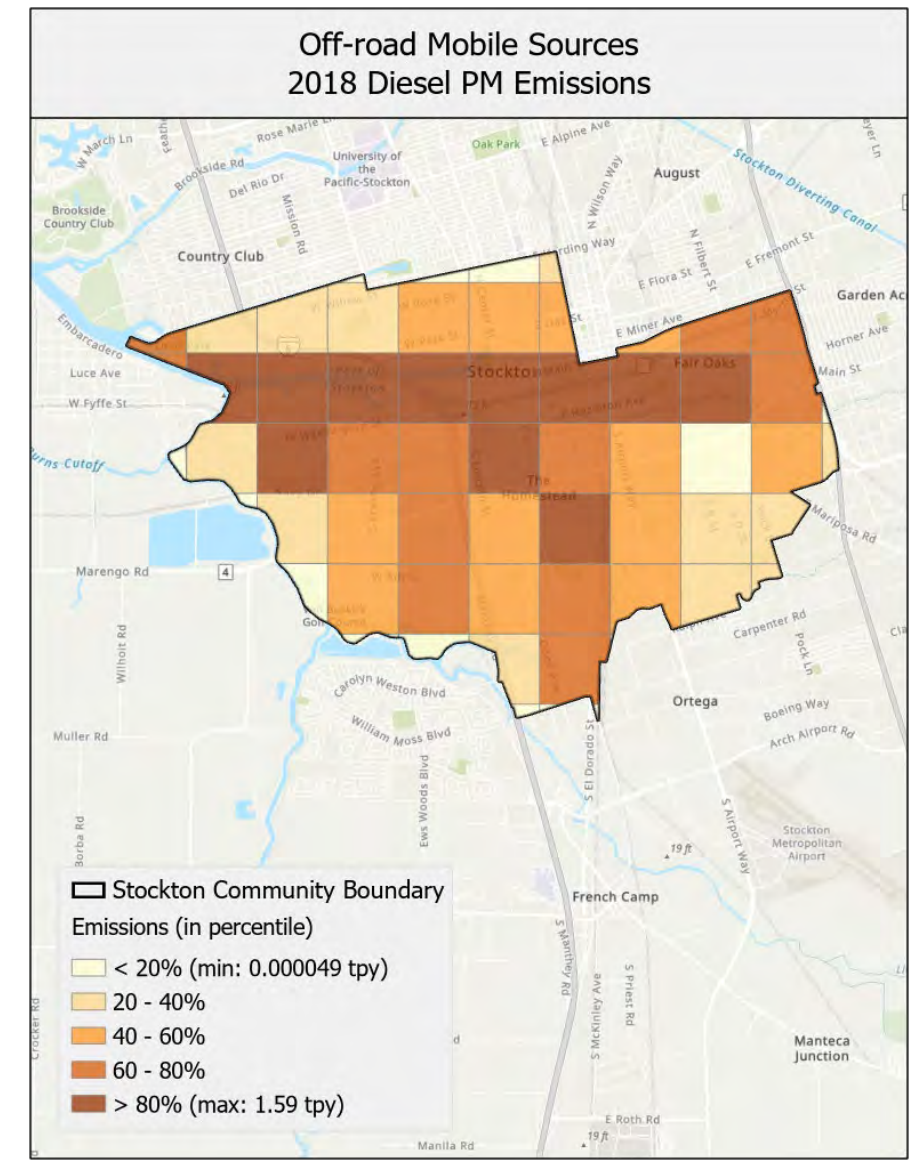

- **Non-facility Sources:**
(e.g., construction/ ag equipment, portable engines)
- No specific location of operation or facility level data

Existing activity data from reporting requirements, voluntary reporting, surveys, or purchased data sources

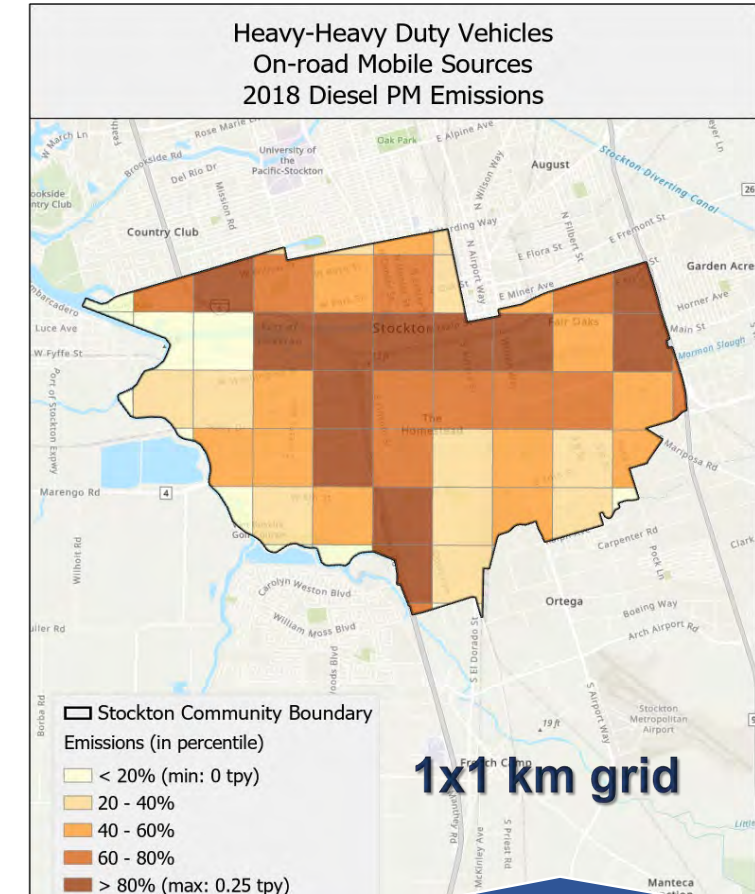

DRAFT 2018 Off-Road Mobile Source Emissions

DPM: Diesel Particulate Matter

* Map shows area-weighted emissions for grids that are only partially within the community boundary.

On-Road Mobile Sources

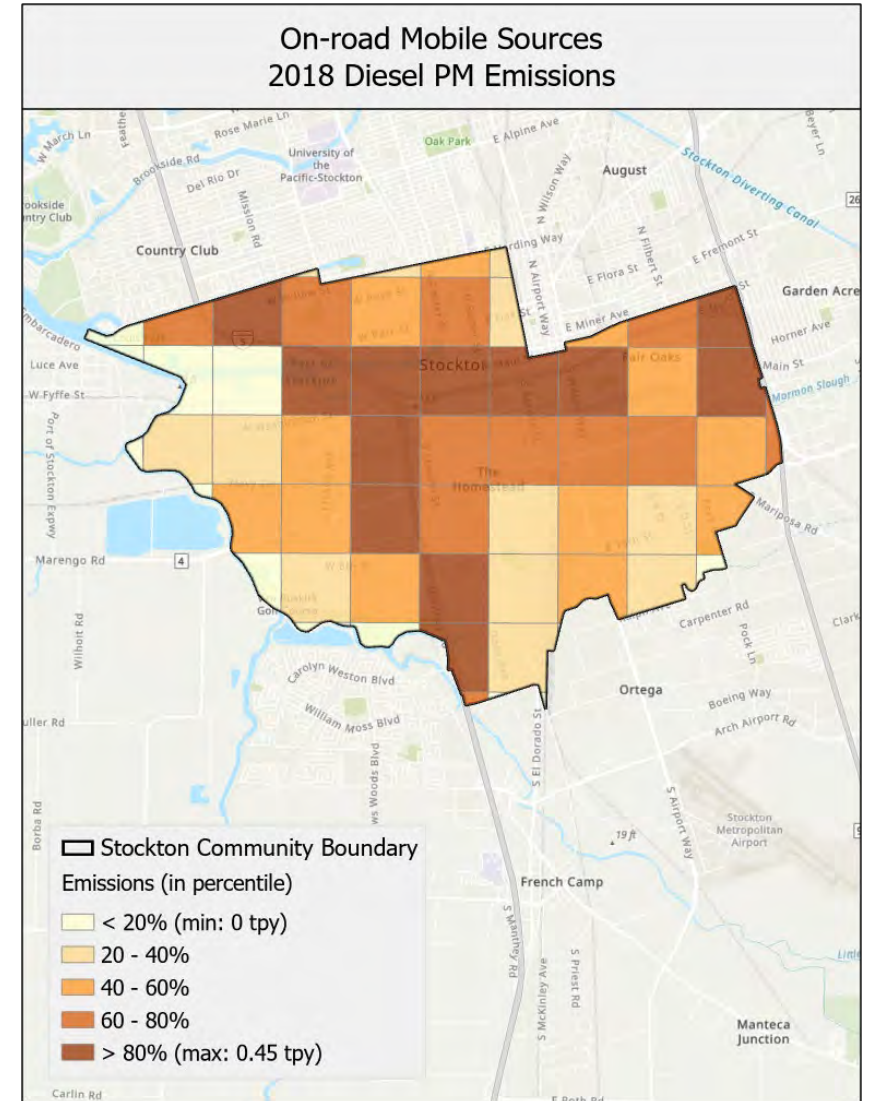

Estimate VMT based on vehicle activity in the community

Apply emission factors to VMT to calculate emissions

DRAFT 2018 On-Road Mobile Source Emissions

LDV: Light Duty Vehicles
 LHDV: Light-Heavy Duty Vehicles
 MHDV: Medium-Heavy Duty Vehicles
 HDDV: Heavy-Heavy Duty Vehicles
 BUS: Buses

* Map shows area-weighted emissions for grids that are only partially within the community boundary.

Notes from Stockton June 3, 2020 Breakout Sessions with Stockton Community Steering Committee Members

<u>Heavy-Duty Traffic</u>	
Community Steering Committee Member Concerns and Questions:	Potential Actions Recommended by Community Steering Committee Members:
<ul style="list-style-type: none"> • Communities and the workforce near highways are exposed to traffic emissions (Boggs Tract, as an example) 	<ul style="list-style-type: none"> • Replace locally based trucks (captive truck fleets) with clean technologies • Vegetative barriers (using <u>drought-tolerant</u> trees) • Port of Stockton looking into replacing drayage trucks, other short-haul vehicles with electric, have installed some vegetative barriers. • Better enforcement of heavy-duty truck and bus idling • Education/outreach about heavy-duty truck and bus idling • Requested air monitoring to be done in the Boggs tract area
<ul style="list-style-type: none"> • Trucks idling in communities 	
<p>Boggs Tract:</p> <ul style="list-style-type: none"> • Concerned with additional truck traffic due to expansions at the Port of Stockton, and would like additional monitoring in this area • Mentioned past study conducted at George Washington Elementary <ul style="list-style-type: none"> ○ Report states results from this study said that most PM2.5 emissions were from roadside dust • Highway Bypass <ul style="list-style-type: none"> ○ Resulted in heavy duty truck traffic to be re-routed out of the area, but that also re-routed all traffic and residents now have to drive more to get to the community, resulting in more emissions 	
<ul style="list-style-type: none"> • Port of Stockton <ul style="list-style-type: none"> ○ Considerable heavy-duty truck idling ○ Increased heavy-duty truck traffic due to expansion projects at the Port • Dry materials being unloaded and stored in piles. The wind blows the dry materials into the community and they do not know what it is. 	
<ul style="list-style-type: none"> • Parked heavy-duty trucks near apartment complex (Deltaview Apartments), creating vibration and idling, emissions impact area. Happening at empty lot near DMV office. Happening 2-3 nights per week. 	

Heavy-Duty Traffic

- Diesel exhaust from large passenger trucks in the area (e.g. Chevy, Ford, etc.)
- University of Pacific transport vehicles are old and fuming, need cleaner vehicles
- Dashmesh Trucking (a lot of idling) near Edison School (what can be done?)
- Truck wash station (many truck idling), on French camp Turnpike (west of Edison, next to Freeway)
- Cooking emissions from mobile food vendors
- Truck traffic to Port
- Headstart on busy streets: El Concillio Headstart on Sutter Street and one at St George
- Upcoming Delta Conveyance Project, concern with emissions (what can be done?)
- Idling cars and trucks are concerning
- Concern about heavy-duty truck emissions coming out of the port
- Heavy-duty trucks taking side roads through residential like Mt. Diablo adjacent to Luis park II. Trucks use this to avoid traffic on I-5. The trucks damage trees and they die. Then the city has to cut the trees down
- Heavy-duty trucks idling at French Camp down El Dorado (heavy-duty trucks park in the middle of the street to load and unload, which also blocks traffic)
- Main concern is diesel traffic
- Boggs tract area near the port of Stockton: Indoor air quality is a concern at this school near the Boggs tract area due to heavy-duty truck idling trying to get into the port and lunch spots for the truck drivers

Cooking Emissions

Community Steering Committee Member Concerns and Questions:	Potential Actions Recommended by Community Steering Committee Members:
<ul style="list-style-type: none"> • Charbroiling/cooking activities 	<ul style="list-style-type: none"> • Better understanding of these impacts <ul style="list-style-type: none"> ○ Alec (CSC member) offered to help continue this work with specific restaurants • Controls for restaurants • District to provide some detail of ongoing work to receive reports and register underfired cooking operations, providing better information about this source. Can update the committee as we continue this work.
<ul style="list-style-type: none"> • Smoke from outdoor BBQs at liquor stores in the area, impacting residents 	
<ul style="list-style-type: none"> • Commercial cooking concerns, asked about the number cooking operations in the community. 	
<ul style="list-style-type: none"> • 5' x 6' open barbecue trailer in parking lot, right next to supermarket, close to St. George and Mckinley (less than ½ mile away) 	
<ul style="list-style-type: none"> • Open fire cooking from homeless (concentrated in South and East area) (there is one right behind St. George school) 	
<ul style="list-style-type: none"> • Outdoor grills and truck/train idling...should they be seen in the same light <ul style="list-style-type: none"> ○ Often outdoor grilling around a residential area ○ Conflicted as sometimes these grills are in food desert areas ○ Scrubbers for these food truck/outdoor grills ○ Outdoor grills might be only source of income ○ Maybe focus on those organizations that have more financial resources ○ Need for monitoring in these areas ○ Not something we usually think about 	
<ul style="list-style-type: none"> • Cooking like large BBQ outside of a gas station or store near (center street) 	

<u>Monitoring</u>	
Community Steering Committee Member Concerns and Questions:	Potential Actions Recommended by Community Steering Committee Members:
<ul style="list-style-type: none"> • Monitoring questions brought up and focused on <ul style="list-style-type: none"> ○ What is the outcome of emissions monitoring? ○ How many monitors will be used? ○ Where will monitors be placed and how will that be decided? • What is the difference between the trends shown in the presentation for the Stockton monitored data and the gridded emissions shown in the other presentation that show high emissions around freeways, etc. 	<ul style="list-style-type: none"> • Need for monitoring in South side of Stockton, along Lincoln Ave (near DMV, St. Mary's Dining Room)
<ul style="list-style-type: none"> • Concern about lack of air monitoring in Stockton 	
<ul style="list-style-type: none"> • Looking for wind data from the Stockton area. 	
<ul style="list-style-type: none"> • Would like to compare pollution data with surrounding areas, i.e. Merced, etc. 	

<u>Outdoor burning</u>	
Community Steering Committee Member Concerns and Questions:	Potential Actions Recommended by Community Steering Committee Members:
<ul style="list-style-type: none"> • Concern about emissions from trash fires 	<ul style="list-style-type: none"> • Not letting fields overgrow may be a mitigation to prevent burning of empty fields
<ul style="list-style-type: none"> • Particular concern about exposure of homeless residents/residents in informal settlements to emissions from fires, trains 	
<ul style="list-style-type: none"> • Grass fires started by homeless, multiple fires due to homeless, burning in barrels or in the open 	
<ul style="list-style-type: none"> • Too much material stockpiled in areas near the Port, causing high potential for fires 	
<ul style="list-style-type: none"> • Incinerator at the Port, unhealthy emissions and causing smells in the area 	
<ul style="list-style-type: none"> • Homeless fires near the Mormon slough, burning various materials 	
<ul style="list-style-type: none"> • Recent Stockton pallet fire was significant, smoke impacted Lodi and other cities surrounding Stockton 	

<u>Outdoor burning</u>	
<ul style="list-style-type: none"> • Need better regulations on how much material can be stacked at facilities, too high of a potential for fire. (Asked if District could follow-up with appropriate agency to help reduce fire risk). 	
<ul style="list-style-type: none"> • More commonly think about smokestacks as a cause of pollution 	
<ul style="list-style-type: none"> • Homeless people who do burning, have heard that homeless have higher rates of cancer 	
<ul style="list-style-type: none"> • Pallet fire last week was a problem, curious about the impact 	
<ul style="list-style-type: none"> • Burning in encampments generate localized pollutions concerns 	
<ul style="list-style-type: none"> • Burning trash and burning other items 	
<ul style="list-style-type: none"> • Bianca Mendoza has a field behind her house and the grass burns a few times a year 	
<ul style="list-style-type: none"> • Fire encampments illegal fires/cooking 	
<ul style="list-style-type: none"> • Wildfire emissions can infiltrate homes, EJ concern is housing access to basic necessities, like stable internet, which can be more broadly applied to access to safe spaces from outdoor air pollution and during shelter-in-place orders (can't use any community center) 	

<u>Trains/Railroad</u>	
Community Steering Committee Member Concerns and Questions:	Potential Actions Recommended by Community Steering Committee Members:
<ul style="list-style-type: none"> • Concern about emissions from railroads 	<ul style="list-style-type: none"> • Other CSC have allocated funding to replace locomotives
<ul style="list-style-type: none"> • Emissions from Amtrak trains running in area 	
<ul style="list-style-type: none"> • Train station (idling), not just Amtrak but all the trains, including cargo train 	
<ul style="list-style-type: none"> • Train idling-Who has regulatory authority? How can CSC address issue? 	

<u>Emissions Inventory</u>	
Community Steering Committee Member Concerns and Questions:	Potential Actions Recommended by Community Steering Committee Members:
<ul style="list-style-type: none"> • how the 1km resolution was achieved and the level of detail that the District/CARB had about emissions inventories from specific sources 	<ul style="list-style-type: none"> • Ozone and other pollutants are trending down over the past 40 years • We don't have all the 2020 data. We are processing 2019 emission inventory data now and it will be available to committee when it is ready.
<ul style="list-style-type: none"> • Would like more information on toxics inventory 	
<ul style="list-style-type: none"> • Wants more evidence to be able to focus on what the concerns are and focus on those. 	
<ul style="list-style-type: none"> • Data seemed obsolete between 2018-2020 	
<ul style="list-style-type: none"> • Do we have the 2020 data 	
<ul style="list-style-type: none"> • In South Side, are there any emissions coming from recycling company, propane company 	

<u>Lawn Equipment</u>	
Community Steering Committee Member Concerns and Questions:	Potential Actions Recommended by Community Steering Committee Members:
<ul style="list-style-type: none"> • Leaf blower emissions 	
<ul style="list-style-type: none"> • Emissions from lawn care equipment, are there studies summarizing the emissions from this equipment? (CARB said they would follow up). 	
<ul style="list-style-type: none"> • Concerned with dust in the area, watering turns dust into mud, messy 	

<u>Dust</u>	
Community Steering Committee Member Concerns and Questions:	Potential Actions Recommended by Community Steering Committee Members:
<ul style="list-style-type: none"> • Dust from agricultural operations, Boggs Tract farm (grow vegetables, fruits, chicken), behind community center, about 5 acres 	<ul style="list-style-type: none"> • Would like to add surface stabilization / paving to the community emission reduction plan
<ul style="list-style-type: none"> • Dust near the Port 	
<ul style="list-style-type: none"> • Dust from empty lots in the area 	
<ul style="list-style-type: none"> • Dust west of I-5 by port of Stockton between Charter Way and Downtown 	

<u>Odor</u>	
Community Steering Committee Member Concerns and Questions:	Potential Actions Recommended by Community Steering Committee Members:
<ul style="list-style-type: none"> • Sulfur from port of Stockton impacting nearby schools (headaches) 	
<ul style="list-style-type: none"> • Steel company off of Highway 4 and Highway 99 (a lot of odors but not sure what it is) 	

<u>Urban Greening</u>	
Community Steering Committee Member Concerns and Questions:	Potential Actions Recommended by Community Steering Committee Members:
<ul style="list-style-type: none"> • Potential measures including urban greening, solar panel, bike trails 	<ul style="list-style-type: none"> • Vegetative buffers have been used by land use agencies this could be a measure that you may include in the CERP • Urban zoning
<ul style="list-style-type: none"> • Lack of green space between roadways and homes/trees to help filter the air/City of Trees 	
<ul style="list-style-type: none"> • Southern part of the airport area increase capacity with Amazon. There is a demand for more warehouses and they are taking greenspace/ag land 	

<u>Construction</u>	
Community Steering Committee Member Concerns and Questions:	Potential Actions Recommended by Community Steering Committee Members:
<ul style="list-style-type: none"> • Levy construction work 	
<ul style="list-style-type: none"> • Concern about construction on proposed delta tunnels 	

<u>Other</u>	
Community Steering Committee Member Concerns and Questions:	Potential Actions Recommended by Community Steering Committee Members:
<ul style="list-style-type: none"> • Duraflame facility near the Port 	
<ul style="list-style-type: none"> • Comments about powering refrigerators, RVs running in the area 	
<ul style="list-style-type: none"> • Airport traffic emissions 	
<ul style="list-style-type: none"> • Business and warehouse 	

Meeting Highlights*
AB 617 Stockton Community Steering Committee Meeting #3
Wednesday, May 6, 2020, 5:30 pm
Zoom Virtual Meeting

Action items for the Stockton Community Steering Committee (CSC):

- Please visit <http://community.valleyair.org/selected-communities/stockton/> to complete sources of concern exercise by **May 24th**.
- If you prefer to tell the Valley Air District about your sources of concerns rather than going through map exercise, please email or contact District staff at ab617@valleyair.org
- Start thinking about:
 - Where should air monitoring assets be placed in the community?
 - What pollutants/types of sources should be considered in the community air monitoring plan?

Action items for the San Joaquin Valley Pollution Control Air District (Valley Air District):

- Email poll to CSC regarding potential future meeting times.
- Follow up with CSC members who volunteered to be community co-hosts.
- Heather M. Bolstad will follow up with information about the exact PM levels in peat soil.

Welcome, Introductions

Christal Love Lazard, Facilitator, Institute for Local Government
Ryan Hayashi, Deputy APCO, Valley Air District
Dillon Delvo, Community Co-host, Little Manila Rising

Christal welcomed the Stockton Community Steering Committee (CSC) members and members of the public, provided Zoom instructions for the meeting, and did the roll call. Ryan welcomed participants and thanked Dillon for working with the Valley Air District on the meeting agenda. Dillon welcomed everyone and shared a brief preview of his and Phillip's presentation.

Historical Perspective on Stockton

Dillon Delvo, Community Co-host, Little Manila Rising
Phillip Merlo, Director of Education, San Joaquin Historical Museum

Phillip presented a look back on what led to the socioeconomic and environmental disparities in Stockton. Dillon followed up with a brief history and work of Little Manila. Presentation highlights:

- Racially restricted housing covenants created a segregated landscape in Stockton. A system was designed to keep people of color and immigrant communities from building wealth.
- Historically, the industrial zoning has been concentrated predominantly in South Stockton, a historically segregated area, to enable the construction of freeways near low-income areas (to reduce the cost of eminent domain) and accommodate emerging industries focused on the transportation of products,
- Stockton zoning policies created a long-term impact on health of low-income communities in South Stockton with higher incidences of elevated blood pressure, asthma and other health disparities.
- Stockton is one of the centers of Filipino-American history. Little Manila Rising has worked to

preserve the remaining three Filipino historic buildings, raise awareness about the consequences and impacts of environmental injustice, and promote cultural heritage.

Air Monitoring Capabilities Introduction

Jon Klassen, Director of Air Quality Science and Planning, Valley Air District

The Valley Air District staff introduced the community air monitoring capabilities in preparation for a community monitoring exercise in June. Presentation highlights:

- Air monitoring is a key component required by AB 617. The CSC will provide input on preparing a community air-monitoring plan. Based on community feedback and CSC recommendations on what to monitor and where, staff will draft the monitoring plan and bring it back to the CSC for review and comments.
- California Air Resources Board's (CARB's) Stockton-Hazelton air monitoring site provides a long record of air quality data (going back as far as 1976). This data will be used to complement the community air monitoring plan that will be developed with the community steering committee in Stockton. Historical data is available at: <https://www.arb.ca.gov/aqmis2/aqmis2.php>
- Once the Community Steering Committee has developed a Community Air Monitoring Plan (CAMP), air quality monitoring data will be available on the Valley Air District's website and on CARB's AQView webpage at <https://ww2.arb.ca.gov/es/community-air-quality-portal>
- Community air monitoring equipment that can be placed in Stockton includes: an air monitoring trailer, stand-alone PM 2.5 monitors, compact multi-pollutant systems and mobile air monitoring van. There are a number of various factors to consider when making placement choices and designing the Stockton air monitoring system.
- The Valley Air District is asking the Committee for initial thoughts and comments in the following areas:
 - Where should air monitoring assets be placed in the community?
 - What pollutants/types of sources should be considered in the community air monitoring plan?

Question: Because monitors cannot be too close to a single source of pollution, how do we set up monitoring in the areas with multiple sources of emissions to collect the right type of data?

Answer: The air monitoring vans can get closer to various sources of concern and pollution speciation can be used to determine possible sources of air pollutants.

Question: Why would we put equipment in the areas that require additional resources (lease, agreements, monthly cost, etc.)?

Answer: Based on the CSC's feedback and locations identified by the committee would determine which sites are available. The Valley Air District will look to identify locations on city and county property near the locations identified by the CSC to minimize any potential additional costs.

Chat Question: How long should we leave a monitor in place to get accurate data?

Chat Answer: Monitoring will be accurate as soon as it is deployed. To understand long-term trends, it is best to keep the monitors in place for at least a year. This provides an understanding of possible difference in emissions due to seasonality. For mobile monitoring, we hope to move around often, focusing on different locations on different days as recommended as part of the CAMP.

Chat Question: Does your mobile van have Proton transfer time of flight MS real-time air toxics monitor?

Chat Answer: We do have a PRT-MS that can be outfitted to the van or stationary trailer.

Chat Comment: Happy to have a monitor at St. George Church/School.

Chat Question: One thing to think about is the timing for the air monitoring. We want to provide monitoring once everything is open and traffic is out again. This will give a good representation of what we experience normally.

Chat Answer: We certainly will take into account actual activity occurring near monitoring. That way we have context. For example, this is not a great time to get "normal" information on vehicle traffic emissions, just like monitoring during a wildfire is certainly not a good picture of the community. However, monitoring at any time will always give a good picture of what's happening in the community, which is certainly a goal.

Chat Question: In terms of the types of monitors that were listed, have they already been bought? Does the brand of the monitor make a difference in what type of data would be collected?

Chat Answer: We are in the process of ordering some new equipment to use in the Stockton community, but we do have some resources already available. The brand of analyzer can have slight differences, but we're planning to use the highest precision analyzers to make sure we collect accurate data.

Chat Question: To what extent will the Committee (or even the community members here) be involved in gathering, analyzing and presenting the data to the Stockton community?

Chat Answer: As we collect community-level air monitoring data in Stockton, we'll produce regular reports summarizing the results. These will be shared with the Stockton Community Steering Committee and can also be shared with the Stockton community at large.

Chat Question: What data does the mobile van currently gather? I know there were some questions regarding using a Google vehicle to gather additional data? Also are we able to use smaller monitors that may be placed in more of our AB617 areas?

Chat Answer: Our mobile air monitoring vans can measure quite a few pollutants, including ozone, PM2.5, black carbon, NOx, CO, SO2/H2S, VOCs, and meteorology. As we develop our community air monitoring plan, we can hear from the Committee on the interest is using smaller monitors in the community.

Chat Question: Will prior air monitoring data be incorporated or used during the development of the CERP?

Chat Answer: Certainly! We actually used prior data to develop the recommendation for Stockton to be selected for AB 617 resources. We also will use emissions data (known emissions from sources) to develop CERP strategies.

Chat Comment: Stockton's air quality situation most closely resembles the West Oakland model. We can learn a lot from the West Oakland studies that have been done over the last couple of decades. There have been quite a few studies done by a variety of organizations.

Chat Question: Along with the air monitoring data that will be collected, will health data be collected as well? I'm curious to see if there are possible cancer clusters in areas affected by any sources of pollution here in Stockton.

Chat Question: Will there be a subcommittee for air monitoring?

Chat Question: Where are we at with Washington Elementary? And how do we effectively monitor areas with high emissions without having reports reflect pollution from just one source? In other words, how do we balance monitoring?

Chat Question: What is the micron range of peat soil generally?

Chat Question: What about mineral sources? Such as asbestos, etc.

How Air Pollution Impacts Health

Heather M. Bolstad, Ph.D, Staff Toxicologist, OEHHA Community and Environmental Epidemiology Research Branch

A discussion with the California Office of Environment Health Hazard Assessment (OEHHA) about health impacts of air pollution. Presentation highlights:

- Diesel exhaust, mobile sources, industry, pesticides, freeways are possible sources of exposure to air pollutants.
- OEHHA developed benchmarks for toxicity called the Health Guidance Values. Toxicity depends on the amount of time someone is exposed to a chemical. The analysis is designed to protect the most sensitive population: elderly, children, and pregnant women, those with underlined conditions.
- A number of factors influence toxicity including duration and length of exposure and sensitivity.
- Particular matter 2.5 (PM) microns can reach deep into the lungs. Short-term exposure is associated with respiratory irritation, decreased lung function, asthma attacks, irregular heartbeat, increase in respiratory symptoms. Short- and long-term exposure has been associated with premature death, cardiovascular mortality and hospitalization, respiratory and asthma hospitalization. Diesel exhaust, wood smoke, metals, volatile organic compounds present health concerns.
- The risk from the amounts of chemicals in the air is determined differently for cancer and non-cancer risks.

Question: There are trucks that still emit black smoke. They do not represent the trucking industry today in California because the industry has been switching to newer engines that do not emit that much black carbon.

Answer: There is some diesel-powered equipment that would not meet the current emission standards (including agricultural equipment). The black smoke is an extreme example.

Question: What is the micron range of peat soil?

Answer: It is probably going to include both PM 2.5 and PM 10. The microbes in the peat soil could increase inflammatory reactions from exposure. Components in the particles also play a role in addition to size.

Chat Question: Will we have access to current health statistics for our area and what kinds of studies are in process.

Chat Answer: We have the CalEnviroScreen tool on the AB 617 site, which spatially displays health and environmental statistics by census tract (scroll to bottom) <http://community.valleyair.org/>

Chat Comment: I think looking into peat "dust" in this area is a MUST!

Sources of Concern Introduction

Jessica Olsen, Program Manager, Valley Air District

The Valley Air District staff introduced the online tool developed to get community feedback and thoughts on sources of air pollution concern. Presentation highlights:

- This community engagement online tool will help the Valley Air District to understand air quality concerns for the community and emissions from sources in addition to already available data.
- Besides adding air pollution sources of concern by dropping the pins on the map, users can also add comments, attach photos, respond to other comments, like comments, filter by the source.
- Users can also comment outside the district boundary map.
- If you don't know the precise location of the sources on the map (where it's coming from), type your address to post a comment about the source of concern.

Chat Question: Is this available in other languages also?

Chat Answer: It has a 'Google translate' feature. The professional side-by-side translation is not available. To access the tool in other languages, a separate page with an identical map would need to be created. Meanwhile, the Google translate button will help Committee members to read and understand comments in other languages on the existing page.

Chat Comment: I would love to see that feature if it translates the entire site. Thinking of how to grassroots market this tool. Awesome tool.

Question: Where could we find the link to this tool?

Answer: <https://valleyair.mysocialpinpoint.com/ab-617-stockton>

Question: Is this tool available for the public or just for the Committee?

Answer: The tool is open to the public. Users will be asked to provide email addresses, name and indicate if they are Committee members. If you know other residents in the area who would like to provide information about the sources of pollution, please let them know how to log onto the site.

Wrap Up/Next Steps

Discussion about future meeting start times

Christal Love Lazard, Facilitator, Institute for Local Government

The Valley Air District will follow up with the poll about meeting times. The CSC members who volunteered to be a community co-host included Mariah Looney, Douglas Vigil and Esperanza Vielma. The Valley Air District will follow up with these individuals to schedule which one will cohost which upcoming meeting. There are no comments on Facebook Live. All the presentations, Zoom meeting recording, meetings highlights and transcripts will be posted online.

REMINDERS

- Next meeting June 3rd via Zoom

**Refer to meeting recording to review the full details and comments from the meeting.*

Agenda for Stockton Community Steering Committee Meeting #3

Wednesday, May 6, 2020 – 5:30 pm - 7:25 pm

Zoom Meeting: <https://zoom.us/j/226892770>

Meeting ID: 226 892 770

Teleconference: 888 788 0099 US (Toll-free)

5:30 p.m. Welcome, Introductions

*Christal Love Lazard, Facilitator, Institute for Local Government
Ryan Hayashi, Deputy APCO, Valley Air District
Dillon Delvo, Community Co-host, Little Manila Rising*

5:35 p.m. Historical Perspective on Stockton

A look back on what lead to socioeconomic and environmental disparities in Stockton
*Dillion Delvo, Community Co-host, Little Manila Rising
Phillip Merlo, Director of Education, San Joaquin Historical Museum*

Breakout Discussions

Christal Love Lazard, Facilitator, Institute for Local Government

6:05 p.m. How Air Pollution Impacts Health

A discussion with the California Office of Environment Health Hazard Assessment (OEHHA) about health impacts of air pollution

Heather M. Bolstad, Ph.D, Staff Toxicologist, OEHHA Community and Environmental Epidemiology Research Branch

6:35 p.m. Air Monitoring Capabilities Introduction

An introduction from Air District staff on the community air monitoring capabilities in preparation for a community monitoring exercise in June

Jon Klassen, Director of Science and Planning, Valley Air District

6:55 p.m. Sources of Concern Introduction

An introduction from Air District staff on the online tool developed to get your feedback and thoughts on sources of air pollution concern

Jessica Olsen, Program Manager, Valley Air District

Breakout Discussions

Christal Love Lazard, Facilitator, Institute for Local Government

7:25 p.m. Wrap Up/Next Steps

Discussion about future meeting start times

Christal Love Lazard, Facilitator, Institute for Local Government

REMINDERS

- Next meeting June 3rd via Zoom
- Please visit <http://community.valleyair.org/selected-communities/stockton/> to complete sources of concern exercise by May 24th

To request Spanish interpreting services, please contact Jaime Holt or Heather Heinks at (559) 230-6000 or AB617@valleyair.org at least 7 days prior to the meeting date.

Learn more: community.valleyair.org

Agenda para el Comité Directivo Comunitario de Stockton Reunión #3

Miércoles 6 de mayo de 2020 – 5:30 pm a 7:25 pm

Reunión por Zoom: <https://zoom.us/j/226892770>

Meeting ID: 226 892 770

Teleconferencia: **888 788 0099 US** (Llamada gratuita)

- 5:30 p.m. Bienvenida, Introducciones**
Christal Love Lazard, Facilitadora, Institute for Local Government
Ryan Hayashi, Director Adjunto, Distrito del Aire del Valle
Dillon Delvo, Coanfitrión de la Comunidad, Little Manila Rising
- 5:35 p.m. Perspectiva Histórica sobre Stockton**
Una mirada retrospectiva a lo que condujo a las disparidades socioeconómicas y ambientales en Stockton
Dillon Delvo, Coanfitrión de la Comunidad, Little Manila Rising
Phillip Merlo, Director de Educación, San Joaquin Historical Museum
- Sesiones Divididas
Christal Love Lazard, Facilitadora, Institute for Local Government
- 6:05 p.m. Como la Contaminación del Aire Impacta la Salud**
Una discusión con la Oficina de Evaluación de Peligros para la Salud del Medio Ambiente de California (OEHHA, por sus siglas en inglés) sobre los impactos en la salud de la contaminación del aire
Heather M. Bolstad, Ph.D, Toxicóloga, Rama de Investigación de Epidemiología Ambiental y Comunitaria de OEHHA
- 6:35 p.m. Introducción de las Capacidades de Monitoreo del Aire**
Una introducción del personal del Distrito del Aire sobre las capacidades de monitoreo del aire comunitario en preparación para un ejercicio de monitoreo comunitario en junio
Jon Klassen, Director de Ciencia y Planificación, Distrito del Aire del Valle
- 6:55 p.m. Introducción de Fuentes de Preocupación**
Una introducción del personal del Distrito del Aire sobre la herramienta en línea desarrollada para obtener los comentarios y opiniones sobre las fuentes de preocupación por la contaminación del aire
Jessica Olsen, Gerente de Programa, Distrito del Aire del Valle
- Sesiones Divididas
Christal Love Lazard, Facilitadora, Institute for Local Government
- 7:25 p.m. Concluir/Próximos Pasos**
Discusión sobre los horarios de inicio de reuniones futuras
Christal Love Lazard, Facilitadora, Institute for Local Government

RECORDATORIOS

- Próxima reunión el 3 de junio por Zoom
- Por favor visite <http://community.valleyair.org/selected-communities/stockton/> para completar el ejercicio de fuentes de preocupación antes del 24 de mayo

Para solicitar interpretación en Español, por favor comuníquese con Jaime Holt o Heather Heinks al (559) 230-6000 o AB617@valleyair.org por lo menos 7 días antes de la reunión.

Aprende más: community.valleyair.org

OEHHA

SCIENCE FOR A HEALTHY CALIFORNIA

Risk Assessment of Air Contaminants

Stockton Community Steering Committee Meeting
May 6, 2020

HEATHER BOLSTAD, PH.D.

STAFF TOXICOLOGIST

OFFICE OF ENVIRONMENTAL HEALTH HAZARD ASSESSMENT

CALIFORNIA ENVIRONMENTAL PROTECTION AGENCY

Outline

- Background: risk, toxicity, and exposure
- How OEHHA determines toxicity
- Factors that influence toxicity
- Health concerns associated with some air contaminants
- How risk is determined from air monitoring data

$$\text{Risk} = \text{Toxicity} \times \text{Exposure}$$

How dangerous
is the chemical?

Health Guidance
Values

Does chemical contact
or enter our body?

Air monitoring data

What is Exposure?

<https://www.nytimes.com/2015/05/04/business/energy-environment/how-growth-in-dairy-is-affecting-the-environment.html>
<http://www.associatesinsectary.com/about-associates-insectary/spraying-2/>
<https://commons.wikimedia.org/wiki/File:Diesel-smoke.jpg>
<https://www.portofstockton.com/>
<https://www.up.com/index.htm>

How do we determine the toxicity of chemicals?

OEHHA develops benchmarks for toxicity called Health Guidance Values:

Noncancer: Reference Exposure Levels (RELs)

The amount of chemical in the air that is not likely to cause noncancer health effects (like asthma) even in sensitive populations like children and pregnant women

Cancer: Unit risks or cancer potency factors

Describe increase in cancer risk per unit of exposure

What influences toxicity?

- Amount

- Length of exposure (time)

- Sensitivity

<https://www.meadindoor.com/for-physicians/>

Health effects can become more serious as the amount someone is exposed to increases

Toxicity depends on the amount of time someone is exposed to a chemical

OEHHA develops Reference Exposure Levels for specific amounts of time

- Brief exposure (*acute*): occasional 1-hour exposures
- Moderate exposure: repeated 8-hour exposures over a significant fraction of a lifetime
- Constant exposure (*chronic*): continuous exposures from 1 year to a lifetime

Example: exposure to diesel exhaust

Acute: Mowing the lawn for 1 hour

Chronic: Living next to a freeway

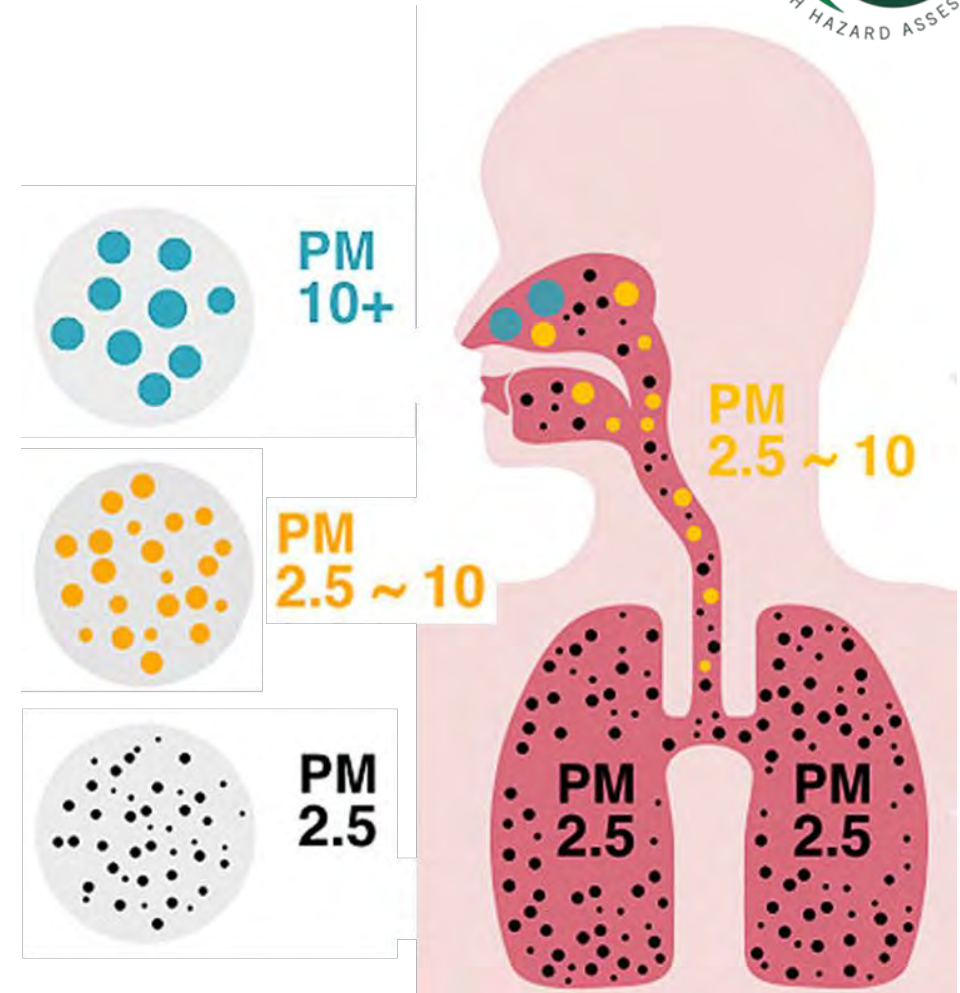

Particulate Matter (PM)

Health Concerns: PM_{2.5}

- Can reach deep into the lung
- *Short-term exposure*: respiratory irritation, ↓ lung function, asthma attacks, irregular heartbeat, ↑ respiratory symptoms
- *Short- and long-term exposure*: premature death, cardiovascular mortality and hospitalizations, respiratory and asthma hospitalizations
- Sensitive populations
 - Elderly
 - Those with emphysema, asthma, chronic heart/lung disease
 - Infants/children (↑ illnesses, ↓ lung function)
 - Pregnant women (↓ birth weight, preterm birth)

https://www.masters.tw/wp-content/uploads/2015/07/pm2_52.jpg

Health Concerns: Diesel Exhaust

Noncancer

Respiratory irritation, cough, allergies, lung inflammation

↑ hospitalizations, ER visits, asthma attacks, premature deaths

Sensitive populations

- Those with respiratory/cardiovascular conditions
- Children
- Elderly

Cancer

Increased cancer risk

~70% of average Californian's cancer risk from air pollution (CARB)

<https://commons.wikimedia.org/wiki/File:Diesel-smoke.jpg>

Health Concerns: Wood Smoke

Contains thousands of chemicals, most concerning are:

- PM_{10} and $PM_{2.5}$
- Carbon monoxide
- Irritants (nitrogen dioxide, sulfur oxides, aldehydes like acrolein and formaldehyde)
 - May play a role in smoke-triggered asthma attacks
- Carcinogens, including polycyclic aromatic hydrocarbons (PAHs), benzene, 1,3-butadiene, formaldehyde

Contributes to indoor air pollution, particularly for PAHs

Reduction in residential wood burning (required by Rule 4901) was associated with decreased hospitalization for cardiovascular disease (Yap & Garcia, 2015)

Health Concerns: Metals

Lung cancer (arsenic, beryllium, cadmium, cobalt, hexavalent chromium, nickel)

Adrenal cancer (cobalt)

Kidney cancer (lead)

Nervous system (arsenic, lead, manganese, selenium)

Respiratory system (beryllium, cadmium, cobalt, hexavalent chromium, nickel)

Liver (selenium)

Kidney (cadmium)

Immune system (beryllium, nickel)

Reproduction and development (arsenic)

Blood (selenium)

Hair, skin, nails (selenium)

Health Concerns: Volatile Organic Compounds (VOCs)

**Nasal tumors
(formaldehyde, naphthalene)**

**Kidney cancer
(ethylbenzene)**

**Leukemia
(benzene)**

Nervous system (benzene, hexane, styrene, toluene, xylenes)

Respiratory system
(acrolein, formaldehyde, naphthalene, styrene, toluene, xylenes)

Liver (ethylbenzene)

Kidney (ethylbenzene)

Reproduction and development
(benzene, ethylbenzene, toluene)

Blood (benzene)

How do we determine the risk from the amount of a chemical measured in air?

Noncancer

How does the amount in air compare to the Reference Exposure Level?

▲ Higher? May be some concern

Reference Exposure Level

▲ Lower? Little concern

Cancer

How much does the amount in air increase cancer risk by?

▲ Higher? Concern

Risk target (insignificant cancer risk)

▲ Lower? Less concern

Questions?

Heather Bolstad, Ph.D.

heather.bolstad@oehha.ca.gov

Development of Stockton Community Air Monitoring Plan

May 6, 2020

Jon Klassen

Director of Air Quality Science and Planning
San Joaquin Valley Air Pollution Control District

Community Air Monitoring

- AB 617 includes requirements for air districts to deploy air monitoring in communities selected by CARB
 - Community air monitoring for Stockton to be in place by January 2021
 - Supplements existing monitoring in/near selected community
- District currently preparing platforms and equipment for community air monitoring in Stockton
- Community access to air monitoring information will be provided
 - District's AB 617 webpage for Stockton Community
 - CARB's online statewide data portal (AQview)
- Stockton community air monitoring will mirror localized air monitoring work being conducted in previously selected AB 617 communities of South Central Fresno and Shafter

Community Air Monitoring Plan Elements

- Stockton Community Steering Committee will provide input in preparing community air monitoring plan
 - District responsible for preparing final plan
- CARB AB 617 Blueprint describes the following 14 elements for community air monitoring plans
 1. Community partnerships
 2. Community-specific purpose for air monitoring
 3. Scope of actions
 4. Air monitoring objectives
 5. Roles and responsibilities
 6. Data quality objectives
 7. Monitoring methods and equipment
 8. Monitoring areas
 9. Quality control procedures
 10. Data management
 11. Field measurements
 12. Evaluating effectiveness
 13. Analyze and interpret data
 14. Communicate results

Goals of Community Air Monitoring Plan

- Community air monitoring plan for Stockton should define clear goals and objectives
- Developed community air monitoring plan should assist in guiding the air monitoring goals for Stockton
 - Collected data will allow for community-level air quality analysis and evaluation of long-term trends
- Collected data will assist with ongoing development and implementation of Stockton community emissions reduction program

Pollutants and Source Types

PM2.5, Black Carbon

- Mobile, industrial, and residential sources

Oxides of Nitrogen
(NO/NO₂/NO_x), Toxics

- Mobile and industrial sources

Carbon Monoxide (CO)

- Mobile sources

Ozone

- Regional, formed through combination of NO_x, VOC, sunlight

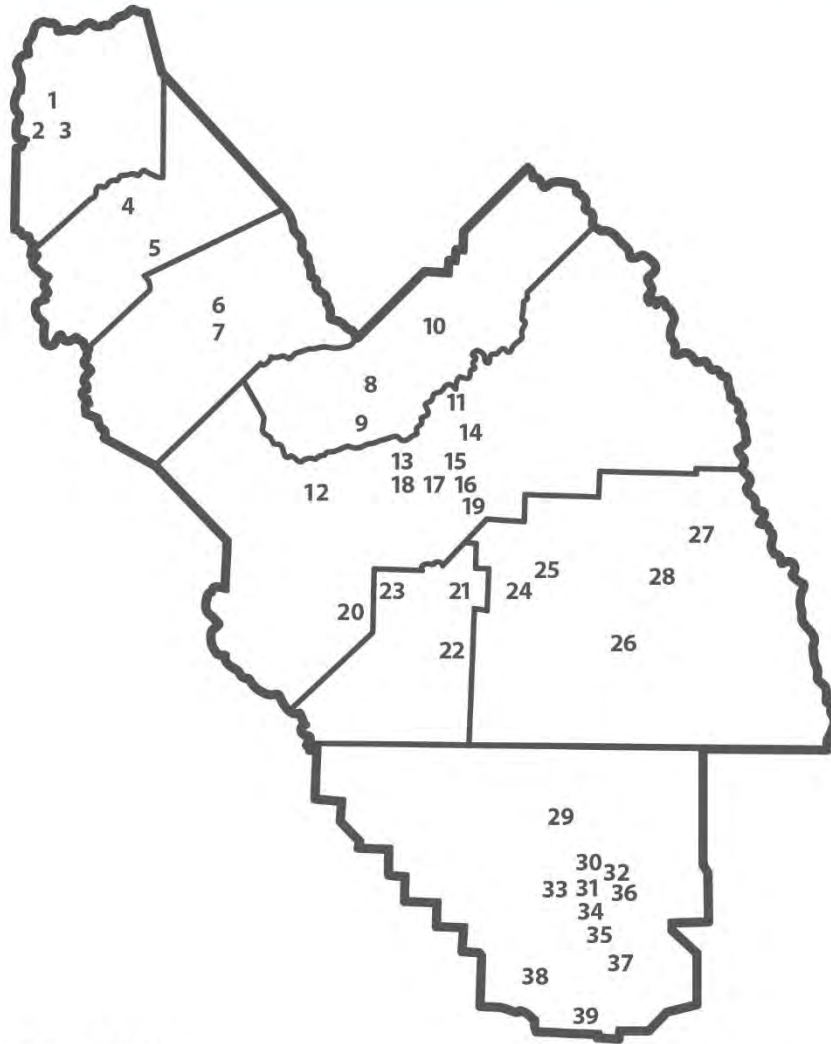

Sulfur Dioxide (SO₂)

- Industrial sources

Volatile Organic
Compounds (VOC)

- Mobile, industrial, and gasoline distribution sources

Air Monitoring Sites in Operation

As of July 2019

San Joaquin Valley
AIR POLLUTION CONTROL DISTRICT

SAN JOAQUIN COUNTY

- 1 Stockton-Hazelton: G, M, P, F, T
- ★ 2 Tracy-Airport: G, M, P, F
- ★ 3 Manteca: P, F, M

STANISLAUS COUNTY

- 4 Modesto-14th St: G, M, P, F
- ★ 5 Turlock: G, M, P, F

MERCED COUNTY

- ★ 6 Merced-M St: P, F
- ★ 7 Merced-Coffee: G, F, M

MADERA COUNTY

- ★ 8 Madera City: G, P, F, M
- ★ 9 Madera-Pump Yard: G, M

Other¹:

- Chukchansi Indians
- ▲ 10 Picayune Rancheria: G, F, P, M

FRESNO COUNTY

Other¹:

- Monache Tribe/Foothill Yokut Indians
- ▲ 11 Table Mountain AMS⁺: G, F, P, M
- ★ 12 Tranquillity: G, F, M
- ★ 13 Fresno-Sky Park: G, M
- ★ 14 Clovis: G, M, P, F
- 15 Fresno-Garland: G, M, P, F, T, N
- ★ 16 Fresno-Pacific: F
- ★ 17 Fresno-Drummond: G, P, M
- ★ 18 Fresno-Foundry: G, M
- ★ 19 Parlier: G, M
- ★ 20 Huron: F, M

MONITORING DESIGNATIONS

- | | | | |
|---|--------------------------|---|--------------------|
| F | Fine Particulate (PM2.5) | P | Particulate (PM10) |
| G | Gaseous | N | National Core |
| M | Meteorological | T | Toxins |

KINGS COUNTY

- ★ 21 Hanford: G, F, M, P
- ★ 22 Corcoran: F, M, P
- Other¹:**
Tachi Yokut Tribe
- ▲ 23 Santa Rosa Rancheria: G, M, P

TULARE COUNTY

- ★ 24 Visalia Airport: M
- 25 Visalia-Church St: G, F, M, P
- ★ 26 Porterville: G, F, M
- Other²:**
▲ 27 Lower Kaweah: A, G, M
▲ 28 Ash Mountain: A, G, M, F

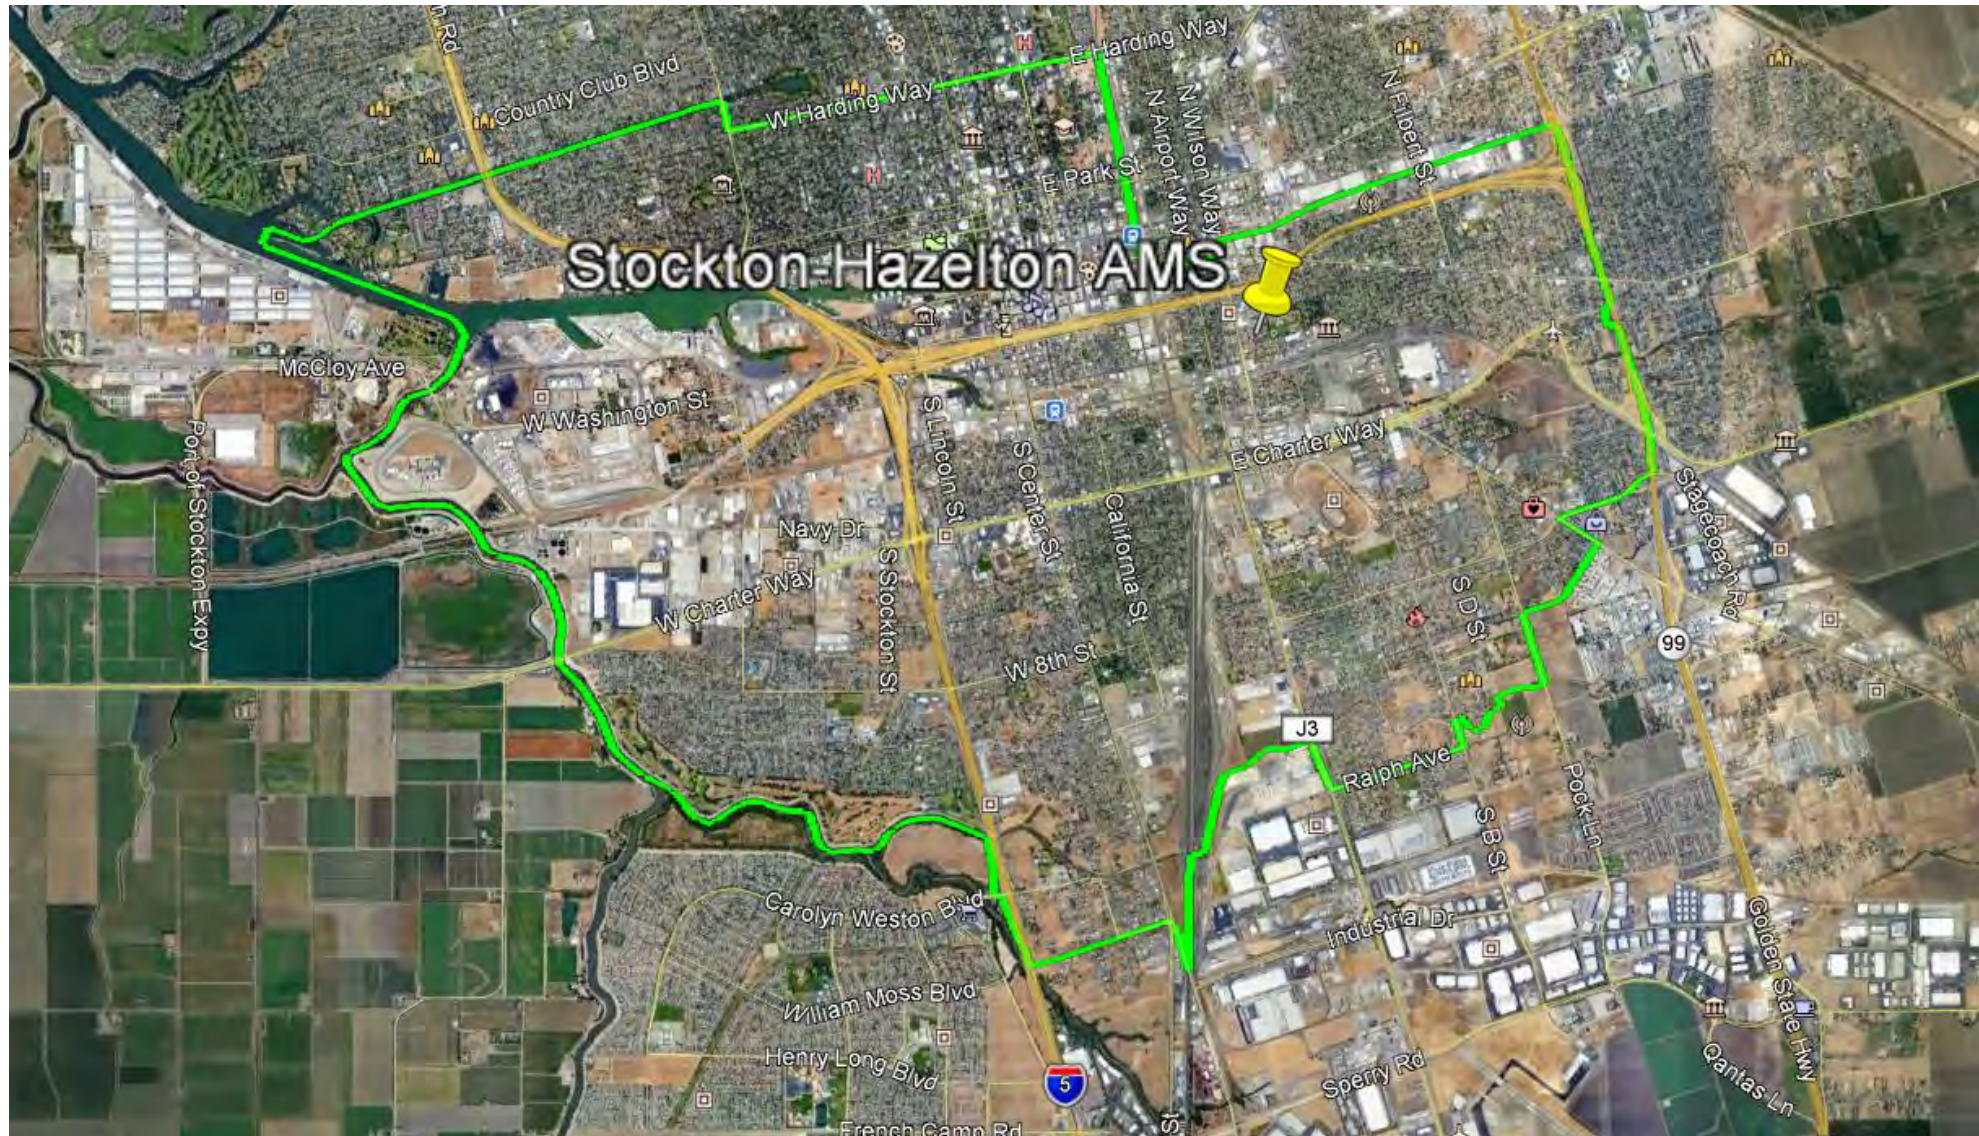

KERN COUNTY

- 29 Shafter: G, M
- 30 Oildale: G, M, P
- ★ 31 Bakersfield-Golden/M St: F, P
- ★ 32 Bakersfield-Westwind: G, M
- 33 Bakersfield-Calif Ave: G, M, P, F, T
- ★ 34 Bakersfield-Muni: G, M
- 35 Bakersfield-Airport (Planz): F
- 36 Edison: G, M
- 37 Arvin-Di-Giorgio: G, M
- ★ 38 Maricopa: G, M
- ★ 39 Lebec: F, M

MONITORING OPERATION

- ★ Sites operated by the District
- Sites operated by the District & CARB
- Sites operated by CARB
- ▲ Sites operated by other agencies
Other¹ Tribal
Other² National Park Service
- + Air Monitoring Station (AMS)

Current Air Monitoring in Stockton Community

Current Air Monitoring in Stockton Community

- Stockton-Hazelton site operated by CARB since 1976
 - Measures Ozone, NO/NO₂/NO_x, CO, PM_{2.5}, PM₁₀, Toxics, Meteorology
 - Located near Wilson and Hazelton Avenues at San Joaquin County Public Health building
- Ongoing air monitoring operations at this existing site provides valuable data that will be used to complement the community air monitoring network in development
- Historical data for this site is available on CARB website
 - <https://www.arb.ca.gov/aqmis2/aqmis2.php>

Community Air Monitoring Data

- District developing various additional resources for community air monitoring in Stockton
 - Development of these resources aimed to be scalable, portable, and rapidly deployable
 - Instrumentation will produce high-precision and quality data
- Air monitoring data collected in Stockton community will be available on AQview
 - Available at: <https://ww2.arb.ca.gov/es/community-air-quality-portal>
- Stockton community air monitoring data will also be displayed on District website in real-time

Community Air Monitoring Platform Capabilities

Air Monitoring Trailer

- PM2.5, Ozone, Black Carbon, CO, NO/NO2/NOx, VOC, Toxics, SO2, H2S, Speciated VOCs, Meteorology
- Extensive capabilities, could be placed in most impacted area

Compact Multi-Pollutant Systems

- PM2.5, Ozone, Black Carbon, CO, NO/NO2/NOx, VOC, SO2, Meteorology
- Variety of pollutants measured, could be placed in areas with multiple concerns

Stand-Alone PM2.5 Monitors

- PM2.5
- Could be placed in various areas where PM2.5 is a concern

Mobile Air Monitoring Van

- PM2.5, Ozone, Black Carbon, CO, NO/NO2/NOx, VOC, SO2, H2S, Toxics, Meteorology
- Maximum flexibility in where measurements can take place

Considerations for Community Air Monitoring

- Number of factors to be taken into consideration when planning for placement of air monitoring equipment
 - Permission of land-owner to place equipment on property
 - Establishment of lease agreements with property owner
 - Security of the location to protect equipment
 - Access to power source to operate equipment
 - Proper monitoring siting (no obstructions, mindful of influence from local sources of pollution)
 - Placing air monitoring equipment at schools is often a long administrative process – would recommend also looking at other properties near schools as an alternative
- These factors frequently impact the ability to find suitable monitoring locations
- These factors should be kept in mind when making recommendations for monitoring locations

Questions for Steering Committee

- District asking Stockton Community Steering Committee for initial thoughts and comments in the following areas:
 - Where should air monitoring assets be placed in the community?
 - What pollutants/types of sources should be considered in the community air monitoring plan?
- What specific information and resources could assist the Community Steering Committee in providing meaningful input in the design of the Community Air Monitoring Plan?

Next Steps

- Stockton Community Air Monitoring Plan exercise planned for upcoming Community Steering Committee meeting
- Exercise will solicit feedback and recommendations on where within the community and what pollutants should be monitored
- Feedback will guide the District in drafting Stockton Community Air Monitoring Plan for Community Steering Committee review and comment

Agenda for Stockton Community Steering Committee Meeting #2

Wednesday, April 22, 2020 – 5:30 pm - 7:30 pm

Zoom Meeting: <https://zoom.us/j/897647600>

Meeting ID: **897 647 600**

Teleconference Dial In: **888 788 0099 US** (Toll-free)

- 5:30 p.m. Welcome, Introductions**
Christal Love Lazard, Institute for Local Government, Facilitator
Ryan Hayashi, Valley Air District
Dillon Delvo, Little Manila Rising
- 5:50 p.m. Zoom How-To**
Review of Zoom tools, proper use, and virtual meeting etiquette
Christal Love Lazard, Facilitator
- 6:50 p.m. District Online Resources**
Walk through the various maps, documents, resources, and tools available online at community.valleyair.org
Jessica Olsen, Valley Air District
- 7:20 p.m. Wrap Up/Next Steps**
Next Meeting May 6, 2020: Zoom Call

To request Spanish interpreting services, please contact Jaime Holt or Heather Heinks at (559) 230-6000 or AB617@valleyair.org at least 7 days prior to the meeting date.

Learn more: community.valleyair.org

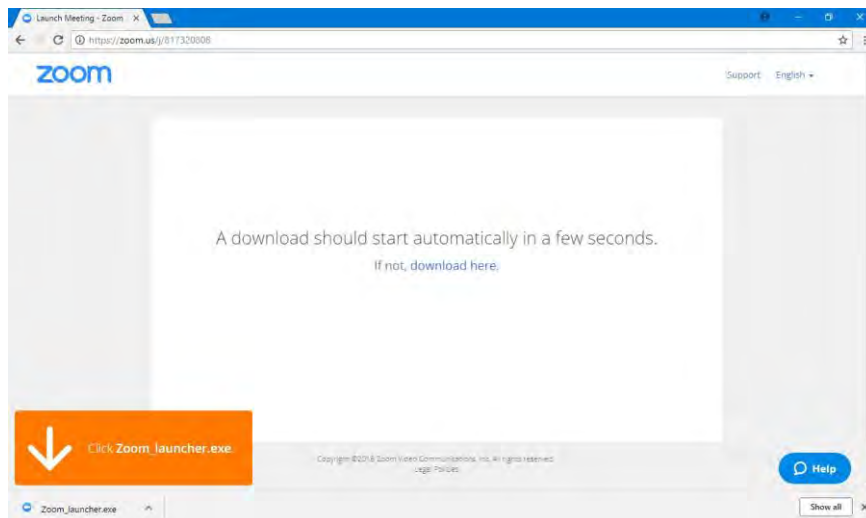

ZOOM INSTRUCTIONS FOR AB 617 PARTICIPANTS

Before a Zoom meeting:

1. You will need a computer, tablet, or smartphone with a speaker or headphones. You will have the opportunity to check your audio and video immediately upon joining a meeting.
2. You will receive an email inviting you to participate in a Zoom meeting from the Valley Air District. The notification will include a link to **Join Zoom**. If you are unable to join using either a computer, tablet or smartphone, you can still listen to the meeting .via phone using the call in number and 9-digit meeting ID provided.

Joining Zoom meeting from your computer:

5-10 min before start time of your meeting, click on the link in your invitation. You *may* be instructed to download the Zoom application.

Once the Zoom app is installed, you should see this window pop up. Click on Zoom Meetings and then on the **Open Link** button.

Zoom app may ask for your name. The text entered in this box will be your name in the participant list and will appear under your web cam video. Click the **Join Meeting** button after you have typed your name.

Your Zoom video:

You have an opportunity to join with or without video.

Your Zoom Audio:

Please choose how you would like to like to hear and to talk to the other participants in the Zoom meeting. You have two audio options: join audio by computer or join audio by phone.

You have an opportunity to test your audio by clicking on “Test Computer Audio.” Once you are satisfied that your audio works, click on “Join audio by computer.”

OR To join via telephone:

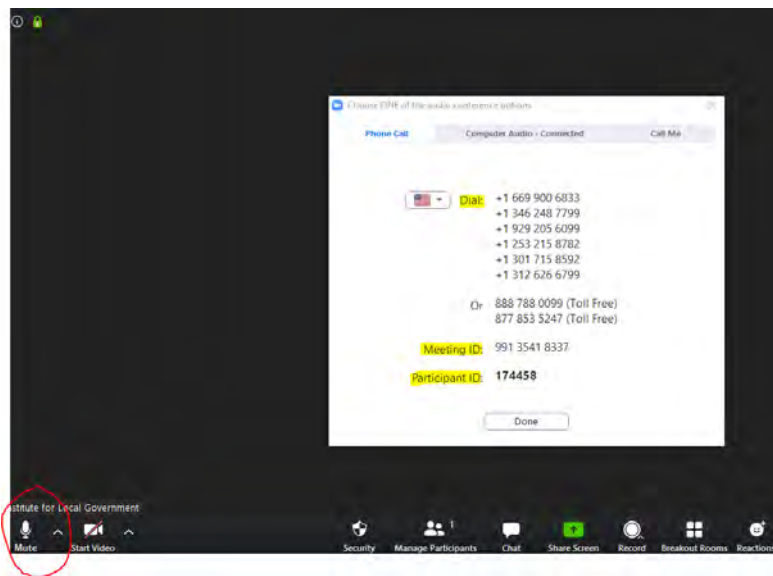

1. On your phone, dial the teleconferencing number provided in your invitation.
2. Enter the **Meeting ID number** (also provided in your invitation) when prompted using your touch-tone keypad.
3. If you have already joined the meeting via computer, please enter your **Participant ID** associated with your Zoom participation. *(Picture is an example of what you will see on the screen. Your numbers will be different).*

To minimize the potential echo during the meeting, please pick one audio option – Phone or Computer Audio.

Switching between computer and phone audio:

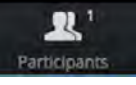

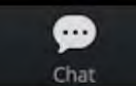

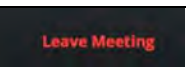

If you need to switch between computer and phone audio, click the bottom left corner arrow on your screen and select **Join Phone Audio** in the pop up menu. Follow the instructions below.

Exploring Participant Controls on the bottom of your screen:

	Once your audio is working, you will see a different icon: a microphone. You can click on this icon to Mute and Unmute yourself.
--	--

	Click on this icon to start your video. If this is the first time you are using Zoom, you will be asked to allow Zoom to use your camera. Click Allow .
	This icon allows you to invite other people to join the meeting.
	This icon tells you how many people are currently in the meeting. View Participant list – opens a pop-out screen that includes a “Raise Hand” icon that you may use to raise a virtual hand.
	If the host of the meeting allows it, you can share your screen by clicking the Share Screen icon. This means that the other participants will be able to see your desktop or the application you want to share.
	Click on this icon to access the chat window and chat with other participants. You can send a message to the entire group or to an individual user. Please be aware that even a private chat may end up in a public record of the zoom meeting. As you already do when face-to-face, show respect to others when using the chat box.
	Click here to leave the meeting when it is over or if you need leave the meeting early while it continues for the other participants.
	Zoom offers to reactions to provide nonverbal feedback. Click the type of reaction you would like to send: clapping hands or thumbs up. The reaction will display for 5 seconds.

Joining Zoom meeting from tablet or phone:

1. Make sure you have downloaded the Zoom app on your smartphone. You can download it just like you would download any other app: from the App Store or Google Play Store (Android).
2. Tap either **Personal Link Name** or **Join with a meeting ID** and enter your information. Then tap Join.
3. To join the meeting, you will be asked to enter Your Name and then tap Continue.

4. Select **Join with Video**
5. Confirm your audio preferences. IF you have strong internet connection, there is no reason not to use Internet Audio
6. Note the icons at the bottom are the same.

General Meeting Best Practices when participating in a Zoom Meeting

These will be refined as we all learn how to have effective AB 617 virtual meetings together

- The host will mute all participants during presentations to reduce background noise.
- Check your internet speed. If you are using free wifi you may need to keep your camera off to improve sound and/or image quality.
- Turn your camera on and have your camera at eye level.
- Stay muted unless you are talking to reduce background noise.
- Use chat box to submit comments / questions.
- To vote, use the vote button on the bottom of the screen.
- Make sure you sit in a well-lit and quiet place.
- Be mindful of what is going on behind you. Think about having solid wall behind you or turning on the virtual background.

If you have any questions regarding Zoom and/or are experiencing technical difficulties, please contact Heather Heinks at (559) 230-5898 or (559)994-7591 for assistance.

Agenda para el Comité Directivo Comunitario de Stockton Reunión #2

Miércoles 22 de abril de 2020 – 5:30 pm a 7:30 pm

Reunión por Zoom: <https://zoom.us/j/897647600>

Meeting ID: **897 647 600**

Teleconferencia: **888 788 0099 US** (Llamada gratuita)

- 5:30 p.m. Bienvenida, Introducciones**
Christal Love Lazard, Facilitadora, Institute for Local Government
Ryan Hayashi, Distrito del Aire del Valle
Dillon Delvo, Little Manila Rising
- 5:50 p.m. Guía Básica para Zoom**
Repaso de las herramientas, el uso apropiado, y la etiqueta de reuniones virtuales en Zoom
Christal Love Lazard, Facilitadora
- 6:50 p.m. Recursos En Línea del Distrito**
Hablar sobre los diversos mapas, documentos, recursos, y herramientas disponible en línea en community.valleyair.org
Jessica Olsen, Distrito del Aire del Valle
- 7:20 p.m. Concluir/Próximos Pasos**
Próxima Reunión 6 de mayo de 2020: Llamada por Zoom

Para solicitar interpretación en Español, por favor comuníquese con Jaime Holt o Heather Heinks al (559) 230-6000 o AB617@valleyair.org por lo menos 7 días antes de la reunión.

Aprende más: community.valleyair.org

INSTRUCCIONES DE ZOOM PARA PARTICIPANTES DE AB 617

Antes de una reunión por Zoom:

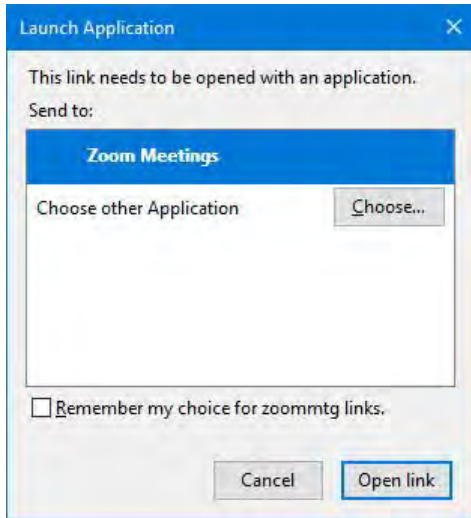

1. Necesitará una computadora, tableta o teléfono inteligente con una bocina o audífonos. Tendrá una oportunidad de verificar su audio y video inmediatamente después de unirse a una reunión.
2. Recibirá un correo electrónico invitándole a participar en una reunión del Distrito del Aire del Valle. La notificación incluirá un enlace para unirse a Zoom (**Join Zoom**). Si no puede unirse usando una computadora, tableta o teléfono inteligente, aún puede escuchar la reunión a través del teléfono usando el número de llamada y la identificación de la reunión de 9 dígitos.

Unirse a la reunión por Zoom desde su computadora:

5-10 minutos antes de la hora de inicio de su reunión, haga clic en el enlace de su invitación. Es **posible** que le indique que descargue la aplicación Zoom.

Una vez que la aplicación Zoom está instalada, debería de ver esta ventana emergente. Haga clic en Zoom Meetings y luego en el botón **Open Link**.

La aplicación Zoom puede preguntar por su nombre. El texto ingresado en este cuadro será su nombre en la lista de participantes y aparecerá debajo de su video de cámara web. Haga clic en el botón **Join Meeting** después de haber escrito su nombre.

Su video de Zoom:

Tiene la oportunidad de unirse con o sin video.

Su audio de Zoom:

Elija cómo le gustaría escuchar y hablar con los demás participantes en la reunión de Zoom. Tiene dos opciones de audio: unir por **audio by computer (audio por computadora)** o unir por **audio by phone (audio por teléfono)**.

Tiene la oportunidad de probar su audio haciendo clic en **“Test Computer Audio.”** Una vez que esté satisfecho de que su audio funciona, haga clic en **“Join audio by computer.”**

○ Para unirse por teléfono:

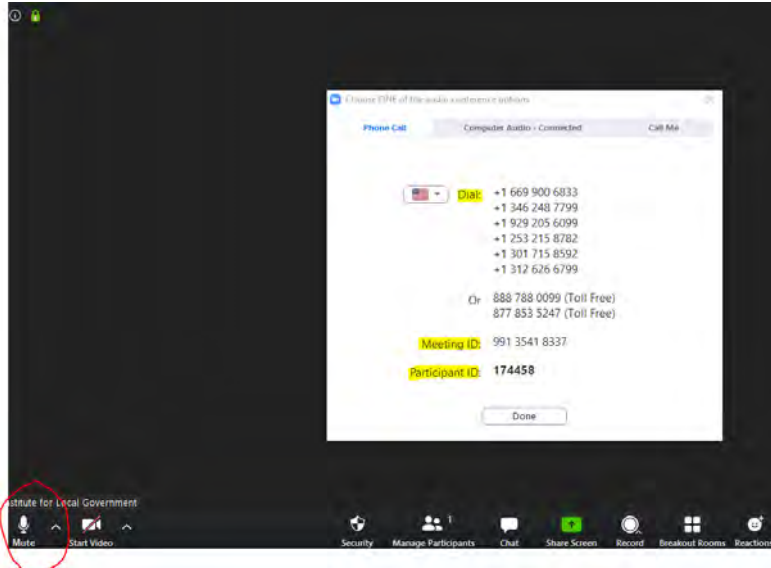

1. En su teléfono, marque el número de teleconferencia proporcionado en su invitación.
2. Ingrese el número de **Meeting ID** (también incluido en su invitación) cuando se le solicite en su teclado.
3. Si ya se unió a la reunión por computadora, ingrese el **Participant ID** asociada con su participación de Zoom. *(La imagen es un ejemplo de lo que verá en la pantalla. Sus números serán diferentes).*

Para minimizar el eco potencial durante la reunión, elija una opción de audio – Audio por Computadora o Teléfono.

Cambiar entre la computadora y el audio del teléfono:

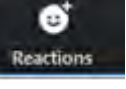

Si necesita cambiar entre la computadora y el audio del teléfono, haga clic en la flecha de la esquina inferior izquierda de la pantalla y seleccione **Join Phone Audio** en el menú emergente. Sigue las instrucciones debajo.

Explorando los Controles de los Participantes en la parte inferior de la pantalla:

	Una vez que su audio esté funcionando, verá un icono diferente: un micrófono. Puede hacer clic en este icono para Silenciar y Activar el sonido.
--	--

	<p>Haga clic en este icono para comenzar su video. Si es la primera vez que usa Zoom, se le pedirá que permita que Zoom use su cámara. Haz clic en Allow.</p>
	<p>Este icono le permite invitar a otras personas a unirse a la reunión.</p>
	<p>Este icono le indica cuántas personas hay actualmente en la reunión. Ver lista de participantes/View Participant List – abre una pantalla emergente que incluye un icono de "Levantar mano/Raise Hand" que puede usar para levantar una mano virtual.</p>
	<p>Si el anfitrión de la reunión lo permite, puede compartir su pantalla haciendo clic en el icono Share Screen. Esto significa que los demás participantes podrán ver de escritorio o la aplicación que desea compartir.</p>
	<p>Haga clic en este icono para acceder a la ventana de chat y chatear con otros participantes. Puede enviar un mensaje a todo el grupo o a un usuario individual. Tenga en cuenta que incluso un chat privado puede terminar en un registro público de la reunión de zoom. Como ya lo hace cuando está cara a cara, muestre respeto a los demás cuando use el chat.</p>
	<p>Haga clic aquí para dejar la reunión cuando termine o si necesita dejarla temprano mientras continúa para los demás participantes.</p>
	<p>Zoom ofrece reacciones para proporcionar comentarios no verbales. Haga clic en el tipo de reacción que le gustaría enviar: aplaudir o levantar el pulgar. La reacción se mostrará durante 5 segundos.</p>

Unirse a la reunión de Zoom desde tableta o teléfono:

1. Asegúrese de haber descargado la aplicación Zoom en su teléfono inteligente. Puede descargarlo como lo haría con cualquier otra aplicación: desde App Store o Google Play Store (Android).
2. Toque **Personal Link Name** o **Join with a meeting ID** e ingrese su información. Luego toque Join.
3. Para unirse a la reunión, se le pedirá que ingrese Su nombre y luego toque Continue.

Mejores Prácticas de Reuniones Generales al participar en una Reunión de Zoom

Estos serán refinados a medida que todos aprendamos cómo tener reuniones virtuales de AB 617 efectivas

- El anfitrión silenciará a todos los participantes durante las presentaciones para reducir el ruido de fondo.
- Verifique su velocidad de internet. Si está utilizando wifi gratuito, es posible que deba mantener su cámara apagada para mejorar la calidad del sonido y/o la imagen.
- Prenda su cámara y manténgala al nivel de los ojos.
- Permanezca en silencio a menos que esté hablando para reducir el ruido de fondo.
- Use el chat para enviar comentarios/preguntas.

- Para votar, use el botón votar en la parte inferior de la pantalla.
- Asegúrese de sentarse en un lugar bien iluminado y tranquilo.
- Sea consciente de lo que sucede detrás de usted. Piense en tener una pared sólida detrás de usted o activar el fondo virtual.

Si tiene alguna pregunta sobre Zoom y/o tiene dificultades técnicas, comuníquese con Heather Heinks al (559) 230-5898 o (559) 994-7591 para obtener ayuda.

Community Emissions Reduction Program

Stockton

February 3, 2021 Draft

San Joaquin Valley
AIR POLLUTION CONTROL DISTRICT

EXECUTIVE SUMMARY

The air quality challenges that the communities in the San Joaquin Valley face are unmatched by any other region in the nation. The San Joaquin Valley, due to its unique geography, topography, and meteorology, continues to face daunting challenges in meeting the latest federal health-based air quality standards. Since 1992, the San Joaquin Valley Air Pollution Control District (District) has implemented nearly 650 rules and regulations to control air pollution in the Valley Air Basin. Numerous plans to improve Valley air quality and attain state and federal air quality standards have detailed a wide-range of strategies, including regulatory measures, extensive incentive investment to promote clean-air technologies in Valley communities, and other first-of-their kind measures, such as the District's Indirect Source Review regulation which reduces emissions from new construction and development projects, and the nationally recognized Tune-in-Tune Up vehicle repair program. The District also has dedicated field staff that are in communities throughout the Valley conducting inspections and responding and investigating complaints to ensure that Valley businesses and residents are complying with federal, state, and local rules and regulations.

As a result of the District's stringent and comprehensive air quality management strategy, along with significant investments made by Valley businesses and residents, since the District's formation in 1992, PM_{2.5} and ozone levels are now at historically low levels, and the Valley continues to be in attainment of the PM₁₀ federal air quality standard. Emissions from stationary sources have been reduced by 85%, cancer risk from exposure to air pollutants has been reduced by 95%, population exposure to elevated PM_{2.5} levels have been reduced by 85%, and population exposure to elevated ozone levels have been reduced by 90%.

Despite these regional air quality improvements, significant concern has been expressed by the California legislature about potential localized impacts of air pollution in disadvantaged communities throughout the state. In answer to that concern, Assembly Bill (AB) 617, signed into law in July 2017, initiated a state-wide effort to monitor and reduce air pollution, and improve public health, in communities that experience disproportionate burdens from exposure to air pollutants through new community-focused and community-driven actions. The community of Stockton AB 617 Community was prioritized by the Air District and subsequently selected by the California Air Resources Board (CARB) as one of the third-year communities selected in the state to receive clean air resources newly available under AB 617, based on a technical analysis of several pollution and poverty-related criteria.

AB 617 provides mechanisms and resources to implement community-specific air quality monitoring networks; to develop, implement, and track emission reduction programs; to improve availability of data and other technical information; and to invest substantial funding in the community through voluntary incentive funding measures. Importantly, these measures are guided by advice and knowledge of local community

members, through their input and involvement on Steering Committees for each AB 617-selected community.

This Community Emission Reduction Program (CERP) provides a description of the community of Stockton AB 617 Community, including geographical boundaries and describes air quality challenges impacting community residents. A technical analysis describes the sources of pollution impacting the community, as well as the location of sensitive receptors within the community. Sources of pollution that are of particular concern to community members are highlighted, and strategies for reducing air pollution impacts and health risk reduction from these sources were evaluated as part of the public engagement process between the Community Steering Committee (CSC), the District, and the California Air Resources Board. Working closely together as a unified partnership, the CSC developed numerous strategies that were ultimately selected for implementation in the community, including incentive funding measures, public engagement strategies, enforcement strategies, and regulatory strategies. Many of the strategies will require close collaboration with state and local organizations and community based organizations to fully implement them. Also included in this CERP is an implementation schedule and necessary metrics for tracking emission reductions within the community. The metrics for tracking progress will be included in regular updates to the CSC during ongoing meetings, annual reporting, and at the five-year milestone.

This draft CERP anticipates investing over \$36 million in emission reduction incentives, and a variety of other clean air projects in the Stockton AB 617 Community area. Additional measures have been developed to reduce exposure to air pollution for sensitive receptors, including schools and residences. These efforts are projected to achieve up to approximately 71 tons of PM_{2.5} reductions and 860 tons of NO_x reductions as well as significant reductions in air toxics emissions in the community, particularly with respect to diesel particulate matter from mobile sources, the main contributor to community air toxics health risk. Additional regulatory and outreach strategies will provide for further reductions in emissions and exposure, while increasing awareness of the community's air quality challenges and the resources available to help the public and businesses reduce emissions and avoid exposure to air pollution.

Air pollution emission reduction and exposure reduction measures implemented under AB 617 programs will further advance ongoing state and District efforts to reduce regional and community exposure to air pollutants. In the preparation of this CERP, the District has worked closely with the CSC, CARB, and the public. The CSC included, residents, community-based organizations, community members, environmental organizations, regulated industry representatives, other local agencies, and other key stakeholders and worked to develop strategies and an implementation plan to reduce harmful air pollutants in the community of Stockton AB 617 Community. The plan developed through this collaborative process employs proven and innovative strategies, and significant resources, to improve community health by reducing exposure to air pollutants in Stockton AB 617 Community.

This CERP and the many air quality improvement strategies it includes would not be possible without the tremendous commitment and effort shown by Stockton Community Steering Committee members. This engaged group of individuals includes area residents; representatives from community and faith based organizations; owners and employees from businesses operating within the community; the City of Stockton, San Joaquin County, Port of Stockton employees; representatives from schools within the community and others. Additionally, the California Air Resources Board staff, members of state and local agencies including the San Joaquin Council of Government, California Department of Transportation, and Housing Authority of the County of San Joaquin have also provided information and guidance to assist the CSC members in the development of the air quality improvement strategies in this CERP. Lastly, the Institute for Local Government should be commended for the excellent meeting facilitation services they provided to guide this process.

1. INTRODUCTION

1.1 IMPLEMENTATION OF AB 617 IN STOCKTON AB 617 COMMUNITY

The implementation of Assembly Bill (AB) 617 (C. Garcia, Chapter 136, Statutes of 2017) has brought additional clean air resources and strategies to Valley environmental justice communities that have been and are currently disproportionately burdened by socioeconomic disadvantages and air pollution, despite significant emissions reductions that have already been achieved regionally. AB 617 provides mechanisms and resources to adopt expedited schedules for the implementation of advanced control technologies for existing stationary source facilities; increased stringency of reporting requirements for stationary sources; develop and implement community-specific air quality monitoring networks; implement, and track localized emission reduction programs; improve availability of data and other technical information; and invest substantial funding in the community through voluntary incentive funding measures. Resources available through this legislation allowed the San Joaquin Valley Air Pollution Control District (District), working in partnership with the Stockton AB 617 CSC, through a comprehensive public outreach and community engagement process, to expand regional programs for community protection and develop a robust plan for reducing local exposure to various forms of air pollution including fine particulate matter and toxic air contaminants in the Stockton AB 617 Community.

Several requirements of AB 617 will serve to reduce air pollution in disadvantaged communities throughout the San Joaquin Valley. AB 617 legislation required districts that are in nonattainment for one or more air pollutants to adopt expedited rule review schedules, by January 2019, for the implementation of Best Available Retrofit Control Technology (BARCT). The District Governing Board adopted this schedule at a public hearing held in December 2018, which set the path forward for the District to research and potentially amend applicable rules. The expedited BARCT implementation schedule is discussed in more detail later in this document. Additionally, AB 617 requires "Stationary Sources" to report their criteria pollutant emissions inventory as well as their air toxics emissions inventory to the State on an annual basis. These emissions inventories will be presented via the Criteria Pollutant and Toxics Emissions Reporting regulation, once fully implemented by California Air Resources Board (CARB). Under AB 617, a Stationary Source is defined as a facility meeting any one of the following:

- Required to submit Greenhouse Gas emissions under the CH&SC § 38530 (Mandatory GHG Emissions Reporting),
- A facility that is authorized by a permit issued by a district to emit 250 or more tons per year of any nonattainment pollutant or its precursors, or
- A facility that receives an elevated prioritization score based on cancer or noncancer health impacts pursuant to Section CH&SC § 44360 (Air Toxics Hot Spots, Chapter 4: Risk Assessment).

The District has worked with closely with CARB, regulated entities, and other stakeholders to implement this new reporting requirement in the Valley. Further

information on the implementation of the AB 617 stationary source criteria pollutant emissions inventory reporting requirement is available at: <https://ww2.arb.ca.gov/our-work/programs/criteria-and-toxics-reporting>.

The District's community identification and prioritization analysis for the second year of AB 617 implementation was based on extensive air quality analysis, numerous health indicators from the state's CalEnviroScreen model (version 3.0), and various other socioeconomic indicators. In developing San Joaquin Valley community recommendations for additional clean air resources and public engagement under AB 617, the District conducted a public engagement process to seek input from Valley residents, businesses, agencies, and other stakeholders through public workshops and meetings throughout the Valley.

Based on this extensive public engagement effort, significant interest and support for the Stockton community, and the District's comprehensive identification and prioritization analysis: the Stockton Community was recommended by the District Governing Board as a second-year AB 617 community. Sources that affect Stockton AB 617 Community include mobile sources and freeways, port operations, and industry. The Stockton AB 617 Community has a high cumulative air pollution exposure burden, a significant number of sensitive receptors, and includes census tracts designated as disadvantaged communities. After further technical review and public engagement, the Stockton AB 617 Community was ultimately selected by the CARB Governing Board for the development of a community air monitoring plan and an emissions reduction program designed to reduce pollution impacts in the selected community.

In accordance with the community-driven nature of AB 617 directives, in September of 2019 the District Governing Board directed staff to immediately convene a CSC committee under a set of guiding principles. The CSC is comprised of residents, businesses, community based organizations, environmental justice advocates, and public agencies, working together to craft and develop a community air monitoring plan and a Community Emissions Reduction Program (CERP). To ensure successful implementation of AB 617, residents, businesses, non-profits organizations, state and local agencies, and other stakeholders from all sectors within the selected community were involved in the development of CERP. Towards that end, the District has worked extensively with the CSC to develop innovative strategies that, once implemented, will improve air quality in the Stockton AB 617 community. The District community recommendation for CARB under the second-year implementation can be found here: https://www.valleyair.org/Board_meetings/GB/agenda_minutes/Agenda/2019/September/final/10.pdf

The Stockton AB 617 Community air monitoring map was developed with the advice of the community Steering Committee. The community-specific air monitoring network will provide an expanded monitoring capacity designed to provide scalable, portable, and rapidly deployable air monitoring equipment to the community. This includes a combination of air monitoring platforms equipped with highly specialized analyzers capable of monitoring a full range of criteria and toxic pollutants. Various monitoring

platforms include larger air monitoring trailers, mobile air monitoring vans, and compact air monitoring sensors. Monitoring data from these sensors will be made available to members of the public in real-time on the Stockton AB 617 webpage. The full community air monitoring plan, with further details on selected monitoring equipment and monitoring locations, is available at:

<http://community.valleyair.org/selected-communities/stockton/community-air-monitoring/>

As a culmination of the community-driven actions and engagement called for under AB 617, the Stockton Community Steering Committee has developed a Community Emissions Reduction Program (CERP), in partnership with CARB, residents, affected sources, and local government bodies in the affected community. Steering Committee input and other comments received from the public in the community have provided instrumental information, critical to implementing community-specific measures and addressing community concerns. Strong collaboration between community members, the District, CARB, and other local agencies has resulted in the development of an ambitious plan for reducing localized pollution and associated health impacts in Stockton AB 617 Community.

This CERP provides a description of the Stockton AB 617 Community, including geographical boundaries and socioeconomic factors impacting community residents. A technical analysis describes the sources of pollution impacting the community, as well as the location of sensitive receptors within the community. Sources of pollution that are of particular concern to community members are highlighted, and possible strategies for reducing pollution impacts from these sources are evaluated. The strategies that were ultimately selected for implementation in the community are outlined, including incentive funding measures, public engagement strategies, enforcement strategies, regulatory strategies, and strategies that will be completed in partnership with other agencies and local organizations. Finally, an implementation schedule and metrics for tracking emission reductions in annual reporting and at the five-year milestone are discussed in detail.

1.2 HEALTH BASED AIR QUALITY OBJECTIVES

CERPs implemented under AB 617 are designed to reduce emissions of pollutants that have been shown to have adverse impacts on public health, including fine particulate matter and toxic air contaminants. As specified in CARB's Community Air Protection Program Blueprint, Appendix C: Criteria for Community Emission Reduction Programs (https://ww2.arb.ca.gov/sites/default/files/2018-10/final_community_air_protection_blueprint_october_2018_appendix_c.pdf), this plan will focus on reducing individual criteria air pollutant and toxic air contaminant emissions to address the impacts of community exposure to multiple pollutants. While each community faces distinct health-based challenges, CARB guidance states that broad health-based air quality objectives provide a consistent foundation for determining the appropriate levels of emissions reductions for CERPs statewide.

The U.S. Environmental Protection Agency and the State of California have established ambient air quality standards, which set health-protective levels for the following criteria pollutants: ozone, particulate matter with a diameter of 10 microns or smaller (PM₁₀), particulate matter with a diameter of 2.5 microns or smaller (PM_{2.5}), carbon monoxide, nitrogen dioxide, sulfur dioxide, and lead. California also has standards for sulfates, vinyl chloride, and hydrogen sulfide. Due to the region's topography and meteorology, the Valley is classified as Serious nonattainment for the federal PM_{2.5} standards, and Extreme nonattainment for federal ozone standards.

Particulate Matter: Particulate matter is a mixture of solid particles and liquid droplets in the air. PM can be emitted directly into the atmosphere (primary PM), or can form as secondary particulates in the atmosphere through the photochemical reactions of precursors (when precursors are energized by sunlight). Thus, PM is made up of a number of components, including acids (such as nitrates and sulfates), organic chemicals, metals, and soil or dust particles. PM₁₀ is particulate matter that is 10 microns or less in diameter, and the PM_{2.5} subset includes smaller particles that are 2.5 microns or less in diameter.

Any particles 10 microns or less are considered respirable, meaning they can be inhaled into the body through the mouth or nose. PM₁₀ can generally pass through the nose and throat and enter the lungs. PM_{2.5}, which is the portion of PM₁₀ that is less than 2.5 microns in size, when inhaled can move deep into the gas exchange tissues of the lungs, where it can be absorbed into the bloodstream and carried to other parts of the body. The potential health impacts of particle pollution are linked to the size of the particles, with the smaller particles having larger impacts. Numerous studies link PM_{2.5} to a variety of health problems, including aggravated asthma, increased respiratory symptoms (irritation of the airways, coughing, difficulty breathing), decreased lung function in children, development of chronic bronchitis, irregular heartbeat, non-fatal heart attacks, increased respiratory and cardiovascular hospitalizations, lung cancer, and premature death. Children, older adults, and individuals with heart or lung diseases are the most likely to be affected by PM_{2.5}.

Many studies have quantified and documented the health benefits of attaining the U.S. Environmental Protection Agency (EPA) air quality standards for PM. The Valley Air Basin is in attainment of the federal standards for PM₁₀, but is currently classified as Serious nonattainment for the federal PM_{2.5} standards. The District, in partnership with CARB, developed the *2018 Plan for the 1997, 2006, and 2012 PM_{2.5} Standards*, which was approved by EPA on June 30, 2020 and details strategies to move the region towards attainment of the federal PM_{2.5} standards. More information is available at: <http://valleyair.org/pmplans>. This plan is also discussed in further detail in Chapter 3.

Ozone: Ozone is a regional air pollutant that is formed through complex chemical reactions in the atmosphere. In contrast, PM_{2.5} concentrations are the result of both local and regional emissions, and reducing localized emissions of PM_{2.5} can reduce disparities in exposure experienced in communities with high cumulative exposure burdens. CARB Office of Community Air Protection guidance states that, because

ozone formation is driven by regional rather than localized source contributions, ozone should be addressed in regional air quality improvement efforts through the State Implementation Plan. Therefore, ozone and related precursors have not been addressed as a part of this CERP development. The District's current plan for attainment of health-based ozone standards throughout the San Joaquin Valley Air Basin can be found here: http://valleyair.org/Air_Quality_Plans/Ozone_Plans.htm

Toxic air contaminants: Toxic air contaminants (TACs) also contribute to a community's cumulative exposure burden. Exposure to TACs can increase the risk of acute and chronic health impacts as well as cancer. Diesel particulate matter is a large concern in areas with high exposure to diesel engine emissions, such as the community of Stockton AB 617 Community. Other toxic air contaminants can contribute to localized health risks, including metals; air toxics related to fossil fuel production, such as benzene and toluene; and compounds associated with combustion, including polycyclic aromatic hydrocarbons and dioxins. The California Office of Environmental Health Hazard Assessment (OEHHA) establishes threshold concentrations for toxic air contaminants at which exposure is not expected to trigger non-cancer health effects. For carcinogens, OEHHA guidance states that there are no safe exposure thresholds. Reducing emissions in the community will be based on identifying technologies and practices that offer the maximum level of toxic air contaminant emissions reductions achievable to address both types of health effects

With the support of community members, this CERP will build upon regional efforts to improve air quality throughout the Valley Air Basin. The Stockton AB 617 Community CERP focuses on reducing emissions of and exposure to PM2.5 and toxic air contaminants from localized sources that contribute to cumulative exposure burdens within the community. Pollution reduction strategies, targets, goals, and metrics included in this CERP have been developed in accordance with these health-based air quality objectives and are presented in more detail in Section 4 of this document.

2. COMMUNITY PARTNERSHIPS AND PUBLIC ENGAGEMENT

Meaningful community engagement, significant outreach and a robust public process have guided the development of this Community Emissions Reduction Plan (CERP). Key features of these efforts undertaken by the Community Steering Committee and the District include:

- Community advocates hosted an in-person tour with community residents for District hosted kick-off meeting and conducting initial public outreach; establishing a Community Steering Committee
- District staff and CARB staff to be introduced to the community (Figure 2-1)
- Due to the COVID-19 pandemic, District staff worked with community residents and organizations to develop a virtual community tour for District, CARB staff, and others to be introduced to the community and the air quality challenges they face (<https://youtu.be/UuQuoSy26x4>)
- Used a co-host model to set agendas and meeting logistics
- Held monthly facilitated, bilingual (English and American Sign Language) in-person (prior to March 2020) and virtual meetings (due to COVID-19)
- Live-streamed and recorded all CSC meetings:
- (<http://community.valleyair.org/selected-communities/stockton/steering-committee-meetings/>)
- Surveyed needs and resources of the CSC members and then transitioned to virtual meetings and community engagement due to COVID-19,
- Provided materials via email, mail and a AB 617 community webpage; Developed a Resident member stipend program and implemented it retroactively to the first official CSC meeting to encourage participation in regular meetings
- Produced and posted on the District's Stockton Community webpage a virtual tour of the community, which highlighted the voices of community residents and CSC members as they discussed the challenges facing community residents
- Used interactive online survey tool such as Survey Monkey and Social Pinpoint to encourage active participation and to develop visual aids to share information to the CSC; and
- Shared presentations by the District, CSC members, CARB staff, Port of Stockton, and the City of Stockton

Figure 2-1 Introductory Tour Hosted by Community Advocates and Residents

In addition, numerous interactions between Community Steering Committee members and District staff occurred in one-on-one or small group meetings allowing for in-depth discussions on joint development of the CERP. See the community webpage (<http://community.valleyair.org/selected-communities/stockton/>) for more details.

2.1 COMMUNITY KICK-OFF MEETING

Between October 2019 and January 2020, District staff worked in collaboration with local Environmental Justice organizations to conduct multilingual outreach targeted at the Stockton AB 617 Community zip codes to encourage attendance at the official kick-off meeting in January 2020. The District provided \$5,000 for a program to provide mini-grants to local Environmental Justice organizations to support on-the-ground outreach designed to inform the community of AB 617 and encourage residents to apply to be members of the CSC. In addition, the District distributed trilingual flyers (Figure 2-2) to local media, schools, agencies, and non-profit organizations; and invested over \$8,000 in social media and print advertisements targeted at the Stockton AB 617 Community zip codes to encourage kick-off meeting participation.

Figure 2-2 Trilingual Community Flyers Distributed

The Community Kick-Off Meeting in the Stockton AB 617 Community was held on Wednesday, January 22, 2020, at the San Joaquin Council of Governments Regional Center (Figure 2-3).

Figure 2-3 Stockton AB 617 Community Kick-off Meeting

Approximately 100 people attended the meeting. In addition to information about AB 617, attendees were invited to participate in an interactive cell-phone based activity to express the community's hopes for the AB 617 program (Figure 2-4).

Prior to the COVID-19 pandemic, the CSC was able to meet in person once and since transitioning to virtual meetings, the CSC has met monthly beginning in April 2020. To ensure successful CERP development, residents, businesses, non-profits, organizations, and other stakeholders within the Stockton community have been fully engaged in CSC meetings. To ensure full engagement by all CSC members, the District assessed language translation needs and determined that there was a need to provide American Sign Language translation at each of the meetings. Commitment demonstrated by the District and CSC members to ensure full and active participation in meetings including:

- Monthly agenda-setting meetings with District, community co-hosts, interested CSC members, CARB staff, and third-party facilitators to collectively set expectations and plan for upcoming CSC meetings
- Real-time interpretation services in all necessary languages
- Expert presentations from partner agencies such as CARB, Port of Stockton, City of Stockton, District staff, and CSC members
- Comprehensive and dedicated Stockton community webpage with tools to view community boundary, committee charter, virtual tour, meeting agendas, sources of community concern, emissions inventories, and other resources
- Neutral meeting facilitation to ensure meetings are inclusive and neutral by bringing out different points of view and preventing individuals from monopolizing discussions
- Through March 2020:
 - Monthly evening meeting at a convenient location in the community
 - Child activity areas and dinner for all attendees
 - All meeting materials in hardcopy and via the comprehensive Stockton community website
- Since April 2020:
 - Monthly evening meetings via Zoom, with technical assistance provided to residents and stakeholders upon request
 - Continued real-time interpretation services through ASL interpreter at each meeting
 - Meeting materials posted ahead of meeting
 - Extra meetings to discuss topics or concerns Community Steering Committee members have
 - Provided laptops and internet service to resident CSC members without these tools to ensure all CSC members have equal opportunities to fully participate

In addition, the District has taken steps over the past several months to better serve CSC members and encourage their active engagement in the meetings and CERP development process. Ensuring effective steering committees requires substantial investment in the form of committee member time, District staff and other resources to schedule, organize, and facilitate frequent after-hours public meetings.

Figure 2-5 Facilitation at a Stockton AB 617 Community Steering Committee meeting

Visit <http://community.valleyair.org/selected-communities/stockton/steering-committee-meetings/> for full documentation of meeting dates, agendas, materials and summaries.

RESPONSE TO COVID-19 STATE OF EMERGENCY

On March 19, 2020, responding to the growing threat of COVID-19 in the state, California Governor Newsom issued Executive Order N-33-20 directing all individuals living in the State of California to stay home except as needed to maintain continuity of operations of the federal critical infrastructure. The result of this order was that the Stockton Community Steering Committee could no longer continue to meet in person.

To address this challenge and to continue moving forward with the important work of developing the Stockton CERP, District staff developed and sent an online survey to all the Stockton Community Steering Committee members to assess the members' ability and willingness to meet virtually. District staff followed up with phone calls to those members that could not complete the survey or who had indicated technological limitations or concerns on the survey to fully understand CSC members' ability to participate in virtual meetings. In addition, District staff, CARB, our Environmental Justice Partners serving on

the committee, and our AB 617 facilitator had multiple conference calls to discuss the challenges related to COVID-19, the results of the surveys and potential solutions based on the Stockton Community Steering Committee member feedback. All the Stockton Community Steering Committee members indicated a strong desire to continue implementing AB 617 and subsequently adopted the use of the online meeting application, Zoom, to meet virtually.

Figure 2-6 Stockton Community Steering Committee Meeting via Zoom

In April 2020, based on these discussions and the results of the surveys, we held a virtual practice meeting via Zoom and via phone with the Stockton Community Steering Committee. During the practice call, the District addressed issues such as ASL interpretation needs and explained how the Stockton Community Steering Committee would use the various available features to provide a high level of discussion and engagement. In addition, the District invested in the online mapping tool Social Pinpoint to facilitate community input in a virtual setting.

COMMUNITY PARTICIPATION AND NEW RESIDENT STIPEND PROGRAM

The Stockton Community Steering Committee meet regularly, requiring ongoing participation and a significant time commitment from community residents, business owners, and other stakeholders. In most cases, steering committee meetings occur in the

evenings and may draw attendees away from their families and other obligations. Community-resident steering committee members are not paid and do not have expenses reimbursed to participate in the process or attend these meetings. Providing stipends to help cover some time and expenses associated with attending meetings is an important way to support this critical participation and encourage sustained and meaningful community engagement throughout these processes. Toward that end, and in response to several residents and community advocates on the Stockton Community Steering Committee, CARB developed new statewide guidance encouraging districts to work with steering committees in developing stipend programs for resident members of steering committees.

On August 20, 2020, the District Governing Board responded to the community needs and approved District staff’s recommendation to provide stipends to eligible resident steering committee members, effective retroactively for participation beginning on January 1, 2020. Under the stipend program developed by District staff in consultation with CSC stakeholders across all San Joaquin Valley AB 617 communities, residents who participate as community steering committee members, who do not receive compensation for their attendance at such meetings, may request a stipend to offset the cost of participating in each regular Community Steering Committee meeting. Eligible residents may receive a \$75 stipend per Community Steering Committee meeting when their attendance is verified on the meeting roll-call list or sign-in sheet and were present for at least 75% of the scheduled meeting (equivalent to missing up to 30 minutes of a scheduled 2 hour meeting). Residents will receive stipends for attending up to fifteen (15) Community Steering Committee meetings in a calendar year, for a total cost of up to \$1,125 per year. The stipends for resident steering committee members are subject to the availability of state AB 617 funding and approved allocation in the District’s Budget on an annual basis.

Verify

By signing below, I certify that the following information is true, accurate, and complete to the best of my knowledge:

- I am a resident of a AB 617 selected community and serve as a Resident member of the Community Steering Committee.
- I understand that I must be present for 75% of any regularly scheduled Community Steering Committee meeting (equivalent to participating in at least 1 hour and 30 minutes of a scheduled 2 hour meeting).
- I have read and agree with the information contained in the Resident Stipend Policy.
- I am not an employee of the Valley Air District or the Institute for Local Government.
- I give my consent to the Valley Air District to use the information on this Enrollment Form for the purpose of contacting me regarding matters related to the AB 617 Community Steering Committee and determining my stipend eligibility.

Signature: _____ Date: _____

Submit: Submit application to the Institute for Local Government via e-mail at ajr@inlgo.org

See Appendix A for full documentation of meeting dates, agendas, materials, attendance and summaries.

2.3 COMMUNITY STEERING COMMITTEE CHARTER

A Charter was developed in consultation with the Stockton AB 617 Community Steering Committee members and a draft was presented to the members at Meeting #1, in March 2020. The Charter and a potential expansion to the community boundary to include the areas of Stockton identified by community members was discussed and approved at the March meeting. The final Charter can be found in Appendix B, and at http://community.valleyair.org/media/1631/03102020_stockton-charter_final_en.pdf.

The final Boundary can be found at

http://community.valleyair.org/media/1615/03042020_southwest-stockton-boundary.pdf.

2.4 STOCKTON COMMUNITY WEBPAGE

A community webpage has been created for the Stockton AB 617 Community, and is regularly updated with new information (<http://community.valleyair.org/selected-communities/stockton/>). The webpage includes information about upcoming meetings, meeting materials (flyers, agendas, presentations, handouts, audio and video links, chat transcripts, meeting summaries), interactive maps, CSC roster, committee charter, membership processes, Community Air Monitoring Plan (CAMP), and CERP documents. A screenshot of the community webpage is shown in Figure 2-8.

[TRACK STOCKTON PROGRESS](#)

Selected Community Profile

Stockton is the largest metropolitan area in the Northern Region of the District, with a current estimated population over 310,000. A number of heavily trafficked freeways pass through the City of Stockton, including interstate 5 and highways 99 and 4, contributing a significant amount of PM2.5 emissions in the community. Specifically, Southwest Stockton (Figure 1) is a densely populated community within the City of Stockton directly impacted by large freeways, the Port of Stockton, freight locomotives, industrial sources, and emissions traveling downwind from the northern portion of the city.

The proposed community of Stockton defined in Figure 1 is approximately 12.2 square miles and has an estimated population of 51,000. The Southwest Stockton community is impacted across a number of health and pollution indicators. Using the State CES tool, all census tracts located within the Southwest Stockton proposed community rank in the top 5% most disadvantaged communities in California, and rank highest in the Valley amongst census tracts not already a part of an AB 617 community. Southwest Stockton also contains the highest ranked census tract in the District's Northern Region (San Joaquin, Stanislaus, and Merced Counties) for overall CES score, which represents a number of health and socioeconomic factors (asthma, cardiovascular disease, low birth weight, educational attainment, housing burdened low-income households, linguistic isolation, poverty, and unemployment).

This community also ranked highest in PM2.5 impacts, and second highest in diesel PM exposure, compared to all other disadvantaged communities in the northern District counties. Specifically, the average overall CES score, PM2.5 exposure, and pollution burden values are all above the 90th percentile. Additionally, most of the community is within the "Rise Stockton" Transformative Climate Community boundary, which allows the District and community to leverage resources to maximize benefits under AB 617.

For assistance or if you have any questions, please contact our central office: [\(559\) 230-6000](tel:5592306000)

In addition to being a portal for access to meeting materials and documents, the webpage also includes interactive maps that present data about the community (<https://sjvapcd.maps.arcgis.com/apps/webappviewer3d/index.html?id=6a8b2a34b0c14748aaee1c69c71c940c>). Figure 2-9 is an example of an interactive map that was created for the Stockton AB 617 Community. These interactive maps provide data on land use, locations of facilities, schools, hospitals, and the air quality concerns identified by the Stockton AB 617 Community Steering Committee and members of the public. This information was provided to help inform and to develop air quality priorities for the CERP.

Figure 2-9 Interactive Map Created for Stockton AB 617 Community Steering Committee

2.5 COMMUNITY PARTNERS

After the Stockton AB 617 CSC identified priorities for the community, partner agencies, and organizations were invited to the meetings to provide updates, input, and presentations on current and future efforts to the work goals of AB 617. CARB staff attended meetings regularly and provided information and updates to the committee. The City of Stockton also attended regularly and provided an update on planning efforts in the community and the TCC program. The City of Stockton agreed to coordinate the TCC program efforts and AB 617 program to leverage the goals of each to best benefit the residents of the Stockton community. Presentations from various CSC members were also an important part of the CERP development process as they provided key insight to the concerns and challenges facing residents of the community. The efforts of the Sierra Club, Little Manila Rising, the Port of Stockton, and others were all presented to the CSC to help provide background information to the participants, highlighting the strengths and challenges of the community.

2.6 ADDITIONAL COMMUNITY ENGAGEMENT

Since late 2020, the CSC and District staff have worked to engage and educate the public with regard to AB 617 and the efforts being made in the Stockton AB 617 Community. Meetings between community members, environmental justice organizations, industry, agency representatives, and other stakeholders have occurred to provide assistance and/or prompt responses to concerns raised regarding the AB 617 process. District staff and CSC members also attended and often made presentations at city and county government meetings, the District's Environmental Justice Advisory Group meetings, the District's Citizens Advisory Committee meetings, the District's Governing Board meetings, environmental justice meetings, and industry professional group meetings to promote participation in the development of the CERP and once completed the implementation of the CERP. In addition, staff often discussed AB 617 at media interviews and during outreach events and health fairs. A full list of outreach efforts is available in Appendix A.

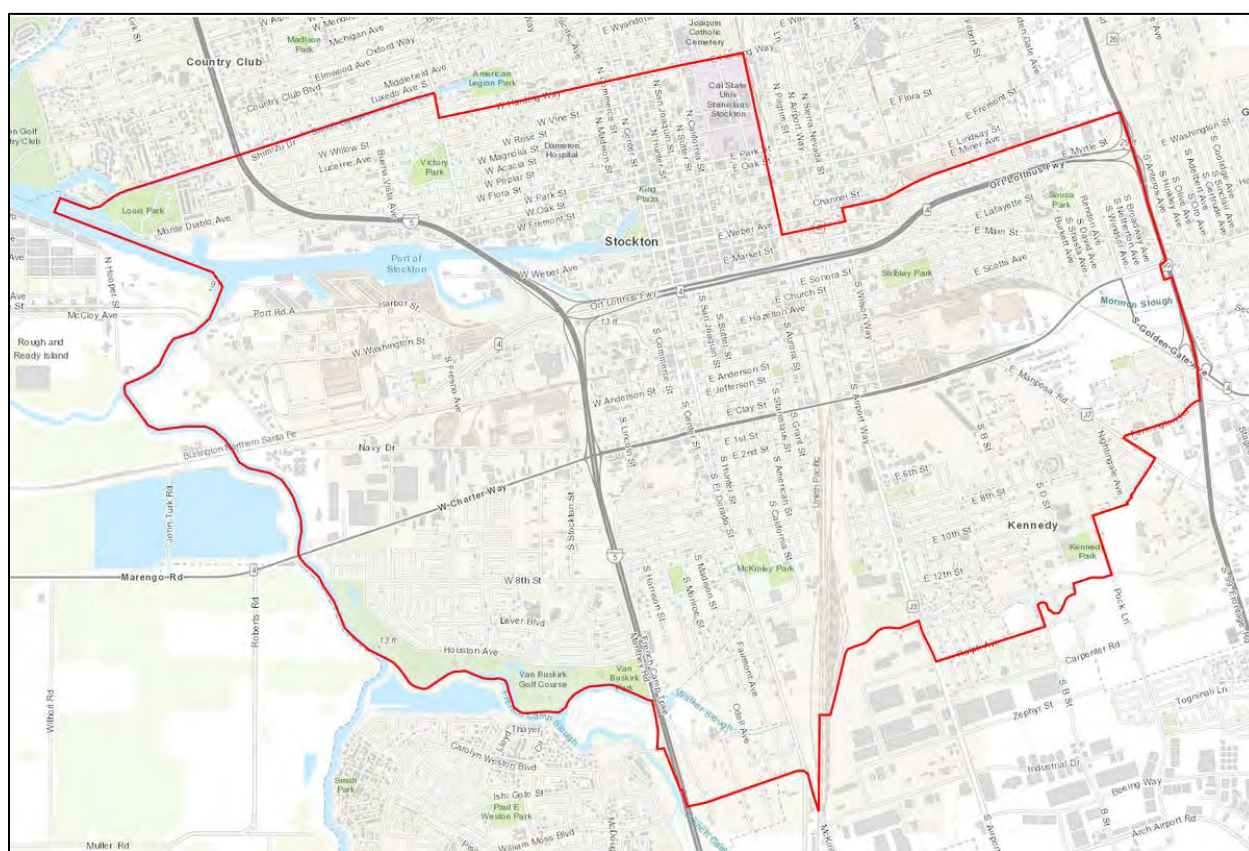

The Stockton AB 617 CSC will continue to work to implement the CERP actions after its adoption by the District Governing Board and the CARB Board, and to provide periodic community updates on implementation progress. Community engagement is essential to the success of the CERP as well as the AB 617 program as a whole, and all parties are committed to build and improve upon existing outreach efforts in the coming months and years.

3. UNDERSTANDING THE COMMUNITY

3.1 COMMUNITY PROFILE

Stockton is the largest metropolitan area in the Northern Region of the District, with a current estimated population over 310,000. A number of heavily trafficked freeways pass through the City of Stockton, including interstate 5 and highways 99 and 4, contributing a significant amount of PM_{2.5} emissions in the community. Specifically, southwest Stockton is a densely populated community within the City of Stockton directly impacted by large freeways, the Port of Stockton, freight locomotives, industrial sources, and emissions traveling downwind from the northern portion of the city.

Figure 3-1 Stockton AB 617 Community

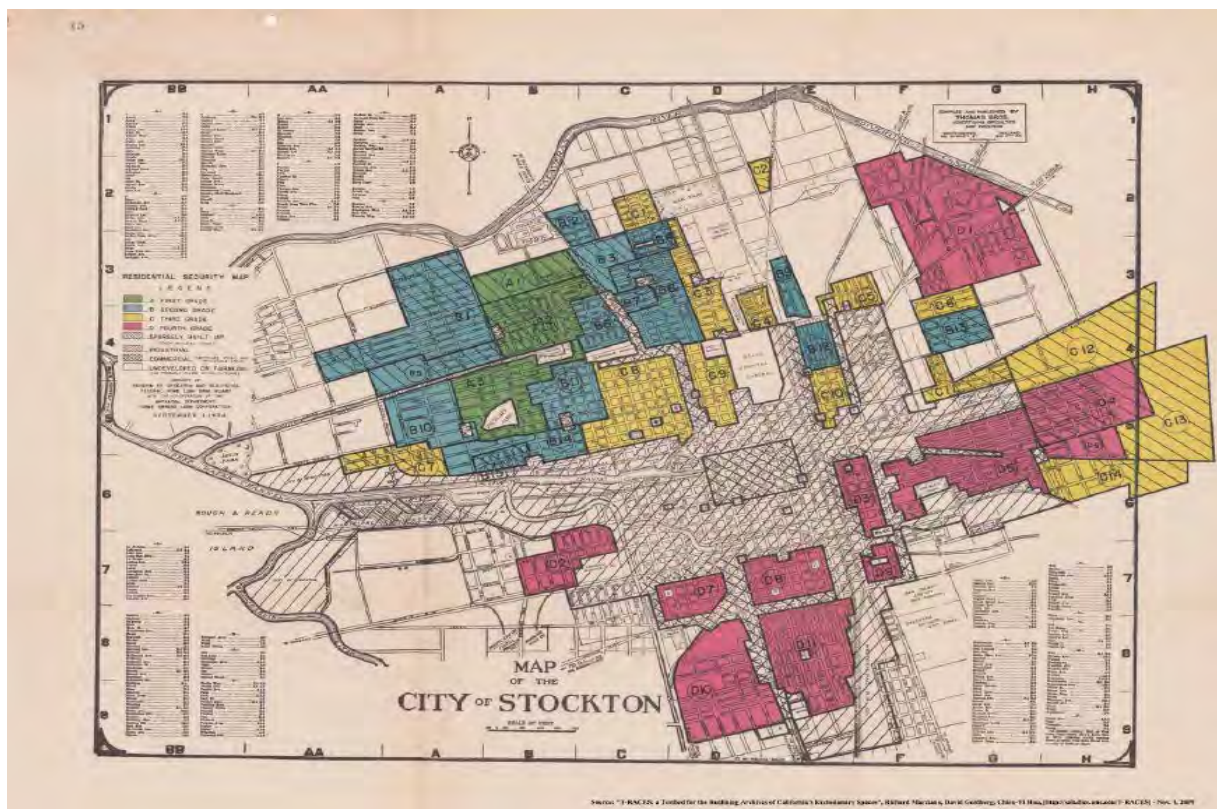

Stockton History

Prior to the 1870s, San Joaquin County lacked access to water for agriculture. The promise of local agriculture resulted in capital investments being made to increase the levels of agriculture in San Joaquin County between 1870-1910. Lack of technological innovation forced agricultural interests to recruit labor globally. People of color, such as Chinese, African-Americans from the South, Japanese, Punjabis, Filipinos, and Mexicans, were forced into labor by employment segregation. Beginning in the late 19th

Century, racially restrictive housing covenants were written into housing deeds to restrict people of color into living in certain zones of the city. These covenants were written into property deeds by developers looking to inflate the values of their homes. Examples of this practice in Stockton was the exclusion of African-American, Indian, Mexican, and Filipino communities south of Main Street and west of Wilson Way. Beginning in the 1930s, the Federal Housing Administration created maps to guide mortgage investment. Intentionally, these maps directed investments away from communities of color, which were deemed risky for investment. This practice is known as “redlining” because the neighborhoods were designated as the color red. Figure 3-2 shows the 1938 Residential Security Map for the City of Stockton.

Figure 3-2 Home Owners’ Loan Corporation Residential Security Map (1938)

Although the racial practice was banned in 1968’s Fair Housing Act, the years preceding contributed to both the built environment and unequal distribution of wealth in the United States today. In the 1930-1940, Stockton experienced huge growth in local industry. Built in 1931 and opened in 1933, the Port of Stockton became the City’s first major industrial center for logistics purposes. Between 1933 and 1940, it grew faster than any port in the U.S. History, doubling tonnage every fiscal quarter. The Port’s success led to business interests in Stockton being perfectly centered for logistical industries, or industries focused on the transportation of products. With the anticipation of future growth in residents and commerce, the City of Stockton actively lobbied for the construction of freeways in Stockton. Between 1955 and the 1970s, I-5, Highway 99, and Highway 4 crosstown freeway were constructed intentionally near low-income

“redlined” communities to reduce the costs of eminent domain. In the 1970s, the construction of the Highway 4 Crosstown freeway demolished a significant portion of the Filipino American

Stockton Air Quality Challenges

The Stockton AB 617 community boundary (Figure 3-1), as designed and approved by the CSC, is approximately 16 square miles and has an estimated population of 132,000. The AB 617 Stockton community is impacted across a number of health and pollution indicators. Using the State CalEnviroScreen (CES) tool, all census tracts located within the Stockton community rank in the top 5% most disadvantaged communities in California. Stockton also contains the highest ranked census tract in the District’s Northern Region (San Joaquin, Stanislaus, and Merced Counties) for overall CES score, which represents a number of health and socioeconomic factors (asthma, cardiovascular disease, low birth weight, educational attainment, housing burdened low-income households, linguistic isolation, poverty, and unemployment).

This community also ranked highest in PM_{2.5} impacts, and second highest in diesel PM exposure, compared to all other disadvantaged communities in the northern District counties. Specifically, the average overall CES score, PM_{2.5} exposure, and pollution burden values are all above the 90th percentile. Additionally, most of the community is within the “Stockton Rising” Transformative Climate Community boundary, which allows the District and community to leverage resources to maximize benefits under AB 617.

The majority of emissions impacting the Stockton AB 617 Community come from passenger vehicle and heavy-duty truck emissions from major freeways, interchanges, and main regional roads that run through the community.

Figure 3-3 Major Freeways Contribute Significant Mobile Source Emissions in the Community

In addition to the emissions originating from mobile sources in the area, this community also includes industrial development and area-wide sources of pollution such as gas stations, commercial cooking, and consumer products that also contribute significantly to the community's emissions levels.

Figure 3-4 Industrial Emissions Sources near Boggs Tract Community

Based on emissions inventory and current air monitoring data in this community, pollutants of concern include particulate matter less than 2.5 micrometers in diameter (PM_{2.5}), Black Carbon (BC), Oxides of Nitrogen (NO_x), Carbon Monoxide (CO), Ozone (O₃) and Volatile Organic Compounds (VOCs). A virtual tour of the Stockton AB 617 community, produced by the Community Steering Committee to highlight some of the community's challenges can be viewed here:

<https://www.youtube.com/watch?v=UuQuoSy26x4&feature=youtu.be>.

Based on District air quality analysis modeling, the Stockton AB 617 Community was found to have exceeded the 24-hour average PM_{2.5} concentration prioritization factor levels of 12, 35, 55, and 65 µg/m³ a total of 120, 18, 4, and 3 days, annually, on average during the 2017-2019 period, respectively. In addition, this community was found to have exceeded the 8-hour average ozone concentration prioritization factor levels of 70, 75, and 84 ppb a total of 15, 7, and 1 days, annually, on average during the 2017-2019 period, respectively. Details about the nature and formation of local air pollution and its adverse health impacts on the community of Stockton AB 617 Community is summarized in Appendix G.

It should be noted that, in addition to selection by CARB for the development of community monitoring and a community emissions reduction program, neighborhoods in the AB 617 selected community were also selected by California's Strategic Growth Council for significant investment. In November 2017, the City of Stockton was awarded a \$170,000 Transformative Climate Communities (TCC) Planning Grant by the Strategic Growth Council to support planning activities in the Downtown and South Stockton region. To mobilize this grant Mayor Tubbs' Office, community partners, and the neighborhood residents created the organization Rise Stockton to carry out this work. The Rise Stockton organization worked for nearly a year to develop a The Sustainable Neighborhood Plan <https://drive.google.com/file/d/1E-HjKq5m9KHurEMch3tamySu2Xcnjt7L/view> to translate community concerns and recommendations into shovel-ready projects.

The policies and projects are centered on twelve Transformative Climate Community Goals, several of which mirror the goals of AB 617 (see Figure 3-5).

Figure 3-5 Stockton’s TCC Goals and Project Area Map

Stockton Rising: TCC Project Area Map

The community engagement and planning conducted during the TCC Planning Grant eventually led to the award of a \$10.8 million Implementation Grant in June 2020. Leading up to that award, Rise Stockton repositioned itself to broadly coordinate the Environmental Justice and Green Economy work conducted by Stockton community partners.

Due to the factors discussed above, this CERP includes strategies for emission reductions from mobile sources, commercial and industrial sources, and residential sources that contribute to the Stockton AB 617 Community air quality challenges. These strategies focus on measures that will bring additional economic resources to the residents and businesses located in the community, as well as achieving significant local emissions reductions.

3.2 TECHNICAL ASSESSMENT TO UNDERSTAND COMMUNITY POLLUTION IMPACTS

Conducting a technical assessment is a necessary step in community emissions reduction program development. The technical assessment relies on results from a variety of analyses to characterize emissions in the community and inform community emissions reduction program development and implementation. This assessment will provide the baseline from which emissions reductions can be measured.

The source attribution technical approach established by CARB provides a methodology for assessing, identifying, and estimating the relative contribution of sources or categories of sources, including but not limited to mobile, stationary, and area-wide sources, to elevated exposure to air pollution in impacted communities. The District's source attribution analysis is based on the following:

- Assesses the share of mobile, area-wide, and stationary source emissions generated in the community,
- Is based on best available data in order to characterize the contribution of emissions sources in the community,
- Follows one of CARB's recommended source attribution approaches.

Based on the above, the District has implemented CARB's Community Emissions Inventory Approach. The following section discusses the community emissions inventory approach and summarizes emission sources in the community. A detailed community-level inventory and source apportionment are included in Appendix C.

3.2.1 COMMUNITY EMISSIONS INVENTORY APPROACH

A community level emissions inventory estimates air pollutant emissions from mobile sources (e.g., cars, heavy-duty trucks, locomotives), area-wide sources (e.g., fireplaces, outdoor food cooking, fugitive dust), and stationary sources (e.g., gas stations, auto body shops, manufacturing facilities) within the community.

The community level inventory consists of the mobile and area-wide sources spatially allocated in the community and stationary sources. A community emissions inventory is the compilation of criteria pollutant and air toxics emissions data from air pollution sources that are within the community. The community emissions inventory includes emissions of volatile organic compounds / reactive organic gases (VOC/ROG), oxides of nitrogen (NOx), particulate matter of 2.5 microns (PM_{2.5}), and toxic air contaminants (e.g. diesel PM).

3.2.2 COMMUNITY EMISSIONS INVENTORY OVERVIEW

Emissions inventories are estimates of the amount and type of pollutants emitted into the atmosphere by mobile sources, stationary sources, and area-wide sources. Additionally, emission inventories are the foundation for any emission reduction program and provide information on the existing air emissions and related air quality in the community, and support development of emission reduction strategies and future emission targets to improve air quality in the community.

Existing traditional criteria pollutant and air toxics emission inventories (that provide combined coverage of mobile and stationary sources) are generally regional in geographic scale and may not adequately characterize emission impacts at the community-level. Developing community-scale emission inventories for understanding existing baseline emissions and tracking future emission reductions within communities selected for Community Emission Reduction Programs and Community Air Monitoring Plans (CAMPs) is an important piece of AB 617. Information and data collected as part of the CAMP will be available real-time and District staff will be providing regular updates on the analysis of the data which may result in modification to existing or development of new strategies for the CERP.

3.2.3 AGENCY COLLABORATIONS

CARB and District staff worked in parallel to develop a comprehensive set of emissions inventory data for the community. The District worked with stationary source facilities in the community to develop the point source emission estimates. CARB staff developed the community-level emission inventory for mobile and area-wide sources. CARB worked with several State and local agencies such as the Department of Transportation (Caltrans), the Department of Motor Vehicles (DMV), the Port of Stockton, and the California Energy Commission (CEC) to assemble activity information necessary to develop the community-level mobile and area-wide source emission estimates. CARB and District staff conducted a thorough review of the community inventory to ensure that the emission estimates reflect the most recent data for stationary sources, and that estimates for mobile and area-wide sources are based on the most recent models and methodologies.

The emissions inventory also includes future forecasted values. The forecasted community-level emissions inventory is based on the growth profiles for stationary sources, mobile, and area-wide source categories provided by CARB. Forecasted emissions include growth and control factors that reflect historical trends, current conditions, and recent economic and demographic forecasts.

3.2.4 COMMUNITY EMISSION INVENTORY SUMMARIES

[What types of sources contribute to air pollution in Stockton?](#)

The largest sources of emissions in and around the community include heavy duty vehicles, medium duty vehicles, and passenger cars, as well as trains, and commercial equipment. Permitted stationary sources regulated by the District in the Stockton AB 617 Community include agricultural commodities storage and transfer operations,

automotive body repair and paint shops, concrete and construction materials manufacturing, electric power generation, motor vehicle coating; bulk fuel storage and transfer terminals, chemical receiving, fabricated metal products; gasoline dispensing operations, government services, municipal water treatment operations, health centers, metal parts coating operations, skilled nursing care facilities, and telecommunications facilities. Paved road dust, residential fuel combustion, construction emissions, and commercial cooking also contribute significantly to the community’s emissions inventory.

Figure 3-6 Sources of PM2.5 Pollution in the Community

The largest sources of PM2.5 emissions in Stockton AB 617 Community are cooking and on-road mobile vehicles (light and medium-duty vehicles and heavy-duty diesel trucks). Road dust, stationary fuel sources, construction & demolition, and residential wood burning are also significant sources of PM2.5 in the community. Other sources include aircraft, trains, ocean going vessels, commercial harbor craft, recreational boats, off-road recreational equipment, off-road equipment, fuel storage and handling.

Figure 3-7 Sources of NOx Emissions in the Community

Almost three-quarters of NOx emissions in Stockton AB 617 Community are from mobile sources. On road mobile sources account for 49.7.% of NOx emissions in Stockton AB 617 Community, including 17% of the NOx inventory from heavy duty diesel trucks and 19.8% from light and medium-duty vehicles. Off road mobile sources, including trains, aircraft, and off-road equipment such as yard trucks, produce 23.9% of the NOx emissions in the community. Fuel combustion at stationary sources is also a significant source of NOx emissions in the community. For more specific information, refer to [Appendix C \(Source Apportionment and Community\)](#).

PM2.5 Speciation: What type of PM2.5 is in the ambient air?

PM2.5 in Stockton AB 617 Community is comprised of many species that contribute to the total PM2.5 concentration measured by air monitors, as summarized in Table 3-3 below. This complex mixture is attributable to mobile, stationary, and area-wide sources described above, as well as naturally occurring emissions. Although the list of species contributing to PM2.5 in Stockton AB 617 Community is lengthy, it can be grouped into larger representative categories. The following is a brief description of how each of these larger species categories are formed and emitted into the atmosphere. The following figures show the speciation of PM2.5 in the Stockton Community, based on modeling data.

Table 3-1 Summary of PM2.5 Species

PM2.5 Species	Description
Organic carbon (Combustion Carbon)	Directly emitted, primarily from combustion sources (e.g. residential wood combustion). Also, smaller amounts attached to geologic material and road dusts. May also be emitted directly by natural/biogenic sources.
Elemental carbon	Also called soot or black carbon; formed during incomplete combustion of fuels (e.g. diesel engines).
Geologic material (Dust)	Road dust and soil dust that are entrained in the air from activity, such as soil disturbance or airflow from traffic.
Trace metals	Identified as components from soil emissions or found in other particulates having been emitted in connection with combustion from engine wear, brake wear, and similar processes. Can also be emitted from fireworks.
Secondary organic aerosol	Secondary particulates formed from photochemical reactions of organic carbon.
Ammonium nitrate	Reaction of ammonia and nitric acid, where the nitric acid is formed from nitrogen oxide emissions, creating nitric acid in photochemical processes or nighttime reactions with ozone.
Ammonium sulfate	Reaction of ammonia and sulfuric acid, where the sulfuric acid is formed primarily from sulfur oxide emissions in photochemical processes, with smaller amounts forming from direct emissions of sulfur.
Combined water	A water molecule attached to one of the above molecules. Combined water is not included when measuring mass of PM2.5 for regulatory purposes, and is therefore excluded from the following charts.

Figure 3-8 Species Contribution to Annual Average PM2.5 Concentrations in the Community

Combustion carbon, ammonium nitrate, and ammonium sulfate all are significant species of PM2.5 emissions on an average day in the Stockton AB 617 Community.

Figure 3-9 Species Contribution to Peak Day PM2.5 Concentrations in the Community

As shown in the figure above, peak PM2.5 emission days in the community see a large increase in ammonium nitrate, which is created from the chemical reaction of NOx and ammonia, largely from fuel combustion during multiday stagnation events. However, ammonium nitrate is generally regarded as having relatively low toxicity compared to other PM2.5 species like elemental carbon.

How will the community inventory change in the future?

The tables and graphs below summarize the total Stockton AB 617 Community emissions inventories for years 2018, 2025, and 2030: These graphs show the proportion of PM2.5, NOx, and VOC emissions that originate from stationary, area, and mobile sources of emissions. The projected inventories take into account the projected emissions from regional transportation plan projects and compliance with regulatory deadlines. The following figures show how the Stockton AB 617 Community-level inventory is expected to change into the future in years 2025 and 2030.

Figure 3-10 2018 Stockton AB 617 Community Emissions Inventory

Table 3-2 2018 Stockton AB 617 Community Emissions Inventory (updated)

Source Categories	NOx (tpy)	VOC (tpy)	PM2.5 (tpy)
Stationary Sources	276.4	281.1	34.9
Area Source	40.2	247.6	75.1
Mobile Sources	884.1	332.1	40.2

Table 3-4 2030 Projected Stockton AB 617 Community Emissions Inventory

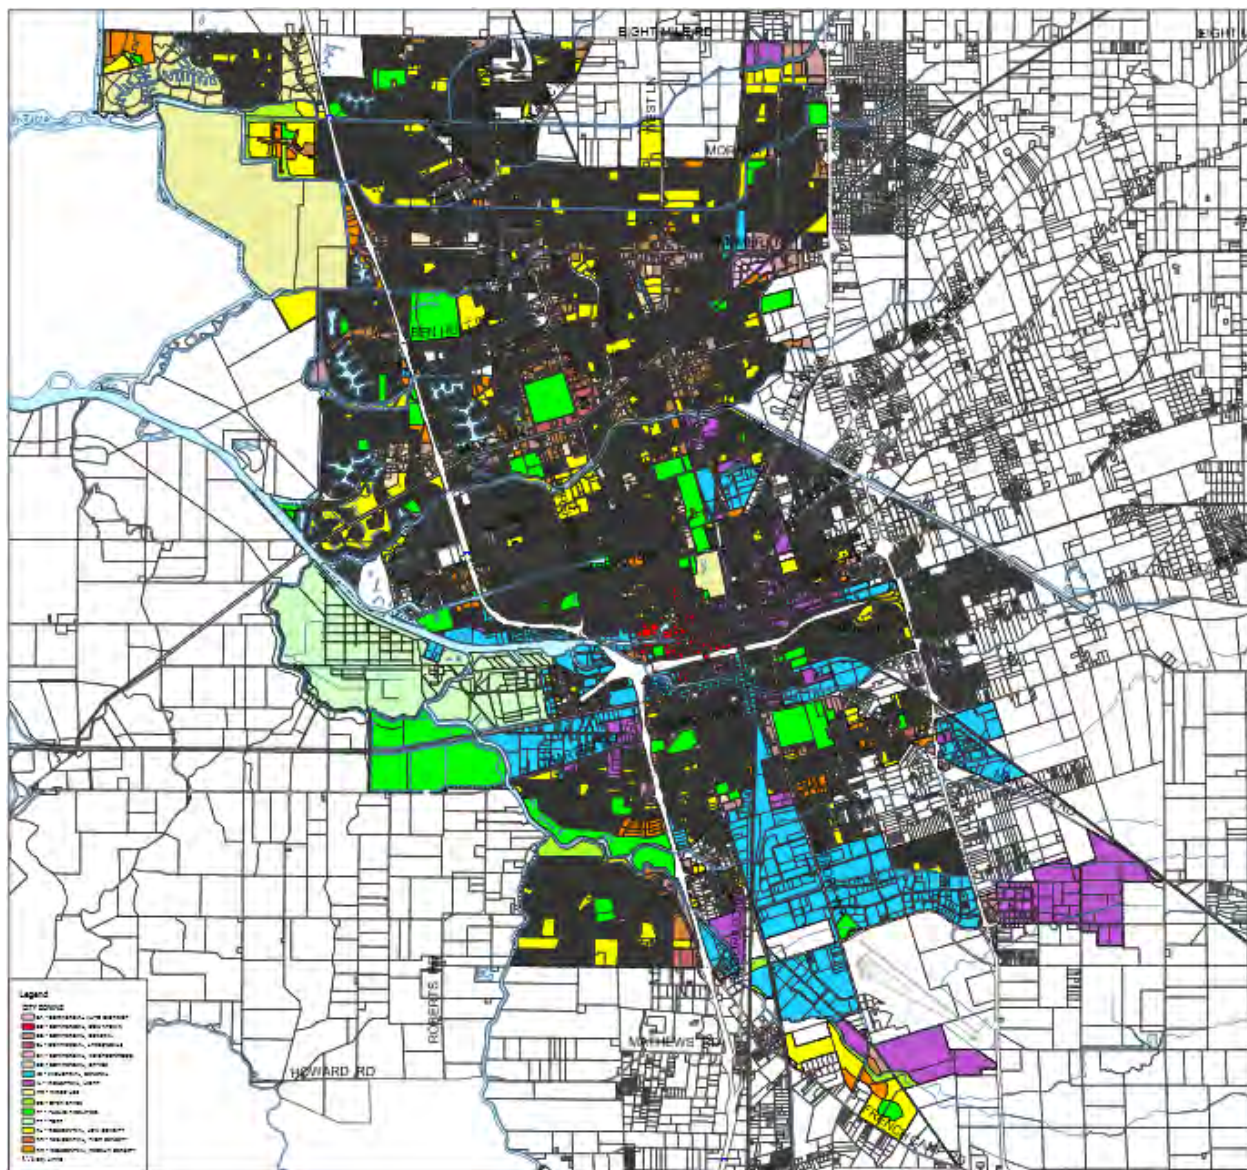

Source Categories	NOx (tpy)	VOC (tpy)	PM2.5 (tpy)
Stationary Sources	169.0	244.9	8.7
Area Source	35.7	290.5	109.1
Mobile Sources	605.4	220.8	33.2

For further information about the emissions inventory for Stockton AB 617 Community, including the stationary source emissions inventory, projected emissions inventory for District permitted facilities, mobile source inventory, and area-wide sources inventory please refer to Appendix C.

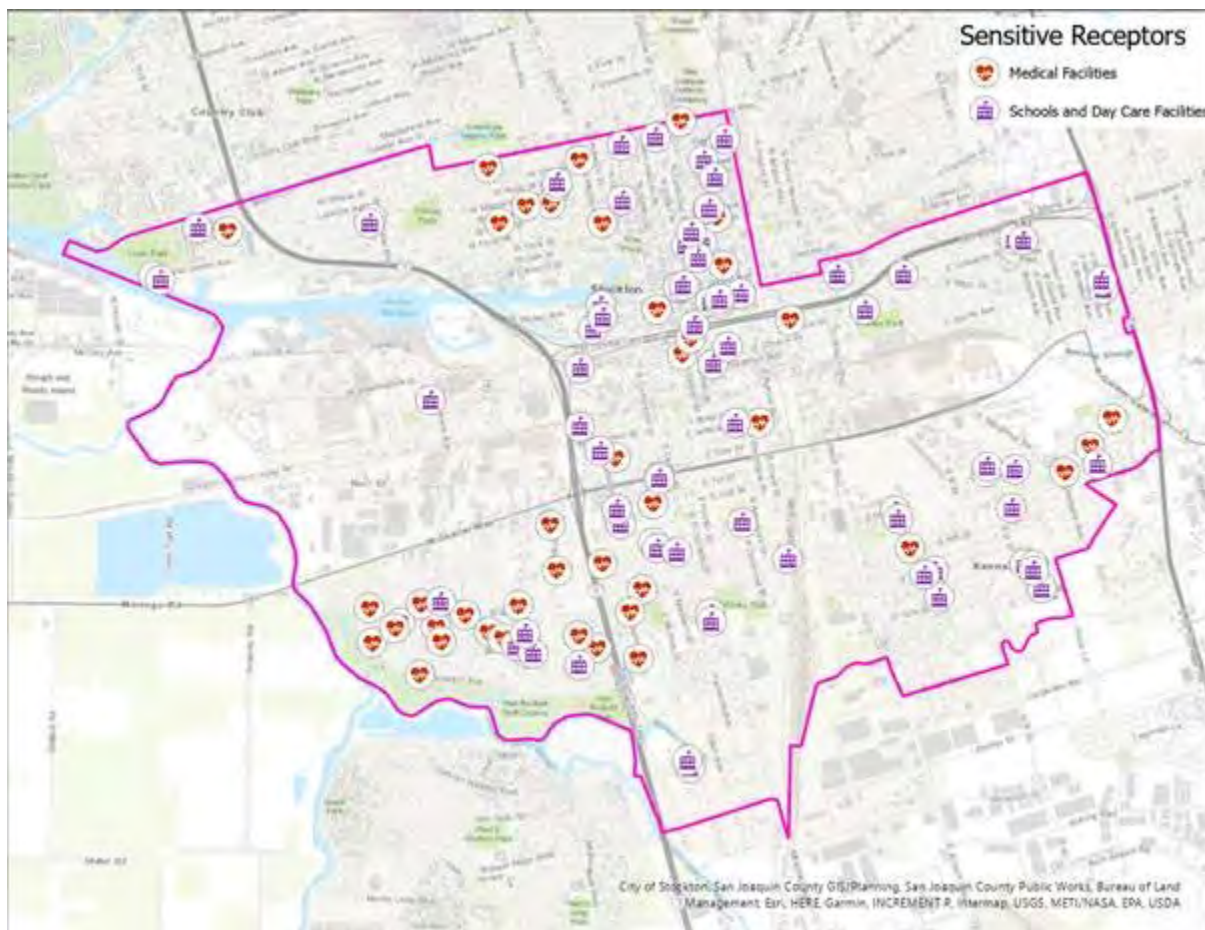

3.2.5 SENSITIVE RECEPTORS AND LAND USE

As illustrated in the City of Stockton General Plan Land Use map, below, the Stockton AB 617 Community contains mixed land uses including light and heavy industrial zoning, commercial areas, residential neighborhoods ranging from low density to urban neighborhoods, and the City's downtown core. Main transportation corridors transect the community, including highways 99, 4, and I5. Areas zoned for heavy industrial use are located in the western and southern portion of the city, with future industrial expansion planned for as detailed in the City's Envision Stockton 2040 General Plan. Further information about the City's General Plan and Specific Plans are available at: <http://www.stocktongov.com/government/departments/communityDevelop/cdPlanGenDocs.html>

The below City of Stockton General Plan Land Use map is available with full resolution on the City of Stockton website: <http://www.stocktongov.com/files/ZoningDistrictMap.pdf>

Figure 3-13 City of Stockton General Plan Land Use Map

The location of sensitive receptors is important to assess the impacts of emissions on public health. Sensitive Receptors are defined as people that have an increased sensitivity to air pollution or environmental contaminants. Sensitive receptor locations include schools, parks and playgrounds, daycare centers, nursing homes, hospitals, and residential dwelling unit(s). The map below shows sensitive receptor locations within the community. The sensitive receptors currently in the community include 35 schools, 50 licensed daycare facilities, and 45 medical care facilities. Sensitive receptors within the community are located in proximity to mobile on-road sources, train routes, manufacturing and industrial sources, off-road mobile equipment, and residential fuel combustion sources.

Figure 3-14 Sensitive Receptor Locations in Stockton

Where can I get more information about air pollution in Stockton AB 617 Community?

To provide detailed community-level data to the Steering Committee and the general public, District staff have created an interactive mapping tool that shows the locations of sensitive receptors, as well as the locations of and emissions inventory for stationary sources, area sources, and both on-road and off-road mobile emissions. Examples of the emissions data available through this mapping tool are shown in the figures below. Please visit the District website to zoom in and explore the community:

<https://sjvapcd.maps.arcgis.com/apps/webappviewer3d/index.html?id=6a8b2a34b0c14748aaee1c69c71c940c> and

3.3 EXISTING AIR QUALITY PROGRAMS

District Plans for Attainment of Health-Based Air Quality Standards

For more than two decades, the District has adopted numerous attainment plans to reduce ozone and particulate precursor emissions. The District's multifaceted approach to reducing emissions in the San Joaquin Valley consists of a combination of innovative regulatory and non-regulatory measures. The U.S. Environmental Protection Agency (EPA) periodically reviews and establishes health-based national air quality standards (also referred to as NAAQS) for ozone, particulates, and other criteria air pollutants guided by the Clean Air Act. The District has adopted numerous air quality attainment plans over the years that identify measures needed in the Valley to attain EPA's increasingly stringent health-based NAAQS.

The District's plans include emissions inventories that identify sources of air pollutants, evaluations for feasibility of implementing potential opportunities to reduce emissions, sophisticated computer modeling to estimate future levels of pollution, and a strategy for how air pollution will be further reduced. District plans also include innovative alternative strategies for accelerating attainment through non-regulatory measures such as incentive programs; technology advancement programs; the District's legislative platform; community outreach and education programs; and additional strategies such

as energy efficiency, eco-driving, green purchasing and contracting, supporting urban heat island mitigation efforts, and encouraging cleaner methods of generating electrical energy and mechanical power.

Measures implemented for these Valley-wide strategies also apply to the AB 617 community of Stockton and have resulted in tremendous emissions reductions being achieved, to the benefit of the health of all Valley residents. Most recently, after an extensive 3-year public process, the District, in coordination with CARB and EPA, adopted the *2018 PM2.5 Plan*. This historic plan builds on decades of air quality improvement efforts and establishes a comprehensive strategy for continuing to improve the Valley's air quality and meet the latest federal PM2.5 standards. Further information on the comprehensive rules, regulations, and other programs that have been developed as a part of the District's attainment planning process are detailed in the District's plans for attainment of state and federal air quality standards, with links provided to each attainment plan below:

PM2.5 Plans for Attainment

- [*2018 Plan for the 1997, 2006, and 2012 PM2.5 Standards*](#)
The District adopted the *2018 Plan for the 1997, 2006, and 2012 PM2.5 Standards* on November 15, 2018. This plan addresses the EPA federal 1997 annual PM2.5 standard of 15 µg/m³ and 24-hour PM2.5 standard of 65 µg/m³; the 2006 24-hour PM2.5 standard of 35 µg/m³; and the 2012 annual PM2.5 standard of 12 µg/m³.
- [*2016 Moderate Area Plan for the 2012 PM2.5 Standard*](#)
The District adopted the *2016 Moderate Area Plan for the 2012 PM2.5 Standard* on September 15, 2016. This plan addresses the EPA federal annual PM2.5 standard of 12 µg/m³, established in 2012. This plan includes an attainment impracticability demonstration and request for reclassification of the Valley from Moderate nonattainment to Serious nonattainment.
- [*2015 Plan for the 1997 PM2.5 Standard*](#)
The District adopted the *2015 Plan for the 1997 PM2.5 Standard* on April 16, 2015. This plan addresses EPA's annual PM2.5 standard of 15 µg/m³ and 24-hour PM2.5 standard of 65 µg/m³, established in 1997.
- [*2012 PM2.5 Plan*](#)
The District adopted the *2012 PM2.5 Plan* in December, 2012. This plan addresses EPA's 24-hour PM2.5 standard of 35 µg/m³, which was established by EPA in 2006.
- [*2008 PM2.5 Plan*](#)
The District adopted the *2008 PM2.5 Plan* in April, 2008. This plan addresses EPA's annual PM2.5 standard of 15 µg/m³, which was established by EPA in 1997.

PM10 Plans for Attainment

- [2007 PM10 Maintenance Plan](#)
The District adopted the *2007 PM10 Maintenance Plan* in September 2007, to assure the San Joaquin Valley's continued attainment of EPA's PM10 standard. EPA designated the Valley as an attainment/maintenance area for PM10.

Ozone Plans for Attainment

- [2022 Plan for the 2015 8-hour Ozone Standard \(Upcoming Ozone Plan\)](#)
The attainment plan for the 2015 federal ozone standard will build upon comprehensive strategies already in place from adopted District plans and CARB's statewide strategies. The NOx reduction commitments from the recent *2018 PM2.5 Plan* and *2016 Ozone Plan*, and other ongoing measures will assist the Valley in meeting the 70 ppb federal ozone standard. Strategies for attainment of the *2015 8-hour ozone standard* will be developed through a public process, building on decades of effective control strategies. District staff will present regular updates regarding the development of the plan at public meetings and workshops, including upcoming meetings of the District Governing Board, Citizens Advisory Committee (CAC), and the Environmental Justice Advisory Group (EJAG).
- [2020 RACT Demonstration](#)
The District adopted the *2020 Reasonably Available Control Technology (RACT) Demonstration for the 2015 8-Hour Ozone Standard* on June 18, 2020.
- [2016 Plan for the 2008 8-Hour Ozone Standard](#)
The District adopted the *2016 Plan for the 2008 8-Hour Ozone Standard* in June 2016. This plan satisfies Clean Air Act requirements and ensures expeditious attainment of the 75 parts per billion 8-hour ozone standard.
- [2014 RACT SIP](#)
The District adopted the *Reasonably Available Control Technology (RACT) Demonstration for the 8-Hour Ozone State Implementation Plan* in June, 2014.
- [2013 Plan for the Revoked 1-Hour Ozone Standard](#)
The District adopted the *2013 Plan for the Revoked 1-Hour Ozone Standard* in September, 2013.
- [2009 RACT SIP](#)
The District adopted the *Reasonably Available Control Technology (RACT) Demonstration for Ozone State Implementation Plans (SIP)* in April, 2009.
- [2007 Ozone Plan](#)
The District adopted the *2007 Ozone Plan* in April 2007. This plan addresses EPA's 8-hour ozone standard of 84 parts per billion (ppb), which was established by EPA in 1997.

As a result of the District's stringent and comprehensive air quality management strategy along with significant investments made by Valley businesses and residents, PM2.5 and ozone levels are now at historically low levels, and the Valley continues to be in attainment of the PM10 NAAQS. Emissions from stationary sources have been reduced by 85%, cancer risk from exposure to air pollutants has been reduced by 95%, population exposure to elevated PM2.5 levels have been reduced by 85%, and population exposure to elevated ozone levels have been reduced by 90%. This success in reducing emissions Valley-wide provides assurance that targeted strategies will provide the desired results in helping to improve the air quality in AB 617 selected communities.

Regulatory Measures

The District has implemented a comprehensive regulatory control strategy for decades. Since 1992, the District has adopted nearly 650 rules and rule amendments to implement aggressive control strategies. Many current rules are fourth or fifth generation, meaning that they have been revised and emissions limits have been lowered numerous times, as new emission control technology has become available and cost effective. Building on decades of developing and implementing effective air pollution control strategies, District rules are required, by the Environmental Protection Agency, to implement the most stringent measures, including best available control measures for new and modified permitting projects, and best available retrofit control technologies for existing equipment when feasible to require in the San Joaquin Valley. The District's stringent and innovative rules have set benchmarks for other air agencies throughout California and the nation. Regulations implemented by the District have reduced emissions from stationary sources by over 80% to date and will continue to achieve significant emissions reductions in the coming years.

District rules reduce emissions of criteria air pollutants and toxic air contaminants from sources in and around the community. Permitted stationary sources regulated by the District in the Stockton AB 617 Community include agricultural commodities storage and transfer operations, automotive body repair and paint shops, concrete and construction materials manufacturing, electric power generation, motor vehicle coating operations, bulk fuel storage and transfer terminals, chemical receiving and storage, , fabricated metal parts and products, gasoline dispensing operations, government services, municipal water treatment operations, health care centers, metal parts coating operations, skilled nursing care facilities, and telecommunications facilities. District rules that reduce emissions from local sources in the Stockton AB 617 Community are outlined in the following table:

Table 3-5 District Rules Reducing Stockton AB 617 Community Air Pollution

Rule #	Rule Description
4001	New Source Performance Standards
4002	National Emission Standards for Hazardous Air Pollutants
4101	Visible Emissions
4102	Nuisance
4201	Particulate Matter Concentration
4202	Particulate Matter Emission Rate
4301	Fuel Burning Equipment
4305	Boilers, Steam Generators, And Process Heaters - Phase 2
4306	Boilers, Steam Generators, and Process Heaters - Phase 3
4307	Boilers, Steam Generators, and Process Heaters - 2.0 MMBtu/hr TO 5.0 MMBtu/hr
4309	Dryers, Dehydrators, and Ovens
4311	Flares
4320	Advanced Emission Reduction Options For Boilers, Steam Generators, and Process Heaters Greater than 5.0 MMBtu/hr
4352	Solid Fuel Fired Boilers, Steam Generators, and Process Heaters
4455	Components At Petroleum Refineries, Gas Liquids Processing Facilities, And Chemical Plants
4601	Architectural Coatings
4603	Surface Coating Of Metal Parts And Products, Plastic Parts And Products, And Pleasure Crafts
4606	Wood Products And Flat Wood Paneling Products Coating Operations
4607	Graphic Arts And Paper, Film, Foil And Fabric Coatings
4612	Motor Vehicle And Mobile Equipment Coating Operations
4621	Gasoline Transfer Into Stationary Storage Containers, Delivery Vessels, And Bulk Plants
4622	Gasoline Transfer Into Motor Vehicle Fuel Tanks
4623	Storage Of Organic Liquids
4624	Organic Liquid Loading
4652	Coatings and Ink Manufacturing
4653	Adhesives And Sealants
4661	Organic Solvents
4672	Petroleum Solvent Dry Cleaning Operations
4684	Polyester Resin Operations
4692	Commercial Charbroiling
4693	Bakery Ovens
4701	Internal Combustion Engines - Phase 1
4702	Internal Combustion Engines
4801	Sulfur Compounds
4901	Wood Burning Fireplaces and Wood Burning Heaters
4902	Residential Water Heaters
4905	Natural Gas-Fired, Fan-Type Central Furnaces
8011	General Requirements
8021	Construction, Demolition Excavation, Extraction, and Other Earthmoving Activities
8031	Bulk Materials
8041	Carryout and Trackout
8051	Open Areas
8061	Paved and Unpaved Roads
8071	Unpaved Vehicle/Equipment Traffic Areas
8081	Agricultural Sources
9310	School Bus Fleets

Rule #	Rule Description
9410	Employer Based Trip Reduction
9510	Indirect Source Review

While California and the federal government have direct authority to regulate tailpipe emissions from mobile sources, the District has also adopted innovative regulations such as the Rule 9510 - Indirect Source Review (discussed in more detail later in this section) and Rule 9410 - Employer-based Trip Reduction to reduce emissions from mobile sources within the District's limited jurisdiction over these sources. A complete listing of the District's current rules and regulations is available at the following link: <http://www.valleyair.org/rules/1ruleslist.htm>

For the recently adopted *2018 Plan for the 1997, 2006, and 2012 PM2.5 Standards* 2018 PM2.5 Plan, the District performed an exhaustive evaluation of all potential additional opportunities for reducing emissions and committed to amend several rules to achieve expeditious attainment of the health-based federal PM2.5 air quality standards (see Section IV). This comprehensive analysis also demonstrated that the District's rules and regulations are at least as stringent, if not more stringent, than all other rules in the nation. Furthermore, in accordance with AB 617 requirements, the District adopted an expedited schedule in December, 2018, for performing further determination of BARCT to ensure that applicable sources are utilizing the cleanest technologies feasible (see Chapter 4).

District New and Modified Stationary Source Review

Beyond District rules that apply to specific categories of stationary sources, District Rule 2201 (New and Modified Stationary Sources Review) applies to all new stationary sources and all modifications to existing stationary sources that are subject to District permit requirements. District Rule 2201, and the associated permitting process, ensure that new or modified stationary sources of air pollution are subject to the most effective emissions controls feasible for implementation; that emissions from the project do not create a public health risk (including a modeled analysis of cancer risks resulting from the project and possible health hazard risks resulting from both acute and chronic exposure to emissions for nearby residences and worksites); and that the project does not increase the potential for a violation of State or National Ambient Air Quality Standards. More information about the District's rigorous permitting process is available at <http://www.valleyair.org/busind/pto/ptoprocess.htm>, and is also summarized below. Under Rule 2201, new facilities or facilities modifying equipment must obtain an Authority to Construct (ATC) permit prior to construction, and are subject to stringent requirements, including:

- Best Available Control Technology (BACT)
- Risk Management Review (RMR)
- Toxic Best Available Control Technology (T-BACT)
- Ambient Air Quality Analysis (AAQA)

Best Available Control Technology (BACT): For each emissions unit (specific piece of equipment) that has the potential to emit over the 2 lb/day BACT threshold, the

District requires the use of the best available air pollution control technology commonly used to control emissions from similar types of equipment. The District also conducts an analysis to determine if, based on specific criteria, cleaner technologies that are not commonly used for these type of equipment could be used to further reduce emissions from the proposed equipment. This very stringent requirement ensures that the most effective air pollution control technique is utilized resulting in reduced public exposure to air pollutants and toxic air contaminants.

As a part of the District's BACT Policy (publicly available at <https://www.valleyair.org/busind/pto/bact/bactidx.htm>), District staff maintain a BACT Clearinghouse, updated and published quarterly, that includes available control technologies and operation methods that meet one of the following conditions:

- A. The control technologies or operation methods have been achieved in practice for an emissions unit and class of source; or
- B. Are contained in any SIP approved by the EPA for an emissions unit category and class of source; or
- C. Are any other emission limitation or control technique, including process and equipment changes of basic or control equipment, found to be technologically feasible for such class or category of sources or for a specific source.

AB 617 legislation requires that CARB develop and maintain a state-wide Technology Clearinghouse for BACT and T-BACT. Once available, District staff will review the Technology Clearinghouse as an additional resource when updating the District's BACT Clearinghouse.

Risk Management Reviews: The District conducts Risk Management Reviews to ensure that the public exposure to toxic air contaminants from projects required to obtain an ATC is less than significant. Very complex computer models and the most conservative assumptions are used to assess the project's maximum impact on resident's health. Projects resulting in estimated significant health risk for the public are not approved. Additional information regarding risk management reviews may be found here: https://www.valleyair.org/policies_per/Policies/apr-1905.pdf

Toxic Best Available Control Technology (T-BACT): When T-BACT is triggered under a Risk Management Review analysis, the District conducts a T-BACT analysis to ensure the most stringent control technique is utilized resulting in reduced public exposure to toxic air contaminants. T-BACT is required for units emitting air toxic emissions that result in a cancer risk of greater than one-in-a-million nearby residences or businesses. Projects resulting in estimated significant health risk for the public are not approved.

Ambient Air Quality Analysis (AAQA): The U.S. Environmental Protection Agency (EPA) and the California Air Resources Board (CARB) have established [National Ambient Air Quality Standards \(NAAQS\)](#) and [California Ambient Air Quality Standards \(CAAQS\)](#), respectively, for numerous pollutants. Under Rule 2201, the District conducts AAQAs to ensure that project related emissions would not cause or make worse a violation of the State or National ambient air quality standard. This

analysis ensures that the public exposure to certain criteria air pollutants is less than the maximum allowed concentration in outdoor air without harm to public.

AB 2588 (Air Toxics Hot Spots Information and Assessment Act)

The District's implementation of [AB 2588](#), California's Air Toxics "Hot Spots" Information and Assessment Act, has resulted in dramatic reductions in emissions of air toxics from existing sources in the San Joaquin Valley. Under this right-to-know law, the District has worked with 7,228 Valley facilities to quantify emissions of air toxics, determine the health risk caused by those emissions, report emissions and any significant risks through written public reports and neighborhood public meetings, and take steps to reduce such risks. As a result of these efforts, and the subsequent reductions in air toxics, since 2007 there have been no Valley facilities that pose a significant risk to any Valley resident under the "Hot Spots" program. A detailed discussion of AB 2588 and facility risk reduction audits conducted to date in the community is included in Chapter 4.

Implementation of State Airborne Toxic Control Measures

The District's integrated air toxics program incorporates Airborne Toxic Control Measure (ATCM) regulations promulgated by CARB. State-issued ATCMs are designed to reduce toxic air emissions from various types or categories of equipment by imposing prescribed air pollution control measures. Implementing ATCMs result in reductions of toxics exposure from targeted facility types or categories that could cause significant risks at a regional level. These ATCMs are implemented primarily through the District's permitting process. Examples of emissions sources that have drastically reduced toxic air contaminant emissions in the San Joaquin Valley because of such rules and regulations include dry cleaners, chrome plating operations, gas stations, and diesel internal combustion engines.

Implementation of Federal National Emissions Standards for Hazardous Air Pollutants (NESHAP) and Maximum Achievable Control Technology (MACT) Standards

The District's integrated air toxics program fulfills federal mandates under Title III of the federal Clean Air Act, which requires specific types of sources of air toxic emissions to directly reduce emissions through federal NESHAP and MACT standards. These standards apply to a variety of source categories, ranging from diesel internal combustion engines to chrome platers, and from refineries to power plants.

Implementation of Federal New Source Performance Standards (NSPS)

The District also fulfills federal mandates under Title I of the federal Clean Air Act, which requires specific types of new, modified, and reconstructed facilities subject to NSPS to directly reduce emissions of criteria air pollutants. These standards apply to a variety of source categories, ranging from hot mix asphalt facilities to sewage treatment plants, and from landfills to boilers.

District Indirect Source Requirements

District Rule 9510 is the only rule of its kind in the State of California and throughout the nation which applies to new residential and commercial development projects. The District's rule is recognized as the benchmark, or best available control, for regulating these indirect sources of emissions, such as from construction equipment and mobile sources associated with new developments. This rule requires mitigation of the growth in emissions from mobile and area sources associated with construction and operation of new development projects in the Valley.

District Air Quality Assistance and Guidance to Public Agencies

The District provides assistance and guidance to other public agencies, including cities and counties in the San Joaquin Valley, to help them assess, minimize, and mitigate air quality impacts of projects undergoing their land-use approval processes, over which the District has no statutory authority. For instance, the District provides comments under the California Environmental Quality Act (CEQA) to public agencies on hundreds of proposed projects each year. District provided CEQA comments are designed to minimize project related air quality impacts. In addition, the District maintains and makes available an extensive suite of guidance documents and tools for assessing and mitigating air quality impacts, including criteria and air toxic emissions, from stationary source projects and other development projects.

Mobile Source Regulations

Mobile source emissions make up over 85% of the Valley's NOx emissions, the primary driver in the formation of particulate and ozone pollution, therefore, reductions in mobile source emissions have become an ever-increasingly important part of the Valley's attainment strategy of federal air quality standards. States and the federal government, unlike the District, have the authority to directly regulate tailpipe emissions from mobile sources. CARB has adopted toughened regulations for heavy-duty trucks, off-road equipment, and other mobile sources. Additionally, the District has adopted innovative regulations such as the Indirect Source Review and Employer-based Trip Reduction rules to reduce emissions from mobile sources within the District's limited jurisdiction over these sources. Local air districts do not have the authority to implement regulations requiring ultra-low tailpipe emissions standards on mobile sources.

With authority to regulate mobile source emissions, CARB has adopted and amended a number of regulations aimed at reducing exposure to diesel PM and NOx from fuel sources, freight transport sources like heavy-duty diesel trucks, transportation sources like passenger cars and buses, and off-road sources like large construction equipment. Phased implementation of these regulations will produce emission reduction benefits in the coming years as the regulated fleets are retrofitted, and as older and dirtier fleet units are replaced with newer and cleaner models at an accelerated pace. CARB's ongoing comprehensive measures to reduce emissions from mobile sources throughout the state are detailed further in Chapter 4, "Statewide Strategies" section.

District Incentive-Based Emission Reduction Programs

The District has increasingly relied on its advocacy efforts to secure state and federal funding sources, and locally-generated funding to implement incentive programs that have become a vital component of the District's overall strategy for achieving the emissions reductions necessary to bring the Valley into attainment with state and federal air quality standards and to protect public health. These programs provide an effective way to accelerate emissions reductions and encourage technology advancement, particularly from mobile sources, a sector not directly under the District's regulatory jurisdiction. Considering over 85% of the NOx emissions in the Valley come from mobile sources, these successful voluntary incentive grant programs help the Valley achieve highly cost-effective emissions reductions that are surplus of the regulatory emissions reductions.

The District operates one of the largest and most well-respected voluntary incentive programs in California. Since the District's inception in 1992, considerable funding has been invested into thousands of clean-air projects throughout the Valley. The District's incentive programs offer Valley businesses and residents the opportunity to replace their older, higher polluting equipment with newer, cleaner models. These incentive programs include options for replacing older diesel powered trucks, ag engines, tractors, locomotives, and construction equipment as well as options for replacing wood burning devices, lawn equipment and passenger vehicles. These projects have achieved significant emissions reductions with corresponding air quality and health benefits. The incentive programs listed in the table below have been implemented in the community of Stockton AB 617 Community from 2005 to October 7, 2020, achieving over 1,200 tons of combined PM, NOx, and VOC emissions reductions in the community.

Table 3-6 Grant Funding Invested in Stockton AB 617 Community- from 2005 to Oct 7, 2020

Stockton AB 617 Community Grant Funding: Incentive Program	Units	Sum of Grant Amount	Total Tons PM, NOx, VOC Emissions Reduced
Bicycle Infrastructure Bike Bath Class I,II,III	2	\$100,000	10.45
Burn Cleaner Wood Stove Change Out New Device	77	\$230,500	18.09
CAP & Trade Demonstration New Electric Vehicle	2	\$2,324,790	0.00
Heavy-Duty Ag-UTV Vehicle Replacement	1	\$13,722	0.31
Heavy-Duty Forklift New Electric Vehicle	1	\$31,780	1.56
Heavy-Duty Locomotive Engine Repower	2	\$3,750,000	177.59
Heavy-Duty Locomotive New Vehicle	2	\$4,825,624	305.04
Heavy-Duty Locomotive Replacement	1	\$1,729,000	97.83
Heavy-Duty Off-Road Ag Vehicle Replacement	1	\$19,000	1.36
Heavy-Duty Off-Road Engine Repower	1	\$279,350	40.36
Heavy-Duty On-Road DERA Vehicle Replacement	7	\$373,728	0.0

Stockton AB 617 Community Grant Funding: Incentive Program	Units	Sum of Grant Amount	Total Tons PM, NOx, VOC Emissions Reduced
Heavy-Duty On-Road Engine Repower	2	\$164,106	45.55
Heavy-Duty On-Road New Vehicle	1	\$28,000	0
Heavy-Duty On-Road Trade Up	3	\$300,00	3.63
Heavy-Duty On-Road Prop 1B Vehicle Replacement	47	\$2,880,000	423.84
Heavy-Duty On-Road Truck Replacement	3	\$195,062	11.16
Heavy-Duty On-Road TVP Engine Retrofit	1	\$20,000	0.04
Heavy-Duty On-Road TVP Vehicle Replacement	21	\$1,336,292	93.01
Heavy-Duty On-Road VIP Vehicle Replacement	6	\$330,000	3.07
Lawn & Garden Residential New Purchase	7	\$533	0.00
Lawn & Garden Residential Replacement	73	\$28,505	0.00
Light-Duty Charge Up EV Charger-Private	1	\$6,000	0.00
Light-Duty Charge Up EV Charger-Public	7	\$312,000	0.00
Light-Duty Drive Clean EV Vehicle Rebate	42	\$246,000	0.79
Light-Duty EFMP Replacement	132	\$1,504,948	1.66
Light-Duty TITU Repairs	670	\$371,326	0.00
Light-Duty Van Pool Voucher	2	\$1,260.00	0.18
Public Benefit Alternative Fuel New Vehicle	53	\$1,015,413	0.00
Remove II Light and Medium Duty EV Purchase	1	\$3,000	0.04
Remove II Pearl Data New Vehicle Purchase	1	\$12,000	0.00
Special Projects Short Sea Shipping	1	\$750,000	0.00
Total	1,171	\$22,881,939	1,235.56

District Technology Advancement Efforts

The District Governing Board approved creation of the Technology Advancement Program in March, 2010, to accelerate development of technologies that can help reduce emissions in the Valley. Meeting EPA's increasingly stringent ozone and PM2.5 air quality standards requires significant advancements in low-emissions technologies from mobile and stationary sources. The Technology Advancement Program provides a strategic and comprehensive means to identify, solicit, and support technology advancement opportunities. Ongoing refinement of the program's technology focus areas targets efforts to achieve the greatest impact on the Valley's attainment and other health-based goals. This program has resulted in the development and deployment of electric feed mixers for dairy operations, clean fuel technologies for trucks, and solar-electric truck refrigeration units. Many of these advanced clean-air technologies are currently operating in the community of Stockton AB 617 Community.

Public Air Quality Education and Outreach

Providing accurate and up to date air quality information to Valley residents is a top priority for the District, especially when circumstances such as wildfires overwhelm all clean air measures and lead to high pollution concentrations. Under these

circumstances, the best course of action is to provide notifications to Valley residents so that sensitive individuals, in particular, can take precautions to minimize exposure. The District has expended significant resources on public notification and risk prevention measures, such as the Real-Time Air Advisory Network (RAAN) and Real-Time Outdoor Activity Risk (ROAR) Guidelines. The following are some additional examples of District outreach programs designed to help Valley residents understand air quality and what they can do to reduce their own impacts:

- Healthy Air Living Schools
 - <http://www.healthyairliving.com/schools>

The above programs are available to community members, and have helped residents and school administrators take health protective action during poor air quality episodes.

4. STRATEGIES TO REDUCE THE CUMULATIVE EXPOSURE BURDEN IN STOCKTON

COMMUNITY IDENTIFIED AIR QUALITY PRIORITIES

During the June 3, 2020 Community Steering Committee (CSC) meeting, Stockton committee members and public attendees participated in a District-facilitated exercise to identify and prioritize their air pollution sources of concern. Participants were placed in groups and were asked to share their thoughts regarding air pollution sources which they believed impacted their community the most, or was of most concern to the individual or entity they represented. The results of these group exercises were then placed into an online mapping tool to create a visual representation of the common pollution sources of concern (Figure 4-1). An online version of the exercise was also sent to the committee and posted to the District's community webpage <http://community.valleyair.org> to allow for additional opportunity to participate in identifying source categories of concern.

Figure 4-1 Results of Sources of Concern Exercise

Through these exercises, some top emission sources categories of concern in Stockton include:

Based on emissions inventory, current air monitoring data, and top sources of concern in this community, pollutants of concern include particulate matter less than 2.5 micrometers in diameter (PM_{2.5}), Black Carbon (BC), Oxides of Nitrogen (NO, NO₂, NO_x), Hydrogen Sulfide (H₂S), Carbon Monoxide (CO), Ozone, and Volatile Organic Compounds (VOCs). In addition, a variety of toxic compounds, including toxic organics and particulate matter, were also identified as pollutants of concern.

To provide additional information about existing control programs for community members not familiar with ongoing air pollution control efforts, District staff prepared an informational document titled, "*Public Resource: Existing Control of Air Pollution Sources of Concern*," (included for reference as Appendix D), and gave several presentations about existing District control programs. Additionally, the Community Co-Hosts are provided the opportunity to share their own experiences and areas of concern

during CSC meetings and their thoughts on opportunities to improve air quality within the community. The CSC meetings have served to build the knowledge base of the CSC members and to assist in developing a Community Emission Reduction Program (CERP) which includes specific measures to reduce exposure to harmful air pollution within the community.

In partnership with the CSC members, community based organizations, businesses in the community, and state and local agencies, a suite of targeted strategies to reduce and mitigate harmful air pollution emissions from community identified sources of concern has been developed. Some of which were suggested by the District in response to CSC identified sources of concern and many of which came directly through suggestions made by CSC members. In addition to the emission reductions which will be achieved through expedited implementation of best available retrofit control technology by facilities within the community, the adoption of rule amendments that will further reduce PM_{2.5} and toxics in the Valley, and enhanced enforcement (additional/targeted enforcement efforts) in the community, these local measures provide accelerated emissions reductions in the community.

AB 617 legislation requires that a CERP identifies cost-effective measures to achieve emission reduction targets in the community. During CSC discussions to review potential strategies for implementation in the community, Committee members consistently supported and prioritized measures that would reduce emissions from residential sources, while also providing tangible benefits to residents in the community. To that end, in addition to measures that reduce emissions from stationary, area, and mobile sources that are large contributors to the community emissions inventory, many of the measures supported by the Steering Committee and proposed for implementation in the Stockton CERP include targeted incentive programs and interagency partnerships that provide co-benefits in the community, in addition to air quality improvements. The measures described in this chapter encompass a range of strategies to reduce community level exposure burden, including regulatory, enforcement, outreach and education, voluntary incentive-based programs, as well as partnerships with other agencies to address issues outside of the District's direct regulatory authority.

It should be noted that the identified funding amounts for each measure are designed assuming that future-year state budget appropriations and funding allocations are similar to those approved by the legislature and CARB for current use in the AB 617 program, and are available in future District budget appropriations.

Incentive program guidelines also generally contain strict requirements that include specific project types and funding amounts. To maximize emission reductions in the AB 617-selected community of Stockton, the CERP includes measures that also leverage existing District incentive funding allocations, above and beyond funding amounts available through AB 617-related funding allocations.

Some of the incentive measures included in the CERP are proposed to operate under existing authority and approved program guidelines, while other measures will require

the development of new program guidelines and associated approval by the District Governing Board and CARB. As the CARB Blueprint states, CARB and the District will continue developing regulatory and incentive actions through separate public processes. Subsequent implementation of proposed CERP measures will be conditional on the successful completion of applicable public processes, necessary financing approvals, technical feasibility analyses, economic competitiveness, safety, and environmental reviews.

The District will continue to work with the CSC to receive community input as program guidelines are developed and projects are implemented within the community [Placeholder for language regarding technical support, health studies, etc], . As experience is gained in implementing the measures contained in the CERP, it may become evident that certain measures are more successful than others in reducing emissions and/or exposure, and are more popular with the community. Committee input on these considerations, and discussions about funding availability and cost-effectiveness/benefits of these projects, may lead to the CSC recommending making adjustments to strategy goals and/or funding amounts to achieve overall emission reduction goals of the CERP. A possible example includes the collection and sharing of community air monitoring data, which could lead to additional discussion with the CSC, which could lead to additional CERP strategy development. During CERP implementation, the CSC will be provided regular updates on implementation progress and their feedback and guidance requested. Based on the updates, it is possible that new strategies could be identified or revisions to existing strategies may be appropriate.

The sections that follow provide detailed information about emission and exposure reduction strategies developed for each source category of concern to the community.

EXPOSURE REDUCTION STRATEGIES FOR SENSITIVE RECEPTORS

Proximity to emission sources can pose health risks for community members, particularly for sensitive groups such as children, the elderly, and those with cardiovascular diseases. Sensitive receptors located in Stockton include schools, daycare facilities, and medical facilities, as shown in the map below. The CARB Blueprint contains several suggested measures that can be implemented to reduce exposure to emissions in areas where these sensitive receptors may be particularly vulnerable to exposure, which are referred to as proximity-based goals.

Figure 4-2 Sensitive Receptors in the Community

In discussions about possible exposure reduction measures to implement in the AB 617-selected community, the Stockton Steering Committee placed a high priority on measures that would protect the health of children, including installing advanced filtration systems at schools and providing indoor air filtration devices to community residents near sources of concern. Other measures prioritized by the Steering Committee included reducing idling near sensitive receptors, and increasing community member knowledge about actions individuals can take to protect their health.

The Steering Committee also suggested additional urban greening, installing vegetative barriers next to industrial sites and along major roadways, and rerouting of heavy-duty trucks corridors near these sensitive receptors. The District has engaged with local

government agencies, CARB, and appropriate state agencies that have the authority to implement these strategies.

Reducing exposure for sensitive receptors will be accomplished through the implementation of the following measures related to school air filtration, home indoor air quality filtration, urban greening, and vegetative barriers.

VEGETATIVE BARRIERS

BACKGROUND

Vegetative barriers, also known as windbreaks, are composed of one or more rows of trees or shrubs that may be planted in specific areas of concern in order to improve air quality in the immediate area by intercepting airborne particles, dust, chemicals, and odors. Pollutants directly emitted from cars, trucks, and other motor vehicles are found in higher concentrations near major roads. In addition, stationary sources such as industrial facilities, factories, and other industrial processes can also contribute air pollutants to their surrounding areas. While various emission control techniques and programs exist to reduce these pollutants from mobile and stationary sources, vegetative barriers have been shown to be an additional measure to potentially reduce a population's exposure to air pollution through the interception of airborne particles and the uptake of gaseous pollutants. Examples of vegetative barriers include trees, bushes, shrubs, or a mix of these. Generally, a higher and thicker vegetative barrier with full coverage will result in greater reductions in downwind pollutant concentrations. In addition to air quality benefits, vegetative barriers can improve aesthetics, increase property values, reduce heat, control surface water runoff, and reduce noise pollution.¹

Characteristics of a vegetative barrier that should be considered include the porosity/density of the vegetative barrier, the characteristics of the vegetation during different seasons, leaf surface characteristics, vegetation air emissions (e.g. biogenic VOCs), and the resistance of the vegetative barrier to air pollution. Other considerations include: soil characteristics, availability of water, control of water runoff, maintenance of the vegetative barrier, use of native and non-invasive species, and roadway safety. Vegetative barriers may also be used with solid barriers to increase mitigation. Research is ongoing as to the effectiveness of vegetative barriers in reducing exposure to pollutants, but a recent study has found that vegetative barrier installations may reduce downwind exposure to carbon monoxide and fine particulate matter by at least 23%.²

The US EPA has produced a fact sheet with further information on vegetative barriers, available here: https://19january2017snapshot.epa.gov/sites/production/files/2016-08/documents/recommendations_for_constructing_roadside_vegetation_barriers_to_improve_near-road_air_quality.pdf

Figure 4-4 Vegetative Barrier around Foster Farms, Fresno, CA

Latest Google Map Information

COMMUNITY CONCERNS AND COMMENTS

The Stockton Steering Committee has identified Vegetative Barriers as a priority for air pollutant mitigation. The committee has expressed the need for the installation of vegetative barriers (and sound walls) around and near sources of concern such as schools, along truck routes, near the Port of Stockton, Charter Way, Boggs Tract and El Dorado with an additional priority along Interstate 5. The committee has expressed the need to enforce existing mitigation plans associated with specific industries.

CURRENT PROGRAMS

The Valley Air District, the City of Stockton, the California Department of Transportation (Caltrans), and other local partners have promoted the use of vegetative barriers for reducing exposure to air pollutants, mitigating the urban heat island effect, and improving aesthetics. The District's Fast Track Action Plan includes the strategic use of tree and vegetation planting as a potential measure to improve air quality.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

Based on community interest in vegetative barriers, the following measure was developed for implementation as a part of the Stockton CERP.

The following is a suggested measure not within the Air District's jurisdiction to directly implement:

VB.1: INCENTIVE PROGRAM FOR THE INSTALLATION OF VEGETATIVE BARRIERS AROUND/NEAR SOURCES OF CONCERN

Overview: The purpose of this strategy is to provide incentives for the installation and maintenance of vegetative barriers around sources of concern to reduce particulate matter, odor, and other emissions, as feasible. Based on community interest in vegetative barriers, the District will also look to partner with other agencies to identify additional grant funding to support the installation of vegetative barriers at/near industrial facilities and along major transportation and goods movement corridors.

It should be noted that the SJVAPCD has no authority over how agencies allow land under their jurisdiction to be used. These land-use decisions, such as whether to allow or require vegetative barriers in specific locations, are historically the responsibility, under state law, of cities and counties, or, in some cases, state and federal agencies responsible for transportation corridors, state and federal parks, and other properties. AB 617 does not provide the District with new land-use regulatory authority, so land-use authority remains with cities, counties, and state and federal land-use agencies, as discussed in CARB's Blueprint (see "Who Has the Authority to Implement Actions?", page 26 of the Blueprint), the District is committed to working with these agencies and the CSC to see this measure implemented this measure.

Implementing Agency: SJVAPCD, CDOT, City, County, Port of Stockton, other local partners

Type of Action: Partnership, Incentives

Implementation: 2021-2025

Budgeted Amount: \$1,000,000

Quantifiable emission reduction: Estimated 5-year emissions reductions associated with this measure includes up to 0.11 tons of PM_{2.5} and NO₂ per year

URBAN GREENING

URBAN GREENING SOURCES IN STOCKTON

Urban greening is one way to help improve air quality and public health in addition to enhancing the overall beautification of the community with drought resistant low maintenance greenery. Trees and vegetation help reduce the impacts of heat islands by increasing the amount of shade and cooling the air by evapotranspiration.³ Careful placement and choice of vegetation will maximize its cooling benefits. Shade provided by trees and other vegetation prevents sunlight from reaching heat-absorbing surfaces such as sidewalks and parking lots, cooling the area by 2 to 9 degrees Fahrenheit. Air quality also benefits from a decrease in energy usage. The less energy used, the fewer power plants running and emitting ozone precursors.⁴ The total net savings when considering energy, ozone, and PM reduced from vegetation were valued at \$210/tree.

Figure 4-5 Urban Heat Island Effect Illustrated (Source: EPA, 1992)

COMMUNITY CONCERNS AND COMMENTS

The steering committees expressed an interest in opportunities for increased urban greening and forestry in the community of Stockton specifically at Charter Way, Boggs Tract, and El Dorado as a strategy to reduce exposure from emissions that occur along local transportation corridors while keeping in mind water and maintenance issues.

CURRENT PROGRAMS

The District Fast Track Action Plan identified Heat Island Mitigation as a measure to be implemented with the goal to increase urban forest canopy shading and increase the albedo of structures and pavement. This guidance includes a model resolution and

³ EPA (1994) *Using Trees and Vegetation to Reduce Heat Islands*. Retrieved 1/21/21 from <https://www.epa.gov/heatislands/using-trees-and-vegetation-reduce-heat-islands>

⁴ EPA (2008) *Heat Island Compendium*. Retrieved 1/21/21 from <https://www.epa.gov/heatislands/heat-island-compendium>

policy statement for use by businesses, government, and organizations who desire to commit to heat island mitigation strategies.

Due to the benefits of urban greening, there are several programs available to support urban greening in communities. Below are the ongoing efforts to promote Urban Greening by other agencies, as well as programs committed to be implemented in future State and/or Valley-wide programs.

- **Transformative Climate Communities (TCC) Program:** The (TCC) Program funds development and infrastructure projects that achieve major environmental, health, and economic benefits in California's most disadvantaged communities. TCC is one of many California Climate Investments programs
- **Fathers & Families of San Joaquin:** Fathers & Families of San Joaquin's Health Justice Tree Planting/ReLeaf program plants trees in disadvantaged communities, trading gray concrete spaces into vibrant green spaces to promote a canopy of healthy environments and reduce greenhouse gases.
- **PUENTES:** PUENTES empowers at risk urban families by providing opportunities to enhance their environment with trees and stewardship for natural resources, foster local food chain viability, employment and entrepreneurship, and reinforce the sense of community involvement and physical wellbeing through volunteer participation in farming and forestry.
- **California ReLeaf Grants:** California ReLeaf seeks and provides pass-through grants to ReLeaf Network Members and other community groups interested in planting and caring for trees in California and offers grant programs through the Social Equity Grant Program and California Arbor Week Grant.
- **California Natural Resources Agency Urban Greening Grant Program:** Consistent with AB 32, the Urban Greening Program will fund projects that reduce greenhouse gases. This program includes urban heat island mitigation projects and energy conservation efforts related to shade tree projects.
- **Cal Fire:** Through the California Climate Investments (CCI) Urban & Community Forestry Grant Program, CALFIRE works to optimize the benefits of trees and related vegetation through multiple-objective projects as specified in the California Urban Forestry Act of 1978.
- **Active Transportation Program (ATP): California Department of Transportation (CALTRANS):** Urban forestry, such as trees and other vegetation, are significant components of several eligible projects under the ATP, including parks, trails, and safe-routes-to-schools.
- **California Urban Forests Council (CAUFC):** As a coalition, CAUFC is dedicated to the expansion and perpetuation of sustainable urban and community forests to enhance the quality of life for all Californians.

Non-profit organizations such as One Tree Planted, River Partners, the San Joaquin River Conservancy, and others provide the public the ability to donate to support tree

planting and also advocate for the allocation of state and federal funding towards tree planting or replanting in forest, river, and/or urban areas in California.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

Due to the community's interest in increased urban greening, the District will be working with other agency partners to bring increased funding for urban greening to the AB 617 selected communities, as further described in the following measure.

The following is a suggested measure not within the Air District's jurisdiction to directly implement:

UG.1 URBAN GREENING AND FORESTRY

Overview: The purpose of this strategy is to identify and support efforts to increase urban greening/forestry to improve air quality for residents in the Stockton community. The focus areas will include, Charter Way, Boggs Tract, and El Dorado. This measure is supported by scientific studies that have shown urban trees and forestry can help with the removal of air pollutants and reduced emissions of volatile organic compounds (VOC's). The effects of urban trees on fine particulate matter (PM2.5) was modeled for ten U.S. cities, with total annual PM2.5 removal varying from 5.2 tons in Syracuse to 71.1 tons in Atlanta. Overall air quality improvements attributed to urban trees ranged between 0.05% in San Francisco to 0.24% in Atlanta (Nowak, Hirabayashi, Bodine, Hoehn, 2013). Based on a study to assess the effects of urban trees on air quality have found that urban vegetation can attribute to temperature reduction, removal of air pollutants, reduced emission of VOCs, and building energy conservation (United States Department of Agriculture Forest Service, 2002). The measure would also include an on-going maintenance program with the city.

The District has long been supportive of the public benefits provided from planting of trees and vegetation. The District's Fast Track Action Plan, adopted by the Governing Board to reduce ozone pollution in the Valley, identified strategic use of tree and vegetation planting as a potential measure to reduce ozone. There has also been significant efforts at the federal, state, and local levels to promote and increase urban greening and forestry through funding opportunities, programs, and projects.

It should be noted that, while the District has no direct authority over how agencies allow land, under their jurisdiction, to be used. These land-use decisions on whether to allow or require urban greening in specific locations, are the responsibility, under state law, of cities and counties, or, in some cases, state and federal agencies responsible for transportation corridors, state and federal parks, and other properties. While AB 617 does not provide the District with new land-use regulatory authority, so land-use authority continues to remain with cities, counties, and state and federal land-use agencies, as discussed in CARB's Blueprint (see "Who Has the Authority to Implement Actions?", page 26 of the Blueprint), the District is committed to working with these agencies and the CSC to see this measure implemented this measure.

Implementing Agency: SJVAPCD, CDOT, City, County, Port of Stockton, other local partners

Type of Action: Partnership, Incentives

Implementation: 2021-2025

Budgeted Amount: \$1,000,000

Quantifiable emission reduction: CARB has an established methodology through the Urban & Community Forestry Program

EXPOSURE REDUCTION STRATEGIES FOR SCHOOLS

SCHOOLS IN THE STOCKTON COMMUNITY

The Stockton Unified School District is the primary district serving the Stockton AB 617 community. In addition to the 32 schools within the Stockton Unified School District, three private schools also operate within the boundaries. Enlisting the participation and support of these schools in the effort to reduce children's exposure is key to ensuring that benefits are as widespread as possible. Targeting schools like Washington Elementary School protects the most vulnerable populations. All children, but especially young children, are considered sensitive receptors with respect to air pollution and it is vital that their protection from unhealthy air during their developing years is made a priority.

COMMUNITY CONCERNS AND COMMENTS

A primary concern expressed by Steering Committee members is to ensure cleaner air both indoors and outdoors for children at school while fully engaging local school districts and parents in clean-air efforts. Committee members expressed a desire to prioritize schools in neighborhoods with the highest risk of exposure to pollutants, such as those near the Stockton Port and near existing truck routes, and to enlist the cooperation and support of Stockton Unified School District as programs are further developed during the implementation phase of the CERP. The Steering Committee also requested incorporating an "Emissions Free Zone" model into the outreach strategies developed.

CURRENT CONTROL PROGRAMS

The District's Healthy Air Living (HAL) Schools program empowers participating schools to make informed decisions about outdoor activities based on real-time air quality conditions. School staff sign up for automated notifications when air quality becomes harmful using the Real-time Air Advisory Network (RAAN) tool, and receive health-protective recommendations for the modification or cancellation of outdoor activities accordingly through the Real-time Outdoor Activity Risk (ROAR) guidelines. The program includes access to resources like anti-idling signs, air quality widgets for school websites, bilingual informational materials, and bilingual educational speakers for students, parents, and staff. This program will be expanded to include an "Emissions Free Zone" model into the coordination with schools.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

Strategies developed to reduce the exposure of children within the community require a twofold approach: increasing enrollment of schools in the HAL School program protects children from exposure to unhealthy outdoor air through the widespread adoption of RAAN and ROAR; further, establishing a program that offers incentive funds to install advanced air filtration systems in community schools reduces exposure to potentially unhealthy indoor air quality.

The following are proposed measures that are within the Air District’s statutory jurisdiction to implement:

SC.1 INCENTIVE PROGRAM TO INSTALL ADVANCED AIR FILTRATION SYSTEMS IN COMMUNITY SCHOOLS

Overview: The goal of this strategy is to reduce the impact of air pollution on children at schools. Air filtration reduces the concentration of particulate contaminants from indoor air and is an important component of a school’s Heating Ventilation and Air Conditioning (HVAC) system. Reducing airborne particles is important due to the negative impacts to human health, especially that of sensitive populations such as children and the elderly.

This strategy would provide up to \$2,640,000 in incentive funding for schools within the Stockton boundary to install advanced air filtration systems, utilizing existing Community Air Protection Program guidelines. Proposed funding amounts would provide local schools with funding to install HVAC filters with a minimum efficiency reporting value (MERV) rating of 14 or greater or the highest MERV filter the current HVAC system can handle and/or standalone air filtration units as determined through an assessment performed by the trained school district staff or third party vendor. The MERV rating reflects the filter’s ability to capture particles in the air, the higher the MERV rating, the better the filter is at trapping particles.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Budgeted Amount: \$2,640,000

SC.2: REDUCE CHILDREN’S EXPOSURE THROUGH INCREASED ENROLLMENT IN THE HEALTHY AIR LIVING SCHOOLS PROGRAM AND THE ESTABLISHMENT OF EMISSION FREE ZONES

Overview: The goal of this strategy is to reduce children’s exposure to unhealthy air by increasing the enrollment of schools in the Healthy Air Living (HAL) Schools program to decrease vehicle idling, limit children’s outdoor activity during episodes of poor air quality, and educate student about protecting our air. Additionally, the strategy is to work with school staff and students to educate the public, educators and parents regarding having an “Emission Free Zone” around schools, thereby reducing negative health impacts on student’s health caused by emissions generated from vehicle idling. To help in this effort, “No Idling” signage in English and Spanish will be distributed to schools within the boundary. Additionally, informational videos will be used as an outreach tool and will be made available in languages such as Spanish, Tagalog, and others on an as needed basis.

Implementing Agency: SJVAPCD

Strategy Type: Outreach

Emission Outcome: Reduction

INDOOR AIR QUALITY

Indoor Air Quality refers to the air quality within buildings and structures, especially as it relates to the health of building occupants. Some health effects may show up shortly after a single exposure or repeated exposures to a pollutant. These include irritation of the eyes, nose, and throat, headaches, dizziness, and fatigue. Such immediate effects are usually short-term and treatable. Sometimes the treatment is simply eliminating the person's exposure to the source of the pollution, if it can be identified. Soon after exposure to some indoor air pollutants, symptoms of some diseases such as asthma may show up, be aggravated, or worsened.

Outdoor air enters and leaves a building by: infiltration, natural ventilation, and mechanical ventilation. In a process known as infiltration, outdoor air flows into buildings through openings, joints, and cracks in walls, floors, and ceilings, and around windows and doors. In natural ventilation, air moves through opened windows and doors. Mechanical ventilation is the use of ducts and fans to circulate air.

Americans spend over 90 per cent of their time indoors, and poor indoor air quality is considered a top environmental health risk. Mitigation programs should focus on achieving measurable improvements in reducing risks from indoor pollutants.

Weatherization measures, such as installing weather-stripping and caulking around windows and doors, can reduce the amount of outdoor air infiltrating into a home and decrease energy costs associated with heating and cooling. In addition, using a portable air cleaner and/or upgrading the air filter in your furnace or central heating, ventilation, and air-conditioning (HVAC) system can help to improve indoor air quality. Portable air cleaners, also known as air purifiers or air sanitizers, are designed to filter the air in a single room or area. Central furnace or HVAC filters are designed to filter air throughout a home. Portable air cleaners and HVAC filters can reduce indoor air pollution; however, they cannot remove all pollutants from the air.

COMMUNITY CONCERNS AND COMMENTS

Community commenters have noted that providing community residents with information about existing weatherization programs, should be augmented with incentives to assist residents in improving indoor air quality through a residential air filtration program.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

Based on interest from the community and a growing understanding at the state level of the need to improve indoor air quality the following strategy has been developed for implementation as a part of the Stockton CERP.

The following is a suggested measure not within the Air District's jurisdiction to directly implement:

IAQ.1: INCENTIVE PROGRAM FOR RESIDENTIAL AIR FILTRATION AND WEATHERIZATION

Overview: The goal of this strategy is to reduce the impact of and exposure to air pollution on community residents near sources of pollution within their homes. Indoor air filtration devices can be of assistance in improving indoor air quality in homes. While air cleaning devices alone cannot adequately remove all indoor pollutants from homes, they can be very helpful when large amount of pollution enter a home during unusual events, such as during a wildfire. Weatherization of a home (improving seals around doors and windows, increasing the amount of home insulation, and improving home HVAC systems) can reduce outside pollutants moving into the home and decrease the overall energy demand for residents.

Due to the ability for some residential air filtrations systems, such as electrostatic precipitator and ionizers, to generate ozone as a byproduct, which is a criteria air pollutant and causes lung irritation¹. In some cases, the use of these types of air filters can increase indoor ozone concentrations beyond public health standards. For this reason, this strategy will focus on the use of mechanical air filtration that relies on using filter media to remove indoor air pollution.

This strategy would establish an incentive program for residential air filtration for community residents near sources of air pollution, and increase outreach and access to programs available for low-income residents in Stockton to receive weatherization services.

Implementing Agency: SJVAPCD, partner agencies such as San Joaquin County Human Services Agency: Home Energy Assistance Program (HEAP)

Strategy Type: Incentive

Budgeted Amount: \$1,000,000

Emission Outcome: Reduction

¹Residential Air Cleaners – A Technical Summary – US EPA
(https://www.epa.gov/sites/production/files/2018-07/documents/residential_air_cleaners_-_a_technical_summary_3rd_edition.pdf)

COMMUNITY OUTREACH STRATEGIES

CURRENT OUTREACH PROGRAMS

The District's Outreach and Communications team conducts air quality outreach throughout all eight counties of the San Joaquin Valley. The District coordinates events, delivers presentations, responds to the media 24/7, manages social networks, pilots outreach campaigns like the Healthy Air Living (HAL) Schools and the winter residential "No Burn" programs, and connects with the public in multiple languages across any medium. In addition to offering media interviews, answering questions posed by the public, partnering with local institutions, and accepting speaking engagements, the District also conducts paid advertising and informational campaigns regularly to spread air quality awareness across social media, digital networks, television, radio, billboards, and other venues. Through the development of innovative tools like RAAN and the Valley Air App, over 10,000 registered users receive automated notifications when the air quality at any location they choose to follow becomes unhealthy, allowing them to make informed decisions about their outdoor activities to limit their own exposure.

COMMUNITY CONCERNS AND COMMENTS

The Committee recommended that the District engage in a wide variety of multi-lingual outreach efforts via both traditional and social media to allow community members to see and learn about air quality issues, take advantage of grant programs, and provide real-time access to information from air monitoring equipment deployed as part of the AB 617 process. Members of the Steering Committee acknowledged the District's ongoing air quality outreach and education efforts, but expressed concern about effectiveness given perceived public indifference. Effectiveness could be improved by increasing the volume and types of outreach, focusing it to a truly localized level, and using partnerships with key local organizations to better understand how to deliver needed information to the Stockton community residents.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

The Community Air Quality Outreach Strategies go beyond current outreach efforts to provide community-specific information about local conditions and measures the public can take to protect themselves during episodes of poor air quality through new media campaigns, workshops hosted in partnership with local civic and community organizations, and other outreach methods as identified by the community and the District.

O.1: MULTILINGUAL OUTREACH TO INCREASE COMMUNITY AWARENESS AND KNOWLEDGE OF AIR QUALITY

Overview: The goal of this strategy is to increase community awareness of available tools to keep informed of real-time changes in air quality, clean air efforts and how communities can get involved through multi-lingual educational campaigns, videos and partner workshops. The strategy looks to focus outreach on areas of Stockton CSC and resident concerns, including fireworks, illegal burning, trash burning, educating trucking operations about impacts of idling, promotion of biking (including bike paths and trails),

public transportation (including, bus, rail, ferry, and others) and other topics of concern/interest. An understanding of what conditions constitute poor air quality, the relative seriousness of a poor air quality episode, and any potential health impacts is necessary for the public to make informed decisions about how and when to limit their exposure.

This strategy would aim to increase Valley Air App downloads and social media followers among members of the community. A partnership with local civic and community organizations would be established to host workshops at locations commonly available to the public such as libraries, schools, and community, health, or recreation centers. Both the social media outreach and live workshops would promote real-time tools such as myRAAN website, the Valley Air App, the Real-time Outdoor Activity Risk (ROAR) Guidelines, the wildfire page of the District's website, as well as information about general air quality education, wildfire smoke impacts, health effects, and similar topics. This strategy would aim to increase myRAAN website registrations, Valley Air App downloads, and social media followers among members of the community. In addition, this strategy would increase awareness of air quality issues with workshops hosted in locations commonly available to the public such as libraries, schools, and community, health, or recreation centers and on Zoom or other online platforms.

Annual goals for these actions include:

- Attend/host 4 community meetings, in-person or online, to share information
- 1 community targeted social media campaign

Implementing Agency: SJVAPCD

Strategy Type: Outreach

LAWN AND GARDEN EQUIPMENT

LAWN AND GARDEN EQUIPMENT IN STOCKTON

Small off-road engines (SORE) which are typically utilized in gas powered lawn and garden equipment emit oil-based particulates, PM_{2.5}, NO_x, and a mixture of hydrocarbons, which combine with other gases to form ozone, carbon monoxide and other toxic air contaminants. This equipment can also cause a significant amount of fugitive dust and can increase fugitive emissions including PM, toxic air contaminants, and ultrafine particles resulting in negative health impacts for the user.

According to a 2003 study by the California Air Resources Board, there are over 11.4 million pieces of residential lawn and garden equipment operating throughout the state. In the Stockton community the emissions from this sector total 6.4 tons per year (TPY) of NO_x, 37.3 TPY of VOC and 0.80 TPY of PM_{2.5}. These total emissions contribute 0.6 % of the NO_x inventory, 3.4 % of the VOC inventory, and 0.1% of the PM_{2.5} inventory.

Figure 4-6 Electric Yard Equipment Reduces Emissions near Homes and Places of Business

COMMUNITY CONCERNS AND COMMENTS

Community Steering Committee comments regarding Lawn and Garden equipment included better outreach to inform community members of available incentives and increased incentives for the equipment as well as providing opportunities for residents to receive free electric lawn mowers. In addition, Community Steering Committee comments suggested prioritizing residential equipment replacements and ensuring that commercial equipment operated primarily within the boundaries of the AB617 community.

CURRENT CONTROL PROGRAMS

CARB has a SORE program, which includes lawn and garden equipment. CARB is continuing to consider new standards for small engines to help California meet its goal of reducing smog-forming pollutant emissions from mobile sources by 80 percent by 2031.

<https://ww2.arb.ca.gov/our-work/programs/small-off-road-engines-sore>

In addition, the District offers incentives to help reduce emissions from gas-powered lawn and garden equipment. The Clean Green Yard Machines (CGYM) program provides funding for the following options:

- The residential CGYM provides rebates for the replacement of an old gas-powered mower with a new electric mower and for the purchase of eligible new electric lawn and garden electric equipment without replacements. To date, this program has replaced over 7,400 lawn mowers with over \$1.5 million in funding. <http://www.valleyair.org/grants/cgym.htm>
- The Commercial CGYM launched in May 2019 and provides funding for the replacement of eligible old gas-powered lawn and garden equipment with battery-powered options for public agencies, private entities, and businesses. <http://valleyair.org/grants/cgym-commercial.htm>

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

In order to achieve additional emission reductions from the Lawn and Garden category the District will provide enhanced outreach and access to Stockton residents or businesses who would like to participate in our available incentive programs. For the residential program, the District proposes to cover the full cost of an electric lawn mower purchase when replacing an existing gas powered mower.

The following are proposed measures that are within the Air District's statutory jurisdiction to implement:

LG.1: INCENTIVE PROGRAM FOR THE REPLACEMENT OF RESIDENTIAL LAWN AND GARDEN EQUIPMENT

Overview: The goal of this strategy is to reduce NOx and PM2.5 emissions from residential lawn and garden equipment by replacing existing gas powered units with battery powered zero emission models. The District's existing Residential Clean Green Yard Machines program focuses on this goal by offering incentive funding ranging from \$100-250 for the replacement of existing gas powered units with battery powered zero emission models. Additionally, the District offers up to \$50 for the purchase of a new eligible electric lawn care equipment without requiring an old piece of equipment to be turned in. Using existing District Board-approved criteria, this strategy will provide enhanced outreach and education as well as higher incentive funds to local Stockton residents to encourage participation and maximize local emission reductions within the community. This strategy will increase outreach and access to incentive funding while providing rebates up to 100% of the equipment cost of a new electric lawn mower when replacing an existing gas powered model. The goal is to replace 50 gas powered units at an expected cost of \$400 per unit.

Implementing Agency: SJVAPCD

Strategy Type: Incentives and Outreach

Budgeted Amount: XX\$20,000

Emission Outcome: Reduction

Quantifiable Emission Reductions: Estimated emissions reductions associated with this measure includes up to 0.012 tons of PM2.5 and 0.018 tons of NOx..

LG.2: INCENTIVE PROGRAM FOR THE REPLACEMENT OF COMMERCIAL LAWN AND GARDEN EQUIPMENT

Overview: The goal of this strategy is to reduce NOx and PM2.5 emissions from commercial landscaping operations, in the Stockton AB 617 community (Stockton community), by replacing existing gas powered equipment with battery powered zero emission models. Emissions from commercial lawn care equipment directly impact equipment operators and community residents. The District currently offers a commercial lawn and garden equipment replacement program which offers incentive funding ranging from \$200-\$15,000 for the replacement of gas powered lawn equipment with battery operated zero emission technology. In addition, the program provides incentive funds for up to two batteries and one charger to ensure that the equipment is capable of operating for a full day of work. Additionally, the District will focus on increased participation from small, locally owned businesses and schools in the Stockton community to generate immediate emission reductions which directly impact local residents on a frequent basis. This strategy will provide enhanced outreach and access to available incentive funds offered by the District, utilizing Board-approved criteria. The goal of this measure is to replace 5 pieces of commercial grade gas powered lawn and garden equipment at an expected cost of up to \$20,000 per unit. Emission reductions associated with this measure will be calculated at a later time.

Implementing Agency: SJVAPCD

Strategy Type: Incentive and Outreach

Budgeted Amount: \$100,000

Emission Outcome: Reduction

Quantifiable Emissions Reductions: Estimated emissions reductions associated with this measure will be calculated based on a methodology currently being developed by CARB.

EMISSIONS EXPOSURE AND LAND USE

LAND USE IN THE COMMUNITY

Land use is the characterization of land based on what can be built on it and what the land can be used for. It is important to note that local air districts do not have authority over land use. Land use decisions are directly under the authority of Land use Agencies (e.g. City and County government agencies and Port of Stockton). Land use agencies have jurisdiction over land use, and as such develop land use plans and make decisions about how they grow and expand. The design of development projects in a community significantly influences how people travel, and land use agencies typically have principal responsibility for approving development projects within their jurisdictions for a variety of land use types such as residential (single or multi-family, etc.), commercial (fast food, shopping center, retail, etc.), and industrial (warehouse distribution centers, port operations, etc.). Through the land use approval process, these agencies are responsible for implementing land use strategies that promote increased walkability, commute alternatives and cleaner transit fleets resulting in air quality benefits within a community.

Land use strategies may result in the reduction of vehicle trips by designing development to be more suitable for walking, bicycling, and transit. These land use strategies are typically outlined as measures and goals within a City or County general plan, which is the primary “long range” planning document used to locate future development and provides the framework within which decisions on how to grow, provide public services and facilities, and protect and enhance the environment are made. For information about the City of Stockton General Plan, please refer to Chapter 3, Understanding the Community. Land use agencies’ decisions are critical in contributing to the improvement in air quality within a community and should be geared towards promoting strategies aimed at reducing vehicle miles travelled by increasing community walkability, implementing commute alternatives, and supporting infrastructure for cleaner transit fleets.

COMMUNITY CONCERNS AND COMMENTS

A primary concern expressed by Steering Committee members during meeting discussions was that heavy duty truck exhaust, specifically attributable to truck traffic and idling at the Port of Stockton and from highways and freeways, result in increased exposure to emissions for residents that live near these heavy duty trucking corridors and major thoroughfares in the community. To address community member concerns, measures included in this section will focus both on strategies to reduce conflicting land uses in the community, as well as transportation strategies that reduce exposure to mobile source emissions resulting from land use decisions.

For example, suggestions from community steering committee members included the installation of vegetative barriers to inhibit emission transport from thoroughfares into neighboring communities, increasing opportunities for bicycle path infrastructure projects, support for car sharing programs, supporting the replacement of older truck

fleets with cleaner technologies and strategizing land use planning to minimize or reduce vehicle miles traveled.

As the majority of these suggestions relate to land use issues for which the District does not have authority, the District's approach is to provide support to develop fueling infrastructure for zero and near-zero-emission vehicles, provide incentives for alternative modes of transportation, and to support the land use planning process through the California Environmental Quality Act (CEQA). The District is supportive of measures and policies the land use agency can implement toward making the communities more transit-, bicycle-, and pedestrian-friendly, avoid land use conflicts that lead to toxics and nuisance problems, and minimizing the need to and/or mitigate air quality impacts of individual development proposals.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN THE COMMUNITY

Several strategies have been identified under this Land Use and Transportation section that span from advocating issues, providing incentives, collaborating with the local land use agency (i.e. City, County, and Port of Stockton), to providing input through the land use process. Land use and transportation strategies developed to reduce emissions due to conflicting land uses are further detailed below.

The following are proposed measures that are within the Air District's statutory jurisdiction to implement:

LU.1: SUPPORT PROJECTS THAT REDUCE VEHICLE MILES TRAVELED

Overview: The purpose of this measure is to facilitate inter-agency collaboration between the City of Stockton, San Joaquin County, and San Joaquin Council of Governments to promote environmentally mindful alternative commute options through early discussion of related land use planning initiatives.

Mobile source emissions represent the vast majority of NO_x emissions within the Stockton Community. Reducing emissions from motor vehicles through the implementation of alternate modes of transportation directly contributes to decreasing public exposure to vehicle emissions, such as diesel particulate matter which adversely impacts human health.

Land use decisions are critical in contributing to the improvement in air quality within a community and should be geared towards promoting strategies aimed at reducing vehicle miles traveled by increasing community walkability. Examples of such strategies are listed below:

- Bicycle infrastructure
- Infrastructure to support alternative modes of transportation (electrical vehicles, near-zero emissions vehicles)
- Satellite offices/telecommuting centers to reduce or eliminate employee commutes

Implementing Agency: SJVAPCD, City of Stockton, San Joaquin County, San Joaquin Council of Governments

Strategy Type: Land Use

Emission Outcome: Mitigation

LU.2: BIKE PATH INFRASTRUCTURE FUNDING

Overview: Assess current bike path infrastructure and seek out additional funding opportunities to make the community more bike and walk friendly.

Reducing emissions from motor vehicles through the implementation of alternate modes of transportation, including bicycling, is important to reduce the public's exposure to vehicle emissions including NOx and PM2.5. This strategy would provide incentive funding for the development and construction of Class 1, Class 2, and Class 3 bicycle paths, lane striping, and routes. The proposed funding level of this measure would be consistent with established District guidelines from the District's REMOVE and Public Benefit Grants Programs. Additionally, the District will work with transportation agencies in the Stockton area, and seek to assist these agencies to help identify and leverage existing funds, in addition to AB 617 funding.

Implementing Agencies: SJVAPCD, City of Stockton, San Joaquin County, and San Joaquin Council of Governments

Strategy Type: Incentives

Emission Outcome: Reduction

Budgeted Amount: \$500,000

Quantifiable Emission Reductions: Estimated lifetime emissions reductions associated with this measure includes up to 2 tons of PM, 3 tons of NOx, and 6 tons of VOC.

LU.4: COLLABORATE WITH THE CITY OF STOCKTON, SAN JOAQUIN COUNTY, AND SAN JOAQUIN COUNCIL OF GOVERNMENTS TO IMPLEMENT INTEGRATED TRANSPORTATION DEVELOPMENT PLANNING TO IMPROVE HEALTH AND QUALITY OF LIFE THROUGH A VARIETY OF STRATEGIES SUCH AS SMART LONG-TERM PLANNING AND BUFFER ZONES AROUND SENSITIVE SITES

Overview: The goal of this strategy is to enhance inter-agency and community collaboration to reduce the impact of pollution from motor vehicles by prioritizing pedestrian-friendly land-use design elements around downtown Stockton.

Mobile source emissions represent the vast majority of NOx emissions within the Stockton Community. Reducing emissions from motor vehicles through the implementation of alternate modes of transportation, including pedestrian-friendly accommodations, directly contributes to decreasing public exposure to vehicle emissions, such as diesel particulates which negatively impact human health.

Land use decisions are critical in contributing to the improvement in air quality within a community and should be geared towards promoting strategies aimed at reducing vehicle miles traveled by removing barriers to pedestrian transportation. Examples of such strategies include:

- Bicycle infrastructure
- Dedicated pedestrian crossings
- Satellite offices/telecommuting centers to reduce or eliminate employee commutes

Implementing Entities: SJVAPCD, City and County, SJCOG

Strategy Type: Land Use

Emission Outcome: Reduction

HEAVY DUTY MOBILE SOURCES

HEAVY DUTY MOBILE SOURCES IN STOCKTON

There are a variety of heavy-duty mobile sources operating in and around the City of Stockton. These can range from on-road trucks, school and transit buses, off-road equipment, including agricultural and construction equipment, line-haul, short-haul and switcher locomotives. This equipment is primarily powered by diesel engines and, depending on the specific category, is regulated by one or more statewide regulations.

Emissions from this source category include oxides of nitrogen (NO_x) and combustion PM from the internal combustion engines. Mobile sources account for more than 85% of the NO_x inventory throughout the Valley ([Appendix C – Source Apportionment and Community](#)). In the Stockton community, 328.08 tons per year of NO_x, 26.44 tons per year of VOC and 9.34 tons per year of PM_{2.5} are attributed to on-road heavy-duty equipment. In addition, 133.08 tons per year of NO_x, 20.49 tons per year of VOC and 6.21 tons per year of PM_{2.5} are attributed to off-road heavy-duty equipment referenced in these measures.

Figure 4-7 Examples of Heavy Duty Mobile Sources

COMMUNITY CONCERNS AND COMMENTS

During the committee discussions regarding heavy-duty mobile sources, a majority of the committee ranked this source as a high priority to address. Committee member comments and suggestions included providing incentives to replace older trucks, alternative fueling infrastructure development, clean fleet requirements, and shifting trucking routes away from residents.

CURRENT CONTROL PROGRAMS

The District does not have regulatory authority of emissions from mobile sources, including heavy duty vehicles and equipment, locomotives, school and transit buses. Diesel powered on-road heavy duty vehicles are subject to the statewide CARB Truck and Bus Regulation which requires all equipment to get progressively cleaner over time. Off-road heavy-duty equipment is similarly controlled through the CARB Off-Road Regulation, which requires all fleets to be upgraded to newer, cleaner technologies over

time. However, at this time, there are no regulatory requirements in place at the state or federal level controlling emissions from locomotives (for more information, see Section 5.6.2 - CARB Enforcement Strategies).

Due to the large amount of pollution that can be attributed to mobile sources, the District has implemented a broad suite of voluntary incentive programs, targeted at reducing emissions from heavy-duty engines operating throughout the Valley.

Heavy Duty Trucks/Buses:

The District currently offers a variety of programs targeted at replacing or upgrading older, high-polluting trucks and buses with cleaner technology.

- The Heavy Duty Truck Replacement Program <http://valleyair.org/grants/truck-replacement.htm>. This program provides incentives for the replacement of existing heavy-duty diesel trucks with new, zero or near-zero-emission technology.
- Program for Heavy-Duty Alternative Fuel Infrastructure which provides local businesses and agencies incentive funding to install alternative fueling infrastructure (electric, natural gas, hydrogen, etc.) to support the increased deployment of heavy-duty advanced clean technology vehicles.
- Electric School Bus Incentive Program - <http://valleyair.org/grants/electric-school-bus.htm>. This program is operated by the District and provides incentives for the replacement of existing older, higher-polluting school buses with new, electric school buses.
- Volkswagen Mitigation Trust – <http://vwbusmoney.valleyair.org/>
The VW Mitigation Trust has \$130 million in funds to replace older, high-polluting transit, school, and shuttle buses with new battery-electric or fuel-cell buses. Replacing an older bus with a zero-emission bus eliminates particulate matter and other pollutants that impact children and residents riding the buses, as well as residents throughout California communities. This statewide program is being administered by the District.

Locomotives:

Freight locomotives are regulated by the U.S. EPA. The current regulation requires that all locomotives purchased in or after 2015 be at least a Tier 4 emission level. Older, lower Tier engines, which comprise the majority of Class 1 fleets, are still permitted to run. Additionally, CARB is planning actions to address freight locomotive emissions within the State. More details can be found in the 2019 March CARB Board Meeting Informational Update: <https://www.arb.ca.gov/board/books/2019/032119/19-3-2pres.pdf>

The District offers two incentive programs for locomotive fleets interested in transitioning to newer, clean technology, including:

- Heavy Duty Program – <http://valleyair.org/grants/locomotive.htm>. Locomotive replacements can be funded as an eligible project category utilizing funding provided to support AB 617. These projects are administered according to Carl Moyer Program guidelines and are subject to additional requirements contained within the approved AB 617 Community Air Protection Guidelines. This program is operated by the District.
- Proposition 1B - <http://valleyair.org/grants/locomotives-prop1b.htm>. This program incentivizes the reduction of emissions and health risks associated with freight movement along California’s trade corridors via upgrading to cleaner technologies or installation of emissions capture and control systems.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

Due to the priority that community members placed on reducing emissions from this source category and the large amount of emissions, including PM_{2.5} and toxic air contaminants (particularly diesel PM) that originate from heavy duty mobile sources in and around the community, the following strategies have been developed for implementation in the Stockton community.

The following are additional suggested measures not within the Air District’s jurisdiction to directly implement:

HD.1: HEAVY DUTY TRUCK REROUTING

Overview: Community Steering Committee members have suggested that a study should be performed to assess the existing heavy-duty diesel truck routes in and around the Port of Stockton and the nearby neighborhoods, including the Boggs Tract neighborhood. The study will focus on whether there are other routes which will result in reduced exposure to toxic air contaminants by residents in the nearby neighborhoods. The District will work with the City, County, and all other appropriate land-use and transportation agencies regarding this and the desire of the CSC for inclusion in the Stockton CERP. The District will work with the City of Stockton and other appropriate agencies to seek funding to support this study.

Jurisdictional Issues: It should be noted that the District has no authority over how agencies allow land under their jurisdiction to be used. These so-called “land-use” decisions, such as truck rerouting, are historically the responsibility, under state law, of cities and counties, or, in some cases, state and federal agencies responsible for transportation corridors, state and federal parks, and other properties. AB 617 does not provide the District with new land-use regulatory authority, so land-use authority remains with cities, counties, and state and federal land-use agencies, as discussed in CARB’s Blueprint (see [“Who Has the Authority to Implement Actions?”](#), page 26 of the Blueprint). However, the District is committed to working with the implementing agencies to identify additional possible funding sources for the study up to \$500,000, developing the scope of work for the study, and coordinating conversations with the implementing agencies and the CSC as necessary.

Implementing Agency: City, County, San Joaquin COG, Caltrans, Port of Stockton

Strategy Type: Partnership

Emission Outcome: Mitigation

Budgeted Amount: \$350,000

The following are proposed measures that are within the Air District's statutory jurisdiction to implement:

HD.2: INCENTIVE PROGRAM FOR HEAVY DUTY TRUCKS REPLACEMENT WITH ZERO AND NEAR ZERO EMISSION TECHNOLOGY

Overview: The goal of this strategy is to reduce emissions from heavy duty diesel trucks operating in the Stockton community. This strategy would provide enhanced outreach and access to incentive funding for zero and near-zero emissions, clean truck technologies that are domiciled and operating within the community. District Board-approved methodology and funding levels can be utilized and the District will encourage small business owners to participate in the program while also promoting the selection of all electric, zero emission technology. This measure would replace 50 older, heavy duty diesel trucks operating in Stockton with zero or near-zero emission technology at an expected cost of up to \$200,000 per truck. Where feasible and available for the truck type and duty-cycle, the District will prioritize funding for replacement with zero-emissions electric vehicle technologies. By reducing or eliminating emissions from heavy duty diesel trucks, significant PM_{2.5}, diesel particulate matter, and NO_x emissions reductions can be achieved.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Emission Outcome: Reduction

Budgeted Amount: \$10,000,000

Quantifiable emission reductions: Estimated emissions reductions associated with this measure includes up to 4 tons of PM (including toxic diesel particulate matter), 191 tons of NO_x, and 14 tons of VOCs.

HD.3: SUPPORT PLANNING AND DEVELOPMENT OF HEAVY-DUTY ELECTRIC VEHICLE CHARGING INFRASTRUCTURE

Overview: The goal of this strategy is to provide support for planning and development of fueling infrastructure for heavy-duty zero emission vehicles and transportation

refrigeration units to support broader deployment of clean vehicles operating throughout the community and reduce the impact of emissions from the idling of heavy duty diesel trucks at distribution centers, warehouses, or other freight facilities where trucks are being loaded or unloaded. Utilizing Board-approved methodology and funding levels the District will work closely with businesses, public agencies, and fueling providers to support and incentivize the development of clean-vehicle fueling infrastructure in the area of the community. This action will prioritize incentive funding to support the development and construction of new electric infrastructure within the community. This includes increased outreach to businesses and public agencies operating vehicles within the community as well as prioritized funding for projects that serve vehicles operating in the community.

Depending on the size, throughput and configuration of the fueling infrastructure, the proposed funding amount of \$1,000,000 would incentivize the development of a new electric charging station.

Implementing Agency: SJVAPCD

Strategy Type: Incentives and Outreach

Emission Outcome: Reduction

Budgeted Amount: \$1,000,000

HD.4: TRUCK IDLING PLUG-INS

Overview: The goal of this strategy is to reduce emissions from heavy duty diesel truck idling and reduce the use of diesel-fueled internal combustion auxiliary power systems at truck stops where diesel trucks congregate in the Stockton community. Truck stop electrification allows a vehicle operator to "plug in" their vehicle and draw electricity directly from the power grid to provide cab heating and cab cooling, to power cab appliances, and to charge the vehicle's battery.

This strategy would provide funding to launch a program in the Stockton community. The District would leverage experience from the Proposition 1B Goods Movement Emission Reduction Program in order to design a program that would fund the purchase and installation of electrical infrastructure and/or equipment to enable heating, cooling, and other use of cab power for parked trucks at truck stops in the Stockton area. This measure would provide \$10,000 in funding per unit, for 33 units. The emission reductions associated with this measure will come from HD.1, as this measure serves to support the deployment of zero and near-zero technology.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Emission Outcome: Reduction

Budgeted Amount: \$100,000

HD.5: ENHANCED ENFORCEMENT OF THE STATEWIDE ANTI-IDLING REGULATION

Overview: The goal of this strategy is to limit the potential for localized emissions from heavy duty vehicles for failure to comply with the state's heavy duty anti-idling regulation. Historically, the District has partnered with CARB to conduct anti-idling enforcement throughout valley communities.

The state's anti-idling Airborne Toxic Control Measure limits nonessential (or unnecessary) vehicle idling to specific time limits. It is applicable to all diesel-fueled commercial motor vehicles with a gross vehicular weight rating of greater than 10,000 pounds. The diesel exhaust from excessive idling has the potential to impose significant adverse health and environmental impacts. Therefore, efforts to ensure compliance with the anti-idling regulation, especially near schools and residential areas, are important to reduce the potential for localized impacts within the community.

The District will partner with CARB to conduct additional targeted anti-idling enforcement efforts in the Stockton community with established benchmarks. These benchmarks include anti-idling surveillance to occur at least once per quarter for the next 5 years. The District and CARB will work with the Community Steering Committee to identify heavy-duty vehicle idling "hot spots," especially those near schools, to aid in focusing the enforcement efforts.

Implementing Agency: SJVAPCD and CARB

Strategy Type: Enforcement

Emission Outcome: Reduction in PM2.5, PM10, NOx, VOC, and CO emissions through higher compliance rates with the state regulation

HD.6: INCENTIVE PROGRAM FOR REPLACING OLDER DIESEL SCHOOL BUSES WITH ZERO EMISSION SCHOOL BUSES

To provide increased outreach and access to incentive funding for the replacement of older, high polluting school buses with new zero-emission school buses operating within the Stockton Unified School District.

Replacing older school buses is important to reduce children's exposure to diesel emissions including NOx and PM2.5 and these pollutants negatively impact human health, especially for sensitive populations such as children. New, zero-emission battery electric and near-zero emission natural gas powered school buses are significantly cleaner than older diesel buses.

Emissions from school buses are regulated by the California Air Resources Board Statewide Truck and Bus Regulation that requires transition to cleaner technology over time. Generally phased in by model year.

<https://www.arb.ca.gov/msprog/onrdiesel/onrdiesel.htm>

This measure would cover up to 100% of the cost of replacing up to 10 diesel school buses with electric buses at \$400,000 each.

Implementing Agency: SJVAPCD

Type of Action: Incentives

Implementation: 2021-2025

Emission Outcome: PM, NOx, and VOC reductions

Budgeted Amount: \$4,000,000

Quantifiable emission reductions: Estimated lifetime emissions reductions associated with this measure includes up to 0.3 tons of PM, 18 tons of NOx, and 4 tons of VOCs.

HD.7: INCENTIVE PROGRAM FOR REPLACING OLDER DIESEL SWITCHER LOCOMOTIVES WITH NEW CLEAN-ENGINE TECHNOLOGY

Overview: To provide incentive funding for the replacement of older, high polluting switcher locomotives with new clean-technology switcher locomotives operating within and surrounding the Stockton community.

Replacing older switcher locomotives is important to reduce the public's exposure to diesel emissions including NOx and PM2.5. These pollutants negatively impact human health, especially for sensitive populations such as children and the elderly. New, clean-technology railcar movers and/or switcher locomotives are significantly cleaner than older uncontrolled diesel railcar movers and/or switcher locomotives.

The goal of this action is to replace up to 4 older, high-polluting switcher locomotives operating within and surrounding the community. The proposed funding amount would cover up to 95% of the cost of replacing up to 4 diesel switcher locomotives at up to \$1,700,000 each.

Implementing Agency: SJVAPCD

Type of Action: Incentives

Implementation: 2021-2025

Emission Outcome: PM, NOx, and VOC reductions

Budgeted Amount: \$6,700,000

Quantifiable emission reductions: Estimated lifetime emissions reductions associated with this measure includes up to 12 tons of PM (including toxic diesel particulate matter), 502 tons of NOx, and 31 tons of VOC.

OLDER/HIGH POLLUTING PASSENGER CARS

OLDER/HIGH POLLUTING PASSENGER CARS IN STOCKTON COMMUNITY

Mobile source emissions account for over 85% of the overall NO_x inventory in the San Joaquin Valley. With no regulatory authority over these sources, the District has relied on voluntary incentive programs to transition older, higher emitting vehicles to newer, cleaner and more fuel efficient models. With limited public transportation options available to residents driving is more prevalent in the Valley than in other areas of the state. Vehicles registered in the Valley are typically older and have higher mileage than statewide averages.

Emissions from light duty vehicles in Stockton total 114.08 tons per year (tpy) of NO_x, 138.23 tpy of VOC, and 12.74 tpy PM_{2.5}. These total emissions contribute 10.5% of the NO_x inventory, 17.5% of the VOC inventory, and 10.3% of the PM_{2.5} inventory.

Figure 4-8 The District's Drive Clean in the San Joaquin Repair and Replacement Program

COMMUNITY CONCERNS AND COMMENTS

Community Steering Committee comments regarding passenger vehicles included increased outreach and incentives for low income residents, increasing charging infrastructure in the community, and questions about the effectiveness of existing programs for low-income individuals. As detailed below, to address these concerns District staff have developed new programs, specifically for Stockton community members, to provide incentive funding for clean-air vehicles, to bring car share programs to the community, and to incentivize the purchase of electric vehicles by the primary local ride share service.

CURRENT CONTROL PROGRAMS

The District does not have regulatory authority of emissions from mobile sources, however, due to the large amount of pollution that originates from passenger vehicles

the District has implemented a suite of programs to reduce pollution from mobile sources. These programs include the following measures:

- Tune In Tune Up vehicle repair program which provides incentive funds to repair high emitting vehicles.
<http://valleyair.org/drivecleaninthesanjoaquin/repair/>
- Vehicle replacement program which provides funding to replace older, high emitting vehicles with newer, cleaner and more fuel efficient models.
<https://www.valleyair.org/drivecleaninthesanjoaquin/replace/>
- The vehicle rebate program provides rebates for the purchase or lease of a new clean air vehicle including battery electric, fuel cell, plug in hybrid, zero emission motorcycles, and advanced technology natural gas vehicles.
<https://www.valleyair.org/drivecleaninthesanjoaquin/rebate/>
- Incentives are available for publically accessible charging infrastructure through the District's Charge Up! Program <http://valleyair.org/grants/chargeup.htm>
- The District's Healthy Air Living school program promotes no idling while picking up children at school and provides no idling signs to schools to encourage drivers to turn off their engines.
- District Indirect Source Rule (9510) accounts for mobile source emissions from construction and new development projects and ensures that emissions from these activities are mitigated.
- District Employer based Trip Reduction Rule (9410) requires large employers to implement measures to encourage employees to take alternative transportation to work in order to reduce single occupancy vehicle trips.
- CARB mobile source strategy calls for increasing the deployment of plug in hybrid, battery electric, and fuel cell vehicles in order to attain federal ozone standards, reducing greenhouse gas emissions, minimizing health risks, reducing petroleum usage and increasing energy efficiency.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

Due to the high priority that community members placed on reducing criteria pollutant and toxic air contaminant emissions that originate from passenger vehicles operating in and around the community, District staff and the Steering Committee have developed targeted strategies for implementation in the Stockton community. As further detailed below, measures developed include additional incentive funding intended to increase the deployment of electric vehicles through the replacement of gas powered vehicles currently in use; launching an electric vehicle car sharing program; providing additional charging infrastructure throughout the community; providing for electric vehicle

maintenance training to increase available repair facilities and job skills; and repairing high polluting passenger vehicles.

The following are proposed measures that are within the Air District’s statutory jurisdiction to implement:

TP.1: INCENTIVE PROGRAM TO HOST A LOCAL TUNE IN TUNE UP EVENTS TO REDUCE EMISSIONS FROM OLDER, HIGH POLLUTING CARS

Overview: The goal of this strategy is to reduce emissions of high emitting passenger vehicles that may be in need of repair by providing funding for up to 5 “Drive Clean in the San Joaquin” Repair Program events within the Stockton AB 617 community in. Under this program, financial incentives up to \$850 will be available for emissions related testing and repairs for eligible high emitting vehicles. Through the program, weekend testing events, if possible, will be held to determine if vehicles are in need of emissions related repairs. Due to the ongoing pandemic, an online and telephone process will be used to provide residents the opportunity to participate until such a time that in-person events can be held safely. Approved participants are provided vouchers which can be utilized for the necessary smog tests, diagnostic work and emissions related repairs at participating STAR certified smog shops. Reducing emissions from passenger vehicles is important due to their contribution to the formation of ozone in the Valley.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Emission Outcome: Reduction

Budgeted Amount: \$300,000

Quantifiable Emission Reductions: Estimated emissions reductions associated with this measure includes up to 3.7 tons of NOx.

TP.2: INCENTIVE PROGRAM FOR THE REPLACEMENT OF PASSENGER VEHICLES WITH BATTERY ELECTRIC OR PLUG IN HYBRID VEHICLES

Overview: The goal of this strategy is to reduce emissions associated with passenger vehicles by replacing 100 vehicles with newer, more fuel efficient models, and providing additional incentives for Level 2 residential chargers in the Stockton community. Emission reductions from passenger vehicles provide benefits to area residents as well as assist in reducing ozone formation in the Valley. Enhanced outreach would be conducted in the Stockton community to ensure that residents are fully aware of available incentive options and community residents would be provided priority access through the program in order to complete projects as quickly as possible. Through the

District's existing Board approved "Drive Clean in the San Joaquin" replacement program, incentives are currently offered for low to moderate income residents of disadvantaged communities to replace their older, high polluting vehicle with a newer, cleaner model. The program currently offers up to \$9,500 towards the purchase on an eligible replacement vehicle, with an additional \$2,000 provided to participating residents who purchase or lease a plug-in hybrid electric or a battery-electric vehicle and want to install a Level 2 charger in their home.

Implementing Agency: SJVAPCD

Strategy Type: Incentives and Outreach

Emission Outcome: Reduction

Budgeted Amount: \$800,000

Quantifiable Emission Reductions: Estimated emissions reductions associated with this measure includes up to 0.2 tons of NOx.

TP.3: INCENTIVE PROGRAM FOR INSTALLATION OF ELECTRIC VEHICLE CHARGING INFRASTRUCTURE

Overview: The goal of this strategy is to provide electric vehicle charging infrastructure necessary to support the deployment of battery electric and plug in hybrid vehicles. The District's Charge Up program currently provides \$5,000 for a Level 2 Single Port, \$6,000 for a Level 2 Dual Port, and \$25,000 for a Level 3/DC Fast Charger with a cap of \$50,000 per applicant and/or site. Having the appropriate charging infrastructure available for Stockton residents will encourage the growth of zero emission passenger vehicles in the community.

This strategy would provide incentive funding for publically accessible charging infrastructure to private and public entities in the Stockton community. This strategy would utilize the existing Charge Up program guidelines and funding amounts. The goal of this measure is to install up to 15 electric vehicle charging stations, including Level 2 and Level 3 chargers, in Stockton at an expected cost of up to \$25,000 per station. This measure is an important part of a long term solution. There are no direct emission reductions associated with this measure, however, this measure supports the emission reductions associated with electric vehicle deployment.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Emission Outcome: Indirect Reduction

Budgeted Amount: \$375,000

TP.4: INCENTIVE PROGRAM FOR EDUCATIONAL TRAINING FOR ELECTRIC VEHICLE MECHANICS

Overview: The goal of this strategy is to provide opportunities to develop and advance the education of personnel on the mechanics, safe operation, and maintenance of alternative fuel vehicles and infrastructure. To support and to encourage ongoing deployment of electric vehicles in the Stockton community it will be necessary to have qualified, trained personnel available to provide service as needed to these vehicles.

This strategy will provide up to \$15,000 per training course for at least 10 alternative fuel mechanic training courses provided by an appropriate entity. While there are no direct emission reductions associated with this measure, this measure supports the emission reductions associated with additional electric vehicle deployment.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Emission Outcome: Indirect Reduction

Budgeted Amount: \$150,000

TP. 5: INCENTIVE PROGRAM FOR THE LAUNCH OF A CAR SHARING PROGRAM IN THE STOCKTON COMMUNITY

Overview: The goal of this strategy is to reduce emissions from passenger vehicles by launching an electric car sharing program in the Stockton community. These types of programs offer access to electric vehicles for a defined period of time at a minimal cost to the user. In addition these programs may allow for a resident to eliminate the use of a gas powered vehicle providing a benefit to community residents by reducing NOx and VOC emissions that would otherwise occur.

This strategy provides funding for a partnering car share provider to launch a program in the Stockton community. The District would leverage experience with existing ride share programs operating in the Valley in order to expand to the Stockton area. This measure would provide \$1,000,000 in funding. Projects will include electric vehicles, related infrastructure and subsidies to help minimize the initial cost to the end user. The emission reductions associated with this measure would be calculated in coordination with the project partners once a specific project location is selected by the CSC.

Implementing Agency: SJVAPCD, Housing Authority of San Joaquin, others

Strategy Type: Incentives

Emission Outcome: Reduction

Budgeted Amount: \$1,000,000

RESIDENTIAL BURNING

BACKGROUND

The wood burning fireplaces and wood burning heaters source category includes emissions from wood burning fireplaces, wood burning heaters, and outdoor wood burning devices. This source category contributes 5.4 tons per year of PM_{2.5} towards area sources of emissions in the community of Stockton, representing 4.3% of the total PM_{2.5} inventory. During winter, residential wood burning, including illegal open burning, is one of the largest sources of particulate pollution. Given the significant localized health impacts associated with residential wood smoke, reducing emissions from residential wood burning is a high priority for Stockton. Many scientific studies have found that prolonged inhalation of wood smoke contributes to adverse impacts on human health, especially among children, elderly, and people with certain medical conditions, and individuals who are sensitive to the impacts of air pollution. A number of environmental justice communities experience a disproportionately high level of directly emitted PM_{2.5} emissions from residential wood burning.

COMMUNITY CONCERNS AND COMMENTS

The community of Stockton raised concerns with residential wood smoke, both from the use of wood burning fireplaces and wood burning heaters and illegal open outdoor burning. The CSC provided recommendations to implement the enhanced financial incentives for residents to replace existing wood burning devices and pellet stoves with natural gas or electric technologies which will reduce the smoke impacts associated with residential wood burning for downwind communities. The Stockton community made recommendations to ensure significant efforts are made to conduct outreach and education in support of this measure and to increase compliance rates with District Rules 4901 – *Wood Burning Fireplaces and Wood Burning Heaters* and Rule 4103 – *Open Burning*.

CURRENT CONTROL PROGRAMS

The District's comprehensive strategy to reduce emissions from residential wood burning includes implementation of stringent wood burning curtailment requirements through Rule 4901, strong outreach and education to establish the necessary public support, and deployment of financial incentives to transition away from wood burning to cleaner alternatives. This approach that combines regulatory and incentive based strategies is designed to improve the public health by reducing toxic wood smoke emissions in Valley neighborhoods during the peak PM_{2.5} winter season (November through February). The District has continually enhanced the strategy since adopting the first regulation in 1993. Today, the District has the toughest and most effective residential wood burning strategy in the nation as it reduces emissions when and where most needed, such as during multi-day periods of stagnation, in the evening hours, and in neighborhoods where residents live and play. Additionally, the District enforces the requirements of Rule 4103 which prohibits the use of open outdoor fires for the purpose of disposing of waste materials.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

Due to the priority that the Steering Committee and members of the public placed on reducing PM2.5 and toxic air contaminant emissions that originate from residential burning in and around the community, targeted measures have been developed to reduce emissions from this source category. Building upon the effective implementation of the District's wood burning emission reduction strategy, the District commits to providing enhanced incentives to replace existing wood burning devices and increased outreach efforts to educate the public about harmful impacts of wood smoke and specific actions they can take to reduce pollution and comply with District requirements.

The following are proposed measures that are within the Air District's statutory jurisdiction to implement:

RB.1: INCENTIVE PROGRAM FOR THE REPLACEMENT OF EXISTING WOOD BURNING DEVICES AND PELLET STOVES WITH NATURAL GAS OR ELECTRIC TECHNOLOGIES

Overview: The goal of this strategy is to reduce the impact of PM2.5 pollution associated with residential wood burning by replacing approximately 100 wood burning devices in Stockton with new natural gas devices or electric heat pumps. During the winter months, one of the largest sources of particulate pollution comes from residential wood burning. Emissions are the result of incomplete combustion and are emitted into Valley neighborhoods where residents live and play. Multiple scientific studies show that prolonged inhalation of wood smoke has adverse impacts on human health. Inhalation of wood smoke contributes to lung disease, and pulmonary arterial hypertension, which can eventually lead to heart failure. Through the District's existing Board approved Burn Cleaner program, incentives are currently offered to replace existing wood or pellet burning inserts or free-standing stoves with new natural gas devices or electric heat pumps. The proposed program under this strategy would offer up to \$3,000 to replace an existing wood burning device with a natural gas device and up to \$4,000 for an eligible electric heating source, such as an electric heat pump.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Emission Outcome: Reduction

Budgeted Amount: \$300,000

Quantifiable Emission Reductions: Estimated emission reductions associated with this measure includes up to 49 tons of PM2.5.

RB.2: EDUCATE PUBLIC REGARDING HARMFUL EFFECTS OF RESIDENTIAL WOOD BURNING FIREPLACE AND WOOD BURNING HEATER SMOKE

Overview: The goal of this strategy is to conduct outreach in the community to educate residents regarding the harmful health effects of residential fireplace wood burning and wood burning heater smoke and the importance of reducing it. Residential wood burning education is important because airborne particles produced by wood smoke (such as PM 2.5) negatively impact human health, especially sensitive populations such as children and seniors who may live in areas where residents burn wood for heating, cooking, or recreation. This strategy's focus includes providing information about programs available to support the transition to natural gas and electric devices, as well as the winter no wood-burning season and District Rule 4901.

This strategy would create a series of four (4) public workshops to educate Stockton residents about wood burning topics and to address questions and concerns interactively and accessibly within a forum setting. Workshops would take place in locations commonly available to the public such as libraries, schools, and community, health, or recreation centers. Depending on circumstances, workshops could also be held in a virtual environment such as Zoom. Wood burning infographics and educational materials would also be circulated to at least six (6) community spaces throughout the Stockton community and the surrounding community with the goal of continuing to spread awareness and increasing applications for incentive funds supporting the transition to natural gas and electric devices. The District will look to coordinate and work with the CSC, community based organizations, and Stockton residents to develop the materials and to provide outreach for the events.

Implementing Agency: SJVAPCD

Strategy Type: Outreach

Emission Outcome: Reduction in localized PM2.5, PM10, NOx, VOC, and CO emissions through higher compliance rates

RB.3: REDUCE ILLEGAL BURNING THROUGH RESIDENTIAL OPEN BURNING EDUCATION

Overview: The goal of this strategy is to reduce illegal burning of residential waste, such as trash, through outreach and education while focusing on areas of concern identified by the CSC, including residential areas and homeless encampments. It is important to continue to educate residents of the localized, harmful emissions created through the burning of residential garbage and how it negatively effects health. Smoke from burning trash and yard waste contain toxic pollutants which are harmful to human health.

This strategy would include working with the City of Stockton and the fire agencies to better understand the illegal open burning issues within the AB 617 community, establish a series of public workshops to educate Stockton residents about illegal open

burning, the health impacts of burning waste, and to address questions and concerns interactively and accessibly within a forum setting either in person or in an online platform such as Zoom. In person workshops would take place in locations commonly available to the public such as libraries, schools, and community, health, or recreation centers when possible. Videos will be used as an outreach tool and be available in languages such as Spanish, Tagalog and others.

Implementing Agency: SJVAPCD, City of Stockton, and local fire agencies

Strategy Type: Outreach

Emissions Outcome: Reduction in localized PM2.5, PM10, NOx, VOC, and CO emissions through higher compliance rates

PORT OF STOCKTON

The Port of Stockton (Port) is a deep-water river inland port located on the Stockton Ship Channel of the Pacific Ocean and is an inland port located approximately 70 nautical miles from the ocean. Operating since 1933, the Port is a hybrid public/private entity and is governed by a commission appointed by the City of Stockton and San Joaquin County. The Port serves as lead agency under the California Environmental Quality Act (CEQA) for projects within its jurisdiction. Cargo is delivered to and from the Port by ships, trucks, and trains. The Port has 7.7 million square feet of warehouses which are either operated by the Port or leased to business partners who provide their own labor. The Port has sixty business partners who have leased land and have constructed and operate facilities with over 125 total tenants. With four major freeways, two transcontinental railroads, an international waterway, and a regional airport, the Port handles liquid and dry bulk, break bulk, and agricultural commodities⁵.

In 2017, nearly 4.7 million tons of cargo moved through the Port of Stockton, and that number is expected to continue to grow. The Port is the fourth busiest in the state and as a result, it has an important role in the local and regional economy, including directly and indirectly supporting thousands of jobs⁶. The Port works with upwards of fifty-five different countries, with goods flowing in both directions.

Figure 4-9 Port of Stockton

COMMUNITY CONCERNS AND COMMENTS

The Stockton community identified the activities associated with the Port as an air quality concern. Sources of air pollution include heavy-duty vehicle traffic, ocean-going

⁵ Port of Stockton, *About Navigating Success*. Retrieved 1/25/2021 from <https://www.portofstockton.com/about/>

⁶ Port of Stockton, *Port Facts & Figures: By the Numbers*. Retrieved 1/25/2021 from <https://www.portofstockton.com/port-facts-figures/>

vessels, commercial harbor craft, cargo handling equipment (such as yard trucks, forklifts, reach stackers, and other equipment) and stationary sources located there. The Community Steering Committee (CSC) have recommended placing air monitors to identify major emission contributors, a comprehensive plan to reduce exposures and emissions, and continued residential involvement on the Port's emission reduction planning efforts.

CURRENT CONTROL PROGRAMS

The District does not have regulatory authority of emissions from the following Port of Stockton sources which are subject to statewide CARB regulations. Ongoing efforts to reduce emissions from the Port of Stockton, include the following CARB regulations. For more information, refer to *Statewide Strategies Overview of California Air Resources Board's Statewide Actions*.

- **Ocean Going Vessel Fuel Regulations**

Adopted in August 2020 and is an updated version of the CARB's At-Berth Regulation that supersedes the existing At-Berth Regulation, as specified, and is designed to achieve further emissions reductions from vessels at berth to improve air quality in communities surrounding ports and terminals throughout California. Emissions reductions will be achieved through the inclusion of new vessel categories (such as vehicle carriers and tanker vessels), new ports, and independent marine terminals, and through updated control requirements, among other provisions.

<https://ww2.arb.ca.gov/our-work/programs/ocean-going-vessel-fuel-regulation>

- **Commercial Harbor Craft Regulation**

CARB's existing commercial harbor craft regulation was adopted in 2007 and will be fully implemented by the end of 2022. CARB is working through a public process to consider additional amendments that may further reduce emissions and pursue more stringent in-use standards, with consideration for Tier 4 engine technology and near-zero and zero emission technologies. For more information on the regulation and potential new regulatory concepts, visit:

<https://ww2.arb.ca.gov/our-work/programs/commercial-harbor-craft>.

- **Mobile Cargo Handling Equipment**

Mobile cargo handling equipment is any motorized vehicle used to handle cargo or perform routine maintenance activities at California's ports and intermodal rail yards. The type of equipment includes yard trucks (hostlers), rubber-tired gantry cranes, container handlers, forklifts, etc. The Mobile Cargo Handling Equipment (CHE) Regulation was adopted in 2005 to reduce toxic and criteria emissions to protect public health and was fully implemented by the end of 2017. CARB staff is currently assessing the availability and performance of zero-emission technology to further reduce emissions. For more information on the regulation, visit: <https://ww2.arb.ca.gov/our-work/programs/cargo-handling-equipment>.

- **Drayage Truck Regulation**

This regulation reduces air toxics and criteria pollutant emissions from drayage trucks. A drayage truck is any in-use on-road vehicle with a gross vehicle weight rating of greater than 26,000 pounds used for transporting cargo to and from

ports and intermodal railyards. The regulation requires all drayage trucks to operate with an engine that is a 2007 model year or newer. Drayage trucks must also meet the requirements of the CARB Truck and Bus Regulation, which requires that all drayage trucks must have 2010 model year or newer engines by January 1, 2023.

<https://ww2.arb.ca.gov/our-work/programs/drayage-trucks-seaports-railyards>

- **Transport Refrigeration Units Regulations**

Transport refrigeration units congregate at distribution centers, railyards, and other facilities, resulting in the potential for health risks to those that live and work nearby. CARB is working through a public process to consider new requirements to transition the transport refrigeration units fleet to zero emission operations by requiring both zero emission technology and supporting infrastructure. For more information on this new regulation, visit: <https://ww2.arb.ca.gov/our-work/programs/transport-refrigeration-unit/new-transport-refrigeration-unit-regulation>.

- **Enforcement of Heavy-Duty Vehicles Inspection Programs**

When emissions control systems are not operating correctly, in-use emissions can increase. CARB's current inspection programs include the roadside Heavy-Duty Vehicle Inspection Program and the fleet Periodic Smoke Inspection Program. These regulations require heavy-duty vehicles operating in California be inspected for excessive smoke and tampering. In July 2018, CARB approved amendments to the Heavy-Duty Vehicle Inspection Program and the Periodic Smoke Inspection Program to reduce the smoke opacity limits to levels more appropriate for today's modern engine technology. CARB is now exploring the development of a more comprehensive heavy-duty inspection and maintenance program that would help ensure all vehicle emissions control systems are maintained adequately throughout the vehicles' operating lives. For more information on existing heavy-duty maintenance programs, visit

<https://ww2.arb.ca.gov/our-work/programs/heavy-duty-diesel-inspection-periodic-smoke-inspection-program>.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN THE COMMUNITY

Several strategies have been identified under this Port section that span from advocating issues, air monitoring placement, collaborating with the City, County, and Port of Stockton, to providing input through resident involvement in a sustainable planning process. Collaborative Port strategies developed to reduce emissions are further detailed below.

The following are proposed measures that are not within the Air District's statutory jurisdiction to implement:

P.1: COLLABORATING TO FACILITATE ENHANCED PLATFORMS FOR DISCUSSION AND INFORMATION SHARING BETWEEN THE COMMUNITY AND THE PORT OF STOCKTON AS PORT-RELATED PROGRAMS AND PROJECTS ARE DEVELOPED

Overview: The purpose of this strategy is to provide a platform for discussion between Port of Stockton, CSC members, residents, community-based organizations, and other stakeholders to ensure air quality impacts associated with future development projects related to the Port of Stockton are taken into consideration.

The South Stockton CSC has prioritized the need for better facilitation of local involvement, and community notification regarding Port of Stockton development projects. In keeping with that priority, the Port has committed to adopting a Community Environmental Committee (CEC) geared toward improving their relationship with the community by implementing new engagement platforms.

This measure would include the following commitments by the Port:

1. Establishing a recurring CEC, in 2021, CEC, in 2021, to build collaboration and improve dialogue between concerned citizens in the community and environmental justice organizations to allow them a forum to raise awareness of health-related concerns regarding emissions from existing and future operations at the Port of Stockton. The goals of the CEC will be to encourage additional community engagement, bring community insights to the Port's environmental improvement efforts, and work on select environmental projects within the Port's jurisdiction to help preserve, protect, and improve the environment. Prospective future projects that would be brought before the CEC include:
 - a. Discussion of future Port of Stockton projects and expansion
 - b. Port of Stockton emission reduction strategy development
 - c. Environmental event planning
 - d. Community outreach support
 - e. Program development
2. Utilizing the Port of Stockton's website to broadcast outward-facing communications through quarterly updates, and to add website functionality for submitting comments, questions, and complaints.
3. Providing routine updates to the CSC regarding ongoing projects happening at the Port of Stockton.

Implementing Agency: Port of Stockton

Strategy Type: Partnership

P.2: INCENTIVE PROGRAM FOR THE DEPLOYMENT OF CLEAN HEAVY-DUTY MOBILE EQUIPMENT OPERATING AT PORTS, INTERMODAL RAILYARDS AND DISTRIBUTION CENTERS

Overview: The goal of this strategy is to reduce emissions from old, high-polluting diesel engines in heavy-duty mobile off-road equipment operating at the Port of Stockton.

Diesel pollution from on-road and off-road operations greatly impacts the health of the community surrounding the Port. Funding will be offered to replace diesel mobile cargo handling equipment used to handle cargo or perform routine maintenance activities at the Port with new, zero and near-zero emissions technologies. Based on CSC priorities, zero-emissions will be prioritized for funding where applicable to the equipment type. Established methodology through the [Carl Moyer Program](#) will be used to quantify the emission reductions for funded projects, but an estimate of potential project reductions is summarized below.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Emission Outcome: NOx & PM reductions

Budget Amount: \$2,000,000

Quantifiable emissions reductions: Estimated emission reductions associated with this measure includes up to 2 tons of NOx.

The following are additional suggested measures not within the Air District's jurisdiction to directly implement:

P.3: TUG BOAT REPLACEMENT/REPOWER

Overview:

The goal of this strategy is to reduce emissions from old, high-polluting diesel engines in tugboats operating at the Port of Stockton. Diesel pollution from freight transport operations greatly impacts the health of the community surrounding the Port. Funding will be offered to repower the existing propulsion and auxiliary engines with new diesel engines. The new engines will have the highest tier rating available that will fit within the confines of their engine compartments. Established methodology through the [Carl Moyer Program](#) will be used to quantify the emission reductions for funded projects.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Emission Outcome: NOx & PM reductions

Budget Amount: \$1,000,000

Quantifiable emissions reductions: Estimated emission reductions associated with this measure includes up to 1 ton of PM and 29 tons of NOx.

P.4: MARINE EXHAUST INTAKE BONNET EMISSIONS CONTROL

Overview: This measure is still being considered by the Stockton Steering Committee. The goal of this strategy is to reduce emissions from the diesel engines of marine vessels while berthed at the Port of Stockton. Diesel pollution from freight transport operations greatly impacts the health of the community surrounding the Port. Funding will be offered to purchase and install a marine vessel exhaust capture and control system. This system will work with marine vessels to reduce PM and NOx emissions while at berth. Available exhaust capture and control systems can reduce PM2.5 up to 95% and NOx up to 90%. Emission reductions for these projects will be quantified using state approved calculation methodology.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Emission Outcome: NOx reductions

Budget Amount: \$2,000,000

Quantifiable emissions reductions: Estimated emission reductions associated with this measure include up to 240 tons of NOx

P.5: UNDERSTANDING AND MITIGATING THE IMPACT OF ALGAL BLOOMS ON AIR QUALITY

Overview: Algal blooms can produce airborne nitrogen compounds like nitrogen oxides that contribute to the formation of other air pollutants such as ground-level ozone, a component of smog which can restrict visibility. Wind and weather can carry ozone many miles from urban to rural areas.⁷ The goal of this strategy is to better understand, and where feasible, mitigate the impact of algae blooms on air quality. While the District, the City of Stockton and the Central Valley Regional Water Quality Control Board (CVWB) have committed to extensive interagency cooperation and action in this Stockton Community Emission Reduction Program (CERP), additional opportunities may present themselves in future discussions involving the CSC, the public, the City, and the District, especially as implementation of the CERP progresses.

This measure is the District's commitment to continue to work with local, water-focused organizations, CVWB, the Port, the City, and academic institutions to facilitate discussions between the community and the involved agencies to better understand, and where feasible mitigate, the impact of algae blooms on air quality. Currently, CVWB has developed a workgroup called the California Cyanobacteria and Harmful Algal Bloom (CCHAB) Network. The CCHAB Network includes federal, state, and local

⁷ EPA. *Nutrient Pollution. The Effects: Environment*. Retrieved 11/9/2020
<https://www.epa.gov/nutrientpollution/effects-environment>

agencies, tribes, academia, and non-governmental organizations working to develop a comprehensive coordinated program to address the causes and impacts of harmful algal blooms (HABs) in the state.⁸ As part of the coordinated program, the State Water Resources Control Board's Surface Water Ambient Monitoring Program (SWAMP) developed the Freshwater HAB Program.⁹ The Central Valley Water Board participates in the statewide Freshwater HAB effort by:

- Collecting information on blooms
- Sampling and analyzing HABs
- Providing information on blooms to local waterbody managers and health officers
- Conducting outreach and education to the general public
- Collaborating with academia and interested stakeholders to better understand the causes of HABs

Implementing Agency: SJVAPCD, Central Valley Regional Water Quality Control Board, Port of Stockton, and City of Stockton

Strategy Type: Partnership

Emission Outcome: Mitigation

STATIONARY SOURCES

STATIONARY SOURCES IN STOCKTON

There are a variety of industrial sources located in and around the Stockton Community. These sources range from smaller operations like gasoline dispensing facilities (GDFs), commercial cooking operations, and auto body coating operations to medium sized operations like wood products and agricultural products processing operations, to larger operations like the biomass power facility, bulk gasoline storage, and cement and concrete products facilities; which include equipment like ovens, internal combustion (IC) engines, boilers/steam generators, and many others.

Criteria pollutant emissions from this source category include NO_x, SO_x, PM₁₀/PM_{2.5}, CO, and VOC, and toxic air contaminants (TACs) like benzene, toluene, xylene, arsenic, and dioxins. Within the Stockton community, 161.57 tons per year of NO_x, 210.08 tons per year of VOC and 7.93 tons per year of PM_{2.5} are attributed to stationary sources.

COMMUNITY CONCERNS AND COMMENTS

During committee discussions regarding industrial sources, committee members identified commercial cooking operations, a wood products manufacturing facility, a biomass facility, a cement products processing facility, and visible dust emissions and odors from operations in and around the port as sources of concern, with suggestions ranging from providing “incentives” to replace older, higher polluting equipment and the evaluation of existing state and District regulatory measures.

CURRENT CONTROL PROGRAMS

For more than 25 years, the District has implemented several generations of emissions control regulations for stationary and area sources under its regulatory jurisdiction. These control measures represent the nation’s toughest air pollution regulations and have greatly contributed to reducing ozone and particulate matter concentrations in the Valley. Stringent and innovative rules, such as those for indirect source review, residential wood burning, glass manufacturing, and agricultural burning, have set benchmarks for California and the nation. While there has been significant progress in reducing air pollution with these regulations, which have been greatly aided by the pollution reduction efforts and financial investments of valley businesses and residents, the District continues to adopt and modify rules to achieve ongoing emissions reductions and advance our progress toward clean air.

Gasoline Dispensing Facilities (GDFs):

Gasoline dispensing facilities in the San Joaquin Valley are subject to District Rule 4621 – *Gasoline Transfer into Stationary Storage Containers, Delivery Vessels, and Bulk Plants* and Rule 4622 – *Gasoline Transfer Into Motor Vehicle Fuel Tanks*.

The purpose of Rule 4621 is to limit VOC emissions from stationary storage containers, delivery vessels, and bulk plants. This rule applies to gasoline storage containers with capacities greater than 250 gallons and has requirements to install CARB certified

vapor control systems. The purpose of Rule 4622 is to limit emissions of gasoline vapors from the transfer of gasoline into motor vehicle fuel tanks. This rule applies to any gasoline storage and dispensing operation or mobile fueler from which gasoline is transferred into motor vehicle fuel tanks. This rule also requires the installation of CARB certified vapor control systems. GDFs are subject to stringent enforcement provisions, including ongoing monitoring of equipment and annual inspections.

Commercial Cooking Operations:

Commercial cooking operations are subject to Rule 4692 – *Commercial Charbroiling* and District Rule 4693 – *Bakery Ovens*. The purpose of Rule 4692 is to limit VOC and PM10 emissions from charbroiling cooking operations. The purpose of Rule 4693 is to limit VOC emissions from the baking of yeast-leavened food products. These rules have very stringent emission limits, periodic monitoring, and source testing requirements.

Commercial cooking operations are subject to stringent enforcement provisions, including ongoing recordkeeping of materials processed and regular inspections.

Auto Body Coating Operations:

Auto body coating operations in the San Joaquin Valley are subject to District Rule 4612 – *Motor Vehicle and Mobile Equipment Coating Operations* and Rule 4101 – *Visible Emissions*.

The purpose of Rule 4612 is to limit VOC emissions from the coating of motor vehicles, mobile equipment, associated parts and components, and associated organic solvent cleaning, storage, and disposal. This rule applies to any person who supplies, sells, offers for sale, manufacturers, or distributes any automotive coating for use within the District, as well as any person who uses, applies, or solicits the use or application of any automotive coating within the District. The rule requires the sale and use of low VOC coatings and solvents, in addition to stringent requirements for the application of these coatings. Auto body coating operations are subject to stringent enforcement provisions, including ongoing recordkeeping of coatings/solvents used and regular inspections. They also must demonstrate continued compliance with additional visible emissions requirements as described in Rule 4101.

Wood Products Processing Operations:

Wood products processing operations are subject to Rule 4101 – *Visible Emissions*, Rule 4201 – *Particulate Matter Concentration*, Rule 4202 – *Particulate Matter – Emission Rate*, Rule 4306/4320 – *Boilers, Steam Generators, and Process Heaters*, and District Rule 4702 – *Internal Combustion Engines*. The purpose of Rules 4101, 4201, and 4202 is to limit particulate matter emissions from exhaust stacks and industrial processes. The purpose of Rules 4306, 4320, and 4702 is to limit emissions of NO_x, CO, VOC, SO_x, and PM10 from fossil fuel combustion in boilers, steam generators, process heaters, and stationary internal combustion engines commonly used in these types of facilities. These rules have very stringent emission limits, periodic monitoring, and source testing requirements.

Wood products processing facilities are subject to stringent enforcement provisions, including ongoing recordkeeping of materials processed and regular inspections.

Agricultural Products Processing Operations:

Agricultural products processing operations are subject to Rule 4101 – *Visible Emissions*, Rule 4201 – *Particulate Matter Concentration*, Rule 4202 – *Particulate Matter – Emission Rate*, and Rule 4306/4320 – *Boilers, Steam Generators, and Process Heaters*. The purpose of Rules 4101, 4201, and 4202 is to limit particulate matter emissions from exhaust stacks and both indoor and outdoor industrial processes. The purpose of Rules 4306 and 4320 is to limit emissions of NO_x, CO, SO_x, and PM₁₀ from natural gas combustion in boilers, steam generators, and process heaters. These rules have very stringent emission limits, periodic monitoring, and source testing requirements.

Agricultural products processing facilities are subject to stringent enforcement provisions, including ongoing recordkeeping of materials processed and annual inspections.

Cement and Concrete Products Operations:

Cement and concrete processing operations are subject to Rule 4101 – *Visible Emissions*, Rule 4201 – *Particulate Matter Concentration*, and Rule 4202 – *Particulate Matter – Emission Rate*. The purpose of Rules 4101, 4201, and 4202 is to limit particulate matter and visible emissions from exhaust stacks, process equipment, and conveying equipment. These rules have very stringent emission limits, periodic monitoring, and source testing requirements.

Cement and concrete products processing facilities are subject to stringent enforcement provisions, including ongoing recordkeeping of materials processed and annual inspections.

Biomass Power Facilities:

Biomass power facilities in the San Joaquin Valley are subject to District Rule 4352 – *Solid Fuel Fired Boilers, Steam Generators, and Process Heaters* and Rule 4101 – *Visible Emissions*.

The purpose of Rule 4352 is to limit emissions of NO_x and CO from solid fuel fired boilers, steam generators and process heaters. This rule applies to any boiler, steam generator or process heater fired on solid fuels, such as biomass. This rule has very stringent emission limits, periodic monitoring, and source testing requirements.

Biomass power facilities are subject to stringent enforcement provisions, including ongoing recordkeeping of materials burned and annual inspections. These facilities must demonstrate continued compliance with additional visible emissions requirements as described in Rule 4101.

Organic Liquid (Gasoline) Terminal Facilities:

Bulk gasoline terminal facilities in the San Joaquin Valley are subject to District Rule 4623 – *Storage of Organic Liquids* and Rule 4624 – *Organic Liquid Loading*.

The purpose of Rule 4623 is to limit VOC emissions from the storage of organic liquids. This rule applies to any tank with a capacity of 1,100 gallons or greater in which any organic liquid is placed, held, or stored. The purpose of Rule 4624 is to limit VOC emissions from the transfer of organic liquids. This rule applies to organic liquid transfer facilities. Facilities that store or transfer organic liquids, such as gasoline pipeline terminals are subject to stringent enforcement provisions, including quarterly leak inspection requirements and annual inspections.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN THE COMMUNITY

Due to the priority that community members placed on reducing PM_{2.5} and toxic air contaminant emissions that originate from industrial sources in and around the community, the following strategies have been developed for implementation in the Stockton community.

The following are proposed measures that are within the Air District's statutory jurisdiction to implement:***SS.1: ENHANCED STATIONARY SOURCE INSPECTION FREQUENCY***

Overview: The goal of this strategy is to limit the potential for localized air quality impacts at permitted facilities that have had emissions violations in the last three years.

The District conducts inspections and investigations of permitted sources to determine compliance with a multitude of health-protective local, state, and federal air quality regulations that target both criteria and toxic pollutants. The District closely monitors these sources and strictly enforces applicable requirements. Compliance inspections are unannounced whenever possible and involve both a physical inspection of the facility and a review of their records. When a violation of a District permit, rule, or regulation is identified, the District takes an appropriate level of enforcement action.

The District reviewed the enforcement history over a three year period (2017-2020) for the permitted facilities in the Stockton community, and determined that 51 enforcement actions were issued to facilities (not including gas stations) for violations resulting in excess emissions. These violations occurred at 13 permitted facilities in the area and 1 ocean-going vessel. The District also issued 18 enforcement actions at 14 gas stations in the Stockton community for violations resulting in excess emissions. The District believes that more frequent inspections for these 27 facilities would help to limit the potential for air quality impacts associated with emissions violations.

The District will increase the frequency of inspection at each facility within the Stockton community that has had an emission-based violation over the past three (3) years. These facilities will be inspected at least twice per calendar year for the next five (5)

years or until the facility has four (4) consecutive inspections without an emissions violation, whichever occurs first.

Implementing Agency: SJVAPCD

Strategy Type: Enforcement

Emission Outcome: Reduction in excess PM2.5, PM10, NOx, VOC, and CO emissions through higher compliance rates

SS.2: REGULATORY ACTIONS: EVALUATION OF RULES TO DETERMINE WHETHER ADDITIONAL REDUCTIONS ARE POSSIBLE FOR SOURCES OF NOx AND PM2.5

Overview: In addition to the Best Available Retrofit Control Technology (BARCT) implementation schedule above, the District will be analyzing District Rule 4352 - *Solid Fuel-Fired Boilers, Steam Generators and Process Heaters* to pursue additional emission reduction opportunities beyond BARCT.. This rule amendment will be reviewed on the schedule included in the District's *2018 PM2.5 Plan* adopted by CARB into the State Implementation Plan.

Emissions reductions achieved through the implementation of more stringent limits potentially required through these rule amendments will further contribute to reduced exposure to air pollution in the community. Community Steering Committee members, members of the AB 617-selected community, and the general public are encouraged to be involved in the upcoming rulemaking process for these rules.

Implementing Agency: SJVAPCD

Strategy Type: Regulatory

Emission Outcome: Reduction

SS.3: REGULATORY ACTIONS: EXPEDITED FACILITY RISK ASSESSMENT AND RISK REDUCTION UNDER DISTRICT IMPLEMENTATION OF THE AIR TOXICS HOT SPOTS INFORMATION AND ASSESSMENT ACT (AB 2588)

Overview: This strategy will expedite the review of stationary sources of pollution in the community that are currently being reassessed under the Air Toxics "Hot Spots" Information and Assessment Act (AB 2588).

Under AB 2588, all facilities located within the boundaries of the District are required to report toxic substances released into the air by their operation to the District. The District's responsibilities under the state's Air Toxics "Hot Spots" program are to:

- Identify Valley facilities that release toxic air contaminants as a result of their day to day operations,

- Collect and quantify emission data from equipment located at permitted facilities,
- Identify facilities causing localized health impacts on nearby residents,
- Determine facility-wide health risks resulting from the emission of toxic air contaminants,
- Notify nearby residents and businesses of significant risk facilities in their vicinity, and
- Require that significant risk facilities reduce their risks to a level that no longer constitutes a significant risk to nearby residences and businesses.

The District's implementation of AB 2588, California's Air Toxics "Hot Spots" Information and Assessment Act, has resulted in major reductions in emissions of air toxics from existing sources in the San Joaquin Valley. Under this right-to-know law, the District has worked with Valley facilities to quantify emissions of air toxics, determine the health risk caused by those emissions, report emissions and any significant risks through written public reports and neighborhood public meetings, and take steps to reduce such risks.

This measure will result in the expedited AB 2588 reviews for facilities located within the Stockton AB 617 Community. More information about this effort can be found later in the section, "Additional Regulatory Measures to Reduce Emissions in the Community" found later in this chapter. Please refer to Appendix E for additional details about the District's Health Risk Assessment Process, and a table identifying the AB 2588 reassessment status of each facility within the community as of December 21, 2020.

Implementing Agency: SJVAPCD

Strategy Type: Regulatory

Emission Outcome: Reduction

DUST IN THE COMMUNITY

BACKGROUND

In the Stockton community sources of dust emissions include from construction, open areas, and other earthmoving activities. Construction, demolition and other earthmoving activities emit 10.57 tons per year of PM_{2.5} in the community. Unpaved road dust and dust from open areas also have minor PM_{2.5} emissions in the area.

COMMUNITY CONCERNS AND COMMENTS

The Community Steering Committee expressed an interest in evaluating air quality impacts and felt it important to look to reduce dust from construction projects and other sources of dust in the community.

CURRENT CONTROL PROGRAMS

Regulation VIII (Fugitive PM₁₀ Prohibition) / Dust Control Plan (DCP): The District's Regulation VIII series (Fugitive PM₁₀ Prohibitions) was adopted in November 2001, and subsequently amended in 2004. This rule series contains a comprehensive suite of rules designed to reduce fugitive PM₁₀ emissions from a range of sources including:

- Specified outdoor fugitive dust sources.
- Construction or demolition related disturbances of soil, including land clearing, grubbing, scraping, excavation, extraction, land leveling, grading, cut and fill operations, travel on the site, travel access roads to and from the site, and demolition activities.
- Outside storage and handling of any unpackaged material, which emits or has the potential to emit dust when stored or handled.
- Prevention and cleanup of mud and dirt whenever it is deposited (carryout and trackout) onto public paved roads
- Open areas 0.5 acres or more within urban areas, or 3.0 acres or more within rural areas that contain at least 1,000 square feet of disturbed surface area.
- Any paved, unpaved, or modified public or private road, street highway, freeway, alley way, access drive, access easement, or driveway.
- Unpaved vehicle/equipment areas, including parking, fueling, service, shipping, receiving, and transfer areas.
- "Off-field" agricultural sources including, but not limited to, unpaved roads, unpaved vehicle/equipment traffic areas, and bulk materials.

The Regulation VIII rules are implemented via the District's Dust Control Plan (DCP) program: https://www.valleyair.org/busind/comply/PM10/compliance_PM10.htm

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

Due to the priority that the Steering Committee placed on reducing dust in the community, specific a specific strategy has been developed to target emission reductions from fugitive dust sources. The District is proposing increased enforcement

of Regulation VIII rules to reduce fugitive dust from construction and earthmoving activities within the community.

The following proposed strategy is within the Air District's statutory jurisdiction to implement:

FD.1: ENHANCED ENFORCEMENT OF DISTRICT REGULATION VIII FUGITIVE DUST REQUIREMENTS

Overview: The goal of this strategy is to limit the potential for localized air quality impacts associated with fugitive dust from construction/earthmoving activities and open areas subject to District Regulation VIII.

District rules limit fugitive dust emissions from construction, demolition, and earthmoving; bulk material storage; open areas; and unpaved roads and vehicle/equipment traffic areas. Furthermore, District rules restrict carryout and trackout of dirt and dust onto paved public roadways. Regulation VIII does not limit emissions from vehicles used in these projects.

Regulation VIII requires, a Construction Notification or Dust Control Plan for all construction activities in the District involving one or more acre of disturbed surface area. District staff reviews each Construction Notification and Dust Control Plan prior to the start of construction, to ensure that operators have planned to utilize required work practices to reduce fugitive dust emissions to within rule limitations. Additionally, District staff surveys and inspects such sites, responds to complaints regarding fugitive dust, and provides training classes for those required to submit Dust Control Plans.

In reviewing the compliance history for the Stockton community, it was determined that the District had received 26 complaints regarding fugitive dust related issues over the last 3 years, with the majority pertaining to construction/earthmoving activities and open areas. Building on the District's existing surveillance and complaint response efforts, the District will conduct at least one targeted enforcement effort within the Stockton community during both the 2nd and 3rd quarters for the next five (5) years. This fugitive dust reduction enforcement strategy is being included in the CERP in response concerns raised by CSC members regarding fugitive dust emissions in the community and the complaint history analysis performed by the District.

Type of Action: Enforcement

ADDITIONAL INFORMATION ABOUT REGULATORY MEASURES TO REDUCE EMISSIONS IN THE COMMUNITY

Due to the nonattainment status of the Valley Air Basin for the criteria pollutants of fine particulate matter and ozone, the District requires that permitted facilities implement the most stringent control measures feasible for implementation to control criteria pollutants and associated precursor emissions. Beyond the regulations and stringent permitting requirements that are already implemented Valley-wide, the following sections detail enhanced regulatory strategies that will be implemented in the AB 617-selected community.

BARCT EXPEDITED SCHEDULE

In addition to community monitoring and emission reduction program requirements, AB 617 requires that air districts located in non-attainment areas perform a Best Available Retrofit Control Technology (BARCT) analysis for all categories of units at facilities subject to the state Cap-and-Trade program. In accordance with AB 617 requirements, the District adopted an expedited schedule for performing further determination of BARCT requirements in December, 2018.

The District utilized an extensive evaluation process to make an initial determination of whether the rules that apply to Cap-and-Trade facilities meet all state BARCT requirements, as mandated by AB 617. While District rules are expected to meet BARCT due to the District's ongoing extensive regulatory evaluations, the proposed BARCT implementation schedule includes commitments to establish updated BARCT determinations for District rules as required under AB 617. The proposed schedule was prepared through a public process, which included two public workshops. In addition to the BARCT implementation schedule, the District will be proceeding with amending a number of District rules included as commitments in the District's *2018 PM_{2.5} Plan*, as discussed earlier in the CERP, that are also subject to the AB 617 BARCT implementation requirement.

In conjunction with District rules applicable to stationary source equipment, under the District's New Source Review permitting regulation, new facilities or facilities modifying equipment that emit air pollutants greater than 2 pounds per day (lb/day), are subject to stringent emissions control requirements. For each piece of equipment that has the potential to emit over the 2 lb/day threshold, the District requires the use of the best available air pollution control technology (BACT) used to control emissions from similar types of equipment. As part of this BACT analysis, the District determines if cleaner technologies that are not generally used for the equipment being analyzed could be used to further reduce emissions from the proposed equipment. This very stringent requirement ensures that the most effective air pollution control technique is utilized, resulting in the least amount of air pollution possible.

In addition to these stringent requirements on new sources of air pollution, rules adopted in the San Joaquin Valley are regularly analyzed for compliance with the state's BARCT requirements.

Best Available Retrofit Control Technology (BARCT)

Existing stationary sources in non-attainment areas such as the San Joaquin Valley have been subject to BARCT requirements since the 1980s, as opposed to some nonattainment areas in California relying on market-based criteria pollutant emission reduction programs and where facilities were not required to comply with BARCT. Although AB 617 does not specifically define BARCT, California Health and Safety Code (CH&SC) Section 40406 defines BARCT as follows:

Best Available Retrofit Control Technology (BARCT) is an air emission limit that applies to existing sources and is the maximum degree of reduction achievable, taking into account environmental, energy and economic impacts by each class or category of source.

Unlike other regions in the state, the District has not relied on market-based systems such as South Coast AQMD's RECLAIM program to achieve regional emissions reductions needed for attainment. Such market-based systems allow sources of pollution to avoid installing BARCT-level controls if regional emissions are reduced at an established rate. This potential path to avoiding installing the best air pollution controls in other air districts was a significant portion of the genesis of this BARCT requirement of AB 617.

In contrast, businesses in the San Joaquin Valley have always had to comply with BARCT in accordance to the implementation schedules established in District rules. When developing attainment plans or amending prohibitory rules, the District evaluates all applicable sources of emissions for potential strategies to reduce emissions. These evaluations include an exhaustive search of air quality regulations throughout the nation, review of existing emission control technologies, and analysis of advanced emission control technologies that may soon be available, to identify potential technologically and economically feasible emission reduction measures. The District's attainment planning efforts rely on these processes to demonstrate on an ongoing basis that District rules meet state and federal emission control requirements, including BARCT and Most Stringent Measures, which exceeds BARCT requirements. Therefore, given the District's ongoing and extensive work to identify and apply most stringent measures necessary to attain the ever-tightening federal health-based standards under the Clean Air Act, it is anticipated that most if not all District rules satisfy BARCT requirements.

The District recognizes that emission control technologies are continually evolving, and therefore, robust and ongoing analysis is necessary to demonstrate that the District's rules continue to meet BARCT and other requirements on an ongoing basis. Furthermore, in the context of the 2016 Ozone attainment plan, the recently adopted PM2.5 attainment plan, and upcoming plans, future rule development actions will be required and, in this process, rules that have recently been determined to meet BARCT during this AB 617 analysis may be subject to further analysis to ensure they continue to meet BARCT requirements. Additionally, in those instances where the District is

made aware of new technology, further case specific and rule specific BARCT determinations may be conducted.

Affected Rules Included in the District's Expedited BARCT Implementation Schedule

As captured in Section 40920.6 of the Health and Safety Code, AB 617 identifies specific requirements for the District to meet when establishing the expedited BARCT implementation schedule. AB 617 requires the schedule to apply to each industrial source that, as of January 1, 2017, was subject to a specified market-based compliance mechanism and give highest priority to those permitted units that have not modified emissions-related permit conditions for the greatest period of time.

Based on information provided by CARB, as of January 1, 2017, 109 facilities within the District were identified as being subject to the state Cap-and-Trade program for greenhouse gas emissions, a market-based compliance mechanism adopted by the state board pursuant to subdivision (c) of Section 38562, and therefore AB 617 BARCT requirements. Evaluating the 109 affected facilities, the District identified that approximately 4,500 active permit units are within the scope of this BARCT analysis. From the 4,500 active permit units, the District determined that 32 District rules that apply to specific source categories of equipment were subject to the BARCT analysis required under AB 617.

District staff performed analysis of 32 affected rules and determined that:

- 5 rules were superseded by a more stringent rule known to meet BARCT or by a rule subject to further BARCT analysis,
- 5 rules were determined to meet Most Stringent Measures (MSM) for NO_x, the only relevant pollutant for these affected rules and, therefore, meet BARCT, and
- 19 rules were specifically determined to meet BARCT through an extensive rule and source category evaluation that compared our rule requirements with federal and state air quality regulations and with regulations of other air districts in California.
- While the remaining 13 rules likely already meet BARCT due to the District's ongoing and extensive regulatory evaluations and enhancements, the proposed BARCT implementation schedule includes commitments to establish updated BARCT determinations for these rules, which will occur in the 2020-2022 timeframe.

Prioritization Criteria for Expedited BARCT Analysis Schedule

Section 40920.6(c)(3) of the Health and Safety Code requires Districts to give highest priority to conduct the BARCT analysis to those rules affecting permitted units that have not modified emissions-related permit conditions for the greatest period of time. To assist in further prioritization, the District also considered local public health, clean air benefits to the surrounding community, and regional air quality and attainment benefits by prioritizing units that emit NO_x and are located within communities selected for action under AB 617. In addition, while cost-effectiveness of controls can't be fully analyzed until each rule is addressed during the development of a BARCT rule, the District also

prioritized rules with the greatest number of potentially affected units, which, when coupled to the law's requirement of prioritizing based on the length of time since the units were last modified, provides some consideration of the most likely controls to be cost-effective.

Public Process

As a part of the public process associated with establishing this schedule, the District conducted a public scoping meeting on June 14, 2018, to solicit input from stakeholders regarding the District's proposed methodology to address the AB 617 requirement to adopt an expedited BARCT analysis schedule by the end of 2018.

The District held a public workshop on November 1, 2018, to solicit input from the stakeholders regarding the District's proposed expedited BARCT Rule implementation schedule. No comments were received from stakeholders after this workshop.

In addition, the District held a public workshop on July 30, 2020, to provide an update on the Best Available Control Technology (BARCT) analysis of District rules as required under AB 617 and the District's Expedited BARCT Implementation Schedule.

Expedited BARCT Implementation Schedule

Through this public process and in accordance with AB 617 requirements, the District has adopted the following expedited BARCT implementation schedule:

Table 4-1 Expedited BARCT Implementation Schedule

Rule	Title	BARCT Determination Status	BARCT Determination Schedule	BARCT Rulemaking Schedule (if necessary)
4454	Refinery Process Unit Turnaround	Rule determined to meet BARCT	2019	---
4641	Cutback, Slow Cure, And Emulsified Asphalt, Paving And Maintenance Operations	Rule determined to meet BARCT	2019	---
4104	Reduction of Animal Matter	Rule determined to meet BARCT	2019	---
4409	Components at Light Crude Oil Production Facilities, Natural Gas Production Facilities, and Natural Gas Processing Facilities	BARCT evaluation completed, rule development process necessary	2019	Public scoping meeting held in Dec 2020, Rule development process to be completed in 2021.
4455	Components at Petroleum Refineries, Gas Liquids Processing Facilities, and Chemical Plants	BARCT evaluation completed, rule development process necessary	2019	
4702	Internal Combustion Engines (VOC only)	Scheduled (in conjunction with PM2.5 Plan commitment)	2020	Rule amendment scheduled for early 2021
4623	Storage of Organic Liquids	BARCT evaluation completed, rule development process necessary	2020	Public scoping meeting held in Dec 2020, Rule development process to be completed in 2021.

4694	Wine Fermentation and Storage Tanks	Rule determined to meet BARCT	2020	-----
4624	Transfer of Organic Liquid	BARCT evaluation completed, rule development process necessary	2020	Public scoping meeting held in Dec 2020, Rule development process to be completed in 2021.
4603	Surface Coating of Metal Parts and Products, Plastic Parts and Products, and Pleasure Crafts	Rule determined to meet BARCT	2020	-----
4601	Architectural Coatings	Rule determined to meet BARCT	2020	-----
4401	Steam-Enhanced Crude Oil Production Wells	BARCT evaluation completed, rule development process necessary	2021	Public scoping meeting held in Dec 2020, Rule development process to be completed in 2021.
4566	Organic Material Composting Operations	Scheduled	2021	-----
4625	Wastewater Separators	Scheduled	2021	-----
4621	Gasoline Transfer Into Stationary Storage Containers, Delivery Vessels, and Bulk Plant	Scheduled	2021	-----
4402	Crude Oil Production Sumps	Scheduled	2021	-----
4351	Boilers, Steam Generators, and Process Heaters - Phase 1	Rule superseded by more stringent rules, District Rules 4305,	---	---

		4306, and 4320		
4405	Oxides of Nitrogen Emissions from Existing Steam Generators Used in Thermally Enhanced Oil Recovery - Central and Western Kern County Fields	Rule superseded by more stringent rules, District Rules 4305, 4306, and 4320	---	---
4406	Sulfur Compounds from Oil-Field Steam Generators - Kern County	Rule superseded by more stringent rules, District Rules 4305, 4306, and 4320	---	---
4305	Boilers, Steam Generators, and Process Heaters - Phase 2	Rule superseded by District Rules 4306 and 4320, more stringent rules	---	---
4701	Internal Combustion Engines - Phase 1	Rule superseded by District Rule 4702, a more stringent rule	---	---
4309	Dryers, Dehydrators, and Ovens	Rule determined to meet BARCT	---	---
4703	Stationary Gas Turbines	Rule determined to meet BARCT	---	---
4306	Boilers, Steam Generators, and Process Heaters - Phase 3	Rule determined to meet BARCT	---	---
4307	Boilers, Steam Generators, and Process Heaters - 2.0 MMBtu/hr to 5.0 MMBtu/hr	Rule determined to meet BARCT	---	---
4320	Advanced Emission Reduction Options for Boilers, Steam Generators, and	Rule determined to meet BARCT	---	---

	Process Heaters Greater Than 5.0 MMBtu/hr			
4311	Flares	Rule determined to meet BARCT	---	---
4354	Glass Melting Furnaces	Rule determined to meet BARCT	---	---
4408	Glycol Dehydration Systems	Rule determined to meet BARCT	---	---
4453	Refinery Vacuum Producing Devices or Systems	Rule determined to meet BARCT	---	---
4612	Motor Vehicle and Mobile Equipment Coating Operations	Rule determined to meet BARCT	---	---
4622	Gasoline Transfer into Motor Vehicle Fuel Tanks	Rule determined to meet BARCT	---	---

UPCOMING 2018 PM_{2.5} PLAN RULE AMENDMENT EFFORTS

In addition to the BARCT implementation schedule above, the District will be proceeding with amending two District rules to pursue additional emission reduction opportunities beyond BARCT, included as commitments in the District's *2018 PM_{2.5} Plan* adopted by CARB into the State Implementation Plan:

Emissions reductions achieved through the implementation of more stringent limits potentially required through these rule amendments will further contribute to reduced exposure to air pollution in the community. Community Steering Committee members, members of the AB 617-selected community, and the general public are encouraged to be involved in the upcoming rulemaking process for these rules.

Table 4-2 Scheduled District Rule Amendments to Reduce PM2.5

Rule	Title	BARCT Status	PM2.5 Plan Rulemaking Schedule
4901	Wood Burning Fireplaces and Wood Burning Heaters	No units subject to AB 617 BARCT analysis. Rule amended in June, 2019.	2019 (Completed)
4311	Flares	Rule meets or exceeds BARCT	2020 (Completed)
4306 and 4320	Boilers, Steam Generators, and Process Heaters - Phase 3 and Advanced Emission Reduction Options for Boilers, Steam Generators, and Process Heaters Greater than 5.0 MMBtu/hr	Rule meets or exceeds BARCT	2020 (Completed)
4692	Commercial Charbroiling	No units subject to AB 617 BARCT analysis	2020 (Completed)
4702	Internal Combustion Engines	Rule meets or exceeds BARCT for NOx, updated AB 617 BARCT determination scheduled for VOCs	2021
4352	Solid Fuel-Fired Boilers, Steam Generators and Process Heaters	No units subject to AB 617 BARCT analysis	2021
4354	Glass Melting Furnaces	Rule meets or exceeds BARCT	2021

Further information on the District's expedited BARCT schedule and rule analyses can be found in the staff report presented to the District Governing Board in December, 2018:

http://www.valleyair.org/Board_meetings/GB/agenda_minutes/Agenda/2018/December/final/13.pdf

PERMITTING: BACT AND T-BACT DETERMINATIONS

The California Air Resources Board (CARB) is developing a Technology Clearinghouse of best available control technology (BACT) and best available control technology for toxic air contaminants (T-BACT) determinations for air districts throughout California. The District will use this Technology Clearinghouse as an additional resource for BACT determinations, and will reference this information when developing BACT and T-BACT technology determinations for any new or modified source permitting processes,

including those in the Stockton community. More information about the District's stringent new and modified source review process is available in Chapter 3.

FACILITY RISK REDUCTION AUDITS UNDER AB 2588 (AIR TOXICS HOT SPOTS INFORMATION AND ASSESSMENT ACT)

Background

The Air Toxics "Hot Spots" Information and Assessment Act (AB 2588) was enacted in September 1987. Under this act, stationary sources are required to report the types and quantities of certain toxic substances their facilities routinely release into the air. The goals of the Air Toxics "Hot Spots" Act are to:

- Identify Valley facilities that release toxic air contaminants as a result of their day-to-day operations,
- Collect and quantify emission data from equipment located at permitted facilities,
- Identify facilities causing localized health impacts on nearby residents,
- Determine facility-wide health risks resulting from the emission of toxic air contaminants,
- Notify nearby residents and businesses of significant risk facilities in their vicinity, and
- Require significant risk facilities to reduce their risks below the level of significance in accordance with the provisions of the "Emissions Inventory Criteria and Guidelines Report" adopted by the Air Resources Board.

District's Implementation of AB 2588

The District's implementation of AB 2588, California's *Air Toxics "Hot Spots" Information and Assessment Act*, has resulted in major reductions in emissions of air toxics from existing sources in the San Joaquin Valley. Under this right-to-know law, the District has worked with Valley facilities to quantify emissions of air toxics, determine the health risk caused by those emissions, report emissions and any significant risks through written public reports and neighborhood public meetings, and take steps to reduce such risks. As a result of this effort, and the resulting emissions reductions, no Valley facility currently poses a significant risk under this program.

The District's integrated air toxics program fulfills the state AB 2588 Hot Spots mandates, aimed at quantifying and assessing localized health risk, notifying affected residents, and reducing risk from facilities with high risk caused by air toxic emissions. In addition, the District's integrated air toxics program incorporates Airborne Toxic Control Measure (ATCM) regulations promulgated by the Air Resources Board, requiring prescribed control measures for various source categories that cause significant risks at a regional level. Furthermore, the District's integrated program fulfills federal mandates under Title III of the federal Clean Air Act, requiring Maximum Available Control Technology (MACT) for sources of air toxics.

In addition to the state and federal mandates, the District's integrated air toxics program also implements the more stringent local permitting and California Environmental Quality Act (CEQA) requirements, specifically to ensure installation of Best Available Control Technology (BACT) for air toxics and that new permits or modifications to existing facilities will not result in a significant increase in health risk to the public.

The District has spent the last two decades implementing a wide variety of methods to reduce toxic air contaminant emissions in the San Joaquin Valley. Based on the latest California Toxics Inventory, 52% of toxic air contaminants come from mobile sources such as cars and trucks, 34% are emitted from area-wide sources like road dust, paints, solvents, and other consumer products, and 14% of all air toxics in the San Joaquin Valley are emitted from stationary sources of pollution under the direct control and regulation of the District. Mobile and area-wide sources of emissions are generally under the regulatory authority of the State of California and the federal government.

The District's integrated approach to addressing and reducing risks from toxic air contaminants has taken three main paths:

- Reducing air toxic emissions from existing stationary sources of emissions,
- Preventing the creation of new or modified stationary sources of significant risk, and
- Finding creative and cooperative methods of reducing risk from emissions sources that the District does not typically regulate.

In 2015, the District began implementing the state Office of Environmental Health Hazard Assessment's (OEHHA's) revised Guidance on Preparation of Health Risk Assessments that was adopted by OEHHA in early March 2015. Following OEHHA revised guidelines, the District began a health risk reassessment of all facilities located in the San Joaquin Valley. The health risk reassessment follows the phased processing schedule outlined in AB 2588, which was originally implemented in the late 80's and early 90's. AB 2588 subjected three major categories (or phases) of facilities to the regulation based upon their level of annual emissions.

Reassessment of facilities subject to the AB2588 Hot Spots regulation is a multi-year process that started in 2016, following the phases identified below:

- Phase I Facilities (≥ 25 tons emissions per year)
- Phase II Facilities ($10 \leq$ tons emissions per year < 25)
- Phase III Facilities (< 10 tons emissions per year)
- Phase IV Facilities (Industry-wide and agricultural facilities)

Prioritizing Facility Health Risks

Based on the emissions inventory, the District is prioritizing each facility's health risk based on established statewide guidelines using a computerized modeling program. A "prioritization" is a conservative health risk assessment screening analysis, resulting in a facility prioritization score used to determine if a more refined health risk assessment is

necessary based on the results of the modeling program. As part of this process, very conservative assumptions are utilized, with many safety factors built in to determine the worst-case health risk to possible receptors. The purpose of these safety factors is to ensure that the most sensitive receptors (children, elderly, pregnant women, and people with weakened immune systems) are protected. Facilities ranked as high priority are required to perform health risk assessments. The District prioritizes and ranks the health risk posed by a facility as "low", "intermediate", or "high" priority, based on the following:

- Low Priority: Prioritization Score ≤ 1
Facility Exempt from further AB 2588 requirements
- Intermediate Priority: $1 < \text{Prioritization Score} \leq 10$
Facility required to provide updated summary every four years
- High Priority: Prioritization Score > 10
Facility required to perform a refined Health Risk Assessment

Health Risk Assessment Process

When a facility's prioritization score exceeds 10, the facility is classified as "High Priority" and a Health Risk Assessment (HRA) is required for the facility, and such facility is required to submit an HRA for District approval. The District and State Office of Environmental Health Hazard Assessment (OEHHA) are required by the Air Toxics "Hot Spots" Act to review each HRA. Understanding that risk calculations involves a level of uncertainty due to limited data in many areas requiring the use of assumptions. With a focus on health protection, very conservative assumptions are utilized, with many safety factors built in to determine the worst-case risk to possible receptors. The purpose of these safety factors is to ensure that the most sensitive receptors (children, elderly, pregnant women, and people with weakened immune systems) are protected. Therefore, while the actual risk may be much less than the calculated risk, it is very unlikely to be higher than calculated.

Upon approval of facility HRA, the District determines the facility's health risk status, which is classified as a low risk, intermediate risk, high risk, or risk reduction required, based on the following HRA scores:

- Low Risk: HRA cancer risk ≤ 1 in a million, and
HRA total hazard index of < 0.1
(Facility Exempt from further AB 2588 requirements)
- Intermediate Risk: $1 \leq \text{HRA cancer risk} < 10$ in a million, or
 $0.1 \leq \text{HRA total hazard index} \leq 1.0$
(Facility required to provide update summary on a quadrennial basis)

- High Risk: HRA cancer risk ≥ 10 in a million, or
HRA total hazard index of > 1.0
(Public Notice)

- Risk Reduction Required: HRA cancer risk ≥ 100 in a million cancer, or
HRA total hazard index of > 5.0
(Public Notice and Risk Reduction Audit Plan)

Facilities that pose health risks above District action levels are required to submit plans to reduce their risk. The Risk Reduction Audit Plan (RRAP) trigger level for cancer risk is 100 cases per million exposed persons, based on the maximum exposure beyond facility boundaries at a residence or business. The action level (Risk Reduction Audit Plan) for non-cancer risk is a hazard index of 5 at any point beyond the facility boundary where a person could reasonably experience exposure to such a risk.

The District's review of completeness of the facility's RRAP includes a substantive analysis of the emission reduction measures included in the plan, and the ability of those measures to achieve emission reduction goals as quickly as feasible. If the District determines that the RRAP does not meet those requirements, the District shall remand the audit and plan to the facility and specify the deficiencies. A facility operator shall submit a RRAP addressing the deficiencies identified by the District within 90 days of receipt of a deficiency notice. An updated prioritization and/or health risk assessment shall be determined based on the approved RRAP.

Risk Reduction Audit and Plan Facilities within the District

Based on facility information, as of October 1, 2020, no District permitted facilities in the Stockton AB 617 community present a significant risk for toxic air pollutants and are not required to perform a Risk Reduction Audit and Plan.

AB 617 Community Facility Lists with Associated AB 2588 Designations

Assembly Bill 617 requires the CARB and air districts to develop and implement emissions reporting for disadvantaged communities. With the establishment of the selected community boundaries, the District has put into effect a plan to expedite and streamline the AB 2588 reassessments for facilities located within the selected community of Stockton.

Community-Based AB 2588 Reassessments

Based on previous AB 2588 analyses and on the on-going District's integrated air toxics program, no Valley facilities have been determined to pose significant risk. Therefore, no existing facility(s) have or have been required to prepare a Risk Reduction Audit Plan. However, as mentioned above, the District is currently in the process of

reassessing Valley facilities under AB 2588, which includes those located in the selected community of Stockton.

Please refer to Appendix E for further details about the District's Health Risk Assessment Process, and a table identifying the AB 2588 reassessment status of each facility within the community as of December 21, 2020.

STATEWIDE INCENTIVE AND REGULATORY STRATEGIES

This section provided by the California Air Resources Board

Overview of California Air Resources Board's Statewide Actions

Community-scale air pollution exposure is caused by many factors, including the cumulative impacts from multiple pollution sources. Effective solutions require multiple strategies at both the statewide and local level to deliver new emissions reductions directly within these communities.

The California Air Resources Board (CARB) has adopted a number of comprehensive air quality and climate plans over the last several years that lay out new emissions reduction strategies. These plans include the State Strategy for the State Implementation Plan,¹⁰ the California Sustainable Freight Action Plan,¹¹ California's 2017 Climate Change Scoping Plan,¹² and the Short-Lived Climate Pollutants Reduction Strategy,¹³ along with a suite of incentive programs. The Community Air Protection Blueprint¹⁴ further identified additional actions to reduce the air pollution burden in heavily impacted communities throughout the State. Together, these plans provide a foundation for the new actions identified as part of this community emissions reduction program.

This section illustrates CARB's statewide role in the community emissions reduction program, by broadly describing the regulatory and incentive-based foundational actions CARB has taken to reduce emissions statewide. It also highlights specific actions that address areas of concern identified by the Stockton community. CARB's potential enforcement strategies are described in Chapter 5 of this CERP.

INCENTIVE PROGRAMS

CARB operates incentive programs that reduce the costs of developing, purchasing, and operating cleaner technologies. The programs help ensure cleaner cars, trucks,

¹⁴ California Air Resources Board, *Final Community Air Protection Blueprint for Selecting Communities, Preparing Community Emissions Reduction Programs, Identifying Statewide Strategies, and Conducting Community Air Monitoring*, October, 2018, available at: <https://ww2.arb.ca.gov/capp-blueprint>.

equipment, and facilities are operating in our neighborhoods. Specifically, these program accelerate the introduction of advanced technology vehicles and equipment, accelerate the turnover of older and higher emitting vehicles and equipment, and increase access to clean vehicles and transportation in disadvantaged communities and lower-income households.

Examples of CARB incentive programs include the Carl Moyer Memorial Air Quality Standards Attainment Program¹⁵ and the Community Air Protection Incentives,¹⁶ Proposition 1B: Goods Movement Emission Reduction Program,¹⁷ Funding Agricultural Replacement Measures for Emission Reductions Program,¹⁸ and Low Carbon Transportation Investments and Air Quality Improvement Program (which includes the Hybrid and Zero-Emission Truck and Bus Voucher Incentive Project).¹⁹ While CARB is responsible for program oversight, some of these programs are implemented as a partnership with local air districts.

Community Air Protection Incentives

Since 2017 the California Legislature has budgeted \$704 million to support Assembly Bill (AB) 617 (C. Garcia, Chapter 136, Statutes of 2017) with incentives directed by local air districts to put advanced technologies to work for cleaner air in the California communities that are most heavily impacted by disproportionate levels of air pollution.

The Legislature designated the initial appropriation of \$250 million in 2017 for immediate benefits in heavily impacted communities while the other aspects of AB 617 were created and implemented. In order to ensure swift action, the Legislature directed that air districts must spend funds according to two existing mobile source incentive programs: the Carl Moyer Memorial Air Quality Standards Attainment Program, and the Proposition 1B Goods Movement Emission Reduction Program. Air districts have been using the resulting Community Air Protection Funds Supplement to the Carl Moyer Program 2017 Guidelines since it was approved by the Board on April 27, 2018.

The Legislature appropriated an additional \$245 million in 2018 and provided additional direction for new opportunities for stationary source incentives as well as Community-Identified Projects consistent with Community Emissions Reduction Programs. The approved 2019 California State Budget contains another appropriation of \$209 million

¹⁷ For more information on the Proposition 1B: Goods Movement Emission Reduction Program, visit: <https://ww2.arb.ca.gov/our-work/programs/proposition-1b-goods-movement-emission-reduction-program>.

¹⁸ For more information on the Funding Agricultural Replacement Measures for Emission Reductions Program, visit: <https://ww2.arb.ca.gov/our-work/programs/farmer-program>.

¹⁹ For more information on the Low Carbon Transportation Investments and Air Quality Improvement Program, visit: <https://ww2.arb.ca.gov/our-work/programs/low-carbon-transportation-investments-and-air-quality-improvement-program>.

for continued incentives to support the Community Air Protection Program, with Legislative direction matching the previous year's appropriation.

Subsequently, staff developed the Community Air Protection (CAP) Incentives 2019 Guidelines²⁰ to provide eligibility and funding criteria for two new project categories, this represents CARB's first steps in providing incentives to clean up stationary sources of air pollution. The new project categories aim to reduce hexavalent chromium emissions from chrome plating activities, as well as include a suite of project types to reduce exposure at public schools. These guidelines will continue to be expanded with new categories of projects, to be responsive to the needs of the most heavily impacted communities across the State.

At the May 2019 Board hearing, CARB staff was directed to provide more flexibility within the Community Air Protection Incentives Guidelines to allow communities and air districts the ability to develop specific Project Plans to quickly address unique local air quality concerns.

Unlike traditional Moyer projects, Stationary and Community-Identified projects do not lend themselves to the same type of cost effectiveness evaluation. Therefore, the proposed criteria for stationary and Community-Identified projects will focus on community involvement, transparency, and consistency. Air Districts will work with communities to identify project categories needed to address community problems and general concepts. Air districts will then develop Project Plans that:

- Document community support – Community members will evaluate whether there has been sufficient community involvement
- Detail the project selection process
- Set participant requirements
- Establish funding amounts and project costs
- Quantify expected emissions/exposure reductions

To ensure reporting requirements are met CARB will be responsible for:

- Assisting districts with development of technical details
- Helping districts be consistent in quantifying benefits
- Confirming that project plans are consistent with statutory requirements
- Ensuring transparency for communities regarding projects funded, dollars spent, and benefits expected

For more information on air pollution incentives, grants, and credit programs, visit: <https://ww2.arb.ca.gov/our-work/topics/incentives>.

²⁰ For more information on the Community Air Protection (CAP) Incentives 2019 Guidelines, visit: <https://ww2.arb.ca.gov/resources/documents/community-air-protection-incentives-guidelines>

REGULATORY PROGRAMS

Federal, State, and local air quality agencies all work together to reduce emissions. At the federal level, the U.S. Environmental Protection Agency (U.S. EPA) has primary authority to control emissions from certain mobile sources, including sources that are all or partly under federal jurisdiction (e.g., some farm and construction equipment, aircraft, marine vessels, locomotives), which it shares in some cases with air districts and CARB. The U.S. EPA also establishes ambient air quality standards for some air pollutants.

At the State level, CARB is responsible for controlling emissions from mobile sources and consumer products (except where federal law preempts CARB's authority), controlling toxic emissions from mobile and stationary sources, controlling greenhouse gases from mobile and stationary sources, developing fuel specifications, and coordinating State-level air quality planning strategies with other agencies.

Regionally, air districts are primarily responsible for controlling emissions from stationary and indirect sources (with the exception of consumer products in most cases) through rules and permitting programs within their regions.

CARB regulatory programs are designed to reduce emissions to protect public health, achieve air quality standards, reduce greenhouse gas emissions, and reduce exposure to toxic air contaminants. CARB establishes regulatory requirements for cleaner technologies (both zero and near-zero emissions) and their deployment into the fleet, for cleaner fuels, and to ensure in-use performance. CARB's regulatory programs are broad – impacting stationary sources, mobile sources, and multiple points within product supply chains from manufacturers to distributors, retailers, and end-users. CARB's regulations affect cars, trucks, ships, off-road equipment, consumer products, fuels, and stationary sources.

One important and relevant regulatory authority of CARB's is to adopt measures to reduce emissions of toxic air contaminants from mobile and non-mobile sources, known as Airborne Toxic Control Measures (ATCM).²¹ These regulatory measures include process requirements, emissions limits, or technology requirements. Additionally, the Statewide Air Toxics "Hot Spots" Program²² addresses the health risk from toxic air contaminants at individual facilities across the State. The Air Toxics "Hot Spots" Program includes several components to collect emissions data, identify facilities having localized impacts, ascertain health risks, notify nearby residents of significant risks, and reduce those significant risks to acceptable levels.

²¹ California Health and Safety Code § 39650 et seq.

²² Assembly Bill 2588, Air Toxics "Hot Spots" Information and Assessment Act, Connelly, Statutes of 1987, California Health and Safety Code § 44300 et seq.

Under the Air Toxics “Hot Spots” Program, air districts are required to set a threshold for facilities that pose a significant health risk and prioritize facilities for health risk assessments. Air districts also establish a risk value above which facilities must conduct a risk reduction audit and emissions reduction plan. Facilities must develop these health risk assessments, risk reduction audits, and emission reduction plans. CARB provides technical guidance to support smaller businesses conducting health risk assessments and developing emissions reduction plans.

Additionally, in some instances CARB has pursued enforceable agreements with industry that result in voluntary but enforceable adoption of the cleanest technologies or practices and provide assurance that emissions reductions will be realized. CARB’s agreement with the Union Pacific Railroad Company and BNSF Railway Company to accelerate introduction of cleaner locomotives in the South Coast Air Basin is an example of an enforceable agreement.

CARB ACTIONS RELATED TO THE STOCKTON COMMUNITY

This section highlights CARB actions that specifically relate to the Stockton community. This list should not be interpreted as comprehensive or exhaustive, but rather illustrative of some of the major statewide strategies driving emissions reductions in conjunction with those local level strategies identified in this community emissions reduction program. Additional CARB foundational strategies can be found in Appendix D and Appendix F of the Community Air Protection Blueprint.²³

Recently Adopted CARB Regulations

CARB adopted the **Advanced Clean Trucks Rule**²⁴ in June 2020 requiring truck manufacturers to transition from producing diesel trucks and vans to electric zero-emission trucks including heavy-duty vehicles beginning in 2024. Manufacturers who certify Class 2b-8 chassis or complete vehicles with combustion engines are required to sell zero-emission trucks as an increasing percentage of their annual California sales from 2024 to 2035. By 2035, zero-emission truck/chassis sales will need to be 55% of Class 2b – 3 truck sales, 75% of Class 4 – 8 straight truck sales, and 40% of truck tractor sales. This rule also requires that fleets report information on a one-time basis about their vehicles to support future zero-emission fleet rules.

In August 2020 CARB adopted the **Heavy-Duty Engine and Vehicle Omnibus Regulation and Associated Amendments**²⁵ which require manufacturers to comply

²³ California Air Resources Board, *Final Community Air Protection Blueprint for Selecting Communities, Preparing Community Emissions Reduction Programs, Identifying Statewide Strategies, and Conducting Community Air Monitoring*, October, 2018, available at: <https://ww2.arb.ca.gov/capp-blueprint>.

²⁴ For more information on the Advanced Clean Trucks Rule, visit: <https://ww2.arb.ca.gov/our-work/programs/advanced-clean-trucks>.

²⁵ For more information on the Heavy-Duty Engine and Vehicle Omnibus Regulation and Associated Amendments, visit: <https://ww2.arb.ca.gov/our-work/programs/heavy-duty-low-nox>

with tougher emissions standards, overhaul engine testing procedures, and further extend engine warranties to ensure that emissions of NO_x (oxides of nitrogen, a key component of smog) are reduced to help California meet federal air quality standards and critical public health goals. The regulation is expected to have a significant impact on communities adjacent to railyards, ports and warehouses that typically experience heavy truck traffic. These trucks often idle, move slowly and make frequent stops – all actions that increase NO_x emissions. Today's heavy-duty trucks do not control NO_x effectively during such “low load” conditions. The new standards will reduce NO_x emissions by 90 percent or more when trucks are operating under these low load real-world operations. All components of the new rule will be phased-in, allowing engine manufacturers time to prepare for compliance. The NO_x standards that engines must meet will be cut to approximately 75 percent below current standards beginning in 2024, and 90 percent below current standards in 2027.

The **Control Measure for Ocean-Going Vessels At Berth**²⁶ was also adopted in August 2020 and is an updated version of the CARB's At-Berth Regulation that supersedes the existing At-Berth Regulation, as specified, and is designed to achieve further emissions reductions from vessels at berth to improve air quality in communities surrounding ports and terminals throughout California. Emissions reductions will be achieved through the inclusion of new vessel categories (such as vehicle carriers and tanker vessels), new ports, and independent marine terminals, and through updated control requirements, among other provisions.

Upcoming CARB Regulations

Commercial Harbor Craft Regulation Amendments – CARB's existing commercial harbor craft regulation was adopted in 2007 and will be fully implemented by the end of 2022. CARB is working through a public process to consider additional amendments that may further reduce emissions and pursue more stringent in-use standards, with consideration for Tier 4 engine technology and near-zero and zero emission technologies. For more information on the regulation and potential new regulatory concepts, visit: <https://ww2.arb.ca.gov/our-work/programs/commercial-harbor-craft>.

Heavy-Duty Vehicle Inspection and Maintenance – When emissions control systems are not operating correctly, in-use emissions can increase. CARB's current inspection programs include the roadside Heavy-Duty Vehicle Inspection Program and the fleet Periodic Smoke Inspection Program. These regulations require heavy-duty vehicles operating in California be inspected for excessive smoke and tampering. In July 2018, CARB approved amendments to the Heavy-Duty Vehicle Inspection Program and the Periodic Smoke Inspection Program to reduce the smoke opacity limits to levels more appropriate for today's modern engine technology. CARB is now exploring the

²⁶ For more information on the Control Measure for Ocean-Going Vessels At Berth, see: <https://ww2.arb.ca.gov/our-work/programs/ocean-going-vessels-berth-regulation>, and the At Berth Factsheet: https://ww2.arb.ca.gov/sites/default/files/2020-08/External%20At-Berth%20Fact%20Sheet%20August%202020%20ADA_0.pdf

development of a more comprehensive heavy-duty inspection and maintenance program that would help ensure all vehicle emissions control systems are maintained adequately throughout the vehicles' operating lives. For more information on existing heavy-duty maintenance programs, visit: <https://ww2.arb.ca.gov/our-work/programs/heavy-duty-diesel-inspection-periodic-smoke-inspection-program>. For more information on the development of a comprehensive heavy-duty inspection and maintenance program, visit: <https://ww2.arb.ca.gov/our-work/programs/heavy-duty-inspection-and-maintenance-program>.

Cargo Handling Equipment Regulation Amendments – Mobile cargo handling equipment is any motorized vehicle used to handle cargo or perform routine maintenance activities at California's ports and intermodal rail yards. The type of equipment includes yard trucks (hostlers), rubber-tired gantry cranes, container handlers, forklifts, etc. The Mobile Cargo Handling Equipment (CHE) Regulation was adopted in 2005 to reduce toxic and criteria emissions to protect public health and was fully implemented by the end of 2017. CARB staff is currently assessing the availability and performance of zero-emission technology to further reduce emissions. For more information on the regulation, visit: <https://ww2.arb.ca.gov/our-work/programs/cargo-handling-equipment>.

Advanced Clean Fleet Rules – CARB is developing a medium and heavy-duty zero-emission fleet regulation with the goal of achieving a zero-emission truck and bus California fleet by 2045 everywhere feasible and significantly earlier for certain market segments such as last mile delivery and drayage applications. For more information, visit: <https://ww2.arb.ca.gov/our-work/programs/advanced-clean-fleets>.

Transport Refrigeration Unit Regulations – Transport refrigeration units congregate at distribution centers, railyards, and other facilities, resulting in the potential for health risks to those that live and work nearby. CARB is working through a public process to consider new requirements to transition the transport refrigeration units fleet to zero emission operations by requiring both zero emission technology and supporting infrastructure. For more information on this new regulation, visit: <https://ww2.arb.ca.gov/our-work/programs/transport-refrigeration-unit/new-transport-refrigeration-unit-regulation>.

Small Off-Road Engines – In 2020, CARB will consider new standards for small off-road engines (SORE), which are spark-ignition engines rated at or below 19 kilowatts and used primarily for lawn, garden, and other outdoor power equipment. For more information on the strategy, visit: <https://ww2.arb.ca.gov/our-work/programs/small-off-road-engines-sore>

Advanced Clean Cars II – CARB staff is developing the Advanced Clean Cars II regulations, which will seek to reduce criteria and greenhouse gas emissions from new light- and medium-duty vehicles beyond the 2025 model year, and increase the number of zero emission vehicles for sale. For more information on these new regulations, visit: <https://ww2.arb.ca.gov/our-work/programs/advanced-clean-cars-program>.

Commercial Cooking Suggested Control Measure – This strategy consists of a two-phase process to evaluate California’s current emission reduction requirements for commercial cooking operations that prepare food for human consumption, and if necessary, make improvements to achieve additional reductions in particulate matter 10 microns or less in diameter (PM10), particulate matter 2.5 microns or less in diameter (PM2.5) and volatile organic compound emissions that contribute to ozone formation. For more information on the strategy, visit: [Blueprint Appendix F](#) – pages F-8 & F-9.

ESTIMATED EMISSIONS REDUCTIONS FROM CARB MEASURES

CARB has estimated the emissions reduction benefits for some of the proposed statewide measures as shown in Table 4-3 for the 2025 and 2030 milestone years for the Stockton Community. Note the emissions reductions from the recently adopted Ocean-Going Vessels At Berth Amendment and Low NOx Omnibus Regulation are not reflected in the emissions inventory presented in Chapter 3 or Appendix C.

Table 4-3 Estimated Emissions Reductions from CARB Measures in the Stockton Community

Proposed Statewide Measures	Emissions Reduction (tons per year)							
	PM2.5		DPM		NOx		VOC	
	2025	2030	2025	2030	2025	2030	2025	2030
Ocean-Going Vessels At Berth Amendment	0.00	0.18	0.00	0.20	0.00	11.45	0.00	0.56
Advanced Clean Car 2		0.02		0.00		1.00		0.38
Heavy-Duty Inspection and Maintenance	0.34	0.38	0.35	0.40	23.25	27.7		
Low NOx Engine Standard					1.88	14.17		
Small Off-Road Engine Amendment	0.15	0.92	0.12	0.28	17.03	27.09	8.28	28.31

5. ENFORCEMENT PLAN

5.1 INTRODUCTION

Enforcement of air quality rules and regulations by the San Joaquin Valley Air Pollution Control District (District) and the California Air Resources Board (CARB) is critical to continuing air quality progress and achieving the air quality goals contained in the Valley's State Implementation Plans. Compliance with federal, state, and local air quality rules and regulations is ensured by operating robust inspection programs along with a full range of educational and compliance assistance programs.

This Enforcement Plan describes the stationary and mobile source enforcement history for the Stockton AB 617 Community. In addition, the plan describes the overall enforcement programs operated by the District and CARB. Based on the analysis of the enforcement history and input from the Community Steering Committee, the Community Emissions Reduction Plan (CERP) includes focused enforcement measures to enhance enforcement and compliance assistance activities within the community in support of the emission reduction commitments in the CERP.

5.2 OVERVIEW OF SAN JOAQUIN VALLEY AIR POLLUTION CONTROL DISTRICT ENFORCEMENT PROGRAM

The District's mission is to improve the health and quality of life for all Valley residents through efficient, effective, and entrepreneurial air quality management strategies. The District's Enforcement Department seeks to aid in achieving this mission through fair, consistent, and comprehensive enforcement utilizing a full suite of enforcement and compliance assistance related activities to ensure compliance with District, state and federal rules and regulations. The program objectives for the Enforcement Department are set forth in federal and state law and the District's air quality attainment plans. In order to meet these program objectives, District staff perform inspections at approximately 9,200 permitted facilities and responds to approximately 3,000 public complaints, and verifies emissions reductions at thousands of locations where emission reduction incentive projects have been implemented.

The major functions of the District's Enforcement Department are as follows:

Inspections of Stationary Sources

The District performs thousands of comprehensive on-site inspections each year to ensure compliance with federal, state, and District requirements. These compliance evaluations are unannounced whenever possible and play a key part to meeting clean air requirements. The frequency of regular inspections depends on the type of facility. When considering limited resources, priority is given to federal Title V (Major) sources, facilities that emit non-attainment criteria or toxic pollutants, facilities with equipment that is more susceptible to upsets, compliance history of operation, etc. Under this scenario, a chrome plating facility will be inspected more frequently than a back-up, emergency generator which only operates a few hours per year.

Compliance inspections are conducted by well-trained District air quality inspectors. Inspections include a physical inspection of the facility and equipment, a review of operating and monitoring records, and the use of advanced detection equipment, where appropriate, to determine compliance with permitted emission limits. During the inspection, District staff ensures that the equipment is permitted appropriately, and that the facility is operating in compliance with all permit requirements and applicable local, state, and federal regulations. If the facility is determined to be in non-compliance, the inspector issues the facility an enforcement action that requires prompt correction of the issue and generally results in the imposition of a civil penalty to dissuade from any non-compliance in the future.

Complaint Investigations

The District receives thousands of complaints each year for which timely responses and investigations of alleged sources of non-compliance are top priorities. Inspectors are on-call 24 hours per day, seven days a week and use automated voicemail and computer systems to facilitate the timely response to complaints in order to abate non-compliance with District rules, including potential public nuisances. Along these same lines, the District added the ability to easily submit complaints, including video and photographs, online and through mobile smartphone applications. District staff are required to keep the reporting party apprised of the investigation findings until it has been completed. The District provides a bilingual (Spanish-English) telephone complaint line and also has the capability to utilize multilingual translation services, in the field or over the telephone, to ensure that all communities and groups within the Valley are properly served.

Emissions Testing

District inspectors oversee hundreds of third-party emissions tests conducted at stationary sources each year for the purpose of measuring air pollutants and ensuring compliance with established standards from stationary sources of air pollution. District staff have three main tasks when overseeing source tests at stationary source sites. First they review the source test protocol, submitted by the third party source testing contractor, which outlines the testing methods that testing period. District staff reviews the protocol to ensure the proper testing methods will be used and that the source test contractor has the proper equipment and certifications to conduct the test. The second task is to witness the test to ensure the source test contractor follows the correct testing procedures. Lastly, District staff reviews the source test results to ensure the data is properly reported and to act promptly on any compliance issues related to the testing.

In addition, the District utilizes its monitoring van and portable exhaust gas analyzers to assess the emissions from internal combustion engines, boilers, and other combustion devices to ensure they are operating according to specifications and complying with all permitted and/or rule emission limits.

Gasoline Station Permitting, Inspecting and Testing Program

Gasoline stations, in aggregate, are one of the largest potential sources of volatile organic compounds in the Valley. A comprehensive and effective permitting, inspection

and testing program is important to ensure the vapor recovery systems operate as designed and the Valley realizes the emission reductions anticipated in Rule 4621 (Gasoline Transfer Into Stationary Storage Containers, Delivery Vessels and Bulk Plants) and Rule 4622 (Gasoline Transfer into Motor Vehicle Fuel Tanks).

District staff continues to inspect gasoline station vapor recovery systems on a routine basis looking for torn hoses, damaged nozzles, and missing parts. However, during recent years there have been many changes in vapor recovery technology and state laws such that the simple visual inspections are no longer sufficient. More emphasis is now being placed on performance tests that evaluate gasoline station equipment effectiveness. As a result, the District implemented a gasoline dispensing tester certification and training program to ensure qualified third party contractors are available for operators of this equipment.

Wood Burning Heaters and Fireplaces

Further reducing residential wood smoke emissions is a high priority under the District's 2018 PM2.5 Plan given the significant localized health impacts associated with residential wood smoke. Scientific studies show that prolonged inhalation of wood smoke contributes to lung disease, pulmonary arterial hypertension, and pulmonary heart disease, which can eventually lead to heart failure. District Rule 4901 is designed to improve public health by reducing toxic wood smoke emissions in Valley neighborhoods during the peak PM2.5 winter season (November through February).

Since 2004, the District has had a robust enforcement program for designated wood burning curtailment days to ensure the District is achieving the expected emission reductions as a result of the requirements of the rule. This includes having a significant portion of field staff mandatorily assigned to conduct proactive surveillance in counties with declared wood burning curtailments. The District also conducts surveillance in counties with curtailments on days that District offices are closed and performs periodic night-time surveillance throughout the Check Before You Burn season.

In the District's ongoing efforts to utilize the latest forms of technology to improve efficiency and effectiveness, the District tested several technologies for nighttime fireplace and wood burning heater enforcement. The District purchased ultra-low light cameras, which have the greatest capacity to capture non-compliance through photographic and video evidence. The use of the cameras are able to clearly document smoke coming from chimneys in extremely low-light conditions in a way that previous technologies used and tested were unable to match.

Compliance Assistance

The District believes in working closely with businesses and residents to assist in achieving compliance with air pollution rules and regulations. The Compliance Assistance program has emphasized an educational approach to help Valley residents and businesses comply with a variety of air pollution regulations. Businesses and individuals throughout the Valley are provided with:

- **Individualized Assistance:** Personal, one-on-one help is provided to thousands of businesses and residents to ensure they understand the federal, state, and District's requirements.
- **Compliance Assistance Bulletins:** Actively evaluate upcoming rule compliance dates and develop educational materials that are sent to affected groups including, but not limited to, residents, realtors, building departments, contractors, and industrial and commercial facilities.
- **Compliance Schools:** The District provides training classes regarding information on the topics of open burning, gasoline vapor recovery, and wood burning fireplaces and wood burning heaters to individuals who have received a Notice of Violation from the District. In addition to discussing the aforementioned specific topics, the courses also provide general air pollution training, discuss the air quality challenges of the San Joaquin Valley, and opportunities for them to contribute to improving air quality in the Valley.
- **Gasoline Station Tester Training:** Ongoing training for contractors is provided for those wishing to perform vapor recovery tests within the District. District rules require testers be certified to ensure there are a qualified pool of contractors from which businesses can choose to perform their equipment's testing.
- **Asbestos Training:** Comprehensive assistance on asbestos regulations is provided to the public, building industry, building departments, fire departments, and realtors. Staff continues to spend considerable time providing one-on-one assistance, in addition to group trainings, to the regulated community. The District has also developed online tools and resources to educate the public on asbestos notification requirements in the Valley.
- **Residential Wood Burning Heater Professional Training:** Training requirements for qualified individuals (those people having either a certification from the Fireplace Investigation Research and Education, Chimney Safety Institute of America, or the National Fireplace Institute or has documentation demonstrating they are qualified to perform inspections, maintenance and cleaning activities on wood burning heaters) who may be hired to perform inspections of wood burning heaters and pellet stoves to ensure they can be operated in a compliant manner prior for individuals who voluntarily request to register their wood burning heaters and pellet stoves.
- **Fugitive Dust Education:** Staff organizes and conducts classroom training for all groups required to submit dust control plans for construction activities and provides ongoing training and outreach as needed and as requested to businesses and entities that may be subject to the requirements.
- **Prescribed Burning Outreach:** The District meets periodically with the land managers of the USDA Forest Service, National Park Service, US Fish and Wildlife

Service, Bureau of Land Management, California Department of Forestry and Fire Protection, and Southern California Edison Company in order to minimize impacts of smoke from prescribed burns and wildfires. Compliance staff participate on the daily calls during fire season to keep abreast of wildfire and prescribed burn activities throughout the area.

- **Access to District Policies:** District policies are available on the internet for stakeholders to review, comment on, and use to assist them with complying with District requirements. The internet is updated regularly with new or modified policies to ensure availability of current information.

Emission Reduction Incentive Program Inspections

To ensure that the emission reduction projects funded by the District's incentive programs are real and permanent, the District monitors the pre-contract and post-contract performance of grant recipients. Thousands of field inspections are conducted to verify that equipment is appropriately replaced or controlled, adequately maintained, and also verifies that older equipment has been properly disposed of.

Incentive projects requiring compliance inspections include the replacement of older trucks with new less polluting ones, school bus replacements, agricultural pump engine replacements, emissions controls on trucks, and other related control strategies. Each funded project requires a minimum of two initial inspections and several types of projects require ongoing inspections and recordkeeping requirements to assure emission reductions are realized for the life of the project.

5.3 SAN JOAQUIN VALLEY AIR POLLUTION CONTROL DISTRICT ENFORCEMENT HISTORY IN STOCKTON AB 617 COMMUNITY

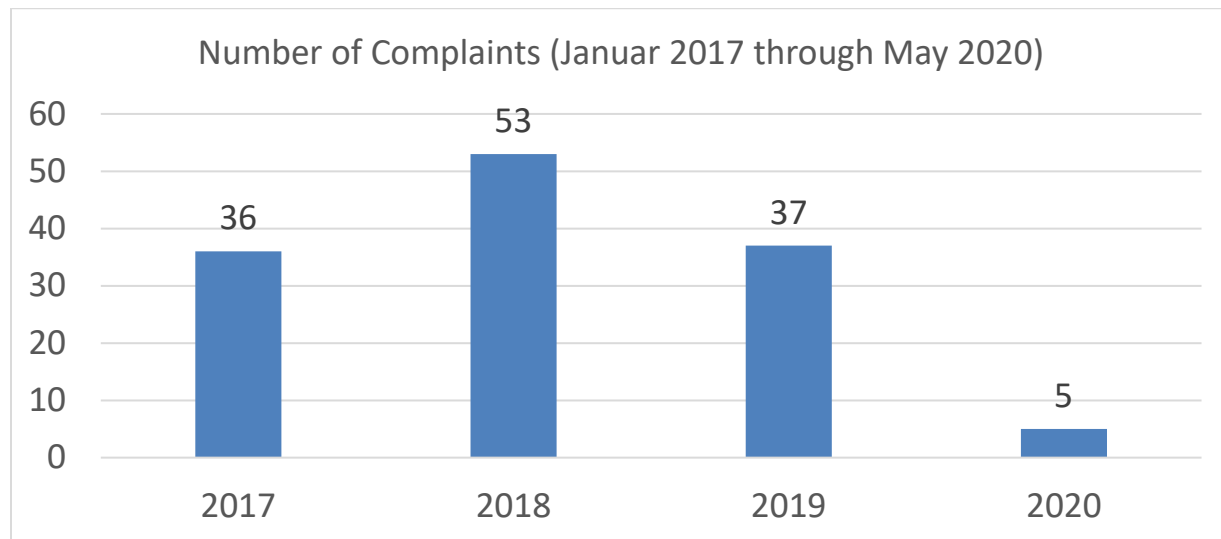

The District's enforcement presence within the Stockton AB 617 Community is comprised of many different facets including, but not limited to, performing facility inspections, investigating complaints from the public, investigating breakdowns, and overseeing third-party emissions testing at facilities. Since 2017, the District has conducted inspections of 2,409 equipment units during 1,121 inspections at permitted facilities within the Stockton AB 617 Community, has received and responded to 131 air quality complaints from the public, and has issued 212 enforcement actions associated with violations of air pollution rules and regulations. A listing of the facilities, inspections, complaints, and enforcement actions can be found in Appendix F.

5.3.1 RESPONSE TO PUBLIC AIR POLLUTION COMPLAINTS

The public plays an important role in protecting public health by reporting local air quality issues that they observe in their communities. Often these complaints serve as the first warning of an air pollution compliance issue that needs to be addressed. The District places the highest priority of responding to complaints from the public and responds to each and every complaint received. In addition, the District operates an "on-call" program to ensure that complaints received outside of normal business hours can be appropriately addressed since air pollution related issues are not bound by

normal business hours. The process of responding to a complaint can be unique for each complaint received depending on factors such as whether the issue is currently in progress, whether the issue is a recurring/ongoing issue, the type of source, the time of day, and the number of complaints received about the issue. Figure 5-1 shows the number of complaints received by the District each year since 2017

Figure 5-1 Number of Complaints by Year from 2017-2020

Based on the resulting complaint investigations, the District confirmed a violation of District rules or regulations and took enforcement action in 18 of the complaints, determined that the issue did not constitute a violation of any federal, state, or local air quality rule in 29 of the complaints, referred 2 complaints to the proper agency with jurisdiction over the issue, and was unable to confirm whether or not a violation occurred in the 82 remaining complaints (at times, the issues associated with public complaints can be transient in nature and the information provided by the reporting party may lack sufficient information to track down and confirm the issue). Of the 18 enforcement actions taken as the result of public complaints, 7 were for illegal residential open burning of waste, 2 were for illegal use of a residential fireplace or outdoor wood burning device, 2 were for fugitive dust related issues, 3 were for permitting/registration related issues, 1 were for agricultural open burns, and 3 was for work practices issues at an automobile coating operation

Figure 5-2 below details the complaints received by type since 2017. Complaints concerning odor nuisance and residential open burning each made up 23% of the total complaints received in the community. Complaints regarding fugitive dust made up approximately 20% of the complaints received in the community. In total, these three categories made up over 66% of the complaints received.

Figure 5-2 Number of Complaints by Type from 2017-2020

The District received and responded to 39 complaints regarding residential open burning and residential fireplace/outdoor wood burning devices during this period. The District confirmed illegal open burning and took enforcement action in 8 of these cases, determined that 3 were not a violation (permissible fireplace burn day or outdoor cooking fire), and was unable to confirm 28 of the complaints. In addition to the complaints received in these categories, members of the Community Steering Committee have suggested increased outreach/education and enforcement in these categories. The District has included specific enhanced enforcement and outreach/education measures as part of the CERP to reduce the potential for localized air quality impacts associated with failure to comply with District rules pertaining to residential open burning and residential fireplace/outdoor wood burning devices.

The District received 31 odor complaints during this period and determined that none of the complaints resulted in a violation failing under the District’s jurisdiction. Under state law, odors are regulated under public nuisance requirements. To become a violation, an odor must cause “injury, detriment, nuisance, or annoyance” to a considerable number of people or the public. Each of the odor complaints were separate instances from a single party; and therefore, did not rise to the level of a public nuisance under state law. Three of the complaints fell outside of the District’s jurisdiction and were referred to the appropriate agency.

Of the 26 fugitive dust complaints received, the District issued an enforcement action in 2 of the cases. In 2 of the instances, the District determined that the operation was complying with the District's Regulation VIII fugitive dust rules and public nuisance rules. In 22 of the instances, the District was unable to confirm the complaint. The complaints that did not result in enforcement actions or were unable to be confirmed were primarily associated with construction/ earthmoving activities track out or open areas. The District has included specific enhanced enforcement measures as part of the CERP to reduce the potential for localized air quality impacts associated with fugitive dust from construction/earthmoving activities and open areas subject to District Regulation VIII. Since the majority of the complaints have been received between April and September, these enhanced enforcement efforts will be conducted during the 2nd and 3rd calendar quarters.

The District received 11 complaints associated with commercial/industrial open burning. The District found that 9 were cooking fires which are exempt from open burning rules, 1 was a spontaneous combustion fire, and in the 1 remaining the District was either unable to locate the burn or the responsible party for the burn. The enhanced enforcement and outreach/education CERP measures for residential open burning will aid in compliance with the rules pertaining to illegal open outdoor burning.

The District received 9 complaints regarding federal asbestos requirements associated with regulated demolitions and renovations. The District issued enforcement actions in 3 of these instances, the District was unable to confirm 3 complaints in this category. The District took no enforcement action in 3 cases as the projects were either complying with federal asbestos requirements or were exempt under federal law.

The District received 2 complaints regarding visible emissions from equipment at facilities within the community. The District was unable to confirm whether or not a violation occurred in the 2 complaints in this category. As discussed below under the District Enforcement Action section, the District has included specific enhanced enforcement measures as part of the CERP to address failure to comply with emission standards at permitted facilities.

5.3.2 DISTRICT ENFORCEMENT ACTIONS

Federal and state law, along with local rules, require the enforcement of air quality rules and regulations. The District takes formal enforcement action for all violations of applicable federal, state, and local rules and regulations within its jurisdiction. In addition, the District enforces conditional permit requirements, Hearing Board orders, and at times seeks delegation to enforce statewide mobile source and greenhouse gas measures. Generally a Notice of Violation (NOV), which normally results in a civil penalty, is issued to document a violation. Under the limited circumstances specified in District Rule 1180, a Notice to Comply (NTC) may be issued for first-time, minor violations. An NTC does not carry a monetary penalty but does require quick resolution of the minor violation. Should a party not correct the violation within the timeframe established by the NTC, an NOV will be issued.

Over the past 3 years, the District has issued 175 NOVs and 37 NTCs in the Stockton AB 617 Community. Figure 5-3 shows the annual breakdown of NOVs and NTCs since 2017.

Figure 5-3 Number of Enforcement Actions Issued by Year (2017-2020)

Figure 5-4 shows the enforcement actions categorized by type. Since 2017, 88 of the 212 enforcement actions resulted from violations of administrative requirements such as recordkeeping, late report submittal, operating with a suspended permit, or operating without a permit. The District issued 51 enforcement actions for violations resulting in excess emissions from facilities (not including gas stations). These violations occurred at 13 permitted facilities in the area and 1 ocean-going vessel. The District also issued 18 enforcement actions to gas stations for violations resulting in excess emissions and 1 gas station certification enforcement action. These violations occurred at 14 gas stations in the area. The District believes that more frequent inspections for these 27 facilities would be prudent to limit the potential for air quality impacts associated with failure to comply with emission standards established by District permit, rule, or regulation.

In addition, the District believes a new pilot training program for conducting self-inspections of equipment at gas stations may help to limit the potential for air quality impacts associated with vapor recovery defects at gasoline dispensing operations. Accordingly, the District has included a compliance assistance CERP measure to develop a new training program to instruct gas station operators on conducting thorough self-inspections to aid in the identifications and timely repair of system defects. The District will provide the hands on training to each gas station operator in the community.

Figure 5-4 Enforcement Actions by Type from 2017-2020

A review of the data also shows that the District has issued 7 violations for residential open burning, and 16 enforcement actions for fireplace/outdoor wood burning heater violations. This further demonstrates the need to include the aforementioned enhanced enforcement and outreach/education CERP measures.

5.4 CALIFORNIA AIR RESOURCES BOARD PROGRAM OVERVIEW AND ENFORCEMENT HISTORY IN STOCKTON

Section 5.4 Provided by the California Air Resources Board

The California Air Resources Board (CARB) enforcement programs cover the vehicles we drive, the diesel engines that power our economy, consumer products that we purchase and greenhouse gas (GHG) emissions from our industries and activities. The goal of Stockton’s enforcement programs is to achieve comprehensive compliance in every regulation CARB adopts. Through enforcement, CARB works to bring responsible parties into compliance, and in doing so, achieves a level playing field across industry so that no company can benefit from non-compliance at the expense of another. CARB also works to deter industries from future violations and takes compliance seriously, because the success of our programs and the protection of public health depend on it.

CARB applies enforcement programs professionally in accordance with our enforcement policy,²⁷ which was updated in 2017. CARB uses program data, complaints and inspections to identify potential non-compliance, and then investigates each case. Once a violation is identified, CARB notifies the responsible party and evaluates what happened. CARB works with the party to achieve compliance and measure the relevant facts and circumstances of each case, relative to the eight statutory factors as described in our enforcement policy, to determine an appropriate penalty. The case is settled when the responsible party has achieved compliance and both parties have agreed upon an appropriate penalty. If a mutual settlement cannot be reached, CARB refers the case to California's Attorney General for civil litigation.

Field inspectors are a critical component of CARB's Heavy-Duty Diesel Enforcement Program. The inspectors work across the state to inspect trucks and other equipment for compliance with CARB's diesel regulations, such as the Heavy-Duty Diesel Vehicle Inspection Program (HDVIP), Drayage Truck, Truck and Bus Regulation, SmartWay and Transport Refrigeration Unit (TRU) Air Toxic Control Measure. Field inspectors also conduct inspections for compliance with In-Use Off-Road and School Bus Idling regulations. CARB inspectors examine heavy-duty vehicles and equipment at numerous locations throughout California, such as at California Highway Patrol (CHP) scale facilities, warehouses, fleet yards, construction sites, random roadside locations, truck stops, rest areas, ports and rail yards.

CARB'S THREE YEAR ENFORCEMENT HISTORY IN STOCKTON

The following section provides an overview of CARB enforcement actions across several enforcement programs within the Stockton Assembly Bill 617 (AB 617) community boundary for years 2017 through 2019.

Under the heavy-duty vehicles and marine enforcement program sub-sections, CARB staff provide overviews of enforcement activities along with maps to display the approximate locations of program inspections, which may help to determine gaps in CARB enforcement activity as well as locations where enhanced enforcement is necessary to deter potential violators within the community. Additional sub-sections include overviews of CARB's fuel enforcement activities, statewide consumer product enforcement activities, case settlements, Supplemental Environmental Projects, and more.

CARB will work closely with the Community Steering Committee (CSC) to determine areas of non-compliance within the Stockton AB 617 area that needs an enforcement presence. CARB acknowledges enforcement presence can be increased in this area and will work with CSC and the San Joaquin Valley Air Pollution Control District (SJVAPCD) to identify opportunities for enhanced enforcement.

²⁷ <https://ww2.arb.ca.gov/resources/documents/enforcement-policy>

Heavy-Duty Vehicles Programs

Over the last three years, CARB has conducted 244 inspections on Heavy-Duty Diesel Vehicles (HDDV) within the selected Stockton AB 617 Community. These inspections occurred across 7 of 12 CARB HDDV enforcement programs, as described in Appendix 4.1.

Table 5-1 below summarizes HDDV enforcement actions in Stockton from 2017 to 2019. Of the five citations issued to HDDVs within the community boundary, four were for emissions violations and one was for a non-emissions violation. Emissions violations further contribute to air pollution while non-emissions violations do not (e.g., a truck not meeting labeling or reporting requirements). CARB is working to compile information on the resolution of violations issued in Stockton and will provide this data to CSC as it becomes available.

Table 5-1 HDDV Enforcement in Stockton: 2017-2019

Program	Inspections	Violations	
		Emissions	Non-Emissions
Drayage	25	0	1
Heavy-Duty Vehicle Inspection Program (HDVIP)	134	0	0
Idling	31	0	0
Off-Road	3	0	0
Smart Way	33	0	0
Transportation Refrigeration Unit (TRU)	2	2	0
Truck and Bus	16	3	0
Total	244	5	1

Figure 5-5 below provides a year-to-year comparison of HDDV enforcement actions and overall compliance rates from 2017 to 2019. Although overall compliance remains high (at and above 96 percent) over the three-year period, the low number of total inspections under the Drayage, Off-Road, TRU and Truck and Bus programs, demonstrate the need for more targeted inspections in the Stockton community. CARB will work closely with CSC to determine methods to identify areas of non-compliance by evaluating emissions inventory, air monitoring data, CARB's three-year history and community groundtruthing information within the Stockton AB 617 boundary.

Figure 5-5 Year-to-Year Comparison of HDDV Enforcement in Stockton

Figure 5-6 below shows the approximate locations (indicated by the truck icons) of the above-mentioned HDDV program inspections in the Stockton community boundary. Visualizing inspection locations helps CARB staff to determine any locations where enhanced enforcement is needed within the community. In the past, CARB staff would target areas with large concentrations of HDDVs such as truck stops and distribution centers. It is important to note that each location represents multiple inspections across the various HDDV programs. In addition, implementing random roadside inspections can be difficult because field staff, in coordination with the California Highway Patrol, must have enough space to perform inspections safely on the side of the road.

Figure 5-6 Map of Heavy-Duty Diesel Vehicle Inspections in Stockton: 2017-2019

In April 2017, the Governor signed into law Senate Bill 1 (SB 1),²⁸ a legislative package meant to generate significant funding for transportation projects (e.g., to repair local streets, bridges, and roadways) across California. SB 1 includes a provision that aims to bring old, polluting buses and trucks into compliance with applicable emission standards as outlined in the Statewide Truck and Bus Regulation, and authorizes DMV to deny registration to non-compliant heavy-duty vehicles²⁹ starting January 1, 2020, through December 31, 2023. By the end of 2023, 100 percent of trucks and buses registered in California, which are subject to the rule, will comply with this regulation.

In response to the legislation, CARB began a streamlined enforcement process to increase outreach to owners of heavy-duty diesel trucks and buses and provide an opportunity for vehicle owners to demonstrate compliance. Those with older vehicle models that could potentially be out of compliance were sent Notices of Non-Compliance (NC) and Notices of Violation (NOV)³⁰ from 2018 through 2019. In the last quarter of 2019, CARB sent warning letters to fleet owners who appeared to have vehicles that could potentially be out of compliance beginning January 1, 2020. HDDV owners are now required to show proof of compliance to Department of Motor Vehicles (DMV) with their vehicle registrations.

²⁸ https://leginfo.ca.gov/faces/billNavClient.xhtml?bill_id=201720180SB1

²⁹ The regulation applies to nearly all diesel-fueled trucks, buses, and school buses with a gross vehicle weight rating (GVWR) greater than 14,000 pounds.

³⁰ A Notice of Non-Compliance letter is sent to request proof of compliance. If compliance cannot be verified, a Notice of Violation is sent.

Table 5-2 Summary of letters sent under SB 1 in Stockton: 2018-2019

Type of Letter	Number of Letters Sent
Warning letters	189
NC and NOV letters	157
Total	346

In Stockton, CARB identified 1,512 HDDVs within the Stockton community. As shown in Table 5-2 above, CARB issued 189 warning letters and 157 NCs and NOVs to owners of vehicles within the area in 2019. Of the 157 vehicle owners sent NCs or NOVs, 29 demonstrated compliance, whereas 118 vehicles were found to be non-compliant and were issued registration holds by DMV and were removed from the road. In total, CARB issued warning letters or took enforcement action against 346 vehicle owners. No enforcement action was taken on 10 other vehicles that were found not to be subject to the Truck and Bus Regulation.

Marine Programs

From 2017 to 2019, CARB staff performed 171 inspections for marine regulation enforcement at the Port of Stockton. Descriptions of the related marine enforcement programs are provided in CARB's Appendix.

Table 5-3 Marine Enforcement in Stockton: 2017-2019

Program	Total Inspections	Violations
CHE	121	23
CHC	21	0
OGV	29	1
Total	171	24

As shown above, marine enforcement focused mainly on the Cargo Handling Equipment (CHE) Regulation. During this period, 24 NOVs were issued for violations of CHE and Ocean Going Vessels (OGV) programs. CARB staff did not find any violations of the Commercial Harbor Craft (CHC) Regulation.

below provides a year-to-year comparison of marine enforcement activities and overall compliance rates from 2017 through 2019.

Figure 5-7 Year-to-Year Comparison of Marine Enforcement in Stockton

Error! Not a valid bookmark self-reference. 5-8 below indicates the approximate locations of the above-mentioned marine program areas at the Port of Stockton. This

map may assist the community in identifying locations that CARB is not aware of or locations where additional inspections can occur.

Figure 5-8 Marine Enforcement Activity at the Port of Stockton: 2017-2019

Consumer Products

Consumer products are chemically formulated products used by household and institutional consumers and can be sources of toxic air contaminants and volatile organic compounds that community members unknowingly bring into their homes.

Examples include:

- Detergents and cleaning compounds
- Polishes and floor finishes
- Cosmetics and personal care products
- Home, lawn and garden products
- Disinfectants and sanitizers
- Aerosol paints and automotive specialty products
- Composite wood products

Consumer product inspections are an important regulatory tool to improve public health in the community. CARB investigators in the Consumer Products program purchase samples of regulated consumer products from outlets all over California. They inspect products for compliance with registration and dating requirements and send selected products to the laboratory for testing.

From 2017 through 2019, CARB conducted 1,883 consumer product inspections statewide. Consumer products are reported statewide because it is assumed these products are sold and delivered throughout the state. Table 5-4 below represents a breakdown of enforcement action in the state.

Table 5-4 Consumer Product Inspections Statewide: 2017-2019

Program	Total Inspections	Violation	Under Investigation
Aerosol Coatings	118	24	72
Antiperspirant/Deodorants	35	4	16
Composite Wood	120	11	50
Other Consumer Products	1,610	73	618
Total	1,883	112	756

Vehicles and Engines

CARB is responsible for evaluating the emission control systems of new vehicles and engines, and evaporative emission control systems of engine-equipped devices. When CARB finds that the vehicle/engine/evaporative emission control system complies with all of California's emission standards and emissions-related requirements, the vehicle/engine/evaporative emission control system may operate in California.

CARB conducted six Vehicles and Engines inspections in the Stockton AB 617 Community during the 2017-2019 period. CARB staff found zero violations across the three programs listed in Table 5-5 below.

Table 5-5 Vehicles & Engines Program Inspections in Stockton: 2017-2019

Program	Inspections	Violations
49 State	1	0
Recreational Marine Engines	1	0
R134A	4	0
Total	6	0

Fuels Enforcement Program

CARB staff are responsible for setting standards and adopting regulations to achieve the maximum degree of emissions reduction possible from vehicular and other mobile sources. Motor vehicle emissions are responsible for approximately 55 percent of air pollution emissions statewide.

As seen in Table 5-6, from 2017 through 2019, CARB staff conducted 112 fuel inspections in the Stockton community. There were no violations issued for these inspections within the community.

Table 5-6 Fuels Program Inspections in Stockton: 2017-2019

Fuel Type	Inspections	Violations
Gas	75	0
Diesel	28	0
Ethanol	8	0
Bio	1	0
Total	112	0

Case Settlements

This section presents an overview of settlement agreements reached between CARB and companies in violation of CARB regulations in the Stockton community. In 2017, a company that failed to comply with requirements of the CHE Regulation signed a settlement agreement with a penalty of \$170,625.00 that was paid to the California Air Pollution Control Fund. In August 2019, CARB settled a case with the Port of Stockton in the amount of \$8,625.00 for violating the CHE Regulation. For further details on these cases, please visit <https://ww2.arb.ca.gov/our-work/programs/enforcement-policy-reports/enforcement-case-settlements>.

Complaints Summary and Resolution

CARB's previous complaint management system relating to HDDVs lacked the ability to track complaints by specific location. However, CARB staff have begun to work on and track all complaints through the California Environmental Protection Agency (CalEPA) Complaint Reporting System.³¹ This will allow CARB staff to better track complaints by community and to see the resolution of the complaint. Furthermore, this process will enhance CARB's complaint response by encouraging better complaint referrals (e.g. referring complaints to the proper agency and/or identifying complaints that may require multiple agencies to be involved in their resolution). To increase the effectiveness of the complaint program, CARB Enforcement developed a training to help communities identify possible violations and report an enforceable complaint.

Complaints are a vital part of CARB's enforcement program and we encourage the community to report possible violations regularly. In 2019, CARB received eight diesel complaints through CARB's complaint reporting system for the Truck and Bus

³¹ <https://calepacomplaints.secure.force.com/complaints/Complaint>

Regulation and four complaints through CalEPA's reporting system within the Stockton AB 617 Community. CARB referred the complaints received to the appropriate section in a timely manner.

Supplemental Environmental Projects

CARB has a Supplemental Environmental Project (SEP) Policy that allows community-based projects to be funded from a portion, up to 50 percent, of the penalties received during settlement of enforcement actions. Every year CARB initiates cases that result in settlements with monetary penalties. The goal of the SEP program is to improve public health, reduce pollution, increase environmental compliance and raise public awareness in neighborhoods most burdened by environmental harm. In Stockton, there is one school air filtration SEP that is currently pending approval for funding. In addition, there are three SEPs funded in the San Joaquin Valley Air District.

Area	AB617 Community	SEPs	Amount Funded	Funding Status
San Joaquin Valley	South Central Fresno	Healthy Air Neighborhoods-Fresno	\$ 35,000.00	Fully funded
San Joaquin Valley	Southwest Stockton	Installation of Air Filtration Systems in Stockton-Washington Elementary School	\$ 80,000.00	Fully funded
San Joaquin Valley	Shafter	Asthma Impact Model Kern	\$ 113,480.00	Fully funded

CARB's SEP policy can be accessed at <https://ww2.arb.ca.gov/our-work/programs/supplemental-environmental-projects-seps>.

Outreach Materials

In an effort to provide communities with more knowledge, tools, and resources for enhanced enforcement, CARB Enforcement has developed the following outreach materials to further inform community members:

- **CARB's Enforcement Visualization Tool**

This web-based tool allows community members to see a map that details statewide field inspections and case settlements across California. This tool allows you to look up inspections by program, type, zip code, and date. A user guide has been developed to go along with the tool. This is a one-pager on how to use the Visualization Tool in your community. The Visualization Tool is available at <https://webmaps.arb.ca.gov/edvs/>.

- **Complaint Reporting**

- CARB has developed a community-focused training to provide communities with the information necessary to report a complaint. The trainings are tailored to each region within the AB 617 Program. For instance, the training provided in the San Joaquin Valley may differ from training given in West Oakland, based on the types of emission sources within the region, as well as contact information for other regulatory parties.
- As shown in Figure 5-9, CARB has also developed reporting cards (available in both English and Spanish) that include information on where to report complaints and what information to provide when reporting complaints. If the community is interested in receiving CARB's complaint reporting training or obtaining the Complaint Reporting business cards through the CSC or another outlet, please contact COES@arb.ca.gov, or speak to your local CARB Enforcement liaison.

Figure 5-9 CARB Complaint Reporting Business Cards

- **Supplemental Environmental Project Brochures**

The SEP brochure outlines the SEP program and how to apply. It is available in both English and Spanish. To learn more about the SEP program, visit <https://ww2.arb.ca.gov/our-work/programs/supplemental-environmental-projects-seps>.

- **Informational Outreach Materials.** CARB staff are currently working on community outreach materials, including a multi-regulation booklet and a community idling factsheet. The booklet, geared towards community members, aims to provide information on the requirements for trucks and buses operating in their communities. For more information on any of the above outreach and training activities, please contact the Community Outreach and Enforcement Section at COES@arb.ca.gov.

CALEPA EJ INITIATIVE

In 2018 and 2019, CARB staff participated in a multi-agency initiative lead by CalEPA that focused on Stockton. As part of the initiative, CARB provided the City of Stockton with No-Idling signs. As of December 2019, seven signs were posted at various locations identified by the community as having high rates of idling trucks. Of the seven signs posted, three were on South Fresno Avenue, three were on Lincoln Street, near the DMV, and one was on Weber Avenue.

In addition, CARB developed a monitoring plan to help quantify the air pollution burden in the Boggs Tract community with a specific focus on George Washington Elementary School. CARB staff installed two Aeroqual sensors at the George Washington Elementary School and data was collected from July 30, 2019 to August 28, 2019. These sensors measured PM_{2.5}, ozone and NO₂ concentrations in the community.

CARB also conducted mobile monitoring to characterize the air quality and its spatial pattern around the school and to identify possible sources of pollution. CARB staff collected monitoring data using a Mobile Sampling Platform. In total, CARB conducted 7 days of sampling from August 15, 2019 to August 30, 2019, making 19 rounds of the community and surrounding area. CARB concluded that areas in the vicinity of the school and near the port showed higher levels of PM₁₀ (and other coarser PM), which was observed to be consistent with road dust from unpaved roads. Initial analysis of the combined monitoring efforts appeared to show that the highest concentrations of measured pollutants were lower than both the Federal and State air quality standards.

The results of CalEPAs environmental justice initiative are located at the following link: <https://calrecycle.maps.arcgis.com/apps/Cascade/index.html?appid=99f5790b860844668bdef48f45dcfa00>

CARB ENFORCEMENT STRATEGIES

The goal of our enforcement programs is to achieve comprehensive compliance in every regulation CARB adopts. CARB acknowledges that the high compliance rates identified in the enforcement history may not necessarily reflect compliance across the community. In cases where enhanced enforcement activities uncover non-compliance issues, CARB's goal will be to achieve the same or higher compliance rates as observed in CARB inspections throughout the AB 617 Community. In addition, CARB's

goal is to work closely with CSC, SJVACPD, local organizations and other agencies within Stockton (e.g. City government) to address gaps in the enforcement of mobile sources. In the past, CARB focused mobile enforcement on high traffic areas, truck stops, distribution centers and areas where complaints were reported.

To achieve these goals, CARB is committed to enhancing enforcement activities within Stockton by utilizing the following tools:

- An assessment of the enforcement history data
- Emissions inventory
- Air monitoring data
- Groundtruthing observations to assist in targeting areas that may require additional enforcement with guidance from CSC

CARB will utilize current regulations and enforcement programs across all sources CARB regulates to target areas of non-compliance within the Stockton community. Listed below are CARB's enforcement strategies to help improve air quality in the Stockton community:

1. Increase the frequency of compliance inspections with guidance from CSC

CARB will collaborate with the Stockton CSC and the District to actively enhance enforcement activities throughout the community boundary. This will be done through a combination of improved complaint reporting, identifying multiple locations for focused inspections, inventory analysis, and community input. CARB will schedule report-back meetings to update CSC on both the status of inspections and to obtain additional areas of mobile source concerns. CARB will work with CSC to meet annually in order to prioritize enforcement strategies and identify possible locations where non-compliant vehicles, TRUs, and off-road equipment are present. CARB will report to the community the number of inspections performed, mapped locations of the enforcement, and the number of citations and NOVs issued.

As of September 2020, through CSC monthly meetings, the committee and citizens have heard there is a need to focus enforcement efforts in the following areas:

- a. Knife River area
- b. Charter Way and Fresno Avenue
- c. South El Dorado
- d. Boggs Tract
- e. Idling HDDVs near schools and residential areas

The fact that there were only two inspections of TRUs from 2017 to 2019, and both were determined to be non-compliant, warrants an increase of TRU inspections in Stockton. In 2021, with the help of CSC and SJVAPCD, CARB will increase TRU enforcement.

If members of CSC have additional guidance on where CARB staff can enhance enforcement efforts, please reach out to the Community Outreach and Enforcement Section at COES@arb.ca.gov.

2. Provide in-person community specific training

CARB will develop and offer training opportunities to the Stockton AB 617 Community. Information will cover topics like the fundamentals of enforcement, how the enforcement process works, instructions on filing a thorough complaint and what to expect from the enforcement process after filing a complaint. Through this program, community members will be able to better support CARB or SJVAPCD enforcement processes. In light of social distance mandates due to COVID-19, CARB may develop online trainings.

3. Achieve compliance with the Truck and Bus Regulation via SB 1

As mentioned earlier, SB 1 includes a provision that, beginning in 2020, a vehicle must demonstrate compliance with the Truck and Bus Regulation before it can be registered with the DMV. Beginning in 2020, the DMV, in conjunction with data provided by CARB, will deny vehicle registration to non-compliant HDDVs based on the model year of the vehicle. Under this legislation, compliance with the Truck and Bus Regulation will be fully implemented by 2023.

4. Coordinate with other agencies

CARB will seek opportunities to coordinate with other agencies with enforcement authority in Stockton such as the City of Stockton, school districts and other CalEPA agencies. For example, CARB staff may work with the City of Stockton to provide truck *No Idling* signage in areas where community members observe trucks idling. In addition, CARB may provide assistance in other areas such as land-use and urban planning, if needed.

5. Enhance CARB's data management practices

CARB is committed to enhancing the quality of enforcement data for the Stockton community. Moving forward, CARB will maintain the location of enforcement activity and received complaints to provide CSC with the most accurate data available. CARB has recently completed a visualization tool that makes CARB enforcement data more transparent and available. This tool can be accessed online by visiting <https://webmaps.arb.ca.gov/edvs/>.

6. Provide annual report of enforcement activities

CARB's Enforcement Division will provide an annual report to CSC to summarize CARB's enforcement activities within the community and update strategies as require

7. Update enforcement strategies as applicable

CARB staff are committed to updating enforcement strategies as requested by the CSC, if said strategies fall within CARB's jurisdiction and if CARB can reasonably accommodate the request (e.g., additional enforcement training for idling vehicles).

As CARB adopts new regulations, CARB will enforce these measures and integrate associated activities and data into the Stockton enforcement measures.

APPENDIX

ENFORCEMENT PROGRAMS DESCRIPTION

Heavy-Duty Vehicle Inspection Program (HDVIP). The HDVIP requires inspection of heavy-duty trucks and buses for excessive smoke and tampering, and engine certification label compliance. Any heavy-duty vehicle traveling in California, including vehicles registered in other states and foreign countries may be tested. CARB inspection teams perform tests at border crossings, CHP weigh stations, fleet facilities, and randomly selected roadside locations. Owners of trucks and buses found in violation are subject to minimum penalties starting at \$300 per violation and up to \$1,000 a day.

Off-Road Construction Equipment (Off-road Regulation). Construction equipment is a major contributor to air pollution, especially when large construction projects are adjacent to neighborhoods. To address this source of air pollution, CARB adopted the nation's first regulation aimed at cleaning up off-road construction equipment such as bulldozers, graders and backhoes. The Off-Road Regulation requires off-road fleets to meet fleet average emission standards and be equipped with best available control technology.

The Tractor-Trailer GHG Regulation (Smart Way). This regulation requires 53-foot or longer dry van or refrigerated van trailers and the tractors that pull them on California highways to use certain equipment that the U.S. EPA Smart Way program has verified or designated to meet their efficiency standards and reduce fuel consumption.

Solid Waste Collection Vehicles (SWCVs). The SWCV Regulation required vehicle owners to upgrade SWCVs by December 31, 2010. On January 24, 2019, the Board approved amendments that now require reporting for SWCVs with 2006 model year and older engines to avoid unnecessary registration delays at the California DMV starting in 2020 due to SB 1 requirements. The approved amendments also added heavy diesel-fueled on-road single engine cranes to the regulation and became effective on July 1, 2019. These specialized cranes are required to phase-in 2010 or newer model year engines from 2019 to 2027.

Transport Refrigeration Unit (TRU). TRUs are refrigeration systems powered by diesel internal combustion engines designed to refrigerate or heat perishable products that are transported in various containers, including semi-trailers, truck vans, shipping containers, and rail cars. Because diesel particulate matter (diesel PM) is an identified toxic air contaminant, CARB adopted an airborne toxic control measure (ATCM) for TRUs and TRU generator sets. CARB staff inspect TRUs to ensure that the units are meeting labeling and in-use performance standards identified in the TRU Regulation.

Drayage. The Drayage Truck Regulation is part of CARB's ongoing efforts to reduce particulate matter (PM) and oxides of nitrogen (NOx) emissions from diesel-fueled engines and improve air quality associated with goods movement. Heavy-duty vehicles that carry goods to or from a port or intermodal facility are required to be equipped with a 2007 or newer model year engine. This requirement becomes stricter in 2023, when drayage trucks are required to be equipped with a 2010 or newer model year engine, because drayage trucks will be required to meet the standards of the Statewide Truck and Bus Regulation.

Statewide Truck and Bus (STB). The STB Regulation requires diesel trucks with a gross vehicle weight rating (GVWR) greater than 14,000 pounds that operate in California to install diesel particulate filters, or replace older engines with cleaner engine technology, on a schedule based on the model year of the engine and GVWR. The following timeline outlines the engine requirements HDDV must meet to be in compliance with the regulation.

Idling. Idling and opacity inspections are performed to ensure an HDDV is compliant with emission standards and is not violating CARB's Idling Regulation. Idling for more than five minutes is prohibited unless the HDDV is certified clean idle and the vehicle is more than 100 feet away from a school or restricted area (exceptions apply). Vehicle owners and drivers in violation are subject to minimum penalties starting at \$300 per violation and up to \$1000 per day.

FUELS INSPECTIONS

California's reformulated gasoline requirements are designed to reduce emissions from evaporation and the burning of gasoline, and Low Carbon Fuel Standard requirements are designed to reduce GHG emissions by reducing the carbon content of fossil fuels. To enforce these programs, CARB staff conduct inspections and review reporting information. When CARB identifies a violation, staff pursue compliance through corrective action and through the issuance and settlement of NOVs.

VEHICLES AND ENGINES

The New Vehicle/Engine Programs evaluate the emission control systems of new vehicles, engines, and evaporative emission control systems produced for California. When all emissions related requirements are met, CARB issues an Executive Order certifying the vehicle/engine/evaporative emission control system as compliant with California's emissions requirements. Vehicles and engines are not legal for sale in California until certified.

MARINE ENFORCEMENT PROGRAMS DESCRIPTION

Ocean Going Vessel (OGV) Fuels Regulation. The OGV Regulation is intended to reduce PM, diesel PM, NOx, and sulfur oxide emissions from ocean-going vessels. Such vessels are required to switch to a low sulfur distillate fuel within 24 nautical miles of the California coast.

Cargo Handling Equipment (CHE). The Mobile CHE Regulation was adopted in 2005 to reduce toxic and criteria emissions such as diesel PM and NOx to protect public health. As part of CARB's continuing efforts to reduce emissions of air pollution in California, CARB staff conduct compliance inspections of CHE used at ports and intermodal rail yards. CHE transfers goods, performs maintenance and repair activities, and includes equipment such as yard trucks, rubber-tired gantry cranes, top handlers, side handlers, forklifts, and loaders. CARB staff also conduct smoke audits on CHE at regulated facilities to insure equipment is maintained to manufacturer specifications.

Commercial Harbor Craft (CHC). There are several types of harbor craft in California, including crew and supply boats, fishing vessels, ferries, excursion vessels, tug boats, barges, dredges, and other vessel types. The CHC Regulation was adopted in 2007 to reduce emissions of diesel PM, NOx, and Reactive Organic Gases from diesel engines used on CHC operated in Regulated California Waters (within 24 nautical miles of the California coast).

CONSUMER PRODUCTS PROGRAMS DESCRIPTION

Composite Wood Products. CARB's ATCM to control formaldehyde emissions from composite wood specifically focuses on three products: hardwood plywood, particleboard, and medium density fiberboard. Investigators in the Composite Wood Products program purchase samples of regulated products from outlets all over California. They inspect products and packaging for compliance with labeling requirements and send selected products to the laboratory for testing.

Consumer Products. Consumer products are chemically formulated products used by household and institutional consumers. Some examples are detergents and cleaning compounds; polishes and floor finishes; cosmetics and personal care products; home, lawn, and garden products; disinfectants and sanitizers; and aerosol paints and automotive specialty products. Consumer products do not include other paint products, furniture coatings, or architectural coatings. Investigators in the Consumer Products program purchase samples of regulated consumer products from outlets all over California. They inspect product containers for compliance with registration and dating requirements and send selected products to the laboratory for testing.

5.5 LEVERAGING COMMUNITY INVOLVEMENT IN ENFORCING RULES TO REDUCE AIR POLLUTION

Members of the community play an important role in protecting public health by reporting air quality issues that they observe to both the District and CARB. The District and CARB value input from the public who reside and work in the community. The complaint process aids both agencies in identifying issues within the communities and ensuring timely resolution. Filing a complaint is easy. The following is the contact information for the District and CARB.

San Joaquin Valley Air Pollution Control District
Stationary Sources - Smoke, Dust, Odors or Other Contaminants
Phone: 1-800-870-1037
Valley Air Smart Phone App
Online: <https://www.valleyair.org/busind/comply/onlinecomplaint.htm>

California Air Resources Board
Automobiles, Trucks, Off-road Equipment, or Other Vehicles
Phone: 1-800-END-SMOG
Online: <https://calepa.ca.gov/enforcement/complaints/>

An effective complaint should contain as much information and as many details as possible as this helps the inspector in responding to the issue and conducting the investigation. The following information is helpful when filing a complaint:

- Time, date, and location of possible violation; including name of facility if known.
- Type of air quality concern. Describe what you see, smell, and feel.
 - See: smoke, fire, dust falling ash, etc.
 - Smell: rotten eggs, gasoline, oil, sweet, sour, smoke, etc.
 - Feel: burning eyes, throat/nose irritation, breathing problem, headache, etc.
- Is the issue still occurring? If not, when did it occur? Is it recurring? If so when?

- Time of day
- Day of week
- Your name and contact information – anonymous complaints can be filed but contact information often helpful in fine tuning the investigation.

To better leverage community involvement, the District and CARB will also assign a dedicated team to work with the Community Steering Committee to follow-up on community concerns, and to conduct community-level compliance assistance, outreach, and education related to compliance and enforcement of local and state rules and regulations. As part of this partnership, the District and CARB will track and report back to the Community Steering Committee on the ongoing enforcement activities within the community to monitor progress in meeting community enforcement measures and to look for innovative strategies to enforcement practices with the goal of increased compliance with air pollution rules and regulations within the community.

5.6 ENFORCEMENT STRATEGIES

5.6.1 DISTRICT ENFORCEMENT STRATEGIES

The District has used the assessment of the three (3) year compliance history in the Stockton AB 617 Community and comments shared by the Community Steering Committee to develop the list of enforcement strategies below which aim to reduce the potential for localized air quality impacts within the Stockton AB 617 Community. During implementation, District staff will provide regular updates on enforcement measures and will solicit guidance and feedback to continue to look for opportunities to evaluate and improve enforcement activities.

1. Enhanced enforcement of District Rule 4901 (*Wood Burning Fireplace and Wood Burning Heaters*) mandatory wood burning curtailments:

This measure is still being considered by the Stockton Steering Committee and may be included in a later draft.

2. Enhanced enforcement of District Rule 4103 (*Open Burning*) to reduce the illegal open burning of residential waste:

To limit the potential for localized PM_{2.5} and toxic impacts associated with the illegal open burning of residential waste, District will conduct targeted surveillance efforts within the Stockton AB 617 Community. Building on the District's existing surveillance and complaint response efforts, the District will conduct additional targeted surveillance efforts in Stockton AB 617 Community at least once per quarter for the next 5 years. The District will work with the Community Steering Committee to focus surveillance efforts in areas where illegal residential open burning has historically occurred.

3. Enhanced inspection frequency of permitted sources:

To limit the potential for localized air quality impacts associated with the failure to comply with emissions standards established by District permit, rule, or regulation, the District will increase the frequency of inspection at each facility that has had an

emission violation over the past three (3) years. These facilities will be inspected at least twice per calendar year for the next five (5) years or until the facility has 4 consecutive inspections without an emission violation, whichever occurs first.

4. Enhanced enforcement of fugitive dust requirements

To limit the potential for localized air quality impacts associated with fugitive dust from construction/earthmoving activities and open areas subject to District Regulation VIII, the District will conduct targeted surveillance efforts within the Stockton AB 617 Community. Building on the District's existing surveillance and complaint response efforts, the District will conduct at least one targeted enforcement effort within the Stockton AB 617 Community during both the 2nd and 3rd quarter for the next five (5) years.

5. Pilot training program for conducting self-inspections at gas stations:

This measure is still being considered by the Stockton Steering Committee and may be included in a later draft.

6. Enhanced enforcement of the state's heavy-duty vehicle anti-idling regulation:

To limit the potential for localized PM_{2.5} and toxic air quality impacts associated with failure to comply with the state's heavy-duty vehicle anti-idling regulation, the District will partner with CARB to conduct additional targeted anti-idling enforcement efforts in Stockton AB 617 Community at least once per quarter for the next 5 years. The District and CARB will work with the Community Steering Committee to identify heavy-duty vehicle idling "hot spots," especially those near schools, to aid in focusing the enforcement efforts.

7. Report back to the Community Steering Committee on Enforcement Activities:

The District will track and provide an annual report to the Community Steering Committee to summarize the District enforcement efforts within the community and to monitor progress in implementing community enforcement measures and meeting enforcement goals.

8. Coordinate with other agencies

The District will seek opportunities to coordinate with other agencies within the Stockton AB 617 Community to address multimedia compliance issues as they arise.

9. Update enforcement strategies as appropriate

The District committed to evaluating the results of ongoing compliance activities within the Stockton AB 617 Community and moving forward will work with the Community Steering Committee to update measures as appropriate.

5.6.2 CARB ENFORCEMENT STRATEGIES

CARB acknowledges that the high compliance rates identified in the enforcement history may not necessarily reflect compliance across the community. In cases where enhanced enforcement activities uncover non-compliance issues, CARB's goal will be

to achieve the same or higher compliance rates as observed in the three-year history. CARB staff will also work closely with the community steering committee, the Air District, and other agencies to address gaps in the enforcement of mobile sources and seek opportunities to close these gaps.

To support achieving these goals, CARB is committed to enhancing enforcement activities within Stockton AB 617 Community by utilizing the following tools:

- An assessment of the enforcement history data
- Targeting areas that may require additional enforcement with guidance from the community steering committee

CARB will utilize current regulations and enforcement programs across all sources CARB regulates to target areas of non-compliance within the Stockton AB 617 Community.

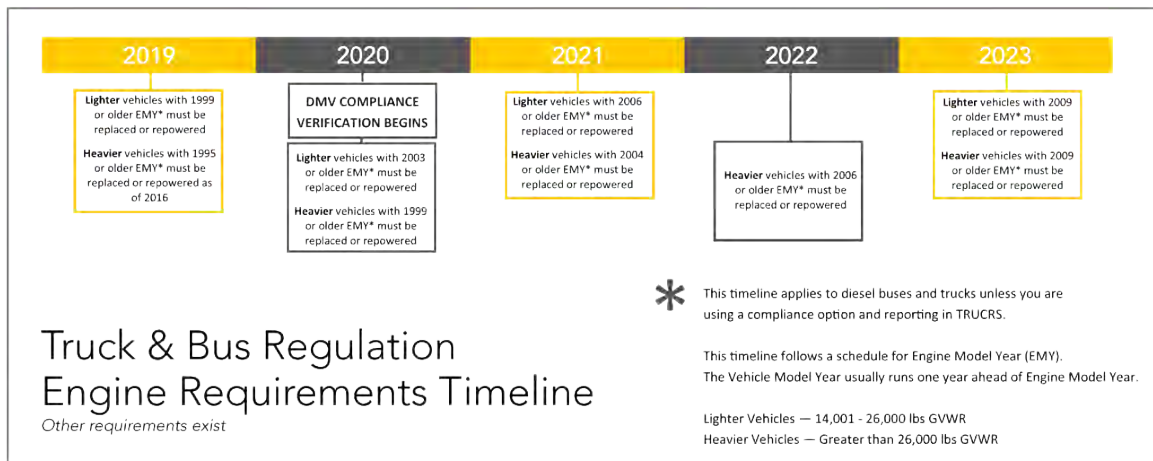

Listed below are CARB's enforcement strategies to help improve air quality in the Stockton AB 617 Community:

1. Increase the frequency of compliance inspections with guidance from the community steering committee:

CARB will collaborate with the Stockton AB 617 Community steering committee to actively enhance enforcement activities. This will be done through a combination of improved complaint reporting, more focused inspections, and report-back meetings to update the community steering committee on both the status of inspections and to obtain additional areas of mobile source concern. CARB will work with the steering committee to meet annually in order to prioritize enforcement strategies and identify possible locations where non-compliant vehicles are present. CARB will additionally report to the community the number of inspections performed, mapped locations of the enforcement, and the number of citations and/or Notices of Violations issued.

2. Achieve Compliance with the Truck and Bus Regulation via Senate Bill 1:

In April 2017, the Governor signed Senate Bill 1 (SB 1) into law which included a provision that, beginning in 2020, a vehicle must demonstrate compliance with the STB regulation before it can be registered with the Department of Motor Vehicles (DMV). Beginning in 2020, the DMV, in conjunction with data provided by CARB, will deny vehicle registration to non-compliant HDVs based on the model year of the HDV.

Figure 5-10 Truck and Bus Regulation Engine Requirements Timeline**3. Provide Annual Report of Enforcement Activities**

CARB's enforcement division will provide an annual report to the CSC to update and summarize CARB's enforcement activities within the community.

4. Coordinate with other agencies

CARB will seek opportunities to coordinate with other agencies with enforcement authority in Stockton AB 617 Community.

5. Enhance CARB's Data Management Practices

CARB is committed to enhancing the quality of enforcement data for the Stockton AB 617 Community. Moving forward, CARB will maintain the location of enforcement activity and received complaints to provide the community steering committee with the most accurate data available. CARB has recently completed a visualization tool that makes CARB enforcement data more transparent and available. The tool can be accessed online by visiting <https://webmaps.arb.ca.gov/edvs/>.

6. Provide in-person community specific training

CARB will develop and implement a new program that will be offered to the Stockton AB 617 Community. Information will cover topics like the fundamentals of enforcement, how the enforcement process works, instructions on filing a thorough complaint, and what to expect from the enforcement process after filing a complaint. Through this program, community members will be able to better support CARB or air district enforcement processes. CARB may also develop online trainings in the future.

7. Update enforcement strategies as applicable

CARB staff are committed to updating enforcement strategies as requested by the community steering committee, if said strategies are enforceable by CARB

staff or if CARB can reasonably accommodate the request (e.g., additional enforcement training for idling vehicles).

6. METRICS TO TRACK PROGRESS

6.1 METRICS FOR FIVE-YEAR MILESTONE EVALUATION

Strategies implemented as a part of this CERP are designed to improve air quality in the community of Stockton. The five-year milestone evaluation is intended, per CARB guidance, to illustrate community scale emissions reductions and air quality trends that may not be evident on an annual reporting basis. To this end, the five year milestone report submitted to CARB for Stockton will include a comprehensive report explaining how air quality data obtained as part of the CAMP and the resulting analyses provided to CSC members helped inform ongoing implementation of CERP strategies and, to the extent possible, how these strategies resulted in lowering emissions in the community. Additionally, the report will include a complete accounting of all projects, emissions reductions, and associated co-benefits implemented as a result of AB 617 program implementation in the community of Stockton.

Table 6-1 Emission Reduction Targets for Incentives Measures

Measure #	Community Suggested Measures	Unit Type	# of Units	Allocation Amount	Cost per Unit (Averaged)	Direct Reductions Estimate Lifetime (Tons)
Community						
VB.1	Vegetative Barriers	Projects	2	\$ 1,000,000	\$500,000	0.5

SS.9	Expedited Facility Risk Assessment And Risk Reduction	Risk Reduction Audits	See Appendix E for detailed list and schedule.				
FD.1	Enhanced Enforcement of Fugitive Dust Requirements	Surveillance	x	x	x	x	x

7. CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA) PROJECT REVIEW

According to Section 15061 (b)(3) of the California Environmental Quality Act (CEQA) Guidelines, a project is exempt from CEQA if, “the activity is covered by the common sense exemption that CEQA applies only to projects which have the potential for causing a significant effect on the environment. Where it can be seen with certainty that there is no possibility that the activity in question may have a significant effect on the environment, the activity is not subject to CEQA.” Since the Project will result in an air quality benefit to the community, the Project is not expected to result in a significant impact under CEQA. As such, the common sense exemption applies.

In addition, this Project is an action taken by a regulatory agency, the San Joaquin Valley Air District, as authorized by state law for the protection and betterment of air quality in the San Joaquin Valley. CEQA Guidelines §15308 provides a categorical exemption for “actions taken by regulatory agencies, as authorized by state or local ordinance, to assure the maintenance, restoration, enhancement, or protection of the environment where the regulatory process involves procedures for protection of the environment. Construction activities and relaxation of standards allowing environmental degradation are not included in this exemption.” No construction activities or relaxation of standards are included in this project. As such, for this additional reason, the District finds that the Project is exempt from CEQA.

Pursuant to Section 15062 of the CEQA Guidelines, the District will file a Notice of Exemption upon Governing Board approval of the Project.

GLOSSARY

AB 617 – Assembly Bill (AB) 617 (C. Garcia, Chapter 136, Statutes of 2017) directs the state and local air districts to identify communities in California that are exposed to high levels of air pollution and established the Community Air Protection Program. Air districts with input from residents and stakeholders are to develop community focused action plans and community air monitoring plans to address localized air pollution and reduce exposure to particulate matter and toxic air contaminants.

Area Sources – Sources of air pollutants that individually emit relatively small quantities of air pollutants, but that may emit considerable quantities of emissions when combined over a large area. Examples include water heaters, lawn maintenance equipment, and consumer products.

Best Available Control Technology (BACT) – These are the most stringent requirements for new or modified sources. An emissions limitation based on using the most up-to-date methods, systems, techniques, and production processes available to achieve the greatest level of emission reductions.

Best Available Retrofit Control Technology (BARCT) – An emissions limitation based on the maximum degree of reduction achievable for existing sources considering environmental, energy, and economic impacts.

Black Carbon – Black carbon is the sooty black material emitted from gasoline and diesel engines, and other sources that burn fossil fuel. It comprises a significant portion of particulate matter. Inhalation of black carbon is associated with health problems including respiratory and cardiovascular disease, cancer, and birth defects.

California Air Resources Board (CARB) – The State of California agency responsible for air pollution control. Responsibilities include: establishing State ambient air quality standards, setting allowable emission levels for mobile sources of emissions and consumer products.

California Environmental Quality Act (CEQA) – Legislation requiring state and local agencies to disclose the significant environmental impacts of a project through the preparation of an Initial Study, Negative Declaration or Environmental Impact Report, including actions to mitigate any significant environmental project impacts.

Cancer Risk – The likelihood that a person will develop cancer during their lifetime.

Carbon Monoxide (CO) - a colorless, odorless gas emitted from combustion processes like mobile sources.

Cargo Handling Equipment (CHE) – Equipment used to move containers within a marine terminal. Cargo-handling equipment includes rubber-tired gantry (RTG) cranes, yard tractors, side-picks, and top picks. The large ship-to-shore cranes that move

containers from the vessel to the container yard and vice-versa are not included in the definition of CHE.

Concentrations – Pollution in the air is typically expressed as a *concentration*. A concentration is the amount that could be extracted from a given volume of air (like a cubic meter). For example, the amount of particulate matter concentrations in terms of “micrograms per cubic meter ($\mu\text{g}/\text{m}^3$).” This is a measure of the amount of particulate matter collected if you were to draw a cubic meter of air through a clean filter, and then weigh the filter on a scale that can measure millionths of a gram. Today we would expect, on average, to be able to collect about 10 μg of PM_{2.5} from a cubic meter of ambient air.

Control Device – Devices designed to capture, remove and/or reduce pollutants that would otherwise be emitted into the air. Examples are baghouses, scrubbers, dust collectors, direct flame afterburners, vapor recovery units, and water sprayers.

Criteria Air Pollutants – As required by the Clean Air Act, the U.S. Environmental Protection Agency (EPA) identifies and set standards to protect human health and welfare for six pollutants: ozone, carbon monoxide, particulate matter, sulfur dioxide, lead, and nitrogen oxide. The term "criteria pollutants" derives from the requirement that the U.S. EPA must describe the characteristics and potential health and welfare effects of these pollutants. U.S. EPA periodically reviews new scientific data and may propose revisions to the standards as a result.

Diesel Engine – An internal combustion engine in which ignition of the fuel, which is injected into the combustion chamber, is caused by the elevated temperature of the air in the cylinder due to mechanical compression.

Diesel Particulate Matter (DPM) – The particles found in the exhaust of diesel-fueled compression ignition engines. Diesel PM may combine and adsorb other species to form structures of complex physical and chemical properties.

Drayage Trucks – A truck used to haul containers to and from the container terminals. It consists of the tractor unit and a semitrailer consisting of the container on a chassis (wheeled base).

Emissions – A gas or liquid stream containing one or more air contaminants discharging or emitted into the atmosphere.

Enforcement Action – When non-compliance with District rules and regulations and local, state, and federal requirements which the District has authority over.

Environmental Protection Agency (EPA) – The federal agency in charge of creating and enforcing regulations to protect human health and the environment.

Fine Particulate Matter (PM_{2.5}) – Particulate matter (PM) is a mixture of solid particles and liquid droplets suspended in the air. Of these particles, those less than 2.5 micrometers in diameter, called fine PM or PM_{2.5}, pose the greatest risk to health. See particulate matter.

Gasoline Dispensing Facilities (GDF) – Retail service station or private facility that stores and/or dispenses gasoline into fuel tanks.

Greenhouse Gases (GHG) – Any gas that absorbs infrared radiation in the atmosphere. Greenhouse gases include water vapor, carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), halogenated fluorocarbons (HCFCs), ozone (O₃), perfluorocarbons (PFCs), sulfur hexafluoride (SF₆) and hydrofluorocarbons (HFCs).

Health Risk Assessment (HRA) – A detailed comprehensive analysis to evaluate and predict the dispersion of hazardous substances in the environment and the potential for exposure of human populations, and to assess and quantify both the individual and population wide health risks associated with those levels of exposure.

High Efficiency Particulate Air Filters (HEPA filters) – A high efficiency particulate air filter capable of filtering 0.3 micron particles with 99.97 percent efficiency.

Idling - keep the engine of a vehicle running while parked.

Indirect Sources – Land uses and facilities that attract or generate motor vehicle trips and thus result in air pollutant emissions; for example, shopping centers, office buildings, warehouses, and airports.

Minimum efficiency reporting value (MERV) – Developed by the American Society of Heating, Refrigerating and Air Conditioning Engineers, MERV rates the effectiveness of air filters. The higher the number, the finer the filtration.

Mixed Land Use – A range of land uses including residential, commercial, and industrial to be collocated in an integrated way that supports sustainable forms of transportation.

Mobile Sources Of Air Pollution – Any motor vehicle that produces air pollution, e.g., cars, trucks, motorcycles (on-road mobile sources) or airplanes, trains and construction equipment (off-road mobile sources).

National Ambient Air Quality Standards (NAAQS) – The Clean Air Act requires U.S. EPA to set National Ambient Air Quality Standards (NAAQS) at a levels determined to be protective of public health within an adequate margin of safety for six pollutants referred to as criteria pollutants. Standards are set based on scientific research and policy assessments reviewed by the Clean Air Scientific Advisory Committee.

New Source Review (NSR) – A pre-construction permitting review requirement that ensures that when a new source of air pollution is built, or when an existing source is modified, the source will implement effective emission control technology and will comply with related regulatory requirements pertaining to air emissions.

Nitrogen Oxides (NOx) - or “oxides of nitrogen” is a group of gases that are composed of nitrogen and oxygen. Two of the most common nitrogen oxides are nitric oxide (NO) and nitrogen dioxide (NO₂).

Off-Road Vehicles – An off-road vehicle is any type of vehicle which can drive on and off paved or gravel surfaces. They are generally characterized by having large tires, open treads, a flexible suspension or caterpillar tracks. Other vehicles that do not travel public streets or highways are called off-highway vehicles and include tractors, forklifts, cranes, backhoes, bulldozers and golf carts.

On-Road Vehicles – A vehicle designed to legally carry people or cargo on public roads and highways such as buses, cars, trucks, vans, motor homes, and motorcycles.

Ozone (O₃) - ground level or “bad” ozone which is not emitted directly into the air, it is created by chemical reactions between oxides of nitrogen (NO_x) and volatile organic compounds (VOC) in the presence of sunlight.

Particulate Matter (PM) – PM includes a wide range of particles that vary in terms of their size and mass, physical state (solid or liquid), chemical composition, toxicity, and how they behave and transform in the atmosphere. PM is commonly characterized based on particle size. Ultrafine PM includes the very smallest particles less than 0.1 micron in diameter (one micron equals one-millionth of a meter). Fine PM, commonly referred to as PM_{2.5}, consists of particles 2.5 microns or less in diameter (includes ultrafine PM). Coarse PM refers to particles between 2.5 microns and 10 microns in diameter. The term “coarse” particles may be misleading; it should be emphasized that even “coarse” particles are still very tiny, many times smaller than the diameter of a human hair. PM₁₀ consists of particles 10 microns or less in diameter (includes ultrafine, fine and coarse PM).

Parts per Billion (ppb) – A weight-to-weight ratio used to describe concentrations. Parts per billion (ppb) is the number of units of mass of a contaminant in the air per 1000 million units of total mass.

Parts per Million (ppm) – A weight-to-weight ratio used to describe concentrations. Parts per million (ppm) is the number of units of mass of a contaminant in the air per million units of total mass.

Partial Zero Emission Vehicle (PZEV) – PZEV is an automobile that has zero *evaporative* emissions from its fuel system and meets Super Ultra Low Emissions Vehicle (SULEV) tailpipe-emission standards. Evaporative emissions are the gasoline fumes that escape during refueling or from the fuel tank and supply lines. See also ZEV.

Sensitive Receptors – Members of the population that are particularly sensitive to the effects of air pollutants, such as children, the elderly, and people with illnesses.

Stationary Sources of Air Pollution (Stationary Sources) – A fixed, non-mobile producer of air pollution, usually found at industrial or commercial facilities.

Toxic Air Contaminants (TACs) – TACs are air pollutants, identified by CARB, which may cause or contribute to an increase in deaths or in serious illness, or which may pose a present or potential health hazard. Health effects may occur at extremely low levels of TACs.

Transport Refrigeration Unit (TRU) – Refrigeration systems powered by integral internal combustion engines designed to control the environment of temperature sensitive products that are transported in trucks and refrigerated trailers. TRUs may be capable of both cooling and heating.

Vehicle Miles Traveled (VMT) – One vehicle (whether a car carrying one passenger or a bus carrying 30 people) traveling one mile constitutes a vehicle mile.

Volatile Organic Compounds (VOCs) - are a large group of carbon-based chemicals that easily become vapors or gases. They include both human-made and naturally occurring chemical compounds.

Zero-Emission Vehicle (ZEV) – Vehicles which produce no emissions from the on-board source of power (for example, a fully electric vehicle).

Community Emissions Reduction Program

Stockton

February 3, 2021 Draft

San Joaquin Valley
AIR POLLUTION CONTROL DISTRICT

EXECUTIVE SUMMARY

The air quality challenges that the communities in the San Joaquin Valley face are unmatched by any other region in the nation. The San Joaquin Valley, due to its unique geography, topography, and meteorology, continues to face daunting challenges in meeting the latest federal health-based air quality standards. Since 1992, the San Joaquin Valley Air Pollution Control District (District) has implemented nearly 650 rules and regulations to control air pollution in the Valley Air Basin. Numerous plans to improve Valley air quality and attain state and federal air quality standards have detailed a wide-range of strategies, including regulatory measures, extensive incentive investment to promote clean-air technologies in Valley communities, and other first-of-their kind measures, such as the District's Indirect Source Review regulation which reduces emissions from new construction and development projects, and the nationally recognized Tune-in-Tune Up vehicle repair program. The District also has dedicated field staff that are in communities throughout the Valley conducting inspections and responding and investigating complaints to ensure that Valley businesses and residents are complying with federal, state, and local rules and regulations.

As a result of the District's stringent and comprehensive air quality management strategy, along with significant investments made by Valley businesses and residents, since the District's formation in 1992, PM_{2.5} and ozone levels are now at historically low levels, and the Valley continues to be in attainment of the PM₁₀ federal air quality standard. Emissions from stationary sources have been reduced by 85%, cancer risk from exposure to air pollutants has been reduced by 95%, population exposure to elevated PM_{2.5} levels have been reduced by 85%, and population exposure to elevated ozone levels have been reduced by 90%.

Despite these regional air quality improvements, significant concern has been expressed by the California legislature about potential localized impacts of air pollution in disadvantaged communities throughout the state. In answer to that concern, Assembly Bill (AB) 617, signed into law in July 2017, initiated a state-wide effort to monitor and reduce air pollution, and improve public health, in communities that experience disproportionate burdens from exposure to air pollutants through new community-focused and community-driven actions. The community of Stockton AB 617 Community was prioritized by the Air District and subsequently selected by the California Air Resources Board (CARB) as one of the third-year communities selected in the state to receive clean air resources newly available under AB 617, based on a technical analysis of several pollution and poverty-related criteria.

AB 617 provides mechanisms and resources to implement community-specific air quality monitoring networks; to develop, implement, and track emission reduction programs; to improve availability of data and other technical information; and to invest substantial funding in the community through voluntary incentive funding measures. Importantly, these measures are guided by advice and knowledge of local community

members, through their input and involvement on Steering Committees for each AB 617-selected community.

This Community Emission Reduction Program (CERP) provides a description of the community of Stockton AB 617 Community, including geographical boundaries and describes air quality challenges impacting community residents. A technical analysis describes the sources of pollution impacting the community, as well as the location of sensitive receptors within the community. Sources of pollution that are of particular concern to community members are highlighted, and strategies for reducing air pollution impacts and health risk reduction from these sources were evaluated as part of the public engagement process between the Community Steering Committee (CSC), the District, and the California Air Resources Board. Working closely together as a unified partnership, the CSC developed numerous strategies that were ultimately selected for implementation in the community, including incentive funding measures, public engagement strategies, enforcement strategies, and regulatory strategies. Many of the strategies will require close collaboration with state and local organizations and community based organizations to fully implement them. Also included in this CERP is an implementation schedule and necessary metrics for tracking emission reductions within the community. The metrics for tracking progress will be included in regular updates to the CSC during ongoing meetings, annual reporting, and at the five-year milestone.

This draft CERP anticipates investing over \$36 million in emission reduction incentives, and a variety of other clean air projects in the Stockton AB 617 Community area. Additional measures have been developed to reduce exposure to air pollution for sensitive receptors, including schools and residences. These efforts are projected to achieve up to approximately ~~6771~~ tons of PM2.5 reductions and ~~860970~~ tons of NOx reductions as well as significant reductions in air toxics emissions in the community, particularly with respect to diesel particulate matter from mobile sources, the main contributor to community air toxics health risk. Additional regulatory and outreach strategies will provide for further reductions in emissions and exposure, while increasing awareness of the community's air quality challenges and the resources available to help the public and businesses reduce emissions and avoid exposure to air pollution.

Air pollution emission reduction and exposure reduction measures implemented under AB 617 programs will further advance ongoing state and District efforts to reduce regional and community exposure to air pollutants. In the preparation of this CERP, the District has worked closely with the CSC, CARB, and the public. The CSC included, residents, community-based organizations, community members, environmental organizations, regulated industry representatives, other local agencies, and other key stakeholders and worked to develop strategies and an implementation plan to reduce harmful air pollutants in the community of Stockton AB 617 Community. The plan developed through this collaborative process employs proven and innovative strategies, and significant resources, to improve community health by reducing exposure to air pollutants in Stockton AB 617 Community.

This CERP and the many air quality improvement strategies it includes would not be possible without the tremendous commitment and effort shown by Stockton Community Steering Committee members. This engaged group of individuals includes area residents; representatives from community and faith based organizations; owners and employees from businesses operating within the community; the City of Stockton, San Joaquin County, Port of Stockton employees; representatives from schools within the community and others. Additionally, the California Air Resources Board staff, members of state and local agencies including the San Joaquin Council of Government, California Department of Transportation, [Housing and Housing](#) Authority of the County of San Joaquin have also provided information and guidance to assist the CSC members in the development of the air quality improvement strategies in this CERP. Lastly, the Institute for Local Government should be commended for the excellent meeting facilitation services they provided to guide this process.

1. INTRODUCTION

1.1 IMPLEMENTATION OF AB 617 IN STOCKTON AB 617 COMMUNITY

The implementation of Assembly Bill (AB) 617 (C. Garcia, Chapter 136, Statutes of 2017) has brought additional clean air resources and strategies to Valley environmental justice communities that have been and are currently disproportionately burdened by socioeconomic disadvantages and air pollution, despite significant emissions reductions that have already been achieved regionally. AB 617 provides mechanisms and resources to adopt expedited schedules for the implementation of advanced control technologies for existing stationary source facilities; increased stringency of reporting requirements for stationary sources; develop and implement community-specific air quality monitoring networks; implement, and track localized emission reduction programs; improve availability of data and other technical information; and invest substantial funding in the community through voluntary incentive funding measures. Resources available through this legislation allowed the San Joaquin Valley Air Pollution Control District (District), working in partnership with the Stockton AB 617 CSC, through a comprehensive public outreach and community engagement process, to expand regional programs for community protection and develop a robust plan for reducing local exposure to various forms of air pollution including fine particulate matter and toxic air contaminants in the Stockton AB 617 Community.

Several requirements of AB 617 will serve to reduce air pollution in disadvantaged communities throughout the San Joaquin Valley. AB 617 legislation required districts that are in nonattainment for one or more air pollutants to adopt expedited rule review schedules, by January 2019, for the implementation of Best Available Retrofit Control Technology (BARCT). The District Governing Board adopted this schedule at a public hearing held in December 2018, which set the path forward for the District to research and potentially amend applicable rules. The expedited BARCT implementation schedule is discussed in more detail later in this document. Additionally, AB 617 requires "Stationary Sources" to report their criteria pollutant emissions inventory as well as their air toxics emissions inventory to the State on an annual basis. These emissions inventories will be presented via the Criteria Pollutant and Toxics Emissions Reporting regulation, once fully implemented by California Air Resources Board (CARB). Under AB 617, a Stationary Source is defined as a facility meeting any one of the following:

- Required to submit Greenhouse Gas emissions under the CH&SC § 38530 (Mandatory GHG Emissions Reporting),
- A facility that is authorized by a permit issued by a district to emit 250 or more tons per year of any nonattainment pollutant or its precursors, or
- A facility that receives an elevated prioritization score based on cancer or noncancer health impacts pursuant to Section CH&SC § 44360 (Air Toxics Hot Spots, Chapter 4: Risk Assessment).

The District has worked closely with CARB, regulated entities, and other stakeholders to implement this new reporting requirement in the Valley. Further

information on the implementation of the AB 617 stationary source criteria pollutant emissions inventory reporting requirement is available at: <https://ww2.arb.ca.gov/our-work/programs/criteria-and-toxics-reporting>.

The District's community identification and prioritization analysis for the second year of AB 617 implementation was based on extensive air quality analysis, numerous health indicators from the state's CalEnviroScreen model (version 3.0), and various other socioeconomic indicators. In developing San Joaquin Valley community recommendations for additional clean air resources and public engagement under AB 617, the District conducted a public engagement process to seek input from Valley residents, businesses, agencies, and other stakeholders through public workshops and meetings throughout the Valley.

Based on this extensive public engagement effort, significant interest and support for the Stockton community, and the District's comprehensive identification and prioritization analysis: the Stockton Community was recommended by the District Governing Board as a second-year AB 617 community. Sources that affect Stockton AB 617 Community include mobile sources and freeways, port operations, and industry. The Stockton AB 617 Community has a high cumulative air pollution exposure burden, a significant number of sensitive receptors, and includes census tracts designated as disadvantaged communities. After further technical review and public engagement, the Stockton AB 617 Community was ultimately selected by the CARB Governing Board for the development of a community air monitoring plan and an emissions reduction program designed to reduce pollution impacts in the selected community.

In accordance with the community-driven nature of AB 617 directives, in September of 2019 the District Governing Board directed staff to immediately convene a CSC committee under a set of guiding principles. The CSC is comprised of residents, businesses, community based organizations, environmental justice advocates, and public agencies, working together to craft and develop a community air monitoring plan and a Community Emissions Reduction Program (CERP). To ensure successful implementation of AB 617, residents, businesses, non-profits organizations, state and local agencies, and other stakeholders from all sectors within the selected community were involved in the development of CERP. Towards that end, the District has worked extensively with the CSC to develop innovative strategies that, once implemented, will improve air quality in the Stockton AB 617 community. The District community recommendation for CARB under the second-year implementation can be found here: https://www.valleyair.org/Board_meetings/GB/agenda_minutes/Agenda/2019/September/final/10.pdf

The Stockton AB 617 Community air monitoring map was developed with the advice of the community Steering Committee. The community-specific air monitoring network will provide an expanded monitoring capacity designed to provide scalable, portable, and rapidly deployable air monitoring equipment to the community. This includes a combination of air monitoring platforms equipped with highly specialized analyzers capable of monitoring a full range of criteria and toxic pollutants. Various monitoring

platforms include larger air monitoring trailers, mobile air monitoring vans, and compact air monitoring sensors. Monitoring data from these sensors will be made available to members of the public in real-time on the Stockton AB 617 webpage. The full community air monitoring plan, with further details on selected monitoring equipment and monitoring locations, is available at:

<http://community.valleyair.org/selected-communities/stockton/community-air-monitoring/>

As a culmination of the community-driven actions and engagement called for under AB 617, the Stockton Community Steering Committee has developed a Community Emissions Reduction Program (CERP), in partnership with CARB, residents, affected sources, and local government bodies in the affected community. Steering Committee input and other comments received from the public in the community have provided instrumental information, critical to implementing community-specific measures and addressing community concerns. Strong collaboration between community members, the District, CARB, and other local agencies has resulted in the development of an ambitious plan for reducing localized pollution and associated health impacts in Stockton AB 617 Community.

This CERP provides a description of the Stockton AB 617 Community, including geographical boundaries and socioeconomic factors impacting community residents. A technical analysis describes the sources of pollution impacting the community, as well as the location of sensitive receptors within the community. Sources of pollution that are of particular concern to community members are highlighted, and possible strategies for reducing pollution impacts from these sources are evaluated. The strategies that were ultimately selected for implementation in the community are outlined, including incentive funding measures, public engagement strategies, enforcement strategies, regulatory strategies, and strategies that will be completed in partnership with other agencies and local organizations. Finally, an implementation schedule and metrics for tracking emission reductions in annual reporting and at the five-year milestone are discussed in detail.

1.2 HEALTH BASED AIR QUALITY OBJECTIVES

CERPs implemented under AB 617 are designed to reduce emissions of pollutants that have been shown to have adverse impacts on public health, including fine particulate matter and toxic air contaminants. As specified in CARB's Community Air Protection Program Blueprint, Appendix C: Criteria for Community Emission Reduction Programs (https://ww2.arb.ca.gov/sites/default/files/2018-10/final_community_air_protection_blueprint_october_2018_appendix_c.pdf), this plan will focus on reducing individual criteria air pollutant and toxic air contaminant emissions to address the impacts of community exposure to multiple pollutants. While each community faces distinct health-based challenges, CARB guidance states that broad health-based air quality objectives provide a consistent foundation for determining the appropriate levels of emissions reductions for CERPs statewide.

The U.S. Environmental Protection Agency and the State of California have established ambient air quality standards, which set health-protective levels for the following criteria pollutants: ozone, particulate matter with a diameter of 10 microns or smaller (PM10), particulate matter with a diameter of 2.5 microns or smaller (PM2.5), carbon monoxide, nitrogen dioxide, sulfur dioxide, and lead. California also has standards for sulfates, vinyl chloride, and hydrogen sulfide. Due to the region's topography and meteorology, the Valley is classified as Serious nonattainment for the federal PM2.5 standards, and Extreme nonattainment for federal ozone standards.

Particulate Matter: Particulate matter is a mixture of solid particles and liquid droplets in the air. PM can be emitted directly into the atmosphere (primary PM), or can form as secondary particulates in the atmosphere through the photochemical reactions of precursors (when precursors are energized by sunlight). Thus, PM is made up of a number of components, including acids (such as nitrates and sulfates), organic chemicals, metals, and soil or dust particles. PM10 is particulate matter that is 10 microns or less in diameter, and the PM2.5 subset includes smaller particles that are 2.5 microns or less in diameter.

Any particles 10 microns or less are considered respirable, meaning they can be inhaled into the body through the mouth or nose. PM10 can generally pass through the nose and throat and enter the lungs. PM2.5, which is the portion of PM10 that is less than 2.5 microns in size, when inhaled can move deep into the gas exchange tissues of the lungs, where it can be absorbed into the bloodstream and carried to other parts of the body. The potential health impacts of particle pollution are linked to the size of the particles, with the smaller particles having larger impacts. Numerous studies link PM2.5 to a variety of health problems, including aggravated asthma, increased respiratory symptoms (irritation of the airways, coughing, difficulty breathing), decreased lung function in children, development of chronic bronchitis, irregular heartbeat, non-fatal heart attacks, increased respiratory and cardiovascular hospitalizations, lung cancer, and premature death. Children, older adults, and individuals with heart or lung diseases are the most likely to be affected by PM2.5.

Many studies have quantified and documented the health benefits of attaining the U.S. Environmental Protection Agency (EPA) air quality standards for PM. The Valley Air Basin is in attainment of the federal standards for PM10, but is currently classified as Serious nonattainment for the federal PM2.5 standards. The District, in partnership with CARB, developed the *2018 Plan for the 1997, 2006, and 2012 PM2.5 Standards*, which was approved by EPA on June 30, 2020 and details strategies to move the region towards attainment of the federal PM2.5 standards. More information is available at: <http://valleyair.org/pmplans>. This plan is also discussed in further detail in Chapter 3.

Ozone: Ozone is a regional air pollutant that is formed through complex chemical reactions in the atmosphere. In contrast, PM2.5 concentrations are the result of both local and regional emissions, and reducing localized emissions of PM2.5 can reduce disparities in exposure experienced in communities with high cumulative exposure burdens. CARB Office of Community Air Protection guidance states that, because

ozone formation is driven by regional rather than localized source contributions, ozone should be addressed in regional air quality improvement efforts through the State Implementation Plan. Therefore, ozone and related precursors have not been addressed as a part of this CERP development. The District's current plan for attainment of health-based ozone standards throughout the San Joaquin Valley Air Basin can be found here: http://valleyair.org/Air_Quality_Plans/Ozone_Plans.htm

Toxic air contaminants: Toxic air contaminants (TACs) also contribute to a community's cumulative exposure burden. Exposure to TACs can increase the risk of acute and chronic health impacts as well as cancer. Diesel particulate matter is a large concern in areas with high exposure to diesel engine emissions, such as the community of Stockton AB 617 Community. Other toxic air contaminants can contribute to localized health risks, including metals; air toxics related to fossil fuel production, such as benzene and toluene; and compounds associated with combustion, including polycyclic aromatic hydrocarbons and dioxins. The California Office of Environmental Health Hazard Assessment (OEHHA) establishes threshold concentrations for toxic air contaminants at which exposure is not expected to trigger non-cancer health effects. For carcinogens, OEHHA guidance states that there are no safe exposure thresholds. Reducing emissions in the community will be based on identifying technologies and practices that offer the maximum level of toxic air contaminant emissions reductions achievable to address both types of health effects

With the support of community members, this CERP will build upon regional efforts to improve air quality throughout the Valley Air Basin. The Stockton AB 617 Community CERP focuses on reducing emissions of and exposure to PM_{2.5} and toxic air contaminants from localized sources that contribute to cumulative exposure burdens within the community. Pollution reduction strategies, targets, goals, and metrics included in this CERP have been developed in accordance with these health-based air quality objectives and are presented in more detail in Section 4 of this document.

2. COMMUNITY PARTNERSHIPS AND PUBLIC ENGAGEMENT

Meaningful community engagement, significant outreach and a robust public process have guided the development of this Community Emissions Reduction Plan (CERP). Key features of these efforts undertaken by the Community Steering Committee and the District include:

- Community advocates hosted an in-person tour with community residents for District hosted kick-off meeting and conducting initial public outreach; establishing a Community Steering Committee
- District staff and CARB staff to be introduced to the community (Figure 2-1)
- Due to the COVID-19 pandemic, District staff worked with community residents and organizations to develop a virtual community tour for District, CARB staff, and others to be introduced to the community and the air quality challenges they face (<https://youtu.be/UuQuoSy26x4>)
- Used a co-host model to set agendas and meeting logistics
- Held monthly facilitated, bilingual (English and American Sign Language) in-person (prior to March 2020) and virtual meetings (due to COVID-19)
- Live-streamed and recorded all CSC meetings:
- (<http://community.valleyair.org/selected-communities/stockton/steering-committee-meetings/>)
- Surveyed needs and resources of the CSC members and then transitioned to virtual meetings and community engagement due to COVID-19,
- Provided materials via email, mail and a AB 617 community webpage; Developed a Resident member stipend program and implemented it retroactively to the first official CSC meeting to encourage participation in regular meetings
- Produced and posted on the District's Stockton Community webpage a virtual tour of the community, which highlighted the voices of community residents and CSC members as they discussed the challenges facing community residents
- Used interactive online survey tool such as Survey Monkey and Social Pinpoint to encourage active participation and to develop visual aids to share information to the CSC; and
- Shared presentations by the District, CSC members, CARB staff, Port of Stockton, and the City of Stockton

Figure 2-1 Introductory Tour Hosted by Community Advocates and Residents

In addition, numerous interactions between Community Steering Committee members and District staff occurred in one-on-one or small group meetings allowing for in-depth discussions on joint development of the CERP. See the community webpage (<http://community.valleyair.org/selected-communities/stockton/>) for more details.

2.1 COMMUNITY KICK-OFF MEETING

Between October 2019 and January 2020, District staff worked in collaboration with local Environmental Justice organizations to conduct multilingual outreach targeted at the Stockton AB 617 Community zip codes to encourage attendance at the official kick-off meeting in January 2020. The District provided \$5,000 for a program to provide mini-grants to local Environmental Justice organizations to support on-the-ground outreach designed to inform the community of AB 617 and encourage residents to apply to be members of the CSC. In addition, the District distributed trilingual flyers (Figure 2-2) to local media, schools, agencies, and non-profit organizations; and invested over \$8,000 in social media and print advertisements targeted at the Stockton AB 617 Community zip codes to encourage kick-off meeting participation.

Figure 2-2 Trilingual Community Flyers Distributed

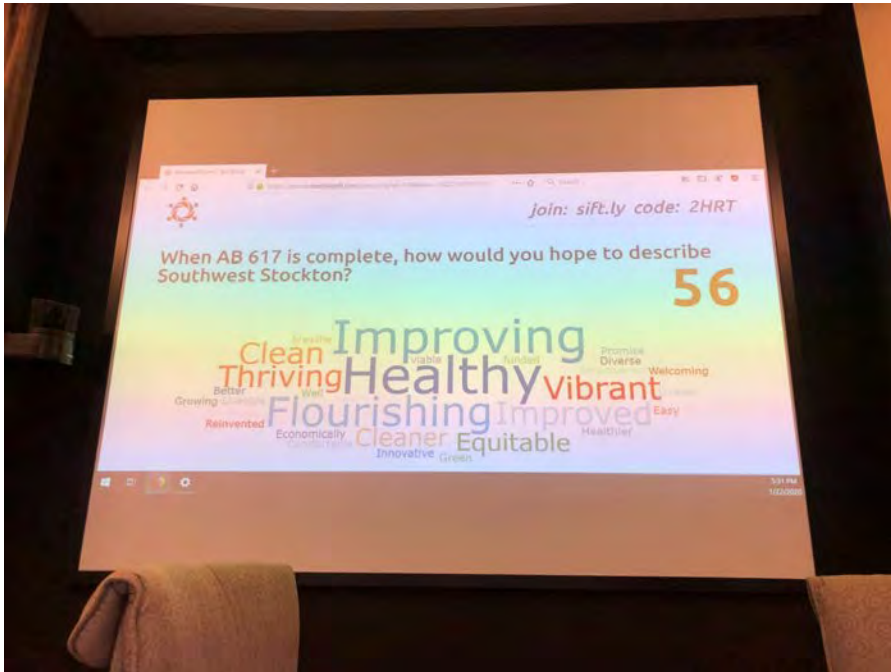

The Community Kick-Off Meeting in the Stockton AB 617 Community was held on Wednesday, January 22, 2020, at the San Joaquin Council of Governments Regional Center (Figure 2-3).

Figure 2-3 Stockton AB 617 Community Kick-off Meeting

Approximately 100 people attended the meeting. In addition to information about AB 617, attendees were invited to participate in an interactive cell-phone based activity to express the community's hopes for the AB 617 program (Figure 2-4).

Figure 2-4 Stockton AB 617 Community Kick-off Meeting Interactive Activity

Attendees were also invited to visit booths, which provided information about monitoring technology, school outreach and District incentive programs. Spanish and Hmong interpretation was provided for the meeting. Community members were encouraged to apply to be on the Stockton AB 617 Community Steering Committee at the Kick-off meeting, and additional time was given for individuals to apply via email or mail.

2.2 COMMUNITY STEERING COMMITTEE

COMMUNITY STEERING COMMITTEE MAKE-UP

Of the 44 individuals who applied to be on the CSC, the final committee consists of 26 community residents; 13 individuals representing environmental justice organizations working in the community, health care organization, educational entity, or a business within the community; and five non-voting government officials. In addition to the regular CSC members, several have alternates should they be unable to attend. A full roster of membership is available at <http://community.valleyair.org/selected-communities/stockton/steering-committee-documents/> and in Table 2-1.

Table 2-1 Stockton AB 617 Community Steering Committee Members

Stockton Community Steering Committee (as of Feb. 17, 2021)				
Primary First Name	Last Name	Alternate	Affiliation	Sector

Skott	Wall		California Air Resources Board	
Nzong	Xiong		Valley Air District	

Prior to the COVID-19 pandemic, the CSC was able to meet in person once and since transitioning to virtual meetings, the CSC has met monthly beginning in April 2020. To ensure successful CERP development, residents, businesses, non-profits, organizations, and other stakeholders within the Stockton community have been fully engaged in CSC meetings. To ensure full engagement by all CSC members, the District assessed language translation needs and determined that there was a need to provide American Sign Language translation at each of the meetings. Commitment demonstrated by the District and CSC members to ensure full and active participation in meetings including:

- Monthly agenda-setting meetings with District, community co-hosts, interested CSC members, CARB staff, and third-party facilitators to collectively set expectations and plan for upcoming CSC meetings
- Real-time interpretation services in all necessary languages
- Expert presentations from partner agencies such as CARB, Port of Stockton, City of Stockton, District staff, and CSC members
- Comprehensive and dedicated Stockton community webpage with tools to view community boundary, committee charter, virtual tour, meeting agendas, sources of community concern, emissions inventories, and other resources
- Neutral meeting facilitation to ensure meetings are inclusive and neutral by bringing out different points of view and preventing individuals from monopolizing discussions
- Through March 2020:
 - Monthly evening meeting at a convenient location in the community
 - Child activity areas and dinner for all attendees
 - All meeting materials in hardcopy and via the comprehensive Stockton community website
- Since April 2020:
 - Monthly evening meetings via Zoom, with technical assistance provided to residents and stakeholders upon request
 - Continued real-time interpretation services through ASL interpreter at each meeting
 - Meeting materials posted ahead of meeting
 - Extra meetings to discuss topics or concerns Community Steering Committee members have
 - Provided laptops and internet service to resident CSC members without these tools to ensure all CSC members have equal opportunities to fully participate

In addition, the District has taken steps over the past several months to better serve CSC members and encourage their active engagement in the meetings and CERP development process. Ensuring effective steering committees requires substantial investment in the form of committee member time, District staff and other resources to schedule, organize, and facilitate frequent after-hours public meetings.

Figure 2-5 Facilitation at a Stockton AB 617 Community Steering Committee meeting

Visit <http://community.valleyair.org/selected-communities/stockton/steering-committee-meetings/> for full documentation of meeting dates, agendas, materials and summaries.

RESPONSE TO COVID-19 STATE OF EMERGENCY

On March 19, 2020, responding to the growing threat of COVID-19 in the state, California Governor Newsom issued Executive Order N-33-20 directing all individuals living in the State of California to stay home except as needed to maintain continuity of operations of the federal critical infrastructure. The result of this order was that the Stockton Community Steering Committee could no longer continue to meet in person.

To address this challenge and to continue moving forward with the important work of developing the Stockton CERP, District staff developed and sent an online survey to all the Stockton Community Steering Committee members to assess the members' ability and willingness to meet virtually. District staff followed up with phone calls to those members that could not complete the survey or who had indicated technological limitations or concerns on the survey to fully understand CSC members' ability to participate in virtual meetings. In addition, District staff, CARB, our Environmental Justice Partners serving on

the committee, and our AB 617 facilitator had multiple conference calls to discuss the challenges related to COVID-19, the results of the surveys and potential solutions based on the Stockton Community Steering Committee member feedback. All the Stockton Community Steering Committee members indicated a strong desire to continue implementing AB 617 and subsequently adopted the use of the online meeting application, Zoom, to meet virtually.

Figure 2-6 Stockton Community Steering Committee Meeting via Zoom

In April 2020, based on these discussions and the results of the surveys, we held a virtual practice meeting via Zoom and via phone with the Stockton Community Steering Committee. During the practice call, the District addressed issues such as ASL interpretation needs and explained how the Stockton Community Steering Committee would use the various available features to provide a high level of discussion and engagement. In addition, the District invested in the online mapping tool Social Pinpoint to facilitate community input in a virtual setting.

COMMUNITY PARTICIPATION AND NEW RESIDENT STIPEND PROGRAM

The Stockton Community Steering Committee meet regularly, requiring ongoing participation and a significant time commitment from community residents, business owners, and other stakeholders. In most cases, steering committee meetings occur in the

evenings and may draw attendees away from their families and other obligations. Community-resident steering committee members are not paid and do not have expenses reimbursed to participate in the process or attend these meetings. Providing stipends to help cover some time and expenses associated with attending meetings is an important way to support this critical participation and encourage sustained and meaningful community engagement throughout these processes. Toward that end, and in response to several residents and community advocates on the Stockton Community Steering Committee, CARB developed new statewide guidance encouraging districts to work with steering committees in developing stipend programs for resident members of steering committees.

On August 20, 2020, the District Governing Board responded to the community needs and approved District staff's recommendation to provide stipends to eligible resident steering committee members, effective retroactively for participation beginning on January 1, 2020. Under the stipend program developed by District staff in consultation with CSC stakeholders across all San Joaquin Valley AB 617 communities, residents who participate as community steering committee members, who do not receive compensation for their attendance at such meetings, may request a stipend to offset the cost of participating in each regular Community Steering Committee meeting. Eligible residents may receive a \$75 stipend per Community Steering Committee meeting when their attendance is verified on the meeting roll-call list or sign-in sheet and were present for at least 75% of the scheduled meeting (equivalent to missing up to 30 minutes of a scheduled 2 hour meeting). Residents will receive stipends for attending up to fifteen (15) Community Steering Committee meetings in a calendar year, for a total cost of up to \$1,125 per year. The stipends for resident steering committee members are subject to the availability of state AB 617 funding and approved allocation in the District's Budget on an annual basis.

Figure 2-7 Resident Stipend Enrollment Form

The image shows a digital form titled "AB 617 Community Air Protection Program Resident Stipend Enrollment Form". At the top, it features logos for the "INSTITUTE FOR LOCAL GOVERNMENT" and "San Joaquin Valley Air Pollution Control District". The form is divided into several sections:

- Name and Last Name:** A text input field.
- Mailing Address:** A text input field with a "City" dropdown menu and a "State" dropdown menu.
- Email Address:** A text input field with a "Country" dropdown menu.
- Verification:** A section with checkboxes for "I am a resident of an AB 617 watershed community and/or a member of the Community Steering Committee" and "I am not an individual or entity in the State of California or its jurisdiction".
- Signature:** A line for a handwritten signature and a "Date" field.
- Submit:** A green button at the bottom.

See Appendix A for full documentation of meeting dates, agendas, materials, attendance and summaries.

2.3 COMMUNITY STEERING COMMITTEE CHARTER

A Charter was developed in consultation with the Stockton AB 617 Community Steering Committee members and a draft was presented to the members at Meeting #1, in March 2020. The Charter and a potential expansion to the community boundary to include the areas of Stockton identified by community members was discussed and approved at the March meeting. The final Charter can be found in Appendix B, and at http://community.valleyair.org/media/1631/03102020_stockton-charter_final_en.pdf. The final Boundary can be found at http://community.valleyair.org/media/1615/03042020_southwest-stockton-boundary.pdf.

2.4 STOCKTON COMMUNITY WEBPAGE

A community webpage has been created for the Stockton AB 617 Community, and is regularly updated with new information (<http://community.valleyair.org/selected-communities/stockton/>). The webpage includes information about upcoming meetings, meeting materials (flyers, agendas, presentations, handouts, audio and video links, chat transcripts, meeting summaries), interactive maps, CSC roster, committee charter, membership processes, Community Air Monitoring Plan (CAMP), and CERP documents. A screenshot of the community webpage is shown in Figure 2-8.

TRACK STOCKTON PROGRESS

Selected Community Profile

Stockton is the largest metropolitan area in the Northern Region of the District, with a current estimated population over 310,000. A number of heavily trafficked freeways pass through the City of Stockton, including Interstate 5 and highways 99 and 4, contributing a significant amount of PM2.5 emissions in the community. Specifically, Southwest Stockton (Figure 1) is a densely populated community within the City of Stockton, freight locomotives, industrial sources, and emissions traveling downwind from the northern portion of the city.

The proposed community of Stockton defined in Figure 1 is approximately 12.2 square miles and has an estimated population of 51,000. The Southwest Stockton community is impacted across a number of health and pollution indicators. Using the State CES tool, all census tracts located within the Southwest Stockton proposed community rank in the top 5% most disadvantaged communities in California, and rank highest in the Valley amongst census tracts not already a part of an AB 617 community. Southwest Stockton also contains the highest ranked census tract in the District's Northern Region (San Joaquin, Stanislaus, and Merced Counties) for overall CES score, which represents a number of health and socioeconomic factors (asthma, cardiovascular disease, low birth weight, educational attainment, housing burdened low-income households, linguistic isolation, poverty, and unemployment).

This community also ranked highest in PM2.5 impacts, and second highest in diesel PM exposure, compared to all other disadvantaged communities in the northern District counties. Specifically, the average overall CES score, PM2.5 exposure, and pollution burden values are all above the 90th percentile. Additionally, most of the community is within the "Rise Stockton" Transformative Climate Community boundary, which allows the District and community to leverage resources to maximize benefits under AB 617.

For assistance or if you have any questions, please contact our central office: (559) 230-6000

In addition to being a portal for access to meeting materials and documents, the webpage also includes interactive maps that present data about the community (<https://sjvapcd.maps.arcgis.com/apps/webappviewer3d/index.html?id=6a8b2a34b0c14748aeee1c69c71c940c>). Figure 2-9 is an example of an interactive map that was created for the Stockton AB 617 Community. These interactive maps provide data on land use, locations of facilities, schools, hospitals, and the air quality concerns identified by the Stockton AB 617 Community Steering Committee and members of the public. This information was provided to help inform and to develop air quality priorities for the CERP.

Figure 2-9 Interactive Map Created for Stockton AB 617 Community Steering Committee

2.5 COMMUNITY PARTNERS

After the Stockton AB 617 CSC identified priorities for the community, partner agencies, and organizations were invited to the meetings to provide updates, input, and presentations on current and future efforts to the work goals of AB 617. CARB staff attended meetings regularly and provided information and updates to the committee. The City of Stockton also attended regularly and provided an update on planning efforts in the community and the TCC program. The City of Stockton agreed to coordinate the TCC program efforts and AB 617 program to leverage the goals of each to best benefit the residents of the Stockton community. Presentations from various CSC members were also an important part of the CERP development process as they provided key insight to the concerns and challenges facing residents of the community. The efforts of the Sierra Club, Little Manila Rising, the Port of Stockton, and others were all presented to the CSC to help provide background information to the participants, highlighting the strengths and challenges of the community.

2.6 ADDITIONAL COMMUNITY ENGAGEMENT

Since late 2020, the CSC and District staff have worked to engage and educate the public with regard to AB 617 and the efforts being made in the Stockton AB 617 Community. Meetings between community members, environmental justice organizations, industry, agency representatives, and other stakeholders have occurred to provide assistance and/or prompt responses to concerns raised regarding the AB 617 process. District staff and CSC members also attended and often made presentations at city and county government meetings, the District's Environmental Justice Advisory Group meetings, the District's Citizens Advisory Committee meetings, the District's Governing Board meetings, environmental justice meetings, and industry professional group meetings to promote participation in the development of the CERP and once completed the implementation of the CERP. In addition, staff often discussed AB 617 at media interviews and during outreach events and health fairs. A full list of outreach efforts is available in Appendix A.

The Stockton AB 617 CSC will continue to work to implement the CERP actions after its adoption by the District Governing Board and the CARB Board, and to provide periodic community updates on implementation progress. Community engagement is essential to the success of the CERP as well as the AB 617 program as a whole, and all parties are committed to build and improve upon existing outreach efforts in the coming months and years.

3. UNDERSTANDING THE COMMUNITY

3.1 COMMUNITY PROFILE

Stockton is the largest metropolitan area in the Northern Region of the District, with a current estimated population over 310,000. A number of heavily trafficked freeways pass through the City of Stockton, including interstate 5 and highways 99 and 4, contributing a significant amount of PM2.5 emissions in the community. Specifically, southwest Stockton is a densely populated community within the City of Stockton directly impacted by large freeways, the Port of Stockton, freight locomotives, industrial sources, and emissions traveling downwind from the northern portion of the city.

Figure 3-1 Stockton AB 617 Community

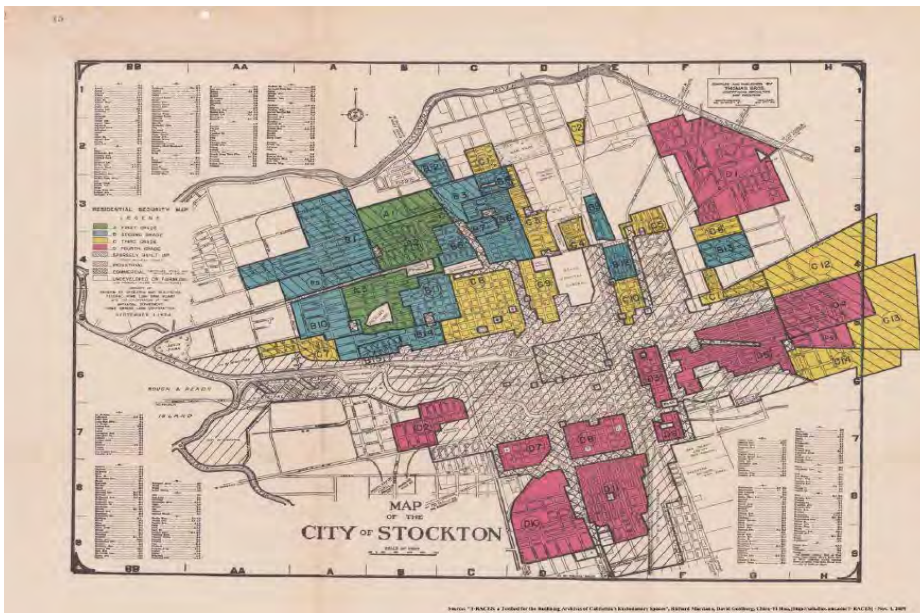

Stockton History

Prior to the 1870s, San Joaquin County lacked access to water for agriculture. The promise of local agriculture resulted in capital investments being made to increase the levels of agriculture in San Joaquin County between 1870-1910. Lack of technological innovation forced agricultural interests to recruit labor globally. People of color, such as Chinese, African-Americans from the South, Japanese, Punjabis, Filipinos, and Mexicans, were forced into labor by employment segregation. Beginning in the late 19th

Century, racially restrictive housing covenants were written into housing deeds to restrict people of color into living in certain zones of the city. These covenants were written into property deeds by developers looking to inflate the values of their homes. Examples of this practice in Stockton was the exclusion of African-American, Indian, Mexican, and Filipino communities south of Main Street and west of Wilson Way. Beginning in the 1930s, the Federal Housing Administration created maps to guide mortgage investment. Intentionally, these maps directed investments away from communities of color, which were deemed risky for investment. This practice is known as “redlining” because the neighborhoods were designated as the color red. Figure 3-2 shows the 1938 Residential Security Map for the City of Stockton.

Figure 3-2 Home Owners’ Loan Corporation Residential Security Map (1938)

Although the racial practice was banned in 1968’s Fair Housing Act, the years preceding contributed to both the built environment and unequal distribution of wealth in the United States today. In the 1930-1940, Stockton experienced huge growth in local industry. Built in 1931 and opened in 1933, the Port of Stockton became the City’s first major industrial center for logistics purposes. Between 1933 and 1940, it grew faster than any port in the U.S. History, doubling tonnage every fiscal quarter. The Port’s success led to business interests in Stockton being perfectly centered for logistical industries, or industries focused on the transportation of products. With the anticipation of future growth in residents and commerce, the City of Stockton actively lobbied for the construction of freeways in Stockton. Between 1955 and the 1970s, I-5, Highway 99, and Highway 4 crosstown freeway were constructed intentionally near low-income

“redlined” communities to reduce the costs of eminent domain. In the 1970s, the construction of the Highway 4 Crosstown freeway demolished a significant portion of the Filipino American

Stockton Air Quality Challenges

The Stockton AB 617 community boundary (Figure 3-1), as designed and approved by the CSC, is approximately 16 square miles and has an estimated population of 132,000. The AB 617 Stockton community is impacted across a number of health and pollution indicators. Using the State CalEnviroScreen (CES) tool, all census tracts located within the Stockton community rank in the top 5% most disadvantaged communities in California. Stockton also contains the highest ranked census tract in the District’s Northern Region (San Joaquin, Stanislaus, and Merced Counties) for overall CES score, which represents a number of health and socioeconomic factors (asthma, cardiovascular disease, low birth weight, educational attainment, housing burdened low-income households, linguistic isolation, poverty, and unemployment).

This community also ranked highest in PM2.5 impacts, and second highest in diesel PM exposure, compared to all other disadvantaged communities in the northern District counties. Specifically, the average overall CES score, PM2.5 exposure, and pollution burden values are all above the 90th percentile. Additionally, most of the community is within the “~~Rise Stockton~~Stockton Rising” Transformative Climate Community boundary, which allows the District and community to leverage resources to maximize benefits under AB 617.

The majority of emissions impacting the Stockton AB 617 Community come from passenger vehicle and heavy-duty truck emissions from major freeways, interchanges, and main regional roads that run through the community.

Figure 3-3 Major Freeways Contribute Significant Mobile Source Emissions in the Community

In addition to the emissions originating from mobile sources in the area, this community also includes industrial development and area-wide sources of pollution such as gas stations, commercial cooking, and consumer products that also contribute significantly to the community's emissions levels.

Figure 3-4 Industrial Emissions Sources near Boggs Tract Community

Based on emissions inventory and current air monitoring data in this community, pollutants of concern include particulate matter less than 2.5 micrometers in diameter (PM_{2.5}), Black Carbon (BC), Oxides of Nitrogen (NO_x), Carbon Monoxide (CO), Ozone (O₃) and Volatile Organic Compounds (VOCs). A virtual tour of the Stockton AB 617 community, produced by the Community Steering Committee to highlight some the community's challenges can be viewed here:

<https://www.youtube.com/watch?v=UuQuoSy26x4&feature=youtu.be>.

Based on District air quality analysis modeling, the Stockton AB 617 Community was found to have exceeded the 24-hour average PM_{2.5} concentration prioritization factor levels of 12, 35, 55, and 65 µg/m³ a total of 120, 18, 4, and 3 days, annually, on average during the 2017-2019 period, respectively. In addition, this community was found to have exceeded the 8-hour average ozone concentration prioritization factor levels of 70, 75, and 84 ppb a total of 15, 7, and 1 days, annually, on average during the 2017-2019 period, respectively. Details about the nature and formation of local air pollution and its adverse health impacts on the community of Stockton AB 617 Community is summarized in Appendix G.

It should be noted that, in addition to selection by CARB for the development of community monitoring and a community emissions reduction program, neighborhoods in the AB 617 selected community were also selected by California's Strategic Growth Council for significant investment. In November 2017, the City of Stockton was awarded a \$170,000 Transformative Climate Communities (TCC) Planning Grant by the Strategic Growth Council to support planning activities in the Downtown and South Stockton region. To mobilize this grant Mayor Tubbs' Office, community partners, and the neighborhood residents created the organization Rise Stockton to carry out this work. The Rise Stockton organization worked for nearly a year to develop a The Sustainable Neighborhood Plan <https://drive.google.com/file/d/1E-HjKq5m9KHurEMch3tamysu2Xcnjt7L/view> to translate community concerns and recommendations into shovel-ready projects.

The policies and projects are centered on twelve Transformative Climate Community Goals, several of which mirror the goals of AB 617 (see Figure 3-5).

Figure 3-5 Stockton's TCC Goals and Project Area Map

Stockton Rising: TCC Project Area Map

The community engagement and planning conducted during the TCC Planning Grant eventually led to the award of a \$10.8 million Implementation Grant in June 2020. Leading up to that award, Rise Stockton repositioned itself to broadly coordinate the Environmental Justice and Green Economy work conducted by Stockton community partners.

Due to the factors discussed above, this CERP includes strategies for emission reductions from mobile sources, commercial and industrial sources, and residential sources that contribute to the Stockton AB 617 Community air quality challenges. These strategies focus on measures that will bring additional economic resources to the residents and businesses located in the community, as well as achieving significant local emissions reductions.

3.2 TECHNICAL ASSESSMENT TO UNDERSTAND COMMUNITY POLLUTION IMPACTS

Conducting a technical assessment is a necessary step in community emissions reduction program development. The technical assessment relies on results from a variety of analyses to characterize emissions in the community and inform community emissions reduction program development and implementation. This assessment will provide the baseline from which emissions reductions can be measured.

The source attribution technical approach established by CARB provides a methodology for assessing, identifying, and estimating the relative contribution of sources or categories of sources, including but not limited to mobile, stationary, and area-wide sources, to elevated exposure to air pollution in impacted communities. The District's source attribution analysis is based on the following:

- Assesses the share of mobile, area-wide, and stationary source emissions generated in the community,
- Is based on best available data in order to characterize the contribution of emissions sources in the community,
- Follows one of CARB's recommended source attribution approaches.

Based on the above, the District has implemented CARB's Community Emissions Inventory Approach. The following section discusses the community emissions inventory approach and summarizes emission sources in the community. A detailed community-level inventory and source apportionment are included in Appendix C.

3.2.1 COMMUNITY EMISSIONS INVENTORY APPROACH

A community level emissions inventory estimates air pollutant emissions from mobile sources (e.g., cars, heavy-duty trucks, locomotives), area-wide sources (e.g., fireplaces, outdoor food cooking, fugitive dust), and stationary sources (e.g., gas stations, auto body shops, manufacturing facilities) within the community.

The community level inventory consists of the mobile and area-wide sources spatially allocated in the community and stationary sources. A community emissions inventory is the compilation of criteria pollutant and air toxics emissions data from air pollution sources that are within the community. The community emissions inventory includes emissions of volatile organic compounds / reactive organic gases (VOC/ROG), oxides of nitrogen (NOx), particulate matter of 2.5 microns (PM2.5), and toxic air contaminants

(e.g. diesel PM).

3.2.2 COMMUNITY EMISSIONS INVENTORY OVERVIEW

Emissions inventories are estimates of the amount and type of pollutants emitted into the atmosphere by mobile sources, stationary sources, and area-wide sources. Additionally, emission inventories are the foundation for any emission reduction program and provide information on the existing air emissions and related air quality in the community, and support development of emission reduction strategies and future emission targets to improve air quality in the community.

Existing traditional criteria pollutant and air toxics emission inventories (that provide combined coverage of mobile and stationary sources) are generally regional in geographic scale and may not adequately characterize emission impacts at the community-level. Developing community-scale emission inventories for understanding existing baseline emissions and tracking future emission reductions within communities selected for Community Emission Reduction Programs and Community Air Monitoring Plans (CAMPs) is an important piece of AB 617. [Information and data collected as part of the CAMP will be available real-time and District staff will be providing regular updates on the analysis of the data which may result in modification to existing or development of new strategies for the CERP.](#)

3.2.3 AGENCY COLLABORATIONS

CARB and District staff worked in parallel to develop a comprehensive set of emissions inventory data for the community. The District worked with stationary source facilities in the community to develop the point source emission estimates. CARB staff developed the community-level emission inventory for mobile and area-wide sources. CARB worked with several State and local agencies such as the Department of Transportation (Caltrans), the Department of Motor Vehicles (DMV), the Port of Stockton, and the California Energy Commission (CEC) to assemble activity information necessary to develop the community-level mobile and area-wide source emission estimates. CARB and District staff conducted a thorough review of the community inventory to ensure that the emission estimates reflect the most recent data for stationary sources, and that estimates for mobile and area-wide sources are based on the most recent models and methodologies.

The emissions inventory also includes future forecasted values. The forecasted community-level emissions inventory is based on the growth profiles for stationary sources, mobile, and area-wide source categories provided by CARB. Forecasted emissions include growth and control factors that reflect historical trends, current conditions, and recent economic and demographic forecasts.

3.2.4 COMMUNITY EMISSION INVENTORY SUMMARIES

[What types of sources contribute to air pollution in Stockton?](#)

The largest sources of emissions in and around the community include heavy duty vehicles, medium duty vehicles, and passenger cars, as well as trains, and commercial equipment. Permitted stationary sources regulated by the District in the Stockton AB

617 Community include agricultural commodities storage and transfer operations, automotive body repair and paint shops, concrete and construction materials manufacturing, electric power generation, motor vehicle coating; bulk fuel storage and transfer terminals, chemical receiving, fabricated metal products; gasoline dispensing operations, government services, municipal water treatment operations, health centers, metal parts coating operations, skilled nursing care facilities, and telecommunications facilities. Paved road dust, residential fuel combustion, construction emissions, and commercial cooking also contribute significantly to the community's emissions inventory.

Figure 3-6 Sources of PM2.5 Pollution in the Community

The largest sources of PM2.5 emissions in Stockton AB 617 Community are cooking and on-road mobile vehicles (light and medium-duty vehicles and heavy-duty diesel trucks). Road dust, stationary fuel sources, construction & demolition, and residential wood burning are also significant sources of PM2.5 in the community. Other sources include aircraft, trains, ocean going vessels, commercial harbor craft, recreational boats, off-road recreational equipment, off-road equipment, fuel storage and handling.

Figure 3-7 Sources of NOx Emissions in the Community

Almost three-quarters of NOx emissions in Stockton AB 617 Community are from mobile sources. On road mobile sources account for 49.7.% of NOx emissions in Stockton AB 617 Community, including 17% of the NOx inventory from heavy duty diesel trucks and 19.8% from light and medium-duty vehicles. Off road mobile sources, including trains, aircraft, and off-road equipment such as yard trucks, produce 23.9% of the NOx emissions in the community. Fuel combustion at stationary sources is also a significant source of NOx emissions in the community. For more specific information, refer to [Appendix C \(Stockton Source Apportionment Source Apportionment and Community\)](#).

PM2.5 Speciation: What type of PM2.5 is in the ambient air?

PM2.5 in Stockton AB 617 Community is comprised of many species that contribute to the total PM2.5 concentration measured by air monitors, as summarized in Table 3-3 below. This complex mixture is attributable to mobile, stationary, and area-wide sources described above, as well as naturally occurring emissions. Although the list of species contributing to PM2.5 in Stockton AB 617 Community is lengthy, it can be grouped into larger representative categories. The following is a brief description of how each of these larger species categories are formed and emitted into the atmosphere. The following figures show the speciation of PM2.5 in the Stockton Community, based on modeling data.

Table 3-1 Summary of PM2.5 Species

PM2.5 Species	Description
Organic carbon (Combustion Carbon)	Directly emitted, primarily from combustion sources (e.g. residential wood combustion). Also, smaller amounts attached to geologic material and road dusts. May also be emitted directly by natural/biogenic sources.
Elemental carbon	Also called soot or black carbon; formed during incomplete combustion of fuels (e.g. diesel engines).
Geologic material (Dust)	Road dust and soil dust that are entrained in the air from activity, such as soil disturbance or airflow from traffic.
Trace metals	Identified as components from soil emissions or found in other particulates having been emitted in connection with combustion from engine wear, brake wear, and similar processes. Can also be emitted from fireworks.
Secondary organic aerosol	Secondary particulates formed from photochemical reactions of organic carbon.
Ammonium nitrate	Reaction of ammonia and nitric acid, where the nitric acid is formed from nitrogen oxide emissions, creating nitric acid in photochemical processes or nighttime reactions with ozone.
Ammonium sulfate	Reaction of ammonia and sulfuric acid, where the sulfuric acid is formed primarily from sulfur oxide emissions in photochemical processes, with smaller amounts forming from direct emissions of sulfur.
Combined water	A water molecule attached to one of the above molecules. Combined water is not included when measuring mass of PM2.5 for regulatory purposes, and is therefore excluded from the following charts.

Figure 3-8 Species Contribution to Annual Average PM2.5 Concentrations in the Community

Combustion carbon, ammonium nitrate, and ammonium sulfate all are significant species of PM2.5 emissions on an average day in the Stockton AB 617 Community.

Figure 3-9 Species Contribution to Peak Day PM2.5 Concentrations in the Community

As shown in the figure above, peak PM2.5 emission days in the community see a large increase in ammonium nitrate, which is created from the chemical reaction of NOx and ammonia, largely from fuel combustion during multiday stagnation events. However, ammonium nitrate is generally regarded as having relatively low toxicity compared to other PM2.5 species like elemental carbon.

How will the community inventory change in the future?

The tables and graphs below summarize the total Stockton AB 617 Community emissions inventories for years 2018, 2025, and 2030: These graphs show the proportion of PM2.5, NOx, and VOC emissions that originate from stationary, area, and mobile sources of emissions. The projected inventories take into account the projected emissions from regional transportation plan projects and compliance with regulatory deadlines. The following figures show how the Stockton AB 617 Community-level inventory is expected to change into the future in years 2025 and 2030.

Figure 3-10 2018 Stockton AB 617 Community Emissions Inventory

Table 3-2 2018 Stockton AB 617 Community Emissions Inventory (updated)

Source Categories	NOx (tpy)	VOC (tpy)	PM2.5 (tpy)
Stationary Sources	276.4	281.1	34.9
Area Source	40.2	247.6	75.1
Mobile Sources	884.1	332.1	40.2

Figure 3-11 2025 Projected Stockton AB 617 Community Emissions Inventory

Table 3-3 2025 Projected Stockton AB 617 Community Emissions Inventory

Source Categories	NOx (tpy)	VOC (tpy)	PM2.5 (tpy)
Stationary Sources	163.4	231.0	8.3
Area Source	36.9	273.7	87.9
Mobile Sources	643.7	244.6	33.3

Figure 3-12 2030 Projected Stockton AB 617 Community Emissions Inventory

Table 3-4 2030 Projected Stockton AB 617 Community Emissions Inventory

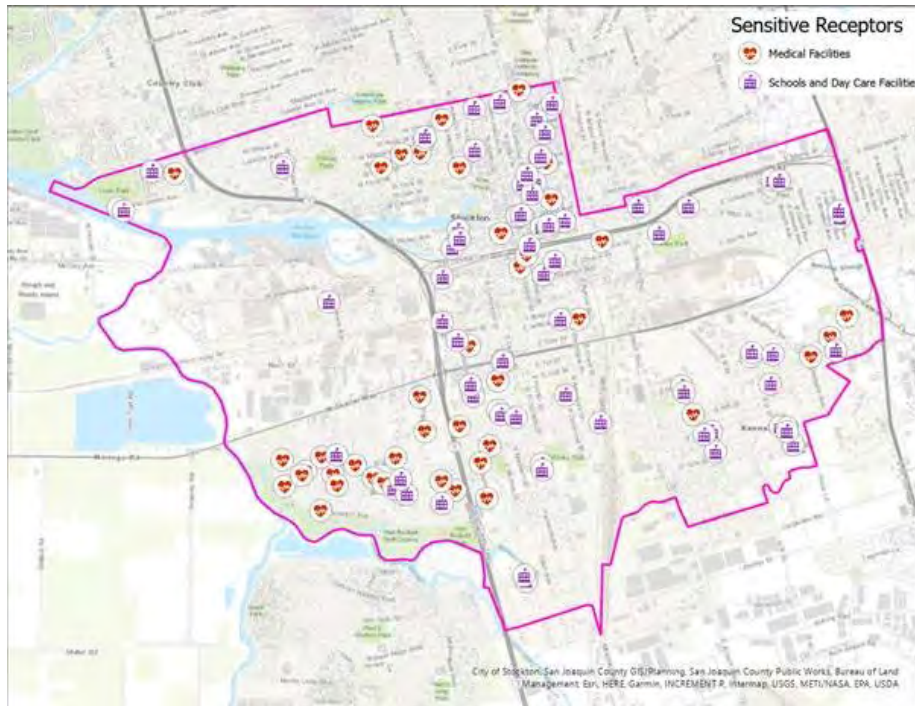

Source Categories	NOx (tpy)	VOC (tpy)	PM2.5 (tpy)
Stationary Sources	169.0	244.9	8.7
Area Source	35.7	290.5	109.1
Mobile Sources	605.4	220.8	33.2

For further information about the emissions inventory for Stockton AB 617 Community, including the stationary source emissions inventory, projected emissions inventory for District permitted facilities, mobile source inventory, and area-wide sources inventory please refer to Appendix C.

3.2.5 SENSITIVE RECEPTORS AND LAND USE

As illustrated in the City of Stockton General Plan Land Use map, below, the Stockton AB 617 Community contains mixed land uses including light and heavy industrial zoning, commercial areas, residential neighborhoods ranging from low density to urban neighborhoods, and the City’s downtown core. Main transportation corridors transect the community, including highways 99, 4, and 15. Areas zoned for heavy industrial use are located in the western and southern portion of the city, with future industrial expansion planned for as detailed in the City’s Envision Stockton 2040 General Plan. Further information about the City’s General Plan and Specific Plans are available at: <http://www.stocktongov.com/government/departments/communityDevelop/cdPlanGenDocs.html>

The below City of Stockton General Plan Land Use map is available with full resolution on the City of Stockton website: <http://www.stocktongov.com/files/ZoningDistrictMap.pdf>

Figure 3-14 Sensitive Receptor Locations in Stockton

Where can I get more information about air pollution in Stockton AB 617 Community?

To provide detailed community-level data to the Steering Committee and the general public, District staff have created an interactive mapping tool that shows the locations of sensitive receptors, as well as the locations of and emissions inventory for stationary sources, area sources, and both on-road and off-road mobile emissions. Examples of the emissions data available through this mapping tool are shown in the figures below. Please visit the District website to zoom in and explore the community:

<https://sjvapcd.maps.arcgis.com/apps/webappviewer3d/index.html?id=6a8b2a34b0c14748a8ee1c69c71c940c> and

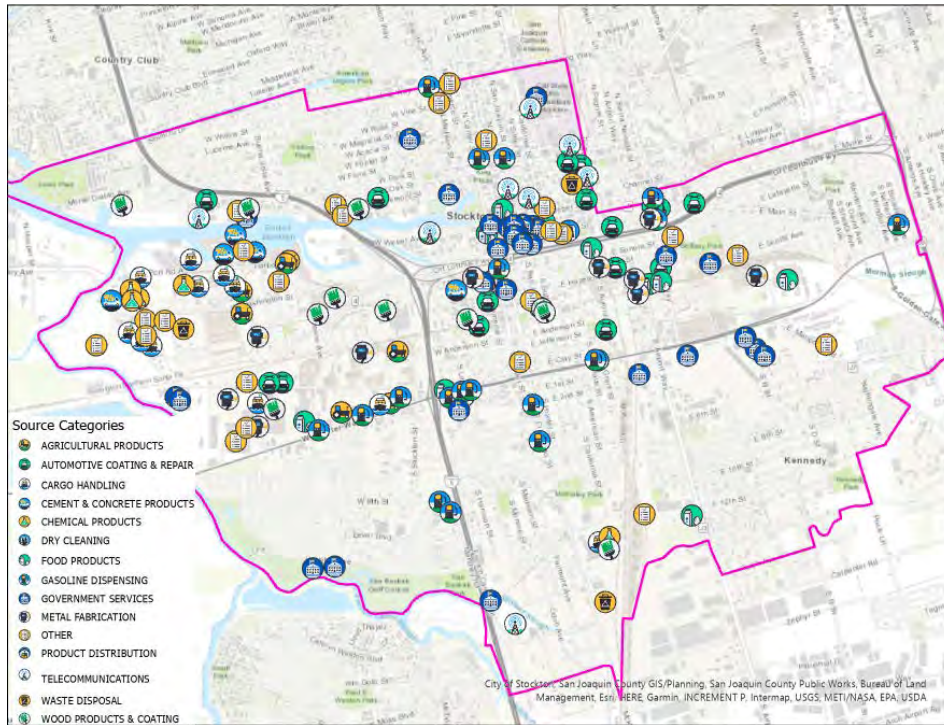

Figure 3-16 District Mapping Tool Showing Concentrations of Area-Wide Emissions within the Community

3.3 EXISTING AIR QUALITY PROGRAMS

District Plans for Attainment of Health-Based Air Quality Standards

For more than two decades, the District has adopted numerous attainment plans to reduce ozone and particulate precursor emissions. The District's multifaceted approach to reducing emissions in the San Joaquin Valley consists of a combination of innovative regulatory and non-regulatory measures. The U.S. Environmental Protection Agency (EPA) periodically reviews and establishes health-based national air quality standards (also referred to as NAAQS) for ozone, particulates, and other criteria air pollutants guided by the Clean Air Act. The District has adopted numerous air quality attainment plans over the years that identify measures needed in the Valley to attain EPA's increasingly stringent health-based NAAQS.

The District's plans include emissions inventories that identify sources of air pollutants, evaluations for feasibility of implementing potential opportunities to reduce emissions, sophisticated computer modeling to estimate future levels of pollution, and a strategy for how air pollution will be further reduced. District plans also include innovative alternative strategies for accelerating attainment through non-regulatory measures such as incentive programs; technology advancement programs; the District's legislative platform; community outreach and education programs; and additional strategies such

as energy efficiency, eco-driving, green purchasing and contracting, supporting urban heat island mitigation efforts, and encouraging cleaner methods of generating electrical energy and mechanical power.

Measures implemented for these Valley-wide strategies also apply to the AB 617 community of Stockton and have resulted in tremendous emissions reductions being achieved, to the benefit of the health of all Valley residents. Most recently, after an extensive 3-year public process, the District, in coordination with CARB and EPA, adopted the *2018 PM2.5 Plan*. This historic plan builds on decades of air quality improvement efforts and establishes a comprehensive strategy for continuing to improve the Valley's air quality and meet the latest federal PM2.5 standards. Further information on the comprehensive rules, regulations, and other programs that have been developed as a part of the District's attainment planning process are detailed in the District's plans for attainment of state and federal air quality standards, with links provided to each attainment plan below:

PM2.5 Plans for Attainment

- [*2018 Plan for the 1997, 2006, and 2012 PM2.5 Standards*](#)
The District adopted the *2018 Plan for the 1997, 2006, and 2012 PM2.5 Standards* on November 15, 2018. This plan addresses the EPA federal 1997 annual PM2.5 standard of 15 µg/m³ and 24-hour PM2.5 standard of 65 µg/m³; the 2006 24-hour PM2.5 standard of 35 µg/m³; and the 2012 annual PM2.5 standard of 12 µg/m³.
- [*2016 Moderate Area Plan for the 2012 PM2.5 Standard*](#)
The District adopted the *2016 Moderate Area Plan for the 2012 PM2.5 Standard* on September 15, 2016. This plan addresses the EPA federal annual PM2.5 standard of 12 µg/m³, established in 2012. This plan includes an attainment impracticability demonstration and request for reclassification of the Valley from Moderate nonattainment to Serious nonattainment.
- [*2015 Plan for the 1997 PM2.5 Standard*](#)
The District adopted the *2015 Plan for the 1997 PM2.5 Standard* on April 16, 2015. This plan addresses EPA's annual PM2.5 standard of 15 µg/m³ and 24-hour PM2.5 standard of 65 µg/m³, established in 1997.
- [*2012 PM2.5 Plan*](#)
The District adopted the *2012 PM2.5 Plan* in December, 2012. This plan addresses EPA's 24-hour PM2.5 standard of 35 µg/m³, which was established by EPA in 2006.
- [*2008 PM2.5 Plan*](#)
The District adopted the *2008 PM2.5 Plan* in April, 2008. This plan addresses EPA's annual PM2.5 standard of 15 µg/m³, which was established by EPA in 1997.

PM10 Plans for Attainment

- [2007 PM10 Maintenance Plan](#)
The District adopted the *2007 PM10 Maintenance Plan* in September 2007, to assure the San Joaquin Valley's continued attainment of EPA's PM10 standard. EPA designated the Valley as an attainment/maintenance area for PM10.

Ozone Plans for Attainment

- [2022 Plan for the 2015 8-hour Ozone Standard \(Upcoming Ozone Plan\)](#)
The attainment plan for the 2015 federal ozone standard will build upon comprehensive strategies already in place from adopted District plans and CARB's statewide strategies. The NOx reduction commitments from the recent *2018 PM2.5 Plan* and *2016 Ozone Plan*, and other ongoing measures will assist the Valley in meeting the 70 ppb federal ozone standard. Strategies for attainment of the *2015 8-hour ozone standard* will be developed through a public process, building on decades of effective control strategies. District staff will present regular updates regarding the development of the plan at public meetings and workshops, including upcoming meetings of the District Governing Board, Citizens Advisory Committee (CAC), and the Environmental Justice Advisory Group (EJAG).
- [2020 RACT Demonstration](#)
The District adopted the *2020 Reasonably Available Control Technology (RACT) Demonstration for the 2015 8-Hour Ozone Standard* on June 18, 2020.
- [2016 Plan for the 2008 8-Hour Ozone Standard](#)
The District adopted the *2016 Plan for the 2008 8-Hour Ozone Standard* in June 2016. This plan satisfies Clean Air Act requirements and ensures expeditious attainment of the 75 parts per billion 8-hour ozone standard.
- [2014 RACT SIP](#)
The District adopted the *Reasonably Available Control Technology (RACT) Demonstration for the 8-Hour Ozone State Implementation Plan* in June, 2014.
- [2013 Plan for the Revoked 1-Hour Ozone Standard](#)
The District adopted the *2013 Plan for the Revoked 1-Hour Ozone Standard* in September, 2013.
- [2009 RACT SIP](#)
The District adopted the *Reasonably Available Control Technology (RACT) Demonstration for Ozone State Implementation Plans (SIP)* in April, 2009.
- [2007 Ozone Plan](#)
The District adopted the *2007 Ozone Plan* in April 2007. This plan addresses EPA's 8-hour ozone standard of 84 parts per billion (ppb), which was established by EPA in 1997.

As a result of the District's stringent and comprehensive air quality management strategy along with significant investments made by Valley businesses and residents, PM2.5 and ozone levels are now at historically low levels, and the Valley continues to be in attainment of the PM10 NAAQS. Emissions from stationary sources have been reduced by 85%, cancer risk from exposure to air pollutants has been reduced by 95%, population exposure to elevated PM2.5 levels have been reduced by 85%, and population exposure to elevated ozone levels have been reduced by 90%. This success in reducing emissions Valley-wide provides assurance that targeted strategies will provide the desired results in helping to improve the air quality in AB 617 selected communities.

Regulatory Measures

The District has implemented a comprehensive regulatory control strategy for decades. Since 1992, the District has adopted nearly 650 rules and rule amendments to implement aggressive control strategies. Many current rules are fourth or fifth generation, meaning that they have been revised and emissions limits have been lowered numerous times, as new emission control technology has become available and cost effective. Building on decades of developing and implementing effective air pollution control strategies, District rules are required, by the Environmental Protection Agency, to implement the most stringent measures, including best available control measures for new and modified permitting projects, and best available retrofit control technologies for existing equipment when feasible to require in the San Joaquin Valley. The District's stringent and innovative rules have set benchmarks for other air agencies throughout California and the nation. Regulations implemented by the District have reduced emissions from stationary sources by over 80% to date and will continue to achieve significant emissions reductions in the coming years.

District rules reduce emissions of criteria air pollutants and toxic air contaminants from sources in and around the community. Permitted stationary sources regulated by the District in the Stockton AB 617 Community include agricultural commodities storage and transfer operations, automotive body repair and paint shops, concrete and construction materials manufacturing, electric power generation, motor vehicle coating operations, bulk fuel storage and transfer terminals, chemical receiving and storage, , fabricated metal parts and products, gasoline dispensing operations, government services, municipal water treatment operations, health care centers, metal parts coating operations, skilled nursing care facilities, and telecommunications facilities. District rules that reduce emissions from local sources in the Stockton AB 617 Community are outlined in the following table:

Table 3-5 District Rules Reducing Stockton AB 617 Community Air Pollution

Rule #	Rule Description
4001	New Source Performance Standards
4002	National Emission Standards for Hazardous Air Pollutants
4101	Visible Emissions
4102	Nuisance
4201	Particulate Matter Concentration
4202	Particulate Matter Emission Rate
4301	Fuel Burning Equipment
4305	Boilers, Steam Generators, And Process Heaters - Phase 2
4306	Boilers, Steam Generators, and Process Heaters - Phase 3
4307	Boilers, Steam Generators, and Process Heaters - 2.0 MMBtu/hr TO 5.0 MMBtu/hr
4309	Dryers, Dehydrators, and Ovens
4311	Flares
4320	Advanced Emission Reduction Options For Boilers, Steam Generators, and Process Heaters Greater than 5.0 MMBtu/hr
4352	Solid Fuel Fired Boilers, Steam Generators, and Process Heaters
4455	Components At Petroleum Refineries, Gas Liquids Processing Facilities, And Chemical Plants
4601	Architectural Coatings
4603	Surface Coating Of Metal Parts And Products, Plastic Parts And Products, And Pleasure Crafts
4606	Wood Products And Flat Wood Paneling Products Coating Operations
4607	Graphic Arts And Paper, Film, Foil And Fabric Coatings
4612	Motor Vehicle And Mobile Equipment Coating Operations
4621	Gasoline Transfer Into Stationary Storage Containers, Delivery Vessels, And Bulk Plants
4622	Gasoline Transfer Into Motor Vehicle Fuel Tanks
4623	Storage Of Organic Liquids
4624	Organic Liquid Loading
4652	Coatings and Ink Manufacturing
4653	Adhesives And Sealants
4661	Organic Solvents
4672	Petroleum Solvent Dry Cleaning Operations
4684	Polyester Resin Operations
4692	Commercial Charbroiling
4693	Bakery Ovens
4701	Internal Combustion Engines - Phase 1
4702	Internal Combustion Engines
4801	Sulfur Compounds
4901	Wood Burning Fireplaces and Wood Burning Heaters
4902	Residential Water Heaters
4905	Natural Gas-Fired, Fan-Type Central Furnaces
8011	General Requirements
8021	Construction, Demolition Excavation, Extraction, and Other Earthmoving Activities
8031	Bulk Materials
8041	Carryout and Trackout
8051	Open Areas
8061	Paved and Unpaved Roads
8071	Unpaved Vehicle/Equipment Traffic Areas
8081	Agricultural Sources
9310	School Bus Fleets

Rule #	Rule Description
9410	Employer Based Trip Reduction
9510	Indirect Source Review

While California and the federal government have direct authority to regulate tailpipe emissions from mobile sources, the District has also adopted innovative regulations such as the Rule 9510 - Indirect Source Review (discussed in more detail later in this section) and Rule 9410 - Employer-based Trip Reduction to reduce emissions from mobile sources within the District's limited jurisdiction over these sources. A complete listing of the District's current rules and regulations is available at the following link: <http://www.valleyair.org/rules/1ruleslist.htm>

For the recently adopted *2018 Plan for the 1997, 2006, and 2012 PM2.5 Standards* 2018 PM2.5 Plan, the District performed an exhaustive evaluation of all potential additional opportunities for reducing emissions and committed to amend several rules to achieve expeditious attainment of the health-based federal PM2.5 air quality standards (see Section IV). This comprehensive analysis also demonstrated that the District's rules and regulations are at least as stringent, if not more stringent, than all other rules in the nation. Furthermore, in accordance with AB 617 requirements, the District adopted an expedited schedule in December, 2018, for performing further determination of BARCT to ensure that applicable sources are utilizing the cleanest technologies feasible (see Chapter 4).

District New and Modified Stationary Source Review

Beyond District rules that apply to specific categories of stationary sources, District Rule 2201 (New and Modified Stationary Sources Review) applies to all new stationary sources and all modifications to existing stationary sources that are subject to District permit requirements. District Rule 2201, and the associated permitting process, ensure that new or modified stationary sources of air pollution are subject to the most effective emissions controls feasible for implementation; that emissions from the project do not create a public health risk (including a modeled analysis of cancer risks resulting from the project and possible health hazard risks resulting from both acute and chronic exposure to emissions for nearby residences and worksites); and that the project does not increase the potential for a violation of State or National Ambient Air Quality Standards. More information about the District's rigorous permitting process is available at <http://www.valleyair.org/busind/pto/ptoprocess.htm>, and is also summarized below. Under Rule 2201, new facilities or facilities modifying equipment must obtain an Authority to Construct (ATC) permit prior to construction, and are subject to stringent requirements, including:

- Best Available Control Technology (BACT)
- Risk Management Review (RMR)
- Toxic Best Available Control Technology (T-BACT)
- Ambient Air Quality Analysis (AAQA)

Best Available Control Technology (BACT): For each emissions unit (specific piece of equipment) that has the potential to emit over the 2 lb/day BACT threshold, the

District requires the use of the best available air pollution control technology commonly used to control emissions from similar types of equipment. The District also conducts an analysis to determine if, based on specific criteria, cleaner technologies that are not commonly used for these type of equipment could be used to further reduce emissions from the proposed equipment. This very stringent requirement ensures that the most effective air pollution control technique is utilized resulting in reduced public exposure to air pollutants and toxic air contaminants.

As a part of the District's BACT Policy (publicly available at <https://www.valleyair.org/busind/pto/bact/bactidx.htm>), District staff maintain a BACT Clearinghouse, updated and published quarterly, that includes available control technologies and operation methods that meet one of the following conditions:

- A. The control technologies or operation methods have been achieved in practice for an emissions unit and class of source; or
- B. Are contained in any SIP approved by the EPA for an emissions unit category and class of source; or
- C. Are any other emission limitation or control technique, including process and equipment changes of basic or control equipment, found to be technologically feasible for such class or category of sources or for a specific source.

AB 617 legislation requires that CARB develop and maintain a state-wide Technology Clearinghouse for BACT and T-BACT. Once available, District staff will review the Technology Clearinghouse as an additional resource when updating the District's BACT Clearinghouse.

Risk Management Reviews: The District conducts Risk Management Reviews to ensure that the public exposure to toxic air contaminants from projects required to obtain an ATC is less than significant. Very complex computer models and the most conservative assumptions are used to assess the project's maximum impact on resident's health. Projects resulting in estimated significant health risk for the public are not approved. Additional information regarding risk management reviews may be found here: https://www.valleyair.org/policies_per/Policies/apr-1905.pdf

Toxic Best Available Control Technology (T-BACT): When T-BACT is triggered under a Risk Management Review analysis, the District conducts a T-BACT analysis to ensure the most stringent control technique is utilized resulting in reduced public exposure to toxic air contaminants. T-BACT is required for units emitting air toxic emissions that result in a cancer risk of greater than one-in-a-million nearby residences or businesses. Projects resulting in estimated significant health risk for the public are not approved.

Ambient Air Quality Analysis (AAQA): The U.S. Environmental Protection Agency (EPA) and the California Air Resources Board (CARB) have established [National Ambient Air Quality Standards \(NAAQS\)](#) and [California Ambient Air Quality Standards \(CAAQS\)](#), respectively, for numerous pollutants. Under Rule 2201, the District conducts AAQAs to ensure that project related emissions would not cause or make worse a violation of the State or National ambient air quality standard. This

analysis ensures that the public exposure to certain criteria air pollutants is less than the maximum allowed concentration in outdoor air without harm to public.

AB 2588 (Air Toxics Hot Spots Information and Assessment Act)

The District's implementation of [AB 2588](#), California's Air Toxics "Hot Spots" Information and Assessment Act, has resulted in dramatic reductions in emissions of air toxics from existing sources in the San Joaquin Valley. Under this right-to-know law, the District has worked with 7,228 Valley facilities to quantify emissions of air toxics, determine the health risk caused by those emissions, report emissions and any significant risks through written public reports and neighborhood public meetings, and take steps to reduce such risks. As a result of these efforts, and the subsequent reductions in air toxics, since 2007 there have been no Valley facilities that pose a significant risk to any Valley resident under the "Hot Spots" program. A detailed discussion of AB 2588 and facility risk reduction audits conducted to date in the community is included in Chapter 4.

Implementation of State Airborne Toxic Control Measures

The District's integrated air toxics program incorporates Airborne Toxic Control Measure (ATCM) regulations promulgated by CARB. State-issued ATCMs are designed to reduce toxic air emissions from various types or categories of equipment by imposing prescribed air pollution control measures. Implementing ATCMs result in reductions of toxics exposure from targeted facility types or categories that could cause significant risks at a regional level. These ATCMs are implemented primarily through the District's permitting process. Examples of emissions sources that have drastically reduced toxic air contaminant emissions in the San Joaquin Valley because of such rules and regulations include dry cleaners, chrome plating operations, gas stations, and diesel internal combustion engines.

Implementation of Federal National Emissions Standards for Hazardous Air Pollutants (NESHAP) and Maximum Achievable Control Technology (MACT) Standards

The District's integrated air toxics program fulfills federal mandates under Title III of the federal Clean Air Act, which requires specific types of sources of air toxic emissions to directly reduce emissions through federal NESHAP and MACT standards. These standards apply to a variety of source categories, ranging from diesel internal combustion engines to chrome platers, and from refineries to power plants.

Implementation of Federal New Source Performance Standards (NSPS)

The District also fulfills federal mandates under Title I of the federal Clean Air Act, which requires specific types of new, modified, and reconstructed facilities subject to NSPS to directly reduce emissions of criteria air pollutants. These standards apply to a variety of source categories, ranging from hot mix asphalt facilities to sewage treatment plants, and from landfills to boilers.

District Indirect Source Requirements

District Rule 9510 is the only rule of its kind in the State of California and throughout the nation which applies to new residential and commercial development projects. The District's rule is recognized as the benchmark, or best available control, for regulating these indirect sources of emissions, such as from construction equipment and mobile sources associated with new developments. This rule requires mitigation of the growth in emissions from mobile and area sources associated with construction and operation of new development projects in the Valley.

District Air Quality Assistance and Guidance to Public Agencies

The District provides assistance and guidance to other public agencies, including cities and counties in the San Joaquin Valley, to help them assess, minimize, and mitigate air quality impacts of projects undergoing their land-use approval processes, over which the District has no statutory authority. For instance, the District provides comments under the California Environmental Quality Act (CEQA) to public agencies on hundreds of proposed projects each year. District provided CEQA comments are designed to minimize project related air quality impacts. In addition, the District maintains and makes available an extensive suite of guidance documents and tools for assessing and mitigating air quality impacts, including criteria and air toxic emissions, from stationary source projects and other development projects.

Mobile Source Regulations

Mobile source emissions make up over 85% of the Valley's NO_x emissions, the primary driver in the formation of particulate and ozone pollution, therefore, reductions in mobile source emissions have become an ever-increasingly important part of the Valley's attainment strategy of federal air quality standards. States and the federal government, unlike the District, have the authority to directly regulate tailpipe emissions from mobile sources. CARB has adopted toughened regulations for heavy-duty trucks, off-road equipment, and other mobile sources. Additionally, the District has adopted innovative regulations such as the Indirect Source Review and Employer-based Trip Reduction rules to reduce emissions from mobile sources within the District's limited jurisdiction over these sources. Local air districts do not have the authority to implement regulations requiring ultra-low tailpipe emissions standards on mobile sources.

With authority to regulate mobile source emissions, CARB has adopted and amended a number of regulations aimed at reducing exposure to diesel PM and NO_x from fuel sources, freight transport sources like heavy-duty diesel trucks, transportation sources like passenger cars and buses, and off-road sources like large construction equipment. Phased implementation of these regulations will produce emission reduction benefits in the coming years as the regulated fleets are retrofitted, and as older and dirtier fleet units are replaced with newer and cleaner models at an accelerated pace. CARB's ongoing comprehensive measures to reduce emissions from mobile sources throughout the state are detailed further in Chapter 4, "Statewide Strategies" section.

District Incentive-Based Emission Reduction Programs

The District has increasingly relied on its advocacy efforts to secure state and federal funding sources, and locally-generated funding to implement incentive programs that have become a vital component of the District's overall strategy for achieving the emissions reductions necessary to bring the Valley into attainment with state and federal air quality standards and to protect public health. These programs provide an effective way to accelerate emissions reductions and encourage technology advancement, particularly from mobile sources, a sector not directly under the District's regulatory jurisdiction. Considering over 85% of the NOx emissions in the Valley come from mobile sources, these successful voluntary incentive grant programs help the Valley achieve highly cost-effective emissions reductions that are surplus of the regulatory emissions reductions.

The District operates one of the largest and most well-respected voluntary incentive programs in California. Since the District's inception in 1992, considerable funding has been invested into thousands of clean-air projects throughout the Valley. The District's incentive programs offer Valley businesses and residents the opportunity to replace their older, higher polluting equipment with newer, cleaner models. These incentive programs include options for replacing older diesel powered trucks, ag engines, tractors, locomotives, and construction equipment as well as options for replacing wood burning devices, lawn equipment and passenger vehicles. These projects have achieved significant emissions reductions with corresponding air quality and health benefits. The incentive programs listed in the table below have been implemented in the community of Stockton AB 617 Community ~~as of from 2005 to~~ October 7, 2020, achieving over 1,200 tons of combined PM, NOx, and VOC emissions reductions in the community.

Table 3-6 Grant Funding Invested in Stockton AB 617 Community- ~~from 2005 to~~ Oct 7, 2020

Stockton AB 617 Community Grant Funding: Incentive Program	Units	Sum of Grant Amount	Total Tons PM, NOx, VOC Emissions Reduced
Bicycle Infrastructure Bike Bath Class I,II,III	2	\$100,000	10.45
Burn Cleaner Wood Stove Change Out New Device	77	\$230,500	18.09
CAP & Trade Demonstration New Electric Vehicle	2	\$2,324,790	0.00
Heavy-Duty Ag-UTV Vehicle Replacement	1	\$13,722	0.31
Heavy-Duty Forklift New Electric Vehicle	1	\$31,780	1.56

District Technology Advancement Efforts

The District Governing Board approved creation of the Technology Advancement Program in March, 2010, to accelerate development of technologies that can help reduce emissions in the Valley. Meeting EPA's increasingly stringent ozone and PM2.5 air quality standards requires significant advancements in low-emissions technologies from mobile and stationary sources. The Technology Advancement Program provides a strategic and comprehensive means to identify, solicit, and support technology advancement opportunities. Ongoing refinement of the program's technology focus areas targets efforts to achieve the greatest impact on the Valley's attainment and other health-based goals. This program has resulted in the development and deployment of electric feed mixers for dairy operations, clean fuel technologies for trucks, and solar-electric truck refrigeration units. Many of these advanced clean-air technologies are currently operating in the community of Stockton AB 617 Community.

Public Air Quality Education and Outreach

Providing accurate and up to date air quality information to Valley residents is a top priority for the District, especially when circumstances such as wildfires overwhelm all clean air measures and lead to high pollution concentrations. Under these

circumstances, the best course of action is to provide notifications to Valley residents so that sensitive individuals, in particular, can take precautions to minimize exposure. The District has expended significant resources on public notification and risk prevention measures, such as the Real-Time Air Advisory Network (RAAN) and Real-Time Outdoor Activity Risk (ROAR) Guidelines. The following are some additional examples of District outreach programs designed to help Valley residents understand air quality and what they can do to reduce their own impacts:

- Healthy Air Living Schools
 - <http://www.healthyairliving.com/schools>
- Real-Time Air Quality Display (READ)
- Web-based Archived Air Quality System (WAAQS)
 - <https://www.valleyair.org/waaqs/>
- Healthy Air Living
 - <http://www.healthyairliving.com/>
- Healthy Air Living Partners
- Check Before You Burn
 - <http://www.valleyair.org/aqinfo/cbyb.htm>
- Air Alerts
 - https://www.valleyair.org/AirAlert/AirAlert_Landing.htm

The above programs are available to community members, and have helped residents and school administrators take health protective action during poor air quality episodes.

4. STRATEGIES TO REDUCE THE CUMULATIVE EXPOSURE BURDEN IN STOCKTON

COMMUNITY IDENTIFIED AIR QUALITY PRIORITIES

During the June 3, 2020 Community Steering Committee (CSC) meeting, Stockton committee members and public attendees participated in a District-facilitated exercise to identify and prioritize their air pollution sources of concern. Participants were placed in groups and were asked to share their thoughts regarding air pollution sources which they believed impacted their community the most, or was of most concern to the individual or entity they represented. The results of these group exercises were then placed into an online mapping tool to create a visual representation of the common pollution sources of concern (Figure 4-1). An online version of the exercise was also sent to the committee and posted to the District’s community webpage <http://community.valleyair.org> to allow for additional opportunity to participate in identifying source categories of concern.

Figure 4-1 Results of Sources of Concern Exercise

Through these exercises, some top emission sources categories of concern in Stockton include:

Based on emissions inventory, current air monitoring data, and top sources of concern in this community, pollutants of concern include particulate matter less than 2.5 micrometers in diameter (PM2.5), Black Carbon (BC), Oxides of Nitrogen (NO, NO2, NOx), Hydrogen Sulfide (H2S), Carbon Monoxide (CO), Ozone, and Volatile Organic Compounds (VOCs). In addition, a variety of toxic compounds, including toxic organics and particulate matter, were also identified as pollutants of concern.

To provide additional information about existing control programs for community members not familiar with ongoing air pollution control efforts, District staff prepared an informational document titled, “Public Resource: Existing Control of Air Pollution Sources of Concern,” (included for reference as Appendix D), and gave several presentations about existing District control programs. Additionally, the Community Co-Hosts are provided the opportunity to share their own experiences and areas of concern

during CSC meetings and their thoughts on opportunities to improve air quality within the community. The CSC meetings have served to build the knowledge base of the CSC members and to assist in developing a Community Emission Reduction Program (CERP) which includes specific measures to reduce exposure to harmful air pollution within the community.

In partnership with the CSC members, community based organizations, businesses in the community, and state and local agencies, a suite of targeted ~~measures-strategies~~ to reduce and mitigate harmful air pollution emissions from community identified sources of concern has been developed. Some of which were suggested by the District in response to CSC identified sources of concern and many of which came directly through suggestions made by CSC members. In addition to the emission reductions which will be achieved through expedited implementation of best available retrofit control technology by facilities within the community, the adoption of rule amendments that will further reduce PM2.5 and toxics in the Valley, and enhanced enforcement (additional/targeted enforcement efforts) in the community, these local measures provide accelerated emissions reductions in the community.

AB 617 legislation requires that a CERP identifies cost-effective measures to achieve emission reduction targets in the community. During CSC discussions to review potential strategies for implementation in the community, Committee members consistently supported and prioritized measures that would reduce emissions from residential sources, while also providing tangible benefits to residents in the community. To that end, in addition to measures that reduce emissions from stationary, area, and mobile sources that are large contributors to the community emissions inventory, many of the measures supported by the Steering Committee and proposed for implementation in the Stockton CERP include targeted incentive programs and interagency partnerships that provide co-benefits in the community, in addition to air quality improvements. The measures described in this chapter encompass a range of strategies to reduce community level exposure burden, including regulatory, enforcement, outreach and education, voluntary incentive-based programs, as well as partnerships with other agencies to address issues outside of the District's direct regulatory authority.

It should be noted that the identified funding amounts for each measure are designed assuming that future-year state budget appropriations and funding allocations are similar to those approved by the legislature and CARB for current use in the AB 617 program, and are available in future District budget appropriations.

Incentive program guidelines also generally contain strict requirements that include specific project types and funding amounts. To maximize emission reductions in the AB 617-selected community of Stockton, the CERP includes measures that also leverage existing District incentive funding allocations, above and beyond funding amounts available through AB 617-related funding allocations.

Some of the incentive measures included in the CERP are proposed to operate under existing authority and approved program guidelines, while other measures will require

the development of new program guidelines and associated approval by the District Governing Board and CARB. As the CARB Blueprint states, CARB and the District will continue developing regulatory and incentive actions through separate public processes. Subsequent implementation of proposed CERP measures will be conditional on the successful completion of applicable public processes, necessary financing approvals, technical feasibility analyses, economic competitiveness, safety, and environmental reviews.

The District will continue to work with the CSC to receive community input as program guidelines are developed and projects are implemented within the community [\[Placeholder for language regarding technical support, health studies, etc\]](#). As experience is gained in implementing the measures contained in the CERP, it may become evident that certain measures are more successful than others in reducing emissions and/or exposure, and are more popular with the community. Committee input on these considerations, and discussions about funding availability and cost-effectiveness/benefits of [these](#) projects, may lead to [the CSC recommending making](#) adjustments to strategy goals and/or funding amounts to achieve overall emission reduction [targets-goals](#) of the CERP. A possible example includes the collection and sharing of community air monitoring data, which could lead to additional discussion with the CSC, which could lead to additional CERP strategy development. During CERP implementation, the CSC will be provided regular updates on implementation progress and their feedback and guidance requested. Based on the updates, it is possible that new strategies could be identified or revisions to existing strategies may be appropriate.

The sections that follow provide detailed information about emission and exposure reduction strategies developed for each source category of concern to the community.

EXPOSURE REDUCTION STRATEGIES FOR SENSITIVE RECEPTORS

Proximity to emission sources can pose health risks for community members, particularly for sensitive groups such as children, the elderly, and those with cardiovascular diseases. Sensitive receptors located in Stockton include schools, daycare facilities, and medical facilities, as shown in the map below. The CARB Blueprint contains several suggested measures that can be implemented to reduce exposure to emissions in areas where these sensitive receptors may be particularly vulnerable to exposure, which are referred to as proximity-based goals.

Figure 4-2 Sensitive Receptors in the Community

In discussions about possible exposure reduction measures to implement in the AB 617-selected community, the Stockton Steering Committee placed a high priority on measures that would protect the health of children, including installing advanced filtration systems at schools and providing indoor air filtration devices to community residents near sources of concern. Other measures prioritized by the Steering Committee included reducing idling near sensitive receptors, and increasing community member knowledge about actions individuals can take to protect their health.

The Steering Committee also suggested additional urban greening, installing vegetative barriers next to industrial sites and along major roadways, and rerouting of heavy-duty trucks corridors near these sensitive receptors. The District has engaged with local

government agencies, CARB, and appropriate state agencies that have the authority to implement these strategies.

Reducing exposure for sensitive receptors will be accomplished through the implementation of the following measures related to school air filtration, home indoor air quality filtration, urban greening, and vegetative barriers.

VEGETATIVE BARRIERS

BACKGROUND

Vegetative barriers, also known as windbreaks, are composed of one or more rows of trees or shrubs that may be planted in specific areas of concern in order to improve air quality in the immediate area by intercepting airborne particles, dust, chemicals, and odors. Pollutants directly emitted from cars, trucks, and other motor vehicles are found in higher concentrations near major roads. In addition, stationary sources such as industrial facilities, factories, and other industrial processes can also contribute air pollutants to their surrounding areas. While various emission control techniques and programs exist to reduce these pollutants from mobile and stationary sources, vegetative barriers have been shown to be an additional measure to potentially reduce a population's exposure to air pollution through the interception of airborne particles and the uptake of gaseous pollutants. Examples of vegetative barriers include trees, bushes, shrubs, or a mix of these. Generally, a higher and thicker vegetative barrier with full coverage will result in greater reductions in downwind pollutant concentrations. In addition to air quality benefits, vegetative barriers can improve aesthetics, increase property values, reduce heat, control surface water runoff, and reduce noise pollution.¹

Characteristics of a vegetative barrier that should be considered include the porosity/density of the vegetative barrier, the characteristics of the vegetation during different seasons, leaf surface characteristics, vegetation air emissions (e.g. biogenic VOCs), and the resistance of the vegetative barrier to air pollution. Other considerations include: soil characteristics, availability of water, control of water runoff, maintenance of the vegetative barrier, use of native and non-invasive species, and roadway safety. Vegetative barriers may also be used with solid barriers to increase mitigation. Research is ongoing as to the effectiveness of vegetative barriers in reducing exposure to pollutants, but a recent study has found that vegetative barrier installations may reduce downwind exposure to carbon monoxide and fine particulate matter by at least 23%.²

The US EPA has produced a fact sheet with further information on vegetative barriers, available here: https://19january2017snapshot.epa.gov/sites/production/files/2016-08/documents/recommendations_for_constructing_roadside_vegetation_barriers_to_improve_near-road_air_quality.pdf

COMMUNITY CONCERNS AND COMMENTS

The Stockton Steering Committee has identified Vegetative Barriers as a priority for air pollutant mitigation. The committee has expressed the need for the installation of vegetative barriers (and sound walls) around and near sources of concern such as schools, along truck routes, near the Port of Stockton, Charter Way, Boggs Tract and El Dorado with an additional priority along Interstate 5. The committee has expressed the need to enforce existing mitigation plans associated with specific industries.

CURRENT PROGRAMS

The Valley Air District, the City of Stockton, the California Department of Transportation (Caltrans), and other local partners have promoted the use of vegetative barriers for reducing exposure to air pollutants, mitigating the urban heat island effect, and improving aesthetics. The District's Fast Track Action Plan includes the strategic use of tree and vegetation planting as a potential measure to improve air quality.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

Based on community interest in vegetative barriers, the following measure was developed for implementation as a part of the Stockton CERP.

The following is a suggested measure not within the Air District's jurisdiction to directly implement:

VB.1: INCENTIVE PROGRAM FOR THE INSTALLATION OF VEGETATIVE BARRIERS AROUND/NEAR SOURCES OF CONCERN

Overview: The purpose of this strategy is to provide incentives for the installation and maintenance of vegetative barriers around sources of concern to reduce particulate matter, odor, and other emissions, as feasible. Based on community interest in vegetative barriers, the District will also look to partner with other agencies to identify additional grant funding to support the installation of vegetative barriers at/near industrial facilities and along major transportation and goods movement corridors.

It should be noted that the SJVAPCD has no authority over how agencies allow land under their jurisdiction to be used. These land-use decisions, such as whether to allow or require vegetative barriers in specific locations, are historically the responsibility, under state law, of cities and counties, or, in some cases, state and federal agencies responsible for transportation corridors, state and federal parks, and other properties. AB 617 does not provide the District with new land-use regulatory authority, so land-use authority remains with cities, counties, and state and federal land-use agencies, as discussed in CARB's Blueprint (see "Who Has the Authority to Implement Actions?", page 26 of the Blueprint), the District is committed to working with these agencies and the CSC to see this measure implemented this measure.

Implementing Agency: SJVAPCD, CDOT, City, County, Port of Stockton, other local partners

Type of Action: Partnership, Incentives

Implementation: 2021-2025

Budgeted Amount: \$1,000,000

Quantifiable emission reduction: Estimated 5-year emissions reductions associated with this measure includes up to *0.11 tons of PM2.5 and NO2 per year*

URBAN GREENING

URBAN GREENING SOURCES IN STOCKTON

Urban greening is one way to help improve air quality and public health in addition to enhancing the overall beautification of the community with drought resistant low maintenance greenery. Trees and vegetation help reduce the impacts of heat islands by increasing the amount of shade and cooling the air by evapotranspiration.³ Careful placement and choice of vegetation will maximize its cooling benefits. Shade provided by trees and other vegetation prevents sunlight from reaching heat-absorbing surfaces such as sidewalks and parking lots, cooling the area by 2 to 9 degrees Fahrenheit. Air quality also benefits from a decrease in energy usage. The less energy used, the fewer power plants running and emitting ozone precursors.⁴ The total net savings when considering energy, ozone, and PM reduced from vegetation were valued at \$210/tree.

Figure 4-5 Urban Heat Island Effect Illustrated (Source: EPA, 1992)

COMMUNITY CONCERNS AND COMMENTS

The steering committees expressed an interest in opportunities for increased urban greening and forestry in the community of Stockton specifically at Charter Way, Boggs Tract, and El Dorado as a strategy to reduce exposure from emissions that occur along local transportation corridors while keeping in mind water and maintenance issues.

CURRENT PROGRAMS

The District Fast Track Action Plan identified Heat Island Mitigation as a measure to be implemented with the goal to increase urban forest canopy shading and increase the albedo of structures and pavement. This guidance includes a model resolution and

³ EPA (1994) *Using Trees and Vegetation to Reduce Heat Islands*. Retrieved 1/21/21 from <https://www.epa.gov/heatislands/using-trees-and-vegetation-reduce-heat-islands>

⁴ EPA (2008) *Heat Island Compendium*. Retrieved 1/21/21 from <https://www.epa.gov/heatislands/heat-island-compendium>

policy statement for use by businesses, government, and organizations who desire to commit to heat island mitigation strategies.

Due to the benefits of urban greening, there are several programs available to support urban greening in communities. Below are the ongoing efforts to promote Urban Greening by other agencies, as well as programs committed to be implemented in future State and/or Valley-wide programs.

- **Transformative Climate Communities (TCC) Program:** The (TCC) Program funds development and infrastructure projects that achieve major environmental, health, and economic benefits in California's most disadvantaged communities. TCC is one of many California Climate Investments programs
- **Fathers & Families of San Joaquin:** Fathers & Families of San Joaquin's Health Justice Tree Planting/ReLeaf program plants trees in disadvantaged communities, trading gray concrete spaces into vibrant green spaces to promote a canopy of healthy environments and reduce greenhouse gases.
- **PUENTES:** PUENTES empowers at risk urban families by providing opportunities to enhance their environment with trees and stewardship for natural resources, foster local food chain viability, employment and entrepreneurship, and reinforce the sense of community involvement and physical wellbeing through volunteer participation in farming and forestry.
- **California ReLeaf Grants:** California ReLeaf seeks and provides pass-through grants to ReLeaf Network Members and other community groups interested in planting and caring for trees in California and offers grant programs through the Social Equity Grant Program and California Arbor Week Grant.
- **California Natural Resources Agency Urban Greening Grant Program:** Consistent with AB 32, the Urban Greening Program will fund projects that reduce greenhouse gases. This program includes urban heat island mitigation projects and energy conservation efforts related to shade tree projects.
- **Cal Fire:** Through the California Climate Investments (CCI) Urban & Community Forestry Grant Program, CALFIRE works to optimize the benefits of trees and related vegetation through multiple-objective projects as specified in the California Urban Forestry Act of 1978.
- **Active Transportation Program (ATP): California Department of Transportation (CALTRANS):** Urban forestry, such as trees and other vegetation, are significant components of several eligible projects under the ATP, including parks, trails, and safe-routes-to-schools.
- **California Urban Forests Council (CAUFC):** As a coalition, CAUFC is dedicated to the expansion and perpetuation of sustainable urban and community forests to enhance the quality of life for all Californians.

Non-profit organizations such as One Tree Planted, River Partners, the San Joaquin River Conservancy, and others provide the public the ability to donate to support tree

planting and also advocate for the allocation of state and federal funding towards tree planting or replanting in forest, river, and/or urban areas in California.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

Due to the community's interest in increased urban greening, the District will be working with other agency partners to bring increased funding for urban greening to the AB 617 selected communities, as further described in the following measure.

The following is a suggested measure not within the Air District's jurisdiction to directly implement:

UG.1 URBAN GREENING AND FORESTRY

Overview: The purpose of this strategy is to identify and support efforts to increase urban greening/forestry to improve air quality for residents in the Stockton community. The focus areas will include, Charter Way, Boggs Tract, and El Dorado. This measure is supported by scientific studies that have shown urban trees and forestry can help with the removal of air pollutants and reduced emissions of volatile organic compounds (VOC's). The effects of urban trees on fine particulate matter (PM2.5) was modeled for ten U.S. cities, with total annual PM2.5 removal varying from 5.2 tons in Syracuse to 71.1 tons in Atlanta. Overall air quality improvements attributed to urban trees ranged between 0.05% in San Francisco to 0.24% in Atlanta (Nowak, Hirabayashi, Bodine, Hoehn, 2013). Based on a study to assess the effects of urban trees on air quality have found that urban vegetation can attribute to temperature reduction, removal of air pollutants, reduced emission of VOCs, and building energy conservation (United States Department of Agriculture Forest Service, 2002). The measure would also include an on-going maintenance program with the city.

The District has long been supportive of the public benefits provided from planting of trees and vegetation. The District's Fast Track Action Plan, adopted by the Governing Board to reduce ozone pollution in the Valley, identified strategic use of tree and vegetation planting as a potential measure to reduce ozone. There has also been significant efforts at the federal, state, and local levels to promote and increase urban greening and forestry through funding opportunities, programs, and projects.

It should be noted that, while the District has no direct authority over how agencies allow land, under their jurisdiction, to be used. These land-use decisions on whether to allow or require urban greening in specific locations, are the responsibility, under state law, of cities and counties, or, in some cases, state and federal agencies responsible for transportation corridors, state and federal parks, and other properties. While AB 617 does not provide the District with new land-use regulatory authority, so land-use authority continues to remain with cities, counties, and state and federal land-use agencies, as discussed in CARB's Blueprint (see "Who Has the Authority to Implement Actions?", page 26 of the Blueprint), the District is committed to working with these agencies and the CSC to see this measure implemented this measure.

Implementing Agency: SJVAPCD, CDOT, City, County, Port of Stockton, other local partners

Type of Action: Partnership, Incentives

Implementation: 2021-2025

Budgeted Amount: \$1,000,000

Quantifiable emission reduction: CARB has an established methodology through the Urban & Community Forestry Program

EXPOSURE REDUCTION STRATEGIES FOR SCHOOLS

SCHOOLS IN THE STOCKTON COMMUNITY

The Stockton Unified School District is the primary district serving the Stockton AB 617 community. In addition to the 32 schools within the Stockton Unified School District, three private schools also operate within the boundaries. Enlisting the participation and support of these schools in the effort to reduce children's exposure is key to ensuring that benefits are as widespread as possible. Targeting schools like Washington Elementary School protects the most vulnerable populations. All children, but especially young children, are considered sensitive receptors with respect to air pollution and it is vital that their protection from unhealthy air during their developing years is made a priority.

COMMUNITY CONCERNS AND COMMENTS

A primary concern expressed by Steering Committee members is to ensure cleaner air both indoors and outdoors for children at school while fully engaging local school districts and parents in clean-air efforts. Committee members expressed a desire to prioritize schools in neighborhoods with the highest risk of exposure to pollutants, such as those near the Stockton Port and near existing truck routes, and to enlist the cooperation and support of Stockton Unified School District as programs are further developed during the implementation phase of the CERP. The Steering Committee also requested incorporating an "Emissions Free Zone" model into the outreach strategies developed.

CURRENT CONTROL PROGRAMS

The District's Healthy Air Living (HAL) Schools program empowers participating schools to make informed decisions about outdoor activities based on real-time air quality conditions. School staff sign up for automated notifications when air quality becomes harmful using the Real-time Air Advisory Network (RAAN) tool, and receive health-protective recommendations for the modification or cancellation of outdoor activities accordingly through the Real-time Outdoor Activity Risk (ROAR) guidelines. The program includes access to resources like anti-idling signs, air quality widgets for school websites, bilingual informational materials, and bilingual educational speakers for students, parents, and staff. This program will be expanded to include an "Emissions Free Zone" model into the coordination with schools.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

Strategies developed to reduce the exposure of children within the community require a twofold approach: increasing enrollment of schools in the HAL School program protects children from exposure to unhealthy outdoor air through the widespread adoption of RAAN and ROAR; further, establishing a program that offers incentive funds to install advanced air filtration systems in community schools reduces exposure to potentially unhealthy indoor air quality.

The following are proposed measures that are within the Air District's statutory jurisdiction to implement:

SC.1 INCENTIVE PROGRAM TO INSTALL ADVANCED AIR FILTRATION SYSTEMS IN COMMUNITY SCHOOLS

Overview: The goal of this strategy is to reduce the impact of air pollution on children at schools. Air filtration reduces the concentration of particulate contaminants from indoor air and is an important component of a school's Heating Ventilation and Air Conditioning (HVAC) system. Reducing airborne particles is important due to the negative impacts to human health, especially that of sensitive populations such as children and the elderly.

This strategy would provide up to \$2,640,000 in incentive funding for schools within the Stockton boundary to install advanced air filtration systems, utilizing existing Community Air Protection Program guidelines. Proposed funding amounts would provide local schools with funding to install HVAC filters with a minimum efficiency reporting value (MERV) rating of 14 or greater or the highest MERV filter the current HVAC system can handle and/or standalone air filtration units as determined through an assessment performed by the trained school district staff or third party vendor. The MERV rating reflects the filter's ability to capture particles in the air, the higher the MERV rating, the better the filter is at trapping particles.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Budgeted Amount: \$2,640,000

SC.2: REDUCE CHILDREN'S EXPOSURE THROUGH INCREASED ENROLLMENT IN THE HEALTHY AIR LIVING SCHOOLS PROGRAM AND THE ESTABLISHMENT OF EMISSION FREE ZONES

Overview: The goal of this strategy is to reduce children's exposure to unhealthy air by increasing the enrollment of schools in the Healthy Air Living (HAL) Schools program to decrease vehicle idling, limit children's outdoor activity during episodes of poor air quality, and educate student about protecting our air. Additionally, the strategy is to work with school staff and students to educate the public, educators and parents regarding having an "Emission Free Zone" around schools, thereby reducing negative health impacts on student's health caused by emissions generated from vehicle idling. To help in this effort, "No Idling" signage in English and Spanish will be distributed to schools within the boundary. Additionally, informational videos will be used as an outreach tool and will be made available in languages such as Spanish, Tagalog, and others on an as needed basis.

Implementing Agency: SJVAPCD

Strategy Type: Outreach

Emission Outcome: Reduction

INDOOR AIR QUALITY

Indoor Air Quality refers to the air quality within buildings and structures, especially as it relates to the health of building occupants. Some health effects may show up shortly after a single exposure or repeated exposures to a pollutant. These include irritation of the eyes, nose, and throat, headaches, dizziness, and fatigue. Such immediate effects are usually short-term and treatable. Sometimes the treatment is simply eliminating the person's exposure to the source of the pollution, if it can be identified. Soon after exposure to some indoor air pollutants, symptoms of some diseases such as asthma may show up, be aggravated, or worsened.

Outdoor air enters and leaves a building by: infiltration, natural ventilation, and mechanical ventilation. In a process known as infiltration, outdoor air flows into buildings through openings, joints, and cracks in walls, floors, and ceilings, and around windows and doors. In natural ventilation, air moves through opened windows and doors. Mechanical ventilation is the use of ducts and fans to circulate air.

Americans spend over 90 per cent of their time indoors, and poor indoor air quality is considered a top environmental health risk. Mitigation programs should focus on achieving measurable improvements in reducing risks from indoor pollutants.

Weatherization measures, such as installing weather-stripping and caulking around windows and doors, can reduce the amount of outdoor air infiltrating into a home and decrease energy costs associated with heating and cooling. In addition, using a portable air cleaner and/or upgrading the air filter in your furnace or central heating, ventilation, and air-conditioning (HVAC) system can help to improve indoor air quality. Portable air cleaners, also known as air purifiers or air sanitizers, are designed to filter the air in a single room or area. Central furnace or HVAC filters are designed to filter air throughout a home. Portable air cleaners and HVAC filters can reduce indoor air pollution; however, they cannot remove all pollutants from the air.

COMMUNITY CONCERNS AND COMMENTS

Community commenters have noted that providing community residents with information about existing weatherization programs, should be augmented with incentives to assist residents in improving indoor air quality through a residential air filtration program.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

Based on interest from the community and a growing understanding at the state level of the need to improve indoor air quality the following strategy has been developed for implementation as a part of the Stockton CERP.

The following is a suggested measure not within the Air District's jurisdiction to directly implement:

IAQ.1: INCENTIVE PROGRAM FOR RESIDENTIAL AIR FILTRATION AND WEATHERIZATION

Overview: The goal of this strategy is to reduce the impact of and exposure to air pollution on community residents near sources of pollution within their homes. Indoor air filtration devices can be of assistance in improving indoor air quality in homes. While air cleaning devices alone cannot adequately remove all indoor pollutants from homes, they can be very helpful when large amount of pollution enter a home during unusual events, such as during a wildfire. Weatherization of a home (improving seals around doors and windows, increasing the amount of home insulation, and improving home HVAC systems) can reduce outside pollutants moving into the home and decrease the overall energy demand for residents.

Due to the ability for some residential air filtrations systems, such as electrostatic precipitator and ionizers, to generate ozone as a byproduct, which is a criteria air pollutant and causes lung irritation¹. In some cases, the use of these types of air filters can increase indoor ozone concentrations beyond public health standards. For this reason, this strategy will focus on the use of mechanical air filtration that relies on using filter media to remove indoor air pollution.

This strategy would establish an incentive program for residential air filtration for community residents near sources of air pollution, and increase outreach and access to programs available for low-income residents in Stockton to receive weatherization services.

Implementing Agency: SJVAPCD, partner agencies such as San Joaquin County Human Services Agency: Home Energy Assistance Program (HEAP)

Strategy Type: Incentive

Budgeted Amount: \$1,000,000

Emission Outcome: Reduction

¹Residential Air Cleaners – A Technical Summary – US EPA

Formatted: Indent: Left: 0", Don't keep with next, Don't keep lines together

COMMUNITY OUTREACH STRATEGIES

CURRENT OUTREACH PROGRAMS

The District's Outreach and Communications team conducts air quality outreach throughout all eight counties of the San Joaquin Valley. The District coordinates events, delivers presentations, responds to the media 24/7, manages social networks, pilots outreach campaigns like the Healthy Air Living (HAL) Schools and the winter residential "No Burn" programs, and connects with the public in multiple languages across any medium. In addition to offering media interviews, answering questions posed by the public, partnering with local institutions, and accepting speaking engagements, the District also conducts paid advertising and informational campaigns regularly to spread air quality awareness across social media, digital networks, television, radio, billboards, and other venues. Through the development of innovative tools like RAAN and the Valley Air App, over 10,000 registered users receive automated notifications when the air quality at any location they choose to follow becomes unhealthy, allowing them to make informed decisions about their outdoor activities to limit their own exposure.

COMMUNITY CONCERNS AND COMMENTS

The Committee recommended that the District engage in a wide variety of multi-lingual outreach efforts via both traditional and social media to allow community members to see and learn about air quality issues, take advantage of grant programs, and provide real-time access to information from air monitoring equipment deployed as part of the AB 617 process. Members of the Steering Committee acknowledged the District's ongoing air quality outreach and education efforts, but expressed concern about effectiveness given perceived public indifference. Effectiveness could be improved by increasing the volume and types of outreach, focusing it to a truly localized level, and using partnerships with key local organizations to better understand how to deliver needed information to the Stockton community residents.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

The Community Air Quality Outreach Strategies go beyond current outreach efforts to provide community-specific information about local conditions and measures the public can take to protect themselves during episodes of poor air quality through new media campaigns, workshops hosted in partnership with local civic and community organizations, and other outreach methods as identified by the community and the District.

0.1: MULTILINGUAL OUTREACH TO INCREASE COMMUNITY AWARENESS AND KNOWLEDGE OF AIR QUALITY

Overview: The goal of this strategy is to increase community awareness of available tools to keep informed of real-time changes in air quality, clean air efforts and how communities can get involved through multi-lingual educational campaigns, videos and

partner workshops. The strategy looks to focus outreach on areas of Stockton CSC and resident concerns, including fireworks, illegal burning, trash burning, educating trucking operations about impacts of idling, promotion of biking (including bike paths and trails), public transportation (including, bus, rail, ferry, and others) and other topics of concern/interest. An understanding of what conditions constitute poor air quality, the relative seriousness of a poor air quality episode, and any potential health impacts is necessary for the public to make informed decisions about how and when to limit their exposure.

This strategy would aim to increase Valley Air App downloads and social media followers among members of the community. A partnership with local civic and community organizations would be established to host workshops at locations commonly available to the public such as libraries, schools, and community, health, or recreation centers. Both the social media outreach and live workshops would promote real-time tools such as myRAAN website, the Valley Air App, the Real-time Outdoor Activity Risk (ROAR) Guidelines, the wildfire page of the District's website, as well as information about general air quality education, wildfire smoke impacts, health effects, and similar topics. This strategy would aim to increase myRAAN website registrations, Valley Air App downloads, and social media followers among members of the community. In addition, this strategy would increase awareness of air quality issues with workshops hosted in locations commonly available to the public such as libraries, schools, and community, health, or recreation centers and on Zoom or other online platforms.

Annual goals for these actions include:

- Attend/host 4 community meetings, in-person or online, to share information
- 1 community targeted social media campaign

Implementing Agency: SJVAPCD

Strategy Type: Outreach

LAWN AND GARDEN EQUIPMENT

LAWN AND GARDEN EQUIPMENT IN STOCKTON

Small off-road engines (SORE) which are typically utilized in gas powered lawn and garden equipment emit oil-based particulates, PM2.5, NOx, and a mixture of hydrocarbons, which combine with other gases to form ozone, carbon monoxide and other toxic air contaminants. This equipment can also cause a significant amount of fugitive dust and can increase fugitive emissions including PM, toxic air contaminants, and ultrafine particles resulting in negative health impacts for the user.

According to a 2003 study by the California Air Resources Board, there are over 11.4 million pieces of residential lawn and garden equipment operating throughout the state. In the Stockton community the emissions from this sector total 6.4 tons per year (TPY) of NOx, 37.3 TPY of VOC and 0.80 TPY of PM2.5. These total emissions contribute 0.6 % of the NOx inventory, 3.4 % of the VOC inventory, and 0.1% of the PM2.5 inventory.

Figure 4-6 Electric Yard Equipment Reduces Emissions near Homes and Places of Business

COMMUNITY CONCERNS AND COMMENTS

Community Steering Committee comments regarding Lawn and Garden equipment included better outreach to inform community members of available incentives and increased incentives for the equipment as well as providing opportunities for residents to receive free electric lawn mowers. In addition, Community Steering Committee comments suggested prioritizing residential equipment replacements and ensuring that commercial equipment operated primarily within the boundaries of the AB617 community.

CURRENT CONTROL PROGRAMS

CARB has a SORE program, which includes lawn and garden equipment. CARB is continuing to consider new standards for small engines to help California meet its goal of reducing smog-forming pollutant emissions from mobile sources by 80 percent by 2031.

<https://ww2.arb.ca.gov/our-work/programs/small-off-road-engines-sore>

In addition, the District offers incentives to help reduce emissions from gas-powered lawn and garden equipment. The Clean Green Yard Machines (CGYM) program provides funding for the following options:

- The residential CGYM provides rebates for the replacement of an old gas-powered mower with a new electric mower and for the purchase of eligible new electric lawn and garden electric equipment without replacements. To date, this program has replaced over 7,400 lawn mowers with over \$1.5 million in funding. <http://www.valleyair.org/grants/cgym.htm>
- The Commercial CGYM launched in May 2019 and provides funding for the replacement of eligible old gas-powered lawn and garden equipment with battery-powered options for public agencies, private entities, and businesses. <http://valleyair.org/grants/cgym-commercial.htm>

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

In order to achieve additional emission reductions from the Lawn and Garden category the District will provide enhanced outreach and access to Stockton residents or businesses who would like to participate in our available incentive programs. For the residential program, the District proposes to cover the full cost of an electric lawn mower purchase when replacing an existing gas powered mower.

The following are proposed measures that are within the Air District's statutory jurisdiction to implement:

LG.1: INCENTIVE PROGRAM FOR THE REPLACEMENT OF RESIDENTIAL LAWN AND GARDEN EQUIPMENT

Overview: The goal of this strategy is to reduce NOx and PM2.5 emissions from residential lawn and garden equipment by replacing existing gas powered units with battery powered zero emission models. The District's existing Residential Clean Green Yard Machines program focuses on this goal by offering incentive funding ranging from \$100-250 for the replacement of existing gas powered units with battery powered zero emission models. Additionally, the District offers up to \$50 for the purchase of a new eligible electric lawn care equipment without requiring an old piece of equipment to be turned in. Using existing District Board-approved criteria, this strategy will provide enhanced outreach and education as well as higher incentive funds to local Stockton residents to encourage participation and maximize local emission reductions within the community. This strategy will increase outreach and access to incentive funding while providing rebates up to 100% of the equipment cost of a new electric lawn mower when replacing an existing gas powered model. The goal is to replace 50 gas powered units at an expected cost of \$400 per unit.

Implementing Agency: SJVAPCD

Strategy Type: Incentives and Outreach

Budgeted Amount: XX\$20,000

Emission Outcome: Reduction

Quantifiable Emission Reductions: Estimated emissions reductions associated with this measure includes up to 0.012 tons of PM2.5 and 0.018 tons of NOx..

LG.2: INCENTIVE PROGRAM FOR THE REPLACEMENT OF COMMERCIAL LAWN AND GARDEN EQUIPMENT

Overview: The goal of this strategy is to reduce NOx and PM2.5 emissions from commercial landscaping operations, in the Stockton AB 617 community (Stockton community), by replacing existing gas powered equipment with battery powered zero emission models. Emissions from commercial lawn care equipment directly impact equipment operators and community residents. The District currently offers a commercial lawn and garden equipment replacement program which offers incentive funding ranging from \$200-\$15,000 for the replacement of gas powered lawn equipment with battery operated zero emission technology. In addition, the program provides incentive funds for up to two batteries and one charger to ensure that the equipment is capable of operating for a full day of work. Additionally, the District will focus on increased participation from small, locally owned businesses and schools in the Stockton community to generate immediate emission reductions which directly impact local residents on a frequent basis. This strategy will provide enhanced outreach and access to available incentive funds offered by the District, utilizing Board-approved criteria. The goal of this measure is to replace 5 pieces of commercial grade gas powered lawn and garden equipment at an expected cost of up to \$20,000 per unit. Emission reductions associated with this measure will be calculated at a later time.

Implementing Agency: SJVAPCD

Strategy Type: Incentive and Outreach

Budgeted Amount: \$100,000

Emission Outcome: Reduction

Quantifiable Emissions Reductions: Estimated emissions reductions associated with this measure will be calculated based on a methodology currently being developed by CARB.

EMISSIONS EXPOSURE AND LAND USE

LAND USE IN THE COMMUNITY

Land use is the characterization of land based on what can be built on it and what the land can be used for. It is important to note that local air districts do not have authority over land use. Land use decisions are directly under the authority of Land use Agencies (e.g. City and County government agencies and Port of Stockton). Land use agencies have jurisdiction over land use, and as such develop land use plans and make decisions about how they grow and expand. The design of development projects in a community significantly influences how people travel, and land use agencies typically have principal responsibility for approving development projects within their jurisdictions for a variety of land use types such as residential (single or multi-family, etc.), commercial (fast food, shopping center, retail, etc.), and industrial (warehouse distribution centers, port operations, etc.). Through the land use approval process, these agencies are responsible for implementing land use strategies that promote increased walkability, commute alternatives and cleaner transit fleets resulting in air quality benefits within a community.

Land use strategies may result in the reduction of vehicle trips by designing development to be more suitable for walking, bicycling, and transit. These land use strategies are typically outlined as measures and goals within a City or County general plan, which is the primary “long range” planning document used to locate future development and provides the framework within which decisions on how to grow, provide public services and facilities, and protect and enhance the environment are made. For information about the City of Stockton General Plan, please refer to Chapter 3, Understanding the Community. Land use agencies’ decisions are critical in contributing to the improvement in air quality within a community and should be geared towards promoting strategies aimed at reducing vehicle miles travelled by increasing community walkability, implementing commute alternatives, and supporting infrastructure for cleaner transit fleets.

COMMUNITY CONCERNS AND COMMENTS

A primary concern expressed by Steering Committee members during meeting discussions was that heavy duty truck exhaust, specifically attributable to truck traffic and idling at the Port of Stockton and from highways and freeways, result in increased exposure to emissions for residents that live near these heavy duty trucking corridors and major thoroughfares in the community. To address community member concerns, measures included in this section will focus both on strategies to reduce conflicting land uses in the community, as well as transportation strategies that reduce exposure to mobile source emissions resulting from land use decisions.

For example, suggestions from community steering committee members included the installation of vegetative barriers to inhibit emission transport from thoroughfares into neighboring communities, increasing opportunities for bicycle path infrastructure projects, support for car sharing programs, supporting the replacement of older truck

fleets with cleaner technologies and strategizing land use planning to minimize or reduce vehicle miles traveled.

As the majority of these suggestions relate to land use issues for which the District does not have authority, the District's approach is to provide support to develop fueling infrastructure for zero and near-zero-emission vehicles, provide incentives for alternative modes of transportation, and to support the land use planning process through the California Environmental Quality Act (CEQA). The District is supportive of measures and policies the land use agency can implement toward making the communities more transit-, bicycle-, and pedestrian-friendly, avoid land use conflicts that lead to toxics and nuisance problems, and minimizing the need to and/or mitigate air quality impacts of individual development proposals.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN THE COMMUNITY

Several strategies have been identified under this Land Use and Transportation section that span from advocating issues, providing incentives, collaborating with the local land use agency (i.e. City, County, and Port of Stockton), to providing input through the land use process. Land use and transportation strategies developed to reduce emissions due to conflicting land uses are further detailed below.

The following are proposed measures that are within the Air District's statutory jurisdiction to implement:

LU.1: SUPPORT PROJECTS THAT REDUCE VEHICLE MILES TRAVELED

Overview: The purpose of this measure is to facilitate inter-agency collaboration between the City of Stockton, San Joaquin County, and San Joaquin Council of Governments to promote environmentally mindful alternative commute options through early discussion of related land use planning initiatives.

Mobile source emissions represent the vast majority of NO_x emissions within the Stockton Community. Reducing emissions from motor vehicles through the implementation of alternate modes of transportation directly contributes to decreasing public exposure to vehicle emissions, such as diesel particulate matter which adversely impacts human health.

Land use decisions are critical in contributing to the improvement in air quality within a community and should be geared towards promoting strategies aimed at reducing vehicle miles traveled by increasing community walkability. Examples of such strategies are listed below:

- Bicycle infrastructure
- Infrastructure to support alternative modes of transportation (electrical vehicles, near-zero emissions vehicles)

- Satellite offices/telecommuting centers to reduce or eliminate employee commutes

Implementing Agency: SJVAPCD, City of Stockton, San Joaquin County, San Joaquin Council of Governments

Strategy Type: Land Use

Emission Outcome: Mitigation

LU.2: BIKE PATH INFRASTRUCTURE FUNDING

Overview: Assess current bike path infrastructure and seek out additional funding opportunities to make the community more bike and walk friendly.

Reducing emissions from motor vehicles through the implementation of alternate modes of transportation, including bicycling, is important to reduce the public's exposure to vehicle emissions including NOx and PM2.5. This strategy would provide incentive funding for the development and construction of Class 1, Class 2, and Class 3 bicycle paths, lane striping, and routes. The proposed funding level of this measure would be consistent with established District guidelines from the District's REMOVE and Public Benefit Grants Programs. Additionally, the District will work with transportation agencies in the Stockton area, and seek to assist these agencies to help identify and leverage existing funds, in addition to AB 617 funding.

Implementing Agencies: SJVAPCD, City of Stockton, San Joaquin County, and San Joaquin Council of Governments

Strategy Type: Incentives

Emission Outcome: Reduction

Budgeted Amount: \$500,000

Quantifiable Emission Reductions: Estimated lifetime emissions reductions associated with this measure includes up to 2 tons of PM, 3 tons of NOx, and 6 tons of VOC.

LU.4: COLLABORATE WITH THE CITY OF STOCKTON, SAN JOAQUIN COUNTY, AND SAN JOAQUIN COUNCIL OF GOVERNMENTS TO IMPLEMENT INTEGRATED TRANSPORTATION DEVELOPMENT PLANNING TO IMPROVE HEALTH AND QUALITY OF LIFE THROUGH A VARIETY OF STRATEGIES SUCH AS SMART LONG-TERM PLANNING AND BUFFER ZONES AROUND SENSITIVE SITES

Overview: The goal of this strategy is to enhance inter-agency and community collaboration to reduce the impact of pollution from motor vehicles by prioritizing pedestrian-friendly land-use design elements around downtown Stockton.

Mobile source emissions represent the vast majority of NOx emissions within the Stockton Community. Reducing emissions from motor vehicles through the implementation of alternate modes of transportation, including pedestrian-friendly accommodations, directly contributes to decreasing public exposure to vehicle emissions, such as diesel particulates which negatively impact human health.

Land use decisions are critical in contributing to the improvement in air quality within a community and should be geared towards promoting strategies aimed at reducing vehicle miles traveled by removing barriers to pedestrian transportation. Examples of such strategies include:

- Bicycle infrastructure
- Dedicated pedestrian crossings
- Satellite offices/telecommuting centers to reduce or eliminate employee commutes

Implementing Entities: SJVAPCD, City and County, SJCOG

Strategy Type: Land Use

Emission Outcome: Reduction

HEAVY DUTY MOBILE SOURCES

HEAVY DUTY MOBILE SOURCES IN STOCKTON

There are a variety of heavy-duty mobile sources operating in and around the City of Stockton. These can range from on-road trucks, school and transit buses, off-road equipment, including agricultural and construction equipment, line-haul, short-haul and switcher locomotives. This equipment is primarily powered by diesel engines and, depending on the specific category, is regulated by one or more statewide regulations.

Emissions from this source category include oxides of nitrogen (NO_x) and combustion PM from the internal combustion engines. Mobile sources account for more than 85% of the NO_x inventory throughout the Valley ([Appendix C – Source Apportionment and Community](#)). In the Stockton community, 328.08 tons per year of NO_x, 26.44 tons per year of VOC and 9.34 tons per year of PM_{2.5} are attributed to on-road heavy-duty equipment. In addition, 133.08 tons per year of NO_x, 20.49 tons per year of VOC and 6.21 tons per year of PM_{2.5} are attributed to off-road heavy-duty equipment referenced in these measures.

Figure 4-7 Examples of Heavy Duty Mobile Sources

COMMUNITY CONCERNS AND COMMENTS

During the committee discussions regarding heavy-duty mobile sources, a majority of the committee ranked this source as a high priority to address. Committee member comments and suggestions included providing incentives to replace older trucks, alternative fueling infrastructure development, clean fleet requirements, and shifting trucking routes away from residents.

CURRENT CONTROL PROGRAMS

The District does not have regulatory authority of emissions from mobile sources, including heavy duty vehicles and equipment, locomotives, school and transit buses. Diesel powered on-road heavy duty vehicles are subject to the statewide CARB Truck and Bus Regulation which requires all equipment to get progressively cleaner over time. Off-road heavy-duty equipment is similarly controlled through the CARB Off-Road Regulation, which requires all fleets to be upgraded to newer, cleaner technologies over

time. However, at this time, there are no regulatory requirements in place at the state or federal level controlling emissions from locomotives (for more information, see Section 5.6.2 - CARB Enforcement Strategies).

Due to the large amount of pollution that can be attributed to mobile sources, the District has implemented a broad suite of voluntary incentive programs, targeted at reducing emissions from heavy-duty engines operating throughout the Valley.

Heavy Duty Trucks/Buses:

The District currently offers a variety of programs targeted at replacing or upgrading older, high-polluting trucks and buses with cleaner technology.

- The Heavy Duty Truck Replacement Program <http://valleyair.org/grants/truck-replacement.htm>. This program provides incentives for the replacement of existing heavy-duty diesel trucks with new, zero or near-zero-emission technology.
- Program for Heavy-Duty Alternative Fuel Infrastructure which provides local businesses and agencies incentive funding to install alternative fueling infrastructure (electric, natural gas, hydrogen, etc.) to support the increased deployment of heavy-duty advanced clean technology vehicles.
- Electric School Bus Incentive Program - <http://valleyair.org/grants/electric-school-bus.htm>. This program is operated by the District and provides incentives for the replacement of existing older, higher-polluting school buses with new, electric school buses.
- Volkswagen Mitigation Trust – <http://vwbusmoney.valleyair.org/>
The VW Mitigation Trust has \$130 million in funds to replace older, high-polluting transit, school, and shuttle buses with new battery-electric or fuel-cell buses. Replacing an older bus with a zero-emission bus eliminates particulate matter and other pollutants that impact children and residents riding the buses, as well as residents throughout California communities. This statewide program is being administered by the District.

Locomotives:

Freight locomotives are regulated by the U.S. EPA. The current regulation requires that all locomotives purchased in or after 2015 be at least a Tier 4 emission level. Older, lower Tier engines, which comprise the majority of Class 1 fleets, are still permitted to run. Additionally, CARB is planning actions to address freight locomotive emissions within the State. More details can be found in the 2019 March CARB Board Meeting Informational Update: <https://www.arb.ca.gov/board/books/2019/032119/19-3-2pres.pdf>

The District offers two incentive programs for locomotive fleets interested in transitioning to newer, clean technology, including:

- Heavy Duty Program – <http://valleyair.org/grants/locomotive.htm>. Locomotive replacements can be funded as an eligible project category utilizing funding provided to support AB 617. These projects are administered according to Carl Moyer Program guidelines and are subject to additional requirements contained within the approved AB 617 Community Air Protection Guidelines. This program is operated by the District.
- Proposition 1B - <http://valleyair.org/grants/locomotives-prop1b.htm>. This program incentivizes the reduction of emissions and health risks associated with freight movement along California’s trade corridors via upgrading to cleaner technologies or installation of emissions capture and control systems.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

Due to the priority that community members placed on reducing emissions from this source category and the large amount of emissions, including PM_{2.5} and toxic air contaminants (particularly diesel PM) that originate from heavy duty mobile sources in and around the community, the following strategies have been developed for implementation in the Stockton community.

The following are additional suggested measures not within the Air District’s jurisdiction to directly implement:

HD.14: HEAVY DUTY TRUCK REROUTING

Overview: Community Steering Committee members have suggested that a study should be performed to assess the existing heavy-duty diesel truck routes in and around the Port of Stockton and the nearby neighborhoods, including the Boggs Tract neighborhood. The study will focus on whether there are other routes which will result in reduced exposure to toxic air contaminants by residents in the nearby neighborhoods. The District will work with the City, County, and all other appropriate land-use and transportation agencies regarding this and the desire of the CSC for inclusion in the Stockton CERP. The District will work with the City of Stockton and other appropriate agencies to seek funding to support this study.

Jurisdictional Issues: It should be noted that the District has no authority over how agencies allow land under their jurisdiction to be used. These so-called “land-use” decisions, such as truck rerouting, are historically the responsibility, under state law, of cities and counties, or, in some cases, state and federal agencies responsible for transportation corridors, state and federal parks, and other properties. AB 617 does not provide the District with new land-use regulatory authority, so land-use authority remains with cities, counties, and state and federal land-use agencies, as discussed in CARB’s Blueprint (see “Who Has the Authority to Implement Actions?”, page 26 of the Blueprint). However, the District is committed to working with the implementing agencies to identify additional possible funding sources for the study up to \$500,000, developing the scope of work for the study, and coordinating conversations with the implementing agencies and the CSC as necessary.

Implementing Agency: City, County, San Joaquin COG, Caltrans, Port of Stockton

Strategy Type: Partnership

Emission Outcome: Mitigation

Budgeted Amount: \$350,000

The following are proposed measures that are within the Air District's statutory jurisdiction to implement:

HD.42: INCENTIVE PROGRAM FOR HEAVY DUTY TRUCKS REPLACEMENT WITH ZERO AND NEAR ZERO EMISSION TECHNOLOGY

Overview: The goal of this strategy is to reduce emissions from heavy duty diesel trucks operating in the Stockton community. This strategy would provide enhanced outreach and access to incentive funding for zero and near-zero emissions, clean truck technologies that are domiciled and operating within the community. District Board-approved methodology and funding levels can be utilized and the District will encourage small business owners to participate in the program while also promoting the selection of all electric, zero emission technology. This measure would replace 50 older, heavy duty diesel trucks operating in Stockton with zero or near-zero emission technology at an expected cost of up to \$200,000 per truck. Where feasible and available for the truck type and duty-cycle, the District will prioritize funding for replacement with zero-emissions electric vehicle technologies. By reducing or eliminating emissions from heavy duty diesel trucks, significant PM2.5, diesel particulate matter, and NOx emissions reductions can be achieved.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Emission Outcome: Reduction

Budgeted Amount: \$10,000,000

Quantifiable emission reductions: Estimated emissions reductions associated with this measure includes up to 4 tons of PM (including toxic diesel particulate matter), 191 tons of NOx, and 14 tons of VOCs.

HD.33: SUPPORT PLANNING AND DEVELOPMENT OF HEAVY-DUTY ELECTRIC VEHICLE CHARGING INFRASTRUCTURE

Overview: The goal of this strategy is to provide support for planning and development of fueling infrastructure for heavy-duty zero emission vehicles and transportation refrigeration units to support broader deployment of clean vehicles operating throughout the community and reduce the impact of emissions from the idling of heavy duty diesel trucks at distribution centers, warehouses, or other freight facilities where trucks are being loaded or unloaded. Utilizing Board-approved methodology and funding levels the District will work closely with businesses, public agencies, and fueling providers to support and incentivize the development of clean-vehicle fueling infrastructure in the area of the community. This action will prioritize incentive funding to support the development and construction of new electric infrastructure within the community. This includes increased outreach to businesses and public agencies operating vehicles within the community as well as prioritized funding for projects that serve vehicles operating in the community.

Depending on the size, throughput and configuration of the fueling infrastructure, the proposed funding amount of \$1,000,000 would incentivize the development of a new electric charging station.

Implementing Agency: SJVAPCD

Strategy Type: Incentives and Outreach

Emission Outcome: Reduction

Budgeted Amount: \$1,000,000

HD.45: TRUCK IDLING PLUG-INS

Overview: The goal of this strategy is to reduce emissions from heavy duty diesel truck idling and reduce the use of diesel-fueled internal combustion auxiliary power systems at truck stops where diesel trucks congregate in the Stockton community. Truck stop electrification allows a vehicle operator to "plug in" their vehicle and draw electricity directly from the power grid to provide cab heating and cab cooling, to power cab appliances, and to charge the vehicle's battery.

This strategy would provide funding to launch a program in the Stockton community. The District would leverage experience from the Proposition 1B Goods Movement Emission Reduction Program in order to design a program that would fund the purchase and installation of electrical infrastructure and/or equipment to enable heating, cooling, and other use of cab power for parked trucks at truck stops in the Stockton area. This measure would provide \$10,000 in funding per unit, for 33 units. The emission reductions associated with this measure will come from HD.1, as this measure serves to support the deployment of zero and near-zero technology.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Emission Outcome: Reduction

Budgeted Amount: \$100,000

HD.56: ENHANCED ENFORCEMENT OF THE STATEWIDE ANTI-IDLING REGULATION

Overview: The goal of this strategy is to limit the potential for localized emissions from heavy duty vehicles for failure to comply with the state's heavy duty anti-idling regulation. Historically, the District has partnered with CARB to conduct anti-idling enforcement throughout valley communities.

The state's anti-idling Airborne Toxic Control Measure limits nonessential (or unnecessary) vehicle idling to specific time limits. It is applicable to all diesel-fueled commercial motor vehicles with a gross vehicular weight rating of greater than 10,000 pounds. The diesel exhaust from excessive idling has the potential to impose significant adverse health and environmental impacts. Therefore, efforts to ensure compliance with the anti-idling regulation, especially near schools and residential areas, are important to reduce the potential for localized impacts within the community.

The District will partner with CARB to conduct additional targeted anti-idling enforcement efforts in the Stockton community with established benchmarks. These benchmarks include anti-idling surveillance to occur at least once per quarter for the next 5 years. The District and CARB will work with the Community Steering Committee to identify heavy-duty vehicle idling "hot spots," especially those near schools, to aid in focusing the enforcement efforts.

Implementing Agency: SJVAPCD and CARB

Strategy Type: Enforcement

Emission Outcome: Reduction in PM2.5, PM10, NOx, VOC, and CO emissions through higher compliance rates with the state regulation

HD.76: INCENTIVE PROGRAM FOR REPLACING OLDER DIESEL SCHOOL BUSES WITH ZERO EMISSION SCHOOL BUSES

~~This measure is still being considered by the Stockton Steering Committee.~~

To provide increased outreach and access to incentive funding for the replacement of older, high polluting school buses with new zero-emission school buses operating within the Stockton Unified School District.

Replacing older school buses is important to reduce children's exposure to diesel emissions including NOx and PM2.5 and these pollutants negatively impact human health, especially for sensitive populations such as children. New, zero-emission battery electric and near-zero emission natural gas powered school buses are significantly cleaner than older diesel buses.

Emissions from school buses are regulated by the California Air Resources Board Statewide Truck and Bus Regulation that requires transition to cleaner technology over time. Generally phased in by model year.

<https://www.arb.ca.gov/msprog/onrdiesel/onrdiesel.htm>

This measure would cover up to 100% of the cost of replacing up to 10 diesel school buses with electric buses at \$400,000 each.

Implementing Agency: SJVAPCD

Type of Action: Incentives

Implementation: 2021-2025

Emission Outcome: PM, NOx, and VOC reductions

Budgeted Amount: \$4,000,000

Quantifiable emission reductions: Estimated lifetime emissions reductions associated with this measure includes up to 0.3 tons of PM, 18 tons of NOx, and 4 tons of VOCs.

HD.497: INCENTIVE PROGRAM FOR REPLACING OLDER DIESEL SWITCHER LOCOMOTIVES WITH NEW CLEAN-ENGINE TECHNOLOGY

~~[This measure is still being considered by the Stockton Steering Committee](#)~~

Overview: To provide incentive funding for the replacement of older, high polluting switcher locomotives with new clean-technology switcher locomotives operating within and surrounding the Stockton community.

Replacing older switcher locomotives is important to reduce the public's exposure to diesel emissions including NOx and PM2.5. These pollutants negatively impact human health, especially for sensitive populations such as children and the elderly. New,

clean-technology railcar movers and/or switcher locomotives are significantly cleaner than older uncontrolled diesel railcar movers and/or switcher locomotives.

The goal of this action is to replace up to 4 older, high-polluting switcher locomotives operating within and surrounding the community. The proposed funding amount would cover up to 95% of the cost of replacing up to 4 diesel switcher locomotives at up to \$1,700,000 each.

Implementing Agency: SJVAPCD

Type of Action: Incentives

Implementation: 2021-2025

Emission Outcome: PM, NOx, and VOC reductions

Budgeted Amount: \$6,700,000

Quantifiable emission reductions: Estimated lifetime emissions reductions associated with this measure includes up to 12 tons of PM (including toxic diesel particulate matter), 502 tons of NOx, and 31 tons of VOC.

~~The following are additional suggested measures not within the Air District's jurisdiction to directly implement:~~

~~HD.11: HEAVY DUTY TRUCK REROUTING~~

~~*Overview:* Community Steering Committee members have suggested that a study should be performed to assess the existing heavy duty diesel truck routes in and around the Port of Stockton and the nearby neighborhoods, including the Beggs Tract neighborhood. The study will focus on whether there are other routes which will result in reduced exposure to toxic air contaminants by residents in the nearby neighborhoods. The District will work with the City, County, and all other appropriate land use and transportation agencies regarding this and the desire of the CSC for inclusion in the Stockton CERP. The District will work with the City of Stockton and other appropriate agencies to seek funding to support this study.~~

~~*Jurisdictional Issues:* It should be noted that the District has no authority over how agencies allow land under their jurisdiction to be used. These so-called "land use" decisions, such as truck rerouting, are historically the responsibility, under state law, of cities and counties, or, in some cases, state and federal agencies responsible for transportation corridors, state and federal parks, and other properties. AB 617 does not provide the District with new land use regulatory authority, so land use authority remains with cities, counties, and state and federal land use agencies, as discussed in~~

~~CARB's Blueprint (see "Who Has the Authority to Implement Actions?", page 26 of the Blueprint). However, the District is committed to working with the implementing agencies to identify additional possible funding sources for the study up to \$500,000, developing the scope of work for the study, and coordinating conversations with the implementing agencies and the CSC as necessary.~~

~~Implementing Agency: City, County, San Joaquin COG, Caltrans, Port of Stockton~~

~~Strategy Type: Partnership~~

~~Emission Outcome: Mitigation~~

~~Budgeted Amount: \$350,000~~

OLDER/HIGH POLLUTING PASSENGER CARS

OLDER/HIGH POLLUTING PASSENGER CARS IN STOCKTON COMMUNITY

Mobile source emissions account for over 85% of the overall NO_x inventory in the San Joaquin Valley. With no regulatory authority over these sources, the District has relied on voluntary incentive programs to transition older, higher emitting vehicles to newer, cleaner and more fuel efficient models. With limited public transportation options available to residents driving is more prevalent in the Valley than in other areas of the state. Vehicles registered in the Valley are typically older and have higher mileage than statewide averages.

Emissions from light duty vehicles in Stockton total 114.08 tons per year (tpy) of NO_x, 138.23 tpy of VOC, and 12.74 tpy PM_{2.5}. These total emissions contribute 10.5% of the NO_x inventory, 17.5% of the VOC inventory, and 10.3% of the PM_{2.5} inventory.

Figure 4-8 The District's Drive Clean in the San Joaquin Repair and Replacement Program

COMMUNITY CONCERNS AND COMMENTS

Community Steering Committee comments regarding passenger vehicles included increased outreach and incentives for low income residents, increasing charging infrastructure in the community, and questions about the effectiveness of existing programs for low-income individuals. As detailed below, to address these concerns District staff have developed new programs, specifically for Stockton community members, to provide incentive funding for clean-air vehicles, to bring car share programs to the community, and to incentivize the purchase of electric vehicles by the primary local ride share service.

CURRENT CONTROL PROGRAMS

The District does not have regulatory authority of emissions from mobiles sources, however, due to the large amount of pollution that originates from passenger vehicles

the District has implemented a suite of programs to reduce pollution from mobile sources. These programs include the following measures:

- Tune In Tune Up vehicle repair program which provides incentive funds to repair high emitting vehicles.
<http://valleyair.org/drivecleaninthesanjoaquin/repair/>
- Vehicle replacement program which provides funding to replace older, high emitting vehicles with newer, cleaner and more fuel efficient models.
<https://www.valleyair.org/drivecleaninthesanjoaquin/replace/>
- The vehicle rebate program provides rebates for the purchase or lease of a new clean air vehicle including battery electric, fuel cell, plug in hybrid, zero emission motorcycles, and advanced technology natural gas vehicles.
<https://www.valleyair.org/drivecleaninthesanjoaquin/rebate/>
- Incentives are available for publically accessible charging infrastructure through the District's Charge Up! Program <http://valleyair.org/grants/chargeup.htm>
- The District's Healthy Air Living school program promotes no idling while picking up children at school and provides no idling signs to schools to encourage drivers to turn off their engines.
- District Indirect Source Rule (9510) accounts for mobile source emissions from construction and new development projects and ensures that emissions from these activities are mitigated.
- District Employer based Trip Reduction Rule (9410) requires large employers to implement measures to encourage employees to take alternative transportation to work in order to reduce single occupancy vehicle trips.
- CARB mobile source strategy calls for increasing the deployment of plug in hybrid, battery electric, and fuel cell vehicles in order to attain federal ozone standards, reducing greenhouse gas emissions, minimizing health risks, reducing petroleum usage and increasing energy efficiency.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

Due to the high priority that community members placed on reducing criteria pollutant and toxic air contaminant emissions that originate from passenger vehicles operating in and around the community, District staff and the Steering Committee have developed targeted strategies for implementation in the Stockton community. As further detailed below, measures developed include additional incentive funding intended to increase the deployment of electric vehicles through the replacement of gas powered vehicles currently in use; launching an electric vehicle car sharing program; providing additional charging infrastructure throughout the community; providing for electric vehicle

maintenance training to increase available repair facilities and job skills; and repairing high polluting passenger vehicles.

The following are proposed measures that are within the Air District's statutory jurisdiction to implement:

TP.1: INCENTIVE PROGRAM TO HOST A LOCAL TUNE IN TUNE UP EVENTS TO REDUCE EMISSIONS FROM OLDER, HIGH POLLUTING CARS

Overview: The goal of this strategy is to reduce emissions of high emitting passenger vehicles that may be in need of repair by providing funding for up to 5 "Drive Clean in the San Joaquin" Repair Program events within the Stockton AB 617 community in. Under this program, financial incentives up to \$850 will be available for emissions related testing and repairs for eligible high emitting vehicles. Through the program, weekend testing events, if possible, will be held to determine if vehicles are in need of emissions related repairs. Due to the ongoing pandemic, an online and telephone process will be used to provide residents the opportunity to participate until such a time that in-person events can be held safely. Approved participants are provided vouchers which can be utilized for the necessary smog tests, diagnostic work and emissions related repairs at participating STAR certified smog shops. Reducing emissions from passenger vehicles is important due to their contribution to the formation of ozone in the Valley.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Emission Outcome: Reduction

Budgeted Amount: \$300,000

Quantifiable Emission Reductions: Estimated emissions reductions associated with this measure includes up to 3.7 tons of NOx.

TP.2: INCENTIVE PROGRAM FOR THE REPLACEMENT OF PASSENGER VEHICLES WITH BATTERY ELECTRIC OR PLUG IN HYBRID VEHICLES

Overview: The goal of this strategy is to reduce emissions associated with passenger vehicles by replacing 100 vehicles with newer, more fuel efficient models, and providing additional incentives for Level 2 residential chargers in the Stockton community. Emission reductions from passenger vehicles provide benefits to area residents as well as assist in reducing ozone formation in the Valley. Enhanced outreach would be conducted in the Stockton community to ensure that residents are fully aware of

available incentive options and community residents would be provided priority access through the program in order to complete projects as quickly as possible. Through the District's existing Board approved "Drive Clean in the San Joaquin" replacement program, incentives are currently offered for low to moderate income residents of disadvantaged communities to replace their older, high polluting vehicle with a newer, cleaner model. The program currently offers up to \$9,500 towards the purchase on an eligible replacement vehicle, with an additional \$2,000 provided to participating residents who purchase or lease a plug-in hybrid electric or a battery-electric vehicle and want to install a Level 2 charger in their home.

Implementing Agency: SJVAPCD

Strategy Type: Incentives and Outreach

Emission Outcome: Reduction

Budgeted Amount: \$800,000

Quantifiable Emission Reductions: Estimated emissions reductions associated with this measure includes up to 0.2 -tons of NOx.

TP.3: INCENTIVE PROGRAM FOR INSTALLATION OF ELECTRIC VEHICLE CHARGING INFRASTRUCTURE

Overview: The goal of this strategy is to provide electric vehicle charging infrastructure necessary to support the deployment of battery electric and plug in hybrid vehicles. The District's Charge Up program currently provides \$5,000 for a Level 2 Single Port, \$6,000 for a Level 2 Dual Port, and \$25,000 for a Level 3/DC Fast Charger with a cap of \$50,000 per applicant and/or site. Having the appropriate charging infrastructure available for Stockton residents will encourage the growth of zero emission passenger vehicles in the community.

This strategy would provide incentive funding for publically accessible charging infrastructure to private and public entities in the Stockton community. This strategy would utilize the existing Charge Up program guidelines and funding amounts. The goal of this measure is to install up to 15 electric vehicle charging stations, including Level 2 and Level 3 chargers, in Stockton at an expected cost of up to \$25,000 per station. This measure is an important part of a long term solution. There are no direct emission reductions associated with this measure, however, this measure supports the emission reductions associated with electric vehicle deployment.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Emission Outcome: Indirect Reduction

Budgeted Amount: \$375,000

TP.4: INCENTIVE PROGRAM FOR EDUCATIONAL TRAINING FOR ELECTRIC VEHICLE MECHANICS

Overview: The goal of this strategy is to provide opportunities to develop and advance the education of personnel on the mechanics, safe operation, and maintenance of alternative fuel vehicles and infrastructure. To support and to encourage ongoing deployment of electric vehicles in the Stockton community it will be necessary to have qualified, trained personnel available to provide service as needed to these vehicles.

This strategy will provide up to \$15,000 per training course for at least 10 alternative fuel mechanic training courses provided by an appropriate entity. While there are no direct emission reductions associated with this measure, this measure supports the emission reductions associated with additional electric vehicle deployment.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Emission Outcome: Indirect Reduction

Budgeted Amount: \$150,000

TP. 5: INCENTIVE PROGRAM FOR THE LAUNCH OF A CAR SHARING PROGRAM IN THE STOCKTON COMMUNITY

Overview: The goal of this strategy is to reduce emissions from passenger vehicles by launching an electric car sharing program in the Stockton community. These types of programs offer access to electric vehicles for a defined period of time at a minimal cost to the user. In addition these programs may allow for a resident to eliminate the use of a gas powered vehicle providing a benefit to community residents by reducing NOx and VOC emissions that would otherwise occur.

This strategy provides funding for a partnering car share provider to launch a program in the Stockton community. The District would leverage experience with existing ride share programs operating in the Valley in order to expand to the Stockton area. This measure would provide \$1,000,000 in funding. Projects will include electric vehicles, related infrastructure and subsidies to help minimize the initial cost to the end user. The emission reductions associated with this measure would be calculated in coordination with the project partners once a specific project location is selected by the CSC.

Implementing Agency: SJVAPCD, Housing Authority of San Joaquin, others

Strategy Type: Incentives

Emission Outcome: Reduction

Budgeted Amount: \$1,000,000

RESIDENTIAL BURNING

BACKGROUND

The wood burning fireplaces and wood burning heaters source category includes emissions from wood burning fireplaces, wood burning heaters, and outdoor wood burning devices. This source category contributes 5.4 tons per year of PM_{2.5} towards area sources of emissions in the community of Stockton, representing 4.3% of the total PM_{2.5} inventory. During winter, residential wood burning, including illegal open burning, is one of the largest sources of particulate pollution. Given the significant localized health impacts associated with residential wood smoke, reducing emissions from residential wood burning is a high priority for Stockton. Many scientific studies have found that prolonged inhalation of wood smoke contributes to adverse impacts on human health, especially among children, elderly, and people with certain medical conditions, and individuals who are sensitive to the impacts of air pollution. A number of environmental justice communities experience a disproportionately high level of directly emitted PM_{2.5} emissions from residential wood burning.

COMMUNITY CONCERNS AND COMMENTS

The community of Stockton raised concerns with residential wood smoke, both from the use of wood burning fireplaces and wood burning heaters and illegal open outdoor burning. The CSC provided recommendations to implement the enhanced financial incentives for residents to replace existing wood burning devices and pellet stoves with natural gas or electric technologies which will reduce the smoke impacts associated with residential wood burning for downwind communities. The Stockton community made recommendations to ensure significant efforts are made to conduct outreach and education in support of this measure and to increase compliance rates with District Rules 4901 – *Wood Burning Fireplaces and Wood Burning Heaters* and Rule 4103 – *Open Burning*.

CURRENT CONTROL PROGRAMS

The District's comprehensive strategy to reduce emissions from residential wood burning includes implementation of stringent wood burning curtailment requirements through Rule 4901, strong outreach and education to establish the necessary public support, and deployment of financial incentives to transition away from wood burning to cleaner alternatives. This approach that combines regulatory and incentive based strategies is designed to improve the public health by reducing toxic wood smoke emissions in Valley neighborhoods during the peak PM_{2.5} winter season (November through February). The District has continually enhanced the strategy since adopting the first regulation in 1993. Today, the District has the toughest and most effective residential wood burning strategy in the nation as it reduces emissions when and where most needed, such as during multi-day periods of stagnation, in the evening hours, and in neighborhoods where residents live and play. Additionally, the District enforces the requirements of Rule 4103 which prohibits the use of open outdoor fires for the purpose of disposing of waste materials.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

Due to the priority that the Steering Committee and members of the public placed on reducing PM2.5 and toxic air contaminant emissions that originate from residential burning in and around the community, targeted measures have been developed to reduce emissions from this source category. Building upon the effective implementation of the District's wood burning emission reduction strategy, the District commits to providing enhanced incentives to replace existing wood burning devices and increased outreach efforts to educate the public about harmful impacts of wood smoke and specific actions they can take to reduce pollution and comply with District requirements.

The following are proposed measures that are within the Air District's statutory jurisdiction to implement:***RB. 1: INCENTIVE PROGRAM FOR THE REPLACEMENT OF EXISTING WOOD BURNING DEVICES AND PELLET STOVES WITH NATURAL GAS OR ELECTRIC TECHNOLOGIES***

Overview: The goal of this strategy is to reduce the impact of PM2.5 pollution associated with residential wood burning by replacing approximately 100 wood burning devices in Stockton with new natural gas devices or electric heat pumps. During the winter months, one of the largest sources of particulate pollution comes from residential wood burning. Emissions are the result of incomplete combustion and are emitted into Valley neighborhoods where residents live and play. Multiple scientific studies show that prolonged inhalation of wood smoke has adverse impacts on human health. Inhalation of wood smoke contributes to lung disease, and pulmonary arterial hypertension, which can eventually lead to heart failure. Through the District's existing Board approved Burn Cleaner program, incentives are currently offered to replace existing wood or pellet burning inserts or free-standing stoves with new natural gas devices or electric heat pumps. The proposed program under this strategy would offer up to \$3,000 to replace an existing wood burning device with a natural gas device and up to \$4,000 for an eligible electric heating source, such as an electric heat pump.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Emission Outcome: Reduction

Budgeted Amount: \$300,000

Quantifiable Emission Reductions: Estimated emission reductions associated with this measure includes up to 49 tons of PM2.5.

RB.2: EDUCATE PUBLIC REGARDING HARMFUL EFFECTS OF RESIDENTIAL WOOD BURNING FIREPLACE AND WOOD BURNING HEATER SMOKE

Overview: The goal of this strategy is to conduct outreach in the community to educate residents regarding the harmful health effects of residential fireplace wood burning and wood burning heater smoke and the importance of reducing it. Residential wood burning education is important because airborne particles produced by wood smoke (such as PM 2.5) negatively impact human health, especially sensitive populations such as children and seniors who may live in areas where residents burn wood for heating, cooking, or recreation. This strategy's focus includes providing information about programs available to support the transition to natural gas and electric devices, as well as the winter no wood-burning season and District Rule 4901.

This strategy would create a series of four (4) public workshops to educate Stockton residents about wood burning topics and to address questions and concerns interactively and accessibly within a forum setting. Workshops would take place in locations commonly available to the public such as libraries, schools, and community, health, or recreation centers. Depending on circumstances, workshops could also be held in a virtual environment such as Zoom. Wood burning infographics and educational materials would also be circulated to at least six (6) community spaces throughout the Stockton community and the surrounding community with the goal of continuing to spread awareness and increasing applications for incentive funds supporting the transition to natural gas and electric devices. The District will look to coordinate and work with the CSC, community based organizations, and Stockton residents to develop the materials and to provide outreach for the events.

Implementing Agency: SJVAPCD

Strategy Type: Outreach

Emission Outcome: Reduction in localized PM2.5, PM10, NOx, VOC, and CO emissions through higher compliance rates

RB.43: REDUCE ILLEGAL BURNING THROUGH RESIDENTIAL OPEN BURNING EDUCATION

Overview: The goal of this strategy is to reduce illegal burning of residential waste, such as trash, through outreach and education while focusing on areas of concern identified by the CSC, including residential areas and homeless encampments. It is important to continue to educate residents of the localized, harmful emissions created through the burning of residential garbage and how it negatively effects health. Smoke from burning trash and yard waste contain toxic pollutants which are harmful to human health.

This strategy would include working with the City of Stockton and the fire agencies to better understand the illegal open burning issues within the AB 617 community,

establish a series of public workshops to educate Stockton residents about illegal open burning, the health impacts of burning waste, and to address questions and concerns interactively and accessibly within a forum setting either in person or in an online platform such as Zoom. In person workshops would take place in locations commonly available to the public such as libraries, schools, and community, health, or recreation centers when possible. Videos will be used as an outreach tool and be available in languages such as Spanish, Tagalog and others.

Implementing Agency: SJVAPCD, City of Stockton, and local fire agencies

Strategy Type: Outreach

Emissions Outcome: Reduction in localized PM2.5, PM10, NOx, VOC, and CO emissions through higher compliance rates

PORT OF STOCKTON

The Port of Stockton (Port) is a deep-water river inland port located on the Stockton Ship Channel of the Pacific Ocean and is an inland port located approximately 70 nautical miles from the ocean. Operating since 1933, the Port is a hybrid public/private entity and is governed by a commission appointed by the City of Stockton and San Joaquin County. The Port serves as lead agency under the California Environmental Quality Act (CEQA) for projects within its jurisdiction. Cargo is delivered to and from the Port by ships, trucks, and trains. The Port has 7.7 million square feet of warehouses which are either operated by the Port or leased to business partners who provide their own labor. The Port has sixty business partners who have leased land and have constructed and operate facilities with over 125 total tenants. With four major freeways, two transcontinental railroads, an international waterway, and a regional airport, the Port handles liquid and dry bulk, break bulk, and agricultural commodities⁵.

In 2017, nearly 4.7 million tons of cargo moved through the Port of Stockton, and that number is expected to continue to grow. The Port is the fourth busiest in the state and as a result, it has an important role in the local and regional economy, including directly and indirectly supporting thousands of jobs⁶. The Port works with upwards of fifty-five different countries, with goods flowing in both directions.

Figure 4-9 Port of Stockton

COMMUNITY CONCERNS AND COMMENTS

The Stockton community identified the activities associated with the Port as an air quality concern. Sources of air pollution include heavy-duty vehicle traffic, ocean-going

⁵ Port of Stockton, *About Navigating Success*. Retrieved 1/25/2021 from <https://www.portofstockton.com/about/>

⁶ Port of Stockton, *Port Facts & Figures: By the Numbers*. Retrieved 1/25/2021 from <https://www.portofstockton.com/port-facts-figures/>

vessels, commercial harbor craft, cargo handling equipment (such as yard trucks, forklifts, reach stackers, and other equipment) and stationary sources located there. The Community Steering Committee (CSC) have recommended placing air monitors to identify major emission contributors, a comprehensive plan to reduce exposures and emissions, and continued residential involvement on the Port's emission reduction planning efforts.

CURRENT CONTROL PROGRAMS

The District does not have regulatory authority of emissions from the following Port of Stockton sources which are subject to statewide CARB regulations. Ongoing efforts to reduce emissions from the Port of Stockton, include the following CARB regulations. For more information, refer to *Statewide Strategies Overview of California Air Resources Board's Statewide Actions*.

- **Ocean Going Vessel Fuel Regulations**

Adopted in August 2020 and is an updated version of the CARB's At-Berth Regulation that supersedes the existing At-Berth Regulation, as specified, and is designed to achieve further emissions reductions from vessels at berth to improve air quality in communities surrounding ports and terminals throughout California. Emissions reductions will be achieved through the inclusion of new vessel categories (such as vehicle carriers and tanker vessels), new ports, and independent marine terminals, and through updated control requirements, among other provisions.

<https://ww2.arb.ca.gov/our-work/programs/ocean-going-vessel-fuel-regulation>

- **Commercial Harbor Craft Regulation**

CARB's existing commercial harbor craft regulation was adopted in 2007 and will be fully implemented by the end of 2022. CARB is working through a public process to consider additional amendments that may further reduce emissions and pursue more stringent in-use standards, with consideration for Tier 4 engine technology and near-zero and zero emission technologies. For more information on the regulation and potential new regulatory concepts, visit:

<https://ww2.arb.ca.gov/our-work/programs/commercial-harbor-craft>.

- **Mobile Cargo Handling Equipment**

Mobile cargo handling equipment is any motorized vehicle used to handle cargo or perform routine maintenance activities at California's ports and intermodal rail yards. The type of equipment includes yard trucks (hostlers), rubber-tired gantry cranes, container handlers, forklifts, etc. The Mobile Cargo Handling Equipment (CHE) Regulation was adopted in 2005 to reduce toxic and criteria emissions to protect public health and was fully implemented by the end of 2017. CARB staff is currently assessing the availability and performance of zero-emission technology to further reduce emissions. For more information on the regulation, visit: <https://ww2.arb.ca.gov/our-work/programs/cargo-handling-equipment>.

- **Drayage Truck Regulation**

This regulation reduces air toxics and criteria pollutant emissions from drayage trucks. A drayage truck is any in-use on-road vehicle with a gross vehicle weight rating of greater than 26,000 pounds used for transporting cargo to and from

ports and intermodal railyards. The regulation requires all drayage trucks to operate with an engine that is a 2007 model year or newer. Drayage trucks must also meet the requirements of the CARB Truck and Bus Regulation, which requires that all drayage trucks must have 2010 model year or newer engines by January 1, 2023.

<https://ww2.arb.ca.gov/our-work/programs/drayage-trucks-seaports-railyards>

- **Transport Refrigeration Units Regulations**

Transport refrigeration units congregate at distribution centers, railyards, and other facilities, resulting in the potential for health risks to those that live and work nearby. CARB is working through a public process to consider new requirements to transition the transport refrigeration units fleet to zero emission operations by requiring both zero emission technology and supporting infrastructure. For more information on this new regulation, visit: <https://ww2.arb.ca.gov/our-work/programs/transport-refrigeration-unit/new-transport-refrigeration-unit-regulation>.

- **Enforcement of Heavy-Duty Vehicles Inspection Programs**

When emissions control systems are not operating correctly, in-use emissions can increase. CARB's current inspection programs include the roadside Heavy-Duty Vehicle Inspection Program and the fleet Periodic Smoke Inspection Program. These regulations require heavy-duty vehicles operating in California be inspected for excessive smoke and tampering. In July 2018, CARB approved amendments to the Heavy-Duty Vehicle Inspection Program and the Periodic Smoke Inspection Program to reduce the smoke opacity limits to levels more appropriate for today's modern engine technology. CARB is now exploring the development of a more comprehensive heavy-duty inspection and maintenance program that would help ensure all vehicle emissions control systems are maintained adequately throughout the vehicles' operating lives. For more information on existing heavy-duty maintenance programs, visit <https://ww2.arb.ca.gov/our-work/programs/heavy-duty-diesel-inspection-periodic-smoke-inspection-program>.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN THE COMMUNITY

Several strategies have been identified under this Port section that span from advocating issues, air monitoring placement, collaborating with the City, County, and Port of Stockton, to providing input through resident involvement in a sustainable planning process. Collaborative Port strategies developed to reduce emissions are further detailed below.

The following are proposed measures that are not within the Air District's statutory jurisdiction to implement:

P.1: COLLABORATING TO FACILITATE ENHANCED PLATFORMS FOR DISCUSSION AND INFORMATION SHARING BETWEEN THE COMMUNITY AND THE PORT OF STOCKTON AS PORT-RELATED PROGRAMS AND PROJECTS ARE DEVELOPED

Overview: The purpose of this strategy is to provide a platform for discussion between Port of Stockton, CSC members, residents, community-based organizations, and other stakeholders to ensure air quality impacts associated with future development projects related to the Port of Stockton are taken into consideration.

The South Stockton CSC has prioritized the need for better facilitation of local involvement, and community notification regarding Port of Stockton development projects. In keeping with that priority, the Port has committed to adopting a Community Environmental Committee (CEC) geared toward improving their relationship with the community by implementing new engagement platforms.

This measure would include the following commitments by the Port:

1. Establishing a recurring CEC, in 2021, CEC, in 2021, to build collaboration and improve dialogue between concerned citizens in the community and environmental justice organizations to allow them a forum to raise awareness of health-related concerns regarding emissions from existing and future operations at the Port of Stockton. The goals of the CEC will be to encourage additional community engagement, bring community insights to the Port's environmental improvement efforts, and work on select environmental projects within the Port's jurisdiction to help preserve, protect, and improve the environment. Prospective future projects that would be brought before the CEC include:
 - a. Discussion of future Port of Stockton projects and expansion
 - b. Port of Stockton emission reduction strategy development
 - c. Environmental event planning
 - d. Community outreach support
 - e. Program development
2. Utilizing the Port of Stockton's website to broadcast outward-facing communications through quarterly updates, and to add website functionality for submitting comments, questions, and complaints.
3. Providing routine updates to the CSC regarding ongoing projects happening at the Port of Stockton.

Implementing Agency: Port of Stockton

Strategy Type: Partnership

P.2: INCENTIVE PROGRAM FOR THE DEPLOYMENT OF CLEAN HEAVY-DUTY MOBILE EQUIPMENT OPERATING AT PORTS, INTERMODAL RAILYARDS AND DISTRIBUTION CENTERS

~~This measure is still being considered by the Stockton Steering Committee~~

Overview: The goal of this strategy is to reduce emissions from old, high-polluting diesel engines in heavy-duty mobile off-road equipment operating at the Port of Stockton. Diesel pollution from on-road and off-road operations greatly impacts the health of the community surrounding the Port. Funding will be offered to replace diesel mobile cargo handling equipment used to handle cargo or perform routine maintenance activities at the Port with new, zero and near-zero emissions technologies. Based on CSC priorities, zero-emissions will be prioritized for funding where applicable to the equipment type. Established methodology through the [Carl Moyer Program](#) will be used to quantify the emission reductions for funded projects, but an estimate of potential project reductions is summarized below.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Emission Outcome: NOx & PM reductions

Budget Amount: \$2,000,000

Quantifiable emissions reductions: Estimated emission reductions associated with this measure includes up to 2 tons of NOx.

The following are additional suggested measures not within the Air District's jurisdiction to directly implement:

P.3: TUG BOAT REPLACEMENT/REPOWER

~~**Overview:** This measure is still being considered by the Stockton Steering Committee~~

The goal of this strategy is to reduce emissions from old, high-polluting diesel engines in tugboats operating at the Port of Stockton. Diesel pollution from freight transport operations greatly impacts the health of the community surrounding the Port. Funding will be offered to repower the existing propulsion and auxiliary engines with new diesel engines. The new engines will have the highest tier rating available that will fit within the confines of their engine compartments. Established methodology through the [Carl Moyer Program](#) will be used to quantify the emission reductions for funded projects.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Emission Outcome: NOx & PM reductions

Budget Amount: \$1,000,000

Quantifiable emissions reductions: Estimated emission reductions associated with this measure includes up to 1 ton of PM and 29 tons of NOx.

P.4: MARINE EXHAUST INTAKE BONNET EMISSIONS CONTROL

Overview: This measure is still being considered by the Stockton Steering Committee. The goal of this strategy is to reduce emissions from the diesel engines of marine vessels while berthed at the Port of Stockton. Diesel pollution from freight transport operations greatly impacts the health of the community surrounding the Port. Funding will be offered to purchase and install a marine vessel exhaust capture and control system. This system will work with marine vessels to reduce PM and NOx emissions while at berth. Available exhaust capture and control systems can reduce PM2.5 up to 95% and NOx up to 90%. Emission reductions for these projects will be quantified using state approved calculation methodology.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Emission Outcome: NOx reductions

Budget Amount: \$2,000,000

Quantifiable emissions reductions: Estimated emission reductions associated with this measure include up to 240 tons of NOx

P.5: UNDERSTANDING AND MITIGATING THE IMPACT OF ALGAL BLOOMS ON AIR QUALITY

Overview: Algal blooms can produce airborne nitrogen compounds like nitrogen oxides that contribute to the formation of other air pollutants such as ground-level ozone, a component of smog which can restrict visibility. Wind and weather can carry ozone many miles from urban to rural areas.⁷ The goal of this strategy is to better understand, and where feasible, mitigate the impact of algae blooms on air quality. While the District, the City of Stockton and the Central Valley Regional Water Quality Control Board (CVWB) have committed to extensive interagency cooperation and action in this Stockton Community Emission Reduction Program (CERP), additional opportunities may present themselves in future discussions involving the CSC, the public, the City, and the District, especially as implementation of the CERP progresses.

⁷ EPA. *Nutrient Pollution. The Effects: Environment*. Retrieved 11/9/2020
<https://www.epa.gov/nutrientpollution/effects-environment>

This measure is the District's commitment to continue to work with local, water-focused organizations, CVWB, the Port, the City, and academic institutions to facilitate discussions between the community and the involved agencies to better understand, and where feasible mitigate, the impact of algae blooms on air quality. Currently, CVWB has developed a workgroup called the California Cyanobacteria and Harmful Algal Bloom (CCHAB) Network. The CCHAB Network includes federal, state, and local agencies, tribes, academia, and non-governmental organizations working to develop a comprehensive coordinated program to address the causes and impacts of harmful algal blooms (HABs) in the state.⁸ As part of the coordinated program, the State Water Resources Control Board's Surface Water Ambient Monitoring Program (SWAMP) developed the Freshwater HAB Program.⁹ The Central Valley Water Board participates in the statewide Freshwater HAB effort by:

- Collecting information on blooms
- Sampling and analyzing HABs
- Providing information on blooms to local waterbody managers and health officers
- Conducting outreach and education to the general public
- Collaborating with academia and interested stakeholders to better understand the causes of HABs

Implementing Agency: SJVAPCD, Central Valley Regional Water Quality Control Board, Port of Stockton, and City of Stockton

Strategy Type: Partnership

Emission Outcome: Mitigation

STATIONARY SOURCES

STATIONARY SOURCES IN STOCKTON

There are a variety of industrial sources located in and around the Stockton Community. These sources range from smaller operations like gasoline dispensing facilities (GDFs), commercial cooking operations, and auto body coating operations to medium sized operations like wood products and agricultural products processing operations, to larger operations like the biomass power facility, bulk gasoline storage, and cement and concrete products facilities; which include equipment like ovens, internal combustion (IC) engines, boilers/steam generators, and many others.

Criteria pollutant emissions from this source category include NO_x, SO_x, PM₁₀/PM_{2.5}, CO, and VOC, and toxic air contaminants (TACs) like benzene, toluene, xylene, arsenic, and dioxins. Within the Stockton community, 161.57 tons per year of NO_x, 210.08 tons per year of VOC and 7.93 tons per year of PM_{2.5} are attributed to stationary sources.

COMMUNITY CONCERNS AND COMMENTS

During committee discussions regarding industrial sources, committee members identified commercial cooking operations, a wood products manufacturing facility, a biomass facility, a cement products processing facility, and visible dust emissions and odors from operations in and around the port as sources of concern, with suggestions ranging from providing “incentives” to replace older, higher polluting equipment and the evaluation of existing state and District regulatory measures.

CURRENT CONTROL PROGRAMS

For more than 25 years, the District has implemented several generations of emissions control regulations for stationary and area sources under its regulatory jurisdiction. These control measures represent the nation’s toughest air pollution regulations and have greatly contributed to reducing ozone and particulate matter concentrations in the Valley. Stringent and innovative rules, such as those for indirect source review, residential wood burning, glass manufacturing, and agricultural burning, have set benchmarks for California and the nation. While there has been significant progress in reducing air pollution with these regulations, which have been greatly aided by the pollution reduction efforts and financial investments of valley businesses and residents, the District continues to adopt and modify rules to achieve ongoing emissions reductions and advance our progress toward clean air.

Gasoline Dispensing Facilities (GDFs):

Gasoline dispensing facilities in the San Joaquin Valley are subject to District Rule 4621 – *Gasoline Transfer into Stationary Storage Containers, Delivery Vessels, and Bulk Plants* and Rule 4622 – *Gasoline Transfer Into Motor Vehicle Fuel Tanks*.

The purpose of Rule 4621 is to limit VOC emissions from stationary storage containers, delivery vessels, and bulk plants. This rule applies to gasoline storage containers with capacities greater than 250 gallons and has requirements to install CARB certified

vapor control systems. The purpose of Rule 4622 is to limit emissions of gasoline vapors from the transfer of gasoline into motor vehicle fuel tanks. This rule applies to any gasoline storage and dispensing operation or mobile fueler from which gasoline is transferred into motor vehicle fuel tanks. This rule also requires the installation of CARB certified vapor control systems. GDFs are subject to stringent enforcement provisions, including ongoing monitoring of equipment and annual inspections.

Commercial Cooking Operations:

Commercial cooking operations are subject to Rule 4692 – *Commercial Charbroiling* and District Rule 4693 – *Bakery Ovens*. The purpose of Rule 4692 is to limit VOC and PM10 emissions from charbroiling cooking operations. The purpose of Rule 4693 is to limit VOC emissions from the baking of yeast-leavened food products. These rules have very stringent emission limits, periodic monitoring, and source testing requirements.

Commercial cooking operations are subject to stringent enforcement provisions, including ongoing recordkeeping of materials processed and regular inspections.

Auto Body Coating Operations:

Auto body coating operations in the San Joaquin Valley are subject to District Rule 4612 – *Motor Vehicle and Mobile Equipment Coating Operations* and Rule 4101 – *Visible Emissions*.

The purpose of Rule 4612 is to limit VOC emissions from the coating of motor vehicles, mobile equipment, associated parts and components, and associated organic solvent cleaning, storage, and disposal. This rule applies to any person who supplies, sells, offers for sale, manufacturers, or distributes any automotive coating for use within the District, as well as any person who uses, applies, or solicits the use or application of any automotive coating within the District. The rule requires the sale and use of low VOC coatings and solvents, in addition to stringent requirements for the application of these coatings. Auto body coating operations are subject to stringent enforcement provisions, including ongoing recordkeeping of coatings/solvents used and regular inspections. They also must demonstrate continued compliance with additional visible emissions requirements as described in Rule 4101.

Wood Products Processing Operations:

Wood products processing operations are subject to Rule 4101 – *Visible Emissions*, Rule 4201 – *Particulate Matter Concentration*, Rule 4202 – *Particulate Matter – Emission Rate*, Rule 4306/4320 – *Boilers, Steam Generators, and Process Heaters*, and District Rule 4702 – *Internal Combustion Engines*. The purpose of Rules 4101, 4201, and 4202 is to limit particulate matter emissions from exhaust stacks and industrial processes. The purpose of Rules 4306, 4320, and 4702 is to limit emissions of NOx, CO, VOC, SOx, and PM10 from fossil fuel combustion in boilers, steam generators, process heaters, and stationary internal combustion engines commonly used in these types of facilities. These rules have very stringent emission limits, periodic monitoring, and source testing requirements.

Wood products processing facilities are subject to stringent enforcement provisions, including ongoing recordkeeping of materials processed and regular inspections.

Agricultural Products Processing Operations:

Agricultural products processing operations are subject to Rule 4101 – *Visible Emissions*, Rule 4201 – *Particulate Matter Concentration*, Rule 4202 – *Particulate Matter – Emission Rate*, and Rule 4306/4320 – *Boilers, Steam Generators, and Process Heaters*. The purpose of Rules 4101, 4201, and 4202 is to limit particulate matter emissions from exhaust stacks and both indoor and outdoor industrial processes. The purpose of Rules 4306 and 4320 is to limit emissions of NO_x, CO, SO_x, and PM₁₀ from natural gas combustion in boilers, steam generators, and process heaters. These rules have very stringent emission limits, periodic monitoring, and source testing requirements.

Agricultural products processing facilities are subject to stringent enforcement provisions, including ongoing recordkeeping of materials processed and annual inspections.

Cement and Concrete Products Operations:

Cement and concrete processing operations are subject to Rule 4101 – *Visible Emissions*, Rule 4201 – *Particulate Matter Concentration*, and Rule 4202 – *Particulate Matter – Emission Rate*. The purpose of Rules 4101, 4201, and 4202 is to limit particulate matter and visible emissions from exhaust stacks, process equipment, and conveying equipment. These rules have very stringent emission limits, periodic monitoring, and source testing requirements.

Cement and concrete products processing facilities are subject to stringent enforcement provisions, including ongoing recordkeeping of materials processed and annual inspections.

Biomass Power Facilities:

Biomass power facilities in the San Joaquin Valley are subject to District Rule 4352 – *Solid Fuel Fired Boilers, Steam Generators, and Process Heaters* and Rule 4101 – *Visible Emissions*.

The purpose of Rule 4352 is to limit emissions of NO_x and CO from solid fuel fired boilers, steam generators and process heaters. This rule applies to any boiler, steam generator or process heater fired on solid fuels, such as biomass. This rule has very stringent emission limits, periodic monitoring, and source testing requirements. Biomass power facilities are subject to stringent enforcement provisions, including ongoing recordkeeping of materials burned and annual inspections. These facilities must demonstrate continued compliance with additional visible emissions requirements as described in Rule 4101.

Organic Liquid (Gasoline) Terminal Facilities:

Bulk gasoline terminal facilities in the San Joaquin Valley are subject to District Rule 4623 – *Storage of Organic Liquids* and Rule 4624 – *Organic Liquid Loading*.

The purpose of Rule 4623 is to limit VOC emissions from the storage of organic liquids. This rule applies to any tank with a capacity of 1,100 gallons or greater in which any organic liquid is placed, held, or stored. The purpose of Rule 4624 is to limit VOC emissions from the transfer of organic liquids. This rule applies to organic liquid transfer facilities. Facilities that store or transfer organic liquids, such as gasoline pipeline terminals are subject to stringent enforcement provisions, including quarterly leak inspection requirements and annual inspections.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN THE COMMUNITY

Due to the priority that community members placed on reducing PM2.5 and toxic air contaminant emissions that originate from industrial sources in and around the community, the following strategies have been developed for implementation in the Stockton community.

The following are proposed measures that are within the Air District's statutory jurisdiction to implement:**SS.14: ENHANCED STATIONARY SOURCE INSPECTION FREQUENCY**

Overview: The goal of this strategy is to limit the potential for localized air quality impacts at permitted facilities that have had emissions violations in the last three years.

The District conducts inspections and investigations of permitted sources to determine compliance with a multitude of health-protective local, state, and federal air quality regulations that target both criteria and toxic pollutants. The District closely monitors these sources and strictly enforces applicable requirements. Compliance inspections are unannounced whenever possible and involve both a physical inspection of the facility and a review of their records. When a violation of a District permit, rule, or regulation is identified, the District takes an appropriate level of enforcement action.

The District reviewed the enforcement history over a three year period (2017-2020) for the permitted facilities in the Stockton community, and determined that 51 enforcement actions were issued to facilities (not including gas stations) for violations resulting in excess emissions. These violations occurred at 13 permitted facilities in the area and 1 ocean-going vessel. The District also issued 18 enforcement actions at 14 gas stations in the Stockton community for violations resulting in excess emissions. The District believes that more frequent inspections for these 27 facilities would help to limit the potential for air quality impacts associated with emissions violations.

The District will increase the frequency of inspection at each facility within the Stockton community that has had an emission-based violation over the past three (3) years. These facilities will be inspected at least twice per calendar year for the next five (5)

years or until the facility has four (4) consecutive inspections without an emissions violation, whichever occurs first.

Implementing Agency: SJVAPCD

Strategy Type: Enforcement

Emission Outcome: Reduction in excess PM2.5, PM10, NOx, VOC, and CO emissions through higher compliance rates

SS.28: REGULATORY ACTIONS: EVALUATION OF RULES TO DETERMINE WHETHER ADDITIONAL REDUCTIONS ARE POSSIBLE FOR SOURCES OF NOx AND PM2.5

Overview: In addition to the Best Available Retrofit Control Technology (BARCT) implementation schedule above, the District will be analyzing District Rule 4352 - *Solid Fuel-Fired Boilers, Steam Generators and Process Heaters* to pursue additional emission reduction opportunities beyond BARCT.. This rule amendment will be reviewed on the schedule included in the District's *2018 PM2.5 Plan* adopted by CARB into the State Implementation Plan.

Emissions reductions achieved through the implementation of more stringent limits potentially required through these rule amendments will further contribute to reduced exposure to air pollution in the community. Community Steering Committee members, members of the AB 617-selected community, and the general public are encouraged to be involved in the upcoming rulemaking process for these rules.

Implementing Agency: SJVAPCD

Strategy Type: Regulatory

Emission Outcome: Reduction

SS.93: REGULATORY ACTIONS: EXPEDITED FACILITY RISK ASSESSMENT AND RISK REDUCTION UNDER DISTRICT IMPLEMENTATION OF THE AIR TOXICS HOT SPOTS INFORMATION AND ASSESSMENT ACT (AB 2588)

Overview: This strategy will expedite the review of stationary sources of pollution in the community that are currently being reassessed under the Air Toxics "Hot Spots" Information and Assessment Act (AB 2588).

Under AB 2588, all facilities located within the boundaries of the District are required to report toxic substances released into the air by their operation to the District. The District's responsibilities under the state's Air Toxics "Hot Spots" program are to:

- Identify Valley facilities that release toxic air contaminants as a result of their day to day operations,
- Collect and quantify emission data from equipment located at permitted facilities,
- Identify facilities causing localized health impacts on nearby residents,
- Determine facility-wide health risks resulting from the emission of toxic air contaminants,
- Notify nearby residents and businesses of significant risk facilities in their vicinity, and
- Require that significant risk facilities reduce their risks to a level that no longer constitutes a significant risk to nearby residences and businesses.

The District's implementation of AB 2588, California's Air Toxics "Hot Spots" Information and Assessment Act, has resulted in major reductions in emissions of air toxics from existing sources in the San Joaquin Valley. Under this right-to-know law, the District has worked with Valley facilities to quantify emissions of air toxics, determine the health risk caused by those emissions, report emissions and any significant risks through written public reports and neighborhood public meetings, and take steps to reduce such risks.

This measure will result in the expedited AB 2588 reviews for facilities located within the Stockton AB 617 Community. More information about this effort can be found later in the section, "Additional Regulatory Measures to Reduce Emissions in the Community" found later in this chapter. Please refer to Appendix E for additional details about the District's Health Risk Assessment Process, and a table identifying the AB 2588 reassessment status of each facility within the community as of December 21, 2020.

Implementing Agency: SJVAPCD

Strategy Type: Regulatory

Emission Outcome: Reduction

DUST IN THE COMMUNITY

BACKGROUND

In the Stockton community sources of dust emissions include from construction, open areas, and other earthmoving activities. Construction, demolition and other earthmoving activities emit 10.57 tons per year of PM2.5 in the community. Unpaved road dust and dust from open areas also have minor PM2.5 emissions in the area.

COMMUNITY CONCERNS AND COMMENTS

The Community Steering Committee expressed an interest in evaluating air quality impacts and felt it important to look to reduce dust from construction projects and other sources of dust in the community.

CURRENT CONTROL PROGRAMS

Regulation VIII (Fugitive PM10 Prohibition) / Dust Control Plan (DCP): The District's Regulation VIII series (Fugitive PM10 Prohibitions) was adopted in November 2001, and subsequently amended in 2004. This rule series contains a comprehensive suite of rules designed to reduce fugitive PM10 emissions from a range of sources including:

- Specified outdoor fugitive dust sources.
- Construction or demolition related disturbances of soil, including land clearing, grubbing, scraping, excavation, extraction, land leveling, grading, cut and fill operations, travel on the site, travel access roads to and from the site, and demolition activities.
- Outside storage and handling of any unpackaged material, which emits or has the potential to emit dust when stored or handled.
- Prevention and cleanup of mud and dirt whenever it is deposited (carryout and trackout) onto public paved roads
- Open areas 0.5 acres or more within urban areas, or 3.0 acres or more within rural areas that contain at least 1,000 square feet of disturbed surface area.
- Any paved, unpaved, or modified public or private road, street highway, freeway, alley way, access drive, access easement, or driveway.
- Unpaved vehicle/equipment areas, including parking, fueling, service, shipping, receiving, and transfer areas.
- "Off-field" agricultural sources including, but not limited to, unpaved roads, unpaved vehicle/equipment traffic areas, and bulk materials.

The Regulation VIII rules are implemented via the District's Dust Control Plan (DCP) program: https://www.valleyair.org/busind/comply/PM10/compliance_PM10.htm

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

Due to the priority that the Steering Committee placed on reducing dust in the community, specific a specific strategy has been developed to target emission reductions from fugitive dust sources. The District is proposing increased enforcement

of Regulation VIII rules to reduce fugitive dust from construction and earthmoving activities within the community.

The following proposed strategy is within the Air District's statutory jurisdiction to implement:

FD.1: ENHANCED ENFORCEMENT OF DISTRICT REGULATION VIII FUGITIVE DUST REQUIREMENTS

Overview: The goal of this strategy is to limit the potential for localized air quality impacts associated with fugitive dust from construction/earthmoving activities and open areas subject to District Regulation VIII.

District rules limit fugitive dust emissions from construction, demolition, and earthmoving; bulk material storage; open areas; and unpaved roads and vehicle/equipment traffic areas. Furthermore, District rules restrict carryout and trackout of dirt and dust onto paved public roadways. Regulation VIII does not limit emissions from vehicles used in these projects.

Regulation VIII requires, a Construction Notification or Dust Control Plan for all construction activities in the District involving one or more acre of disturbed surface area. District staff reviews each Construction Notification and Dust Control Plan prior to the start of construction, to ensure that operators have planned to utilize required work practices to reduce fugitive dust emissions to within rule limitations. Additionally, District staff surveys and inspects such sites, responds to complaints regarding fugitive dust, and provides training classes for those required to submit Dust Control Plans.

In reviewing the compliance history for the Stockton community, it was determined that the District had received 26 complaints regarding fugitive dust related issues over the last 3 years, with the majority pertaining to construction/earthmoving activities and open areas. Building on the District's existing surveillance and complaint response efforts, the District will conduct at least one targeted enforcement effort within the Stockton community during both the 2nd and 3rd quarters for the next five (5) years. This fugitive dust reduction enforcement strategy is being included in the CERP in response concerns raised by CSC members regarding fugitive dust emissions in the community and the complaint history analysis performed by the District.

Implementing Agency: SJVAPCD

Type of Action: Enforcement

ADDITIONAL INFORMATION ABOUT REGULATORY MEASURES TO REDUCE EMISSIONS IN THE COMMUNITY

Due to the nonattainment status of the Valley Air Basin for the criteria pollutants of fine particulate matter and ozone, the District requires that permitted facilities implement the most stringent control measures feasible for implementation to control criteria pollutants and associated precursor emissions. Beyond the regulations and stringent permitting requirements that are already implemented Valley-wide, the following sections detail enhanced regulatory strategies that will be implemented in the AB 617-selected community.

BARCT EXPEDITED SCHEDULE

In addition to community monitoring and emission reduction program requirements, AB 617 requires that air districts located in non-attainment areas perform a Best Available Retrofit Control Technology (BARCT) analysis for all categories of units at facilities subject to the state Cap-and-Trade program. In accordance with AB 617 requirements, the District adopted an expedited schedule for performing further determination of BARCT requirements in December, 2018.

The District utilized an extensive evaluation process to make an initial determination of whether the rules that apply to Cap-and-Trade facilities meet all state BARCT requirements, as mandated by AB 617. While District rules are expected to meet BARCT due to the District's ongoing extensive regulatory evaluations, the proposed BARCT implementation schedule includes commitments to establish updated BARCT determinations for District rules as required under AB 617. The proposed schedule was prepared through a public process, which included two public workshops. In addition to the BARCT implementation schedule, the District will be proceeding with amending a number of District rules included as commitments in the District's *2018 PM2.5 Plan*, as discussed earlier in the CERP, that are also subject to the AB 617 BARCT implementation requirement.

In conjunction with District rules applicable to stationary source equipment, under the District's New Source Review permitting regulation, new facilities or facilities modifying equipment that emit air pollutants greater than 2 pounds per day (lb/day), are subject to stringent emissions control requirements. For each piece of equipment that has the potential to emit over the 2 lb/day threshold, the District requires the use of the best available air pollution control technology (BACT) used to control emissions from similar types of equipment. As part of this BACT analysis, the District determines if cleaner technologies that are not generally used for the equipment being analyzed could be used to further reduce emissions from the proposed equipment. This very stringent requirement ensures that the most effective air pollution control technique is utilized, resulting in the least amount of air pollution possible.

In addition to these stringent requirements on new sources of air pollution, rules adopted in the San Joaquin Valley are regularly analyzed for compliance with the state's BARCT requirements.

Best Available Retrofit Control Technology (BARCT)

Existing stationary sources in non-attainment areas such as the San Joaquin Valley have been subject to BARCT requirements since the 1980s, as opposed to some nonattainment areas in California relying on market-based criteria pollutant emission reduction programs and where facilities were not required to comply with BARCT. Although AB 617 does not specifically define BARCT, California Health and Safety Code (CH&SC) Section 40406 defines BARCT as follows:

Best Available Retrofit Control Technology (BARCT) is an air emission limit that applies to existing sources and is the maximum degree of reduction achievable, taking into account environmental, energy and economic impacts by each class or category of source.

Unlike other regions in the state, the District has not relied on market-based systems such as South Coast AQMD's RECLAIM program to achieve regional emissions reductions needed for attainment. Such market-based systems allow sources of pollution to avoid installing BARCT-level controls if regional emissions are reduced at an established rate. This potential path to avoiding installing the best air pollution controls in other air districts was a significant portion of the genesis of this BARCT requirement of AB 617.

In contrast, businesses in the San Joaquin Valley have always had to comply with BARCT in accordance to the implementation schedules established in District rules. When developing attainment plans or amending prohibitory rules, the District evaluates all applicable sources of emissions for potential strategies to reduce emissions. These evaluations include an exhaustive search of air quality regulations throughout the nation, review of existing emission control technologies, and analysis of advanced emission control technologies that may soon be available, to identify potential technologically and economically feasible emission reduction measures. The District's attainment planning efforts rely on these processes to demonstrate on an ongoing basis that District rules meet state and federal emission control requirements, including BARCT and Most Stringent Measures, which exceeds BARCT requirements. Therefore, given the District's ongoing and extensive work to identify and apply most stringent measures necessary to attain the ever-tightening federal health-based standards under the Clean Air Act, it is anticipated that most if not all District rules satisfy BARCT requirements.

The District recognizes that emission control technologies are continually evolving, and therefore, robust and ongoing analysis is necessary to demonstrate that the District's rules continue to meet BARCT and other requirements on an ongoing basis. Furthermore, in the context of the 2016 Ozone attainment plan, the recently adopted PM2.5 attainment plan, and upcoming plans, future rule development actions will be required and, in this process, rules that have recently been determined to meet BARCT during this AB 617 analysis may be subject to further analysis to ensure they continue to meet BARCT requirements. Additionally, in those instances where the District is

made aware of new technology, further case specific and rule specific BARCT determinations may be conducted.

Affected Rules Included in the District's Expedited BARCT Implementation Schedule

As captured in Section 40920.6 of the Health and Safety Code, AB 617 identifies specific requirements for the District to meet when establishing the expedited BARCT implementation schedule. AB 617 requires the schedule to apply to each industrial source that, as of January 1, 2017, was subject to a specified market-based compliance mechanism and give highest priority to those permitted units that have not modified emissions-related permit conditions for the greatest period of time.

Based on information provided by CARB, as of January 1, 2017, 109 facilities within the District were identified as being subject to the state Cap-and-Trade program for greenhouse gas emissions, a market-based compliance mechanism adopted by the state board pursuant to subdivision (c) of Section 38562, and therefore AB 617 BARCT requirements. Evaluating the 109 affected facilities, the District identified that approximately 4,500 active permit units are within the scope of this BARCT analysis. From the 4,500 active permit units, the District determined that 32 District rules that apply to specific source categories of equipment were subject to the BARCT analysis required under AB 617.

District staff performed analysis of 32 affected rules and determined that:

- 5 rules were superseded by a more stringent rule known to meet BARCT or by a rule subject to further BARCT analysis,
- 5 rules were determined to meet Most Stringent Measures (MSM) for NO_x, the only relevant pollutant for these affected rules and, therefore, meet BARCT, and
- 19 rules were specifically determined to meet BARCT through an extensive rule and source category evaluation that compared our rule requirements with federal and state air quality regulations and with regulations of other air districts in California.
- While the remaining 13 rules likely already meet BARCT due to the District's ongoing and extensive regulatory evaluations and enhancements, the proposed BARCT implementation schedule includes commitments to establish updated BARCT determinations for these rules, which will occur in the 2020-2022 timeframe.

Prioritization Criteria for Expedited BARCT Analysis Schedule

Section 40920.6(c)(3) of the Health and Safety Code requires Districts to give highest priority to conduct the BARCT analysis to those rules affecting permitted units that have not modified emissions-related permit conditions for the greatest period of time. To assist in further prioritization, the District also considered local public health, clean air benefits to the surrounding community, and regional air quality and attainment benefits by prioritizing units that emit NO_x and are located within communities selected for action under AB 617. In addition, while cost-effectiveness of controls can't be fully analyzed until each rule is addressed during the development of a BARCT rule, the District also

prioritized rules with the greatest number of potentially affected units, which, when coupled to the law's requirement of prioritizing based on the length of time since the units were last modified, provides some consideration of the most likely controls to be cost-effective.

Public Process

As a part of the public process associated with establishing this schedule, the District conducted a public scoping meeting on June 14, 2018, to solicit input from stakeholders regarding the District's proposed methodology to address the AB 617 requirement to adopt an expedited BARCT analysis schedule by the end of 2018.

The District held a public workshop on November 1, 2018, to solicit input from the stakeholders regarding the District's proposed expedited BARCT Rule implementation schedule. No comments were received from stakeholders after this workshop.

In addition, the District held a public workshop on July 30, 2020, to provide an update on the Best Available Control Technology (BARCT) analysis of District rules as required under AB 617 and the District's Expedited BARCT Implementation Schedule.

Expedited BARCT Implementation Schedule

Through this public process and in accordance with AB 617 requirements, the District has adopted the following expedited BARCT implementation schedule:

Table 4-1 Expedited BARCT Implementation Schedule

Rule	Title	BARCT Determination Status	BARCT Determination Schedule	BARCT Rulemaking Schedule (if necessary)
4454	Refinery Process Unit Turnaround	Rule determined to meet BARCT	2019	---
4641	Cutback, Slow Cure, And Emulsified Asphalt, Paving And Maintenance Operations	Rule determined to meet BARCT	2019	---
4104	Reduction of Animal Matter	Rule determined to meet BARCT	2019	---
4409	Components at Light Crude Oil Production Facilities, Natural Gas Production Facilities, and Natural Gas Processing Facilities	BARCT evaluation completed, rule development process necessary	2019	Public scoping meeting held in Dec 2020, Rule development process to be completed in 2021.
4455	Components at Petroleum Refineries, Gas Liquids Processing Facilities, and Chemical Plants	BARCT evaluation completed, rule development process necessary	2019	
4702	Internal Combustion Engines (VOC only)	Scheduled (in conjunction with PM2.5 Plan commitment)	2020	Rule amendment scheduled for early 2021
4623	Storage of Organic Liquids	BARCT evaluation completed, rule development process necessary	2020	Public scoping meeting held in Dec 2020, Rule development process to be completed in 2021.

4694	Wine Fermentation and Storage Tanks	Rule determined to meet BARCT	2020	-----
4624	Transfer of Organic Liquid	BARCT evaluation completed, rule development process necessary	2020	Public scoping meeting held in Dec 2020, Rule development process to be completed in 2021.
4603	Surface Coating of Metal Parts and Products, Plastic Parts and Products, and Pleasure Crafts	Rule determined to meet BARCT	2020	-----
4601	Architectural Coatings	Rule determined to meet BARCT	2020	-----
4401	Steam-Enhanced Crude Oil Production Wells	BARCT evaluation completed, rule development process necessary	2021	Public scoping meeting held in Dec 2020, Rule development process to be completed in 2021.
4566	Organic Material Composting Operations	Scheduled	2021	-----
4625	Wastewater Separators	Scheduled	2021	-----
4621	Gasoline Transfer Into Stationary Storage Containers, Delivery Vessels, and Bulk Plant	Scheduled	2021	-----
4402	Crude Oil Production Sumps	Scheduled	2021	-----
4351	Boilers, Steam Generators, and Process Heaters - Phase 1	Rule superseded by more stringent rules, District Rules 4305,	---	---

		4306, and 4320		
4405	Oxides of Nitrogen Emissions from Existing Steam Generators Used in Thermally Enhanced Oil Recovery - Central and Western Kern County Fields	Rule superseded by more stringent rules, District Rules 4305, 4306, and 4320	---	---
4406	Sulfur Compounds from Oil-Field Steam Generators - Kern County	Rule superseded by more stringent rules, District Rules 4305, 4306, and 4320	---	---
4305	Boilers, Steam Generators, and Process Heaters - Phase 2	Rule superseded by District Rules 4306 and 4320, more stringent rules	---	---
4701	Internal Combustion Engines - Phase 1	Rule superseded by District Rule 4702, a more stringent rule	---	---
4309	Dryers, Dehydrators, and Ovens	Rule determined to meet BARCT	---	---
4703	Stationary Gas Turbines	Rule determined to meet BARCT	---	---
4306	Boilers, Steam Generators, and Process Heaters - Phase 3	Rule determined to meet BARCT	---	---
4307	Boilers, Steam Generators, and Process Heaters - 2.0 MMBtu/hr to 5.0 MMBtu/hr	Rule determined to meet BARCT	---	---
4320	Advanced Emission Reduction Options for Boilers, Steam Generators, and	Rule determined to meet BARCT	---	---

	Process Heaters Greater Than 5.0 MMBtu/hr			
4311	Flares	Rule determined to meet BARCT	---	---
4354	Glass Melting Furnaces	Rule determined to meet BARCT	---	---
4408	Glycol Dehydration Systems	Rule determined to meet BARCT	---	---
4453	Refinery Vacuum Producing Devices or Systems	Rule determined to meet BARCT	---	---
4612	Motor Vehicle and Mobile Equipment Coating Operations	Rule determined to meet BARCT	---	---
4622	Gasoline Transfer into Motor Vehicle Fuel Tanks	Rule determined to meet BARCT	---	---

UPCOMING 2018 PM2.5 PLAN RULE AMENDMENT EFFORTS

In addition to the BARCT implementation schedule above, the District will be proceeding with amending two District rules to pursue additional emission reduction opportunities beyond BARCT, included as commitments in the District’s 2018 PM2.5 Plan adopted by CARB into the State Implementation Plan:

Emissions reductions achieved through the implementation of more stringent limits potentially required through these rule amendments will further contribute to reduced exposure to air pollution in the community. Community Steering Committee members, members of the AB 617-selected community, and the general public are encouraged to be involved in the upcoming rulemaking process for these rules.

Table 4-2 Scheduled District Rule Amendments to Reduce PM2.5

Rule	Title	BARCT Status	PM2.5 Plan Rulemaking Schedule
4901	Wood Burning Fireplaces and Wood Burning Heaters	No units subject to AB 617 BARCT analysis. Rule amended in June, 2019.	2019 (Completed)
4311	Flares	Rule meets or exceeds BARCT	2020 (Completed)
4306 and 4320	Boilers, Steam Generators, and Process Heaters - Phase 3 and Advanced Emission Reduction Options for Boilers, Steam Generators, and Process Heaters Greater than 5.0 MMBtu/hr	Rule meets or exceeds BARCT	2020 (Completed)
4692	Commercial Charbroiling	No units subject to AB 617 BARCT analysis	2020 (Completed)
4702	Internal Combustion Engines	Rule meets or exceeds BARCT for NOx, updated AB 617 BARCT determination scheduled for VOCs	2021
4352	Solid Fuel-Fired Boilers, Steam Generators and Process Heaters	No units subject to AB 617 BARCT analysis	2021
4354	Glass Melting Furnaces	Rule meets or exceeds BARCT	2021

Formatted: Keep with next

Further information on the District’s expedited BARCT schedule and rule analyses can be found in the staff report presented to the District Governing Board in December, 2018: http://www.valleyair.org/Board_meetings/GB/agenda_minutes/Agenda/2018/December/final/13.pdf

PERMITTING: BACT AND T-BACT DETERMINATIONS

The California Air Resources Board (CARB) is developing a Technology Clearinghouse of best available control technology (BACT) and best available control technology for toxic air contaminants (T-BACT) determinations for air districts throughout California. The District will use this Technology Clearinghouse as an additional resource for BACT determinations, and will reference this information when developing BACT and T-BACT technology determinations for any new or modified source permitting processes,

including those in the Stockton community. More information about the District's stringent new and modified source review process is available in Chapter 3.

FACILITY RISK REDUCTION AUDITS UNDER AB 2588 (AIR TOXICS HOT SPOTS INFORMATION AND ASSESSMENT ACT)

Background

The Air Toxics "Hot Spots" Information and Assessment Act (AB 2588) was enacted in September 1987. Under this act, stationary sources are required to report the types and quantities of certain toxic substances their facilities routinely release into the air. The goals of the Air Toxics "Hot Spots" Act are to:

- Identify Valley facilities that release toxic air contaminants as a result of their day-to-day operations,
- Collect and quantify emission data from equipment located at permitted facilities,
- Identify facilities causing localized health impacts on nearby residents,
- Determine facility-wide health risks resulting from the emission of toxic air contaminants,
- Notify nearby residents and businesses of significant risk facilities in their vicinity, and
- Require significant risk facilities to reduce their risks below the level of significance in accordance with the provisions of the "Emissions Inventory Criteria and Guidelines Report" adopted by the Air Resources Board.

District's Implementation of AB 2588

The District's implementation of AB 2588, California's *Air Toxics "Hot Spots" Information and Assessment Act*, has resulted in major reductions in emissions of air toxics from existing sources in the San Joaquin Valley. Under this right-to-know law, the District has worked with Valley facilities to quantify emissions of air toxics, determine the health risk caused by those emissions, report emissions and any significant risks through written public reports and neighborhood public meetings, and take steps to reduce such risks. As a result of this effort, and the resulting emissions reductions, no Valley facility currently poses a significant risk under this program.

The District's integrated air toxics program fulfills the state AB 2588 Hot Spots mandates, aimed at quantifying and assessing localized health risk, notifying affected residents, and reducing risk from facilities with high risk caused by air toxic emissions. In addition, the District's integrated air toxics program incorporates Airborne Toxic Control Measure (ATCM) regulations promulgated by the Air Resources Board, requiring prescribed control measures for various source categories that cause significant risks at a regional level. Furthermore, the District's integrated program fulfills federal mandates under Title III of the federal Clean Air Act, requiring Maximum Available Control Technology (MACT) for sources of air toxics.

In addition to the state and federal mandates, the District's integrated air toxics program also implements the more stringent local permitting and California Environmental Quality Act (CEQA) requirements, specifically to ensure installation of Best Available Control Technology (BACT) for air toxics and that new permits or modifications to existing facilities will not result in a significant increase in health risk to the public.

The District has spent the last two decades implementing a wide variety of methods to reduce toxic air contaminant emissions in the San Joaquin Valley. Based on the latest California Toxics Inventory, 52% of toxic air contaminants come from mobile sources such as cars and trucks, 34% are emitted from area-wide sources like road dust, paints, solvents, and other consumer products, and 14% of all air toxics in the San Joaquin Valley are emitted from stationary sources of pollution under the direct control and regulation of the District. Mobile and area-wide sources of emissions are generally under the regulatory authority of the State of California and the federal government.

The District's integrated approach to addressing and reducing risks from toxic air contaminants has taken three main paths:

- Reducing air toxic emissions from existing stationary sources of emissions,
- Preventing the creation of new or modified stationary sources of significant risk, and
- Finding creative and cooperative methods of reducing risk from emissions sources that the District does not typically regulate.

In 2015, the District began implementing the state Office of Environmental Health Hazard Assessment's (OEHHA's) revised Guidance on Preparation of Health Risk Assessments that was adopted by OEHHA in early March 2015. Following OEHHA revised guidelines, the District began a health risk reassessment of all facilities located in the San Joaquin Valley. The health risk reassessment follows the phased processing schedule outlined in AB 2588, which was originally implemented in the late 80's and early 90's. AB 2588 subjected three major categories (or phases) of facilities to the regulation based upon their level of annual emissions.

Reassessment of facilities subject to the AB2588 Hot Spots regulation is a multi-year process that started in 2016, following the phases identified below:

- Phase I Facilities (≥ 25 tons emissions per year)
- Phase II Facilities ($10 \leq$ tons emissions per year < 25)
- Phase III Facilities (< 10 tons emissions per year)
- Phase IV Facilities (Industry-wide and agricultural facilities)

Prioritizing Facility Health Risks

Based on the emissions inventory, the District is prioritizing each facility's health risk based on established statewide guidelines using a computerized modeling program. A "prioritization" is a conservative health risk assessment screening analysis, resulting in a facility prioritization score used to determine if a more refined health risk assessment is

necessary based on the results of the modeling program. As part of this process, very conservative assumptions are utilized, with many safety factors built in to determine the worst-case health risk to possible receptors. The purpose of these safety factors is to ensure that the most sensitive receptors (children, elderly, pregnant women, and people with weakened immune systems) are protected. Facilities ranked as high priority are required to perform health risk assessments. The District prioritizes and ranks the health risk posed by a facility as "low", "intermediate", or "high" priority, based on the following:

- Low Priority: Prioritization Score ≤ 1
 Facility Exempt from further AB 2588 requirements

- Intermediate Priority: $1 < \text{Prioritization Score} \leq 10$
 Facility required to provide updated summary every
 four years

- High Priority: Prioritization Score > 10
 Facility required to perform a refined Health Risk
 Assessment

Health Risk Assessment Process

When a facility's prioritization score exceeds 10, the facility is classified as "High Priority" and a Health Risk Assessment (HRA) is required for the facility, and such facility is required to submit an HRA for District approval. The District and State Office of Environmental Health Hazard Assessment (OEHHA) are required by the Air Toxics "Hot Spots" Act to review each HRA. Understanding that risk calculations involves a level of uncertainty due to limited data in many areas requiring the use of assumptions. With a focus on health protection, very conservative assumptions are utilized, with many safety factors built in to determine the worst-case risk to possible receptors. The purpose of these safety factors is to ensure that the most sensitive receptors (children, elderly, pregnant women, and people with weakened immune systems) are protected. Therefore, while the actual risk may be much less than the calculated risk, it is very unlikely to be higher than calculated.

Upon approval of facility HRA, the District determines the facility's health risk status, which is classified as a low risk, intermediate risk, high risk, or risk reduction required, based on the following HRA scores:

- Low Risk: HRA cancer risk ≤ 1 in a million, and
 HRA total hazard index of < 0.1
 (Facility Exempt from further AB 2588 requirements)

- Intermediate Risk: $1 \leq \text{HRA cancer risk} < 10$ in a million, or
 $0.1 \leq \text{HRA total hazard index} \leq 1.0$
 (Facility required to provide update summary on a
 quadrennial basis)

- High Risk: HRA cancer risk ≥ 10 in a million, or
HRA total hazard index of > 1.0
(Public Notice)
- Risk Reduction Required: HRA cancer risk ≥ 100 in a million cancer, or
HRA total hazard index of > 5.0
(Public Notice and Risk Reduction Audit Plan)

Facilities that pose health risks above District action levels are required to submit plans to reduce their risk. The Risk Reduction Audit Plan (RRAP) trigger level for cancer risk is 100 cases per million exposed persons, based on the maximum exposure beyond facility boundaries at a residence or business. The action level (Risk Reduction Audit Plan) for non-cancer risk is a hazard index of 5 at any point beyond the facility boundary where a person could reasonably experience exposure to such a risk.

The District's review of completeness of the facility's RRAP includes a substantive analysis of the emission reduction measures included in the plan, and the ability of those measures to achieve emission reduction goals as quickly as feasible. If the District determines that the RRAP does not meet those requirements, the District shall remand the audit and plan to the facility and specify the deficiencies. A facility operator shall submit a RRAP addressing the deficiencies identified by the District within 90 days of receipt of a deficiency notice. An updated prioritization and/or health risk assessment shall be determined based on the approved RRAP.

Risk Reduction Audit and Plan Facilities within the District

Based on facility information, as of October 1, 2020, no District permitted facilities in the Stockton AB 617 community present a significant risk for toxic air pollutants and are not required to perform a Risk Reduction Audit and Plan.

AB 617 Community Facility Lists with Associated AB 2588 Designations

Assembly Bill 617 requires the CARB and air districts to develop and implement emissions reporting for disadvantaged communities. With the establishment of the selected community boundaries, the District has put into effect a plan to expedite and streamline the AB 2588 reassessments for facilities located within the selected community of Stockton.

Community-Based AB 2588 Reassessments

Based on previous AB 2588 analyses and on the on-going District's integrated air toxics program, no Valley facilities have been determined to pose significant risk. Therefore, no existing facility(s) have or have been required to prepare a Risk Reduction Audit Plan. However, as mentioned above, the District is currently in the process of

reassessing Valley facilities under AB 2588, which includes those located in the selected community of Stockton.

Please refer to Appendix E for further details about the District's Health Risk Assessment Process, and a table identifying the AB 2588 reassessment status of each facility within the community as of December 21, 2020.

STATEWIDE INCENTIVE AND REGULATORY STRATEGIES

This section provided by the California Air Resources Board

Overview of California Air Resources Board's Statewide Actions

Community-scale air pollution exposure is caused by many factors, including the cumulative impacts from multiple pollution sources. Effective solutions require multiple strategies at both the statewide and local level to deliver new emissions reductions directly within these communities.

The California Air Resources Board (CARB) has adopted a number of comprehensive air quality and climate plans over the last several years that lay out new emissions reduction strategies. These plans include the State Strategy for the State Implementation Plan,¹⁰ the California Sustainable Freight Action Plan,¹¹ California's 2017 Climate Change Scoping Plan,¹² and the Short-Lived Climate Pollutants Reduction Strategy,¹³ along with a suite of incentive programs. The Community Air Protection Blueprint¹⁴ further identified additional actions to reduce the air pollution burden in heavily impacted communities throughout the State. Together, these plans provide a foundation for the new actions identified as part of this community emissions reduction program.

This section illustrates CARB's statewide role in the community emissions reduction program, by broadly describing the regulatory and incentive-based foundational actions CARB has taken to reduce emissions statewide. It also highlights specific actions that address areas of concern identified by the Stockton community. CARB's potential enforcement strategies are described in Chapter 5 of this CERP.

INCENTIVE PROGRAMS

CARB operates incentive programs that reduce the costs of developing, purchasing, and operating cleaner technologies. The programs help ensure cleaner cars, trucks,

equipment, and facilities are operating in our neighborhoods. Specifically, these program accelerate the introduction of advanced technology vehicles and equipment, accelerate the turnover of older and higher emitting vehicles and equipment, and increase access to clean vehicles and transportation in disadvantaged communities and lower-income households.

Examples of CARB incentive programs include the Carl Moyer Memorial Air Quality Standards Attainment Program¹⁵ and the Community Air Protection Incentives,¹⁶ Proposition 1B: Goods Movement Emission Reduction Program,¹⁷ Funding Agricultural Replacement Measures for Emission Reductions Program,¹⁸ and Low Carbon Transportation Investments and Air Quality Improvement Program (which includes the Hybrid and Zero-Emission Truck and Bus Voucher Incentive Project).¹⁹ While CARB is responsible for program oversight, some of these programs are implemented as a partnership with local air districts.

Community Air Protection Incentives

Since 2017 the California Legislature has budgeted \$704 million to support Assembly Bill (AB) 617 (C. Garcia, Chapter 136, Statutes of 2017) with incentives directed by local air districts to put advanced technologies to work for cleaner air in the California communities that are most heavily impacted by disproportionate levels of air pollution.

The Legislature designated the initial appropriation of \$250 million in 2017 for immediate benefits in heavily impacted communities while the other aspects of AB 617 were created and implemented. In order to ensure swift action, the Legislature directed that air districts must spend funds according to two existing mobile source incentive programs: the Carl Moyer Memorial Air Quality Standards Attainment Program, and the Proposition 1B Goods Movement Emission Reduction Program. Air districts have been using the resulting Community Air Protection Funds Supplement to the Carl Moyer Program 2017 Guidelines since it was approved by the Board on April 27, 2018.

The Legislature appropriated an additional \$245 million in 2018 and provided additional direction for new opportunities for stationary source incentives as well as Community-Identified Projects consistent with Community Emissions Reduction Programs. The approved 2019 California State Budget contains another appropriation of \$209 million

¹⁷ For more information on the Proposition 1B: Goods Movement Emission Reduction Program, visit: <https://ww2.arb.ca.gov/our-work/programs/proposition-1b-goods-movement-emission-reduction-program>.

¹⁸ For more information on the Funding Agricultural Replacement Measures for Emission Reductions Program, visit: <https://ww2.arb.ca.gov/our-work/programs/farmer-program>.

¹⁹ For more information on the Low Carbon Transportation Investments and Air Quality Improvement Program, visit: <https://ww2.arb.ca.gov/our-work/programs/low-carbon-transportation-investments-and-air-quality-improvement-program>.

for continued incentives to support the Community Air Protection Program, with Legislative direction matching the previous year's appropriation.

Subsequently, staff developed the Community Air Protection (CAP) Incentives 2019 Guidelines²⁰ to provide eligibility and funding criteria for two new project categories, this represents CARB's first steps in providing incentives to clean up stationary sources of air pollution. The new project categories aim to reduce hexavalent chromium emissions from chrome plating activities, as well as include a suite of project types to reduce exposure at public schools. These guidelines will continue to be expanded with new categories of projects, to be responsive to the needs of the most heavily impacted communities across the State.

At the May 2019 Board hearing, CARB staff was directed to provide more flexibility within the Community Air Protection Incentives Guidelines to allow communities and air districts the ability to develop specific Project Plans to quickly address unique local air quality concerns.

Unlike traditional Moyer projects, Stationary and Community-Identified projects do not lend themselves to the same type of cost effectiveness evaluation. Therefore, the proposed criteria for stationary and Community-Identified projects will focus on community involvement, transparency, and consistency. Air Districts will work with communities to identify project categories needed to address community problems and general concepts. Air districts will then develop Project Plans that:

- Document community support – Community members will evaluate whether there has been sufficient community involvement
- Detail the project selection process
- Set participant requirements
- Establish funding amounts and project costs
- Quantify expected emissions/exposure reductions

To ensure reporting requirements are met CARB will be responsible for:

- Assisting districts with development of technical details
- Helping districts be consistent in quantifying benefits
- Confirming that project plans are consistent with statutory requirements
- Ensuring transparency for communities regarding projects funded, dollars spent, and benefits expected

For more information on air pollution incentives, grants, and credit programs, visit: <https://ww2.arb.ca.gov/our-work/topics/incentives>.

²⁰ For more information on the Community Air Protection (CAP) Incentives 2019 Guidelines, visit: <https://ww2.arb.ca.gov/resources/documents/community-air-protection-incentives-guidelines>

REGULATORY PROGRAMS

Federal, State, and local air quality agencies all work together to reduce emissions. At the federal level, the U.S. Environmental Protection Agency (U.S. EPA) has primary authority to control emissions from certain mobile sources, including sources that are all or partly under federal jurisdiction (e.g., some farm and construction equipment, aircraft, marine vessels, locomotives), which it shares in some cases with air districts and CARB. The U.S. EPA also establishes ambient air quality standards for some air pollutants.

At the State level, CARB is responsible for controlling emissions from mobile sources and consumer products (except where federal law preempts CARB's authority), controlling toxic emissions from mobile and stationary sources, controlling greenhouse gases from mobile and stationary sources, developing fuel specifications, and coordinating State-level air quality planning strategies with other agencies.

Regionally, air districts are primarily responsible for controlling emissions from stationary and indirect sources (with the exception of consumer products in most cases) through rules and permitting programs within their regions.

CARB regulatory programs are designed to reduce emissions to protect public health, achieve air quality standards, reduce greenhouse gas emissions, and reduce exposure to toxic air contaminants. CARB establishes regulatory requirements for cleaner technologies (both zero and near-zero emissions) and their deployment into the fleet, for cleaner fuels, and to ensure in-use performance. CARB's regulatory programs are broad – impacting stationary sources, mobile sources, and multiple points within product supply chains from manufacturers to distributors, retailers, and end-users. CARB's regulations affect cars, trucks, ships, off-road equipment, consumer products, fuels, and stationary sources.

One important and relevant regulatory authority of CARB's is to adopt measures to reduce emissions of toxic air contaminants from mobile and non-mobile sources, known as Airborne Toxic Control Measures (ATCM).²¹ These regulatory measures include process requirements, emissions limits, or technology requirements. Additionally, the Statewide Air Toxics "Hot Spots" Program²² addresses the health risk from toxic air contaminants at individual facilities across the State. The Air Toxics "Hot Spots" Program includes several components to collect emissions data, identify facilities having localized impacts, ascertain health risks, notify nearby residents of significant risks, and reduce those significant risks to acceptable levels.

²¹ California Health and Safety Code § 39650 et seq.

²² Assembly Bill 2588, Air Toxics "Hot Spots" Information and Assessment Act, Connelly, Statutes of 1987, California Health and Safety Code § 44300 et seq.

Under the Air Toxics “Hot Spots” Program, air districts are required to set a threshold for facilities that pose a significant health risk and prioritize facilities for health risk assessments. Air districts also establish a risk value above which facilities must conduct a risk reduction audit and emissions reduction plan. Facilities must develop these health risk assessments, risk reduction audits, and emission reduction plans. CARB provides technical guidance to support smaller businesses conducting health risk assessments and developing emissions reduction plans.

Additionally, in some instances CARB has pursued enforceable agreements with industry that result in voluntary but enforceable adoption of the cleanest technologies or practices and provide assurance that emissions reductions will be realized. CARB’s agreement with the Union Pacific Railroad Company and BNSF Railway Company to accelerate introduction of cleaner locomotives in the South Coast Air Basin is an example of an enforceable agreement.

CARB ACTIONS RELATED TO THE STOCKTON COMMUNITY

This section highlights CARB actions that specifically relate to the Stockton community. This list should not be interpreted as comprehensive or exhaustive, but rather illustrative of some of the major statewide strategies driving emissions reductions in conjunction with those local level strategies identified in this community emissions reduction program. Additional CARB foundational strategies can be found in Appendix D and Appendix F of the Community Air Protection Blueprint.²³

Recently Adopted CARB Regulations

CARB adopted the **Advanced Clean Trucks Rule**²⁴ in June 2020 requiring truck manufacturers to transition from producing diesel trucks and vans to electric zero-emission trucks including heavy-duty vehicles beginning in 2024. Manufacturers who certify Class 2b-8 chassis or complete vehicles with combustion engines are required to sell zero-emission trucks as an increasing percentage of their annual California sales from 2024 to 2035. By 2035, zero-emission truck/chassis sales will need to be 55% of Class 2b – 3 truck sales, 75% of Class 4 – 8 straight truck sales, and 40% of truck tractor sales. This rule also requires that fleets report information on a one-time basis about their vehicles to support future zero-emission fleet rules.

In August 2020 CARB adopted the **Heavy-Duty Engine and Vehicle Omnibus Regulation and Associated Amendments**²⁵ which require manufacturers to comply

²³ California Air Resources Board, *Final Community Air Protection Blueprint for Selecting Communities, Preparing Community Emissions Reduction Programs, Identifying Statewide Strategies, and Conducting Community Air Monitoring*, October, 2018, available at: <https://ww2.arb.ca.gov/capp-blueprint>.

²⁴ For more information on the Advanced Clean Trucks Rule, visit: <https://ww2.arb.ca.gov/our-work/programs/advanced-clean-trucks>.

²⁵ For more information on the Heavy-Duty Engine and Vehicle Omnibus Regulation and Associated Amendments, visit: <https://ww2.arb.ca.gov/our-work/programs/heavy-duty-low-nox>

with tougher emissions standards, overhaul engine testing procedures, and further extend engine warranties to ensure that emissions of NO_x (oxides of nitrogen, a key component of smog) are reduced to help California meet federal air quality standards and critical public health goals. The regulation is expected to have a significant impact on communities adjacent to railyards, ports and warehouses that typically experience heavy truck traffic. These trucks often idle, move slowly and make frequent stops – all actions that increase NO_x emissions. Today's heavy-duty trucks do not control NO_x effectively during such "low load" conditions. The new standards will reduce NO_x emissions by 90 percent or more when trucks are operating under these low load real-world operations. All components of the new rule will be phased-in, allowing engine manufacturers time to prepare for compliance. The NO_x standards that engines must meet will be cut to approximately 75 percent below current standards beginning in 2024, and 90 percent below current standards in 2027.

The **Control Measure for Ocean-Going Vessels At Berth**²⁶ was also adopted in August 2020 and is an updated version of the CARB's At-Berth Regulation that supersedes the existing At-Berth Regulation, as specified, and is designed to achieve further emissions reductions from vessels at berth to improve air quality in communities surrounding ports and terminals throughout California. Emissions reductions will be achieved through the inclusion of new vessel categories (such as vehicle carriers and tanker vessels), new ports, and independent marine terminals, and through updated control requirements, among other provisions.

Upcoming CARB Regulations

Commercial Harbor Craft Regulation Amendments – CARB's existing commercial harbor craft regulation was adopted in 2007 and will be fully implemented by the end of 2022. CARB is working through a public process to consider additional amendments that may further reduce emissions and pursue more stringent in-use standards, with consideration for Tier 4 engine technology and near-zero and zero emission technologies. For more information on the regulation and potential new regulatory concepts, visit: <https://ww2.arb.ca.gov/our-work/programs/commercial-harbor-craft>.

Heavy-Duty Vehicle Inspection and Maintenance – When emissions control systems are not operating correctly, in-use emissions can increase. CARB's current inspection programs include the roadside Heavy-Duty Vehicle Inspection Program and the fleet Periodic Smoke Inspection Program. These regulations require heavy-duty vehicles operating in California be inspected for excessive smoke and tampering. In July 2018, CARB approved amendments to the Heavy-Duty Vehicle Inspection Program and the Periodic Smoke Inspection Program to reduce the smoke opacity limits to levels more appropriate for today's modern engine technology. CARB is now exploring the

²⁶ For more information on the Control Measure for Ocean-Going Vessels At Berth, see: <https://ww2.arb.ca.gov/our-work/programs/ocean-going-vessels-berth-regulation>, and the At Berth Factsheet: https://ww2.arb.ca.gov/sites/default/files/2020-08/External%20At-Berth%20Fact%20Sheet%20August%202020%20ADA_0.pdf

development of a more comprehensive heavy-duty inspection and maintenance program that would help ensure all vehicle emissions control systems are maintained adequately throughout the vehicles' operating lives. For more information on existing heavy-duty maintenance programs, visit: <https://ww2.arb.ca.gov/our-work/programs/heavy-duty-diesel-inspection-periodic-smoke-inspection-program>. For more information on the development of a comprehensive heavy-duty inspection and maintenance program, visit: <https://ww2.arb.ca.gov/our-work/programs/heavy-duty-inspection-and-maintenance-program>.

Cargo Handling Equipment Regulation Amendments – Mobile cargo handling equipment is any motorized vehicle used to handle cargo or perform routine maintenance activities at California's ports and intermodal rail yards. The type of equipment includes yard trucks (hostlers), rubber-tired gantry cranes, container handlers, forklifts, etc. The Mobile Cargo Handling Equipment (CHE) Regulation was adopted in 2005 to reduce toxic and criteria emissions to protect public health and was fully implemented by the end of 2017. CARB staff is currently assessing the availability and performance of zero-emission technology to further reduce emissions. For more information on the regulation, visit: <https://ww2.arb.ca.gov/our-work/programs/cargo-handling-equipment>.

Advanced Clean Fleet Rules – CARB is developing a medium and heavy-duty zero-emission fleet regulation with the goal of achieving a zero-emission truck and bus California fleet by 2045 everywhere feasible and significantly earlier for certain market segments such as last mile delivery and drayage applications. For more information, visit: <https://ww2.arb.ca.gov/our-work/programs/advanced-clean-fleets>.

Transport Refrigeration Unit Regulations – Transport refrigeration units congregate at distribution centers, railyards, and other facilities, resulting in the potential for health risks to those that live and work nearby. CARB is working through a public process to consider new requirements to transition the transport refrigeration units fleet to zero emission operations by requiring both zero emission technology and supporting infrastructure. For more information on this new regulation, visit: <https://ww2.arb.ca.gov/our-work/programs/transport-refrigeration-unit/new-transport-refrigeration-unit-regulation>.

Small Off-Road Engines – In 2020, CARB will consider new standards for small off-road engines (SORE), which are spark-ignition engines rated at or below 19 kilowatts and used primarily for lawn, garden, and other outdoor power equipment. For more information on the strategy, visit: <https://ww2.arb.ca.gov/our-work/programs/small-off-road-engines-sore>

Advanced Clean Cars II – CARB staff is developing the Advanced Clean Cars II regulations, which will seek to reduce criteria and greenhouse gas emissions from new light- and medium-duty vehicles beyond the 2025 model year, and increase the number of zero emission vehicles for sale. For more information on these new regulations, visit: <https://ww2.arb.ca.gov/our-work/programs/advanced-clean-cars-program>.

Commercial Cooking Suggested Control Measure – This strategy consists of a two-phase process to evaluate California’s current emission reduction requirements for commercial cooking operations that prepare food for human consumption, and if necessary, make improvements to achieve additional reductions in particulate matter 10 microns or less in diameter (PM10), particulate matter 2.5 microns or less in diameter (PM2.5) and volatile organic compound emissions that contribute to ozone formation. For more information on the strategy, visit: [Blueprint Appendix F](#) – pages F-8 & F-9.

ESTIMATED EMISSIONS REDUCTIONS FROM CARB MEASURES

CARB has estimated the emissions reduction benefits for some of the proposed statewide measures as shown in Table 4-3 for the 2025 and 2030 milestone years for the Stockton Community. Note the emissions reductions from the recently adopted Ocean-Going Vessels At Berth Amendment and Low NOx Omnibus Regulation are not reflected in the emissions inventory presented in Chapter 3 or Appendix C.

Table 4-3 Estimated Emissions Reductions from CARB Measures in the Stockton Community

Proposed Statewide Measures	Emissions Reduction (tons per year)							
	PM2.5		DPM		NOx		VOC	
	2025	2030	2025	2030	2025	2030	2025	2030
Ocean-Going Vessels At Berth Amendment	0.00	0.18	0.00	0.20	0.00	11.45	0.00	0.56
Advanced Clean Car 2		0.02		0.00		1.00		0.38
Heavy-Duty Inspection and Maintenance	0.34	0.38	0.35	0.40	23.25	27.7		
Low NOx Engine Standard					1.88	14.17		
Small Off-Road Engine Amendment	0.15	0.92	0.12	0.28	17.03	27.09	8.28	28.31

5. ENFORCEMENT PLAN

5.1 INTRODUCTION

Enforcement of air quality rules and regulations by the San Joaquin Valley Air Pollution Control District (District) and the California Air Resources Board (CARB) is critical to continuing air quality progress and achieving the air quality goals contained in the Valley's State Implementation Plans. Compliance with federal, state, and local air quality rules and regulations is ensured by operating robust inspection programs along with a full range of educational and compliance assistance programs.

This Enforcement Plan describes the stationary and mobile source enforcement history for the Stockton AB 617 Community. In addition, the plan describes the overall enforcement programs operated by the District and CARB. Based on the analysis of the enforcement history and input from the Community Steering Committee, the Community Emissions Reduction Plan (CERP) includes focused enforcement measures to enhance enforcement and compliance assistance activities within the community in support of the emission reduction commitments in the CERP.

5.2 OVERVIEW OF SAN JOAQUIN VALLEY AIR POLLUTION CONTROL DISTRICT ENFORCEMENT PROGRAM

The District's mission is to improve the health and quality of life for all Valley residents through efficient, effective, and entrepreneurial air quality management strategies. The District's Enforcement Department seeks to aid in achieving this mission through fair, consistent, and comprehensive enforcement utilizing a full suite of enforcement and compliance assistance related activities to ensure compliance with District, state and federal rules and regulations. The program objectives for the Enforcement Department are set forth in federal and state law and the District's air quality attainment plans. In order to meet these program objectives, District staff perform inspections at approximately 9,200 permitted facilities and responds to approximately 3,000 public complaints, and verifies emissions reductions at thousands of locations where emission reduction incentive projects have been implemented.

The major functions of the District's Enforcement Department are as follows:

Inspections of Stationary Sources

The District performs thousands of comprehensive on-site inspections each year to ensure compliance with federal, state, and District requirements. These compliance evaluations are unannounced whenever possible and play a key part to meeting clean air requirements. The frequency of regular inspections depends on the type of facility. When considering limited resources, priority is given to federal Title V (Major) sources, facilities that emit non-attainment criteria or toxic pollutants, facilities with equipment that is more susceptible to upsets, compliance history of operation, etc. Under this scenario, a chrome plating facility will be inspected more frequently than a back-up, emergency generator which only operates a few hours per year.

Compliance inspections are conducted by well-trained District air quality inspectors. Inspections include a physical inspection of the facility and equipment, a review of operating and monitoring records, and the use of advanced detection equipment, where appropriate, to determine compliance with permitted emission limits. During the inspection, District staff ensures that the equipment is permitted appropriately, and that the facility is operating in compliance with all permit requirements and applicable local, state, and federal regulations. If the facility is determined to be in non-compliance, the inspector issues the facility an enforcement action that requires prompt correction of the issue and generally results in the imposition of a civil penalty to dissuade from any non-compliance in the future.

Complaint Investigations

The District receives thousands of complaints each year for which timely responses and investigations of alleged sources of non-compliance are top priorities. Inspectors are on-call 24 hours per day, seven days a week and use automated voicemail and computer systems to facilitate the timely response to complaints in order to abate non-compliance with District rules, including potential public nuisances. Along these same lines, the District added the ability to easily submit complaints, including video and photographs, online and through mobile smartphone applications. District staff are required to keep the reporting party apprised of the investigation findings until it has been completed. The District provides a bilingual (Spanish-English) telephone complaint line and also has the capability to utilize multilingual translation services, in the field or over the telephone, to ensure that all communities and groups within the Valley are properly served.

Emissions Testing

District inspectors oversee hundreds of third-party emissions tests conducted at stationary sources each year for the purpose of measuring air pollutants and ensuring compliance with established standards from stationary sources of air pollution. District staff have three main tasks when overseeing source tests at stationary source sites. First they review the source test protocol, submitted by the third party source testing contractor, which outlines the testing methods that testing period. District staff reviews the protocol to ensure the proper testing methods will be used and that the source test contractor has the proper equipment and certifications to conduct the test. The second task is to witness the test to ensure the source test contractor follows the correct testing procedures. Lastly, District staff reviews the source test results to ensure the data is properly reported and to act promptly on any compliance issues related to the testing.

In addition, the District utilizes its monitoring van and portable exhaust gas analyzers to assess the emissions from internal combustion engines, boilers, and other combustion devices to ensure they are operating according to specifications and complying with all permitted and/or rule emission limits.

Gasoline Station Permitting, Inspecting and Testing Program

Gasoline stations, in aggregate, are one of the largest potential sources of volatile organic compounds in the Valley. A comprehensive and effective permitting, inspection

and testing program is important to ensure the vapor recovery systems operate as designed and the Valley realizes the emission reductions anticipated in Rule 4621 (Gasoline Transfer Into Stationary Storage Containers, Delivery Vessels and Bulk Plants) and Rule 4622 (Gasoline Transfer into Motor Vehicle Fuel Tanks).

District staff continues to inspect gasoline station vapor recovery systems on a routine basis looking for torn hoses, damaged nozzles, and missing parts. However, during recent years there have been many changes in vapor recovery technology and state laws such that the simple visual inspections are no longer sufficient. More emphasis is now being placed on performance tests that evaluate gasoline station equipment effectiveness. As a result, the District implemented a gasoline dispensing tester certification and training program to ensure qualified third party contractors are available for operators of this equipment.

Wood Burning Heaters and Fireplaces

Further reducing residential wood smoke emissions is a high priority under the District's 2018 PM2.5 Plan given the significant localized health impacts associated with residential wood smoke. Scientific studies show that prolonged inhalation of wood smoke contributes to lung disease, pulmonary arterial hypertension, and pulmonary heart disease, which can eventually lead to heart failure. District Rule 4901 is designed to improve public health by reducing toxic wood smoke emissions in Valley neighborhoods during the peak PM2.5 winter season (November through February).

Since 2004, the District has had a robust enforcement program for designated wood burning curtailment days to ensure the District is achieving the expected emission reductions as a result of the requirements of the rule. This includes having a significant portion of field staff mandatorily assigned to conduct proactive surveillance in counties with declared wood burning curtailments. The District also conducts surveillance in counties with curtailments on days that District offices are closed and performs periodic night-time surveillance throughout the Check Before You Burn season.

In the District's ongoing efforts to utilize the latest forms of technology to improve efficiency and effectiveness, the District tested several technologies for nighttime fireplace and wood burning heater enforcement. The District purchased ultra-low light cameras, which have the greatest capacity to capture non-compliance through photographic and video evidence. The use of the cameras are able to clearly document smoke coming from chimneys in extremely low-light conditions in a way that previous technologies used and tested were unable to match.

Compliance Assistance

The District believes in working closely with businesses and residents to assist in achieving compliance with air pollution rules and regulations. The Compliance Assistance program has emphasized an educational approach to help Valley residents and businesses comply with a variety of air pollution regulations. Businesses and individuals throughout the Valley are provided with:

- **Individualized Assistance:** Personal, one-on-one help is provided to thousands of businesses and residents to ensure they understand the federal, state, and District's requirements.
- **Compliance Assistance Bulletins:** Actively evaluate upcoming rule compliance dates and develop educational materials that are sent to affected groups including, but not limited to, residents, realtors, building departments, contractors, and industrial and commercial facilities.
- **Compliance Schools:** The District provides training classes regarding information on the topics of open burning, gasoline vapor recovery, and wood burning fireplaces and wood burning heaters to individuals who have received a Notice of Violation from the District. In addition to discussing the aforementioned specific topics, the courses also provide general air pollution training, discuss the air quality challenges of the San Joaquin Valley, and opportunities for them to contribute to improving air quality in the Valley.
- **Gasoline Station Tester Training:** Ongoing training for contractors is provided for those wishing to perform vapor recovery tests within the District. District rules require testers be certified to ensure there are a qualified pool of contractors from which businesses can choose to perform their equipment's testing.
- **Asbestos Training:** Comprehensive assistance on asbestos regulations is provided to the public, building industry, building departments, fire departments, and realtors. Staff continues to spend considerable time providing one-on-one assistance, in addition to group trainings, to the regulated community. The District has also developed online tools and resources to educate the public on asbestos notification requirements in the Valley.
- **Residential Wood Burning Heater Professional Training:** Training requirements for qualified individuals (those people having either a certification from the Fireplace Investigation Research and Education, Chimney Safety Institute of America, or the National Fireplace Institute or has documentation demonstrating they are qualified to perform inspections, maintenance and cleaning activities on wood burning heaters) who may be hired to perform inspections of wood burning heaters and pellet stoves to ensure they can be operated in a compliant manner prior for individuals who voluntarily request to register their wood burning heaters and pellet stoves.
- **Fugitive Dust Education:** Staff organizes and conducts classroom training for all groups required to submit dust control plans for construction activities and provides ongoing training and outreach as needed and as requested to businesses and entities that may be subject to the requirements.
- **Prescribed Burning Outreach:** The District meets periodically with the land managers of the USDA Forest Service, National Park Service, US Fish and Wildlife

Service, Bureau of Land Management, California Department of Forestry and Fire Protection, and Southern California Edison Company in order to minimize impacts of smoke from prescribed burns and wildfires. Compliance staff participate on the daily calls during fire season to keep abreast of wildfire and prescribed burn activities throughout the area.

- **Access to District Policies:** District policies are available on the internet for stakeholders to review, comment on, and use to assist them with complying with District requirements. The internet is updated regularly with new or modified policies to ensure availability of current information.

Emission Reduction Incentive Program Inspections

To ensure that the emission reduction projects funded by the District's incentive programs are real and permanent, the District monitors the pre-contract and post-contract performance of grant recipients. Thousands of field inspections are conducted to verify that equipment is appropriately replaced or controlled, adequately maintained, and also verifies that older equipment has been properly disposed of.

Incentive projects requiring compliance inspections include the replacement of older trucks with new less polluting ones, school bus replacements, agricultural pump engine replacements, emissions controls on trucks, and other related control strategies. Each funded project requires a minimum of two initial inspections and several types of projects require ongoing inspections and recordkeeping requirements to assure emission reductions are realized for the life of the project.

5.3 SAN JOAQUIN VALLEY AIR POLLUTION CONTROL DISTRICT ENFORCEMENT HISTORY IN STOCKTON AB 617 COMMUNITY

The District's enforcement presence within the Stockton AB 617 Community is comprised of many different facets including, but not limited to, performing facility inspections, investigating complaints from the public, investigating breakdowns, and overseeing third-party emissions testing at facilities. Since 2017, the District has conducted inspections of 2,409 equipment units during 1,121 inspections at permitted facilities within the Stockton AB 617 Community, has received and responded to 131 air quality complaints from the public, and has issued 212 enforcement actions associated with violations of air pollution rules and regulations. A listing of the facilities, inspections, complaints, and enforcement actions can be found in Appendix F.

5.3.1 RESPONSE TO PUBLIC AIR POLLUTION COMPLAINTS

The public plays an important role in protecting public health by reporting local air quality issues that they observe in their communities. Often these complaints serve as the first warning of an air pollution compliance issue that needs to be addressed. The District places the highest priority of responding to complaints from the public and responds to each and every complaint received. In addition, the District operates an "on-call" program to ensure that complaints received outside of normal business hours can be appropriately addressed since air pollution related issues are not bound by

normal business hours. The process of responding to a complaint can be unique for each complaint received depending on factors such as whether the issue is currently in progress, whether the issue is a recurring/ongoing issue, the type of source, the time of day, and the number of complaints received about the issue. Figure 5-1 shows the number of complaints received by the District each year since 2017

Figure 5-1 Number of Complaints by Year from 2017-2020

Based on the resulting complaint investigations, the District confirmed a violation of District rules or regulations and took enforcement action in 18 of the complaints, determined that the issue did not constitute a violation of any federal, state, or local air quality rule in 29 of the complaints, referred 2 complaints to the proper agency with jurisdiction over the issue, and was unable to confirm whether or not a violation occurred in the 82 remaining complaints (at times, the issues associated with public complaints can be transient in nature and the information provided by the reporting party may lack sufficient information to track down and confirm the issue). Of the 18 enforcement actions taken as the result of public complaints, 7 were for illegal residential open burning of waste, 2 were for illegal use of a residential fireplace or outdoor wood burning device, 2 were for fugitive dust related issues, 3 were for permitting/registration related issues, 1 were for agricultural open burns, and 3 was for work practices issues at an automobile coating operation

Figure 5-2 below details the complaints received by type since 2017. Complaints concerning odor nuisance and residential open burning each made up 23% of the total complaints received in the community. Complaints regarding fugitive dust made up approximately 20% of the complaints received in the community. In total, these three categories made up over 66% of the complaints received.

Figure 5-2 Number of Complaints by Type from 2017-2020

The District received and responded to 39 complaints regarding residential open burning and residential fireplace/outdoor wood burning devices during this period. The District confirmed illegal open burning and took enforcement action in 8 of these cases, determined that 3 were not a violation (permissible fireplace burn day or outdoor cooking fire), and was unable to confirm 28 of the complaints. In addition to the complaints received in these categories, members of the Community Steering Committee have suggested increased outreach/education and enforcement in these categories. The District has included specific enhanced enforcement and outreach/education measures as part of the CERP to reduce the potential for localized air quality impacts associated with failure to comply with District rules pertaining to residential open burning and residential fireplace/outdoor wood burning devices.

The District received 31 odor complaints during this period and determined that none of the complaints resulted in a violation failing under the District’s jurisdiction. Under state law, odors are regulated under public nuisance requirements. To become a violation, an odor must cause “injury, detriment, nuisance, or annoyance” to a considerable number of people or the public. Each of the odor complaints were separate instances from a single party; and therefore, did not rise to the level of a public nuisance under state law. Three of the complaints fell outside of the District’s jurisdiction and were referred to the appropriate agency.

Of the 26 fugitive dust complaints received, the District issued an enforcement action in 2 of the cases. In 2 of the instances, the District determined that the operation was complying with the District's Regulation VIII fugitive dust rules and public nuisance rules. In 22 of the instances, the District was unable to confirm the complaint. The complaints that did not result in enforcement actions or were unable to be confirmed were primarily associated with construction/ earthmoving activities track out or open areas. The District has included specific enhanced enforcement measures as part of the CERP to reduce the potential for localized air quality impacts associated with fugitive dust from construction/earthmoving activities and open areas subject to District Regulation VIII. Since the majority of the complaints have been received between April and September, these enhanced enforcement efforts will be conducted during the 2nd and 3rd calendar quarters.

The District received 11 complaints associated with commercial/industrial open burning. The District found that 9 were cooking fires which are exempt from open burning rules, 1 was a spontaneous combustion fire, and in the 1 remaining the District was either unable to locate the burn or the responsible party for the burn. The enhanced enforcement and outreach/education CERP measures for residential open burning will aid in compliance with the rules pertaining to illegal open outdoor burning.

The District received 9 complaints regarding federal asbestos requirements associated with regulated demolitions and renovations. The District issued enforcement actions in 3 of these instances, the District was unable to confirm 3 complaints in this category. The District took no enforcement action in 3 cases as the projects were either complying with federal asbestos requirements or were exempt under federal law.

The District received 2 complaints regarding visible emissions from equipment at facilities within the community. The District was unable to confirm whether or not a violation occurred in the 2 complaints in this category. As discussed below under the District Enforcement Action section, the District has included specific enhanced enforcement measures as part of the CERP to address failure to comply with emission standards at permitted facilities.

5.3.2 DISTRICT ENFORCEMENT ACTIONS

Federal and state law, along with local rules, require the enforcement of air quality rules and regulations. The District takes formal enforcement action for all violations of applicable federal, state, and local rules and regulations within its jurisdiction. In addition, the District enforces conditional permit requirements, Hearing Board orders, and at times seeks delegation to enforce statewide mobile source and greenhouse gas measures. Generally a Notice of Violation (NOV), which normally results in a civil penalty, is issued to document a violation. Under the limited circumstances specified in District Rule 1180, a Notice to Comply (NTC) may be issued for first-time, minor violations. An NTC does not carry a monetary penalty but does require quick resolution of the minor violation. Should a party not correct the violation within the timeframe established by the NTC, an NOV will be issued.

Over the past 3 years, the District has issued 175 NOVs and 37 NTCs in the Stockton AB 617 Community. Figure 5-3 shows the annual breakdown of NOVs and NTCs since 2017.

Figure 5-3 Number of Enforcement Actions Issued by Year (2017-2020)

Figure 5-4 shows the enforcement actions categorized by type. Since 2017, 88 of the 212 enforcement actions resulted from violations of administrative requirements such as recordkeeping, late report submittal, operating with a suspended permit, or operating without a permit. The District issued 51 enforcement actions for violations resulting in excess emissions from facilities (not including gas stations). These violations occurred at 13 permitted facilities in the area and 1 ocean-going vessel. The District also issued 18 enforcement actions to gas stations for violations resulting in excess emissions and 1 gas station certification enforcement action. These violations occurred at 14 gas stations in the area. The District believes that more frequent inspections for these 27 facilities would be prudent to limit the potential for air quality impacts associated with failure to comply with emission standards established by District permit, rule, or regulation.

In addition, the District believes a new pilot training program for conducting self-inspections of equipment at gas stations may help to limit the potential for air quality impacts associated with vapor recovery defects at gasoline dispensing operations. Accordingly, the District has included a compliance assistance CERP measure to develop a new training program to instruct gas station operators on conducting thorough self-inspections to aid in the identifications and timely repair of system defects. The District will provide the hands on training to each gas station operator in the community.

Figure 5-4 Enforcement Actions by Type from 2017-2020

A review of the data also shows that the District has issued 7 violations for residential open burning, and 16 enforcement actions for fireplace/outdoor wood burning heater violations. This further demonstrates the need to include the aforementioned enhanced enforcement and outreach/education CERP measures.

5.4 CALIFORNIA AIR RESOURCES BOARD PROGRAM OVERVIEW AND ENFORCEMENT HISTORY IN STOCKTON

Section 5.4 Provided by the California Air Resources Board

The California Air Resources Board (CARB) enforcement programs cover the vehicles we drive, the diesel engines that power our economy, consumer products that we purchase and greenhouse gas (GHG) emissions from our industries and activities. The goal of Stockton’s enforcement programs is to achieve comprehensive compliance in every regulation CARB adopts. Through enforcement, CARB works to bring responsible parties into compliance, and in doing so, achieves a level playing field across industry so that no company can benefit from non-compliance at the expense of another. CARB also works to deter industries from future violations and takes compliance seriously, because the success of our programs and the protection of public health depend on it.

CARB applies enforcement programs professionally in accordance with our enforcement policy,²⁷ which was updated in 2017. CARB uses program data, complaints and inspections to identify potential non-compliance, and then investigates each case. Once a violation is identified, CARB notifies the responsible party and evaluates what happened. CARB works with the party to achieve compliance and measure the relevant facts and circumstances of each case, relative to the eight statutory factors as described in our enforcement policy, to determine an appropriate penalty. The case is settled when the responsible party has achieved compliance and both parties have agreed upon an appropriate penalty. If a mutual settlement cannot be reached, CARB refers the case to California's Attorney General for civil litigation.

Field inspectors are a critical component of CARB's Heavy-Duty Diesel Enforcement Program. The inspectors work across the state to inspect trucks and other equipment for compliance with CARB's diesel regulations, such as the Heavy-Duty Diesel Vehicle Inspection Program (HDVIP), Drayage Truck, Truck and Bus Regulation, SmartWay and Transport Refrigeration Unit (TRU) Air Toxic Control Measure. Field inspectors also conduct inspections for compliance with In-Use Off-Road and School Bus Idling regulations. CARB inspectors examine heavy-duty vehicles and equipment at numerous locations throughout California, such as at California Highway Patrol (CHP) scale facilities, warehouses, fleet yards, construction sites, random roadside locations, truck stops, rest areas, ports and rail yards.

CARB'S THREE YEAR ENFORCEMENT HISTORY IN STOCKTON

The following section provides an overview of CARB enforcement actions across several enforcement programs within the Stockton Assembly Bill 617 (AB 617) community boundary for years 2017 through 2019.

Under the heavy-duty vehicles and marine enforcement program sub-sections, CARB staff provide overviews of enforcement activities along with maps to display the approximate locations of program inspections, which may help to determine gaps in CARB enforcement activity as well as locations where enhanced enforcement is necessary to deter potential violators within the community. Additional sub-sections include overviews of CARB's fuel enforcement activities, statewide consumer product enforcement activities, case settlements, Supplemental Environmental Projects, and more.

CARB will work closely with the Community Steering Committee (CSC) to determine areas of non-compliance within the Stockton AB 617 area that needs an enforcement presence. CARB acknowledges enforcement presence can be increased in this area and will work with CSC and the San Joaquin Valley Air Pollution Control District (SJVAPCD) to identify opportunities for enhanced enforcement.

²⁷ <https://ww2.arb.ca.gov/resources/documents/enforcement-policy>

Heavy-Duty Vehicles Programs

Over the last three years, CARB has conducted 244 inspections on Heavy-Duty Diesel Vehicles (HDDV) within the selected Stockton AB 617 Community. These inspections occurred across 7 of 12 CARB HDDV enforcement programs, as described in Appendix 4.1.

Table 5-1 below summarizes HDDV enforcement actions in Stockton from 2017 to 2019. Of the five citations issued to HDDVs within the community boundary, four were for emissions violations and one was for a non-emissions violation. Emissions violations further contribute to air pollution while non-emissions violations do not (e.g., a truck not meeting labeling or reporting requirements). CARB is working to compile information on the resolution of violations issued in Stockton and will provide this data to CSC as it becomes available.

Table 5-1 HDDV Enforcement in Stockton: 2017-2019

Program	Inspections	Violations	
		Emissions	Non-Emissions
Drayage	25	0	1
Heavy-Duty Vehicle Inspection Program (HDVIP)	134	0	0
Idling	31	0	0
Off-Road	3	0	0
Smart Way	33	0	0
Transportation Refrigeration Unit (TRU)	2	2	0
Truck and Bus	16	3	0
Total	244	5	1

Figure 5-5 below provides a year-to-year comparison of HDDV enforcement actions and overall compliance rates from 2017 to 2019. Although overall compliance remains high (at and above 96 percent) over the three-year period, the low number of total inspections under the Drayage, Off-Road, TRU and Truck and Bus programs, demonstrate the need for more targeted inspections in the Stockton community. CARB will work closely with CSC to determine methods to identify areas of non-compliance by evaluating emissions inventory, air monitoring data, CARB’s three-year history and community groundtruthing information within the Stockton AB 617 boundary.

Figure 5-5 Year-to-Year Comparison of HDDV Enforcement in Stockton

Figure 5-6 below shows the approximate locations (indicated by the truck icons) of the above-mentioned HDDV program inspections in the Stockton community boundary. Visualizing inspection locations helps CARB staff to determine any locations where enhanced enforcement is needed within the community. In the past, CARB staff would target areas with large concentrations of HDDVs such as truck stops and distribution centers. It is important to note that each location represents multiple inspections across the various HDDV programs. In addition, implementing random roadside inspections can be difficult because field staff, in coordination with the California Highway Patrol, must have enough space to perform inspections safely on the side of the road.

Figure 5-6 Map of Heavy-Duty Diesel Vehicle Inspections in Stockton: 2017-2019

In April 2017, the Governor signed into law Senate Bill 1 (SB 1),²⁸ a legislative package meant to generate significant funding for transportation projects (e.g., to repair local streets, bridges, and roadways) across California. SB 1 includes a provision that aims to bring old, polluting buses and trucks into compliance with applicable emission standards as outlined in the Statewide Truck and Bus Regulation, and authorizes DMV to deny registration to non-compliant heavy-duty vehicles²⁹ starting January 1, 2020, through December 31, 2023. By the end of 2023, 100 percent of trucks and buses registered in California, which are subject to the rule, will comply with this regulation.

In response to the legislation, CARB began a streamlined enforcement process to increase outreach to owners of heavy-duty diesel trucks and buses and provide an opportunity for vehicle owners to demonstrate compliance. Those with older vehicle models that could potentially be out of compliance were sent Notices of Non-Compliance (NC) and Notices of Violation (NOV)³⁰ from 2018 through 2019. In the last quarter of 2019, CARB sent warning letters to fleet owners who appeared to have vehicles that could potentially be out of compliance beginning January 1, 2020. HDDV owners are now required to show proof of compliance to Department of Motor Vehicles (DMV) with their vehicle registrations.

²⁸ https://leginfo.ca.gov/faces/billNavClient.xhtml?bill_id=201720180SB1

²⁹ The regulation applies to nearly all diesel-fueled trucks, buses, and school buses with a gross vehicle weight rating (GVWR) greater than 14,000 pounds.

³⁰ A Notice of Non-Compliance letter is sent to request proof of compliance. If compliance cannot be verified, a Notice of Violation is sent.

Table 5-2 Summary of letters sent under SB 1 in Stockton: 2018-2019

Type of Letter	Number of Letters Sent
Warning letters	189
NC and NOV letters	157
Total	346

In Stockton, CARB identified 1,512 HDDVs within the Stockton community. As shown in Table 5-2 above, CARB issued 189 warning letters and 157 NCs and NOVs to owners of vehicles within the area in 2019. Of the 157 vehicle owners sent NCs or NOVs, 29 demonstrated compliance, whereas 118 vehicles were found to be non-compliant and were issued registration holds by DMV and were removed from the road. In total, CARB issued warning letters or took enforcement action against 346 vehicle owners. No enforcement action was taken on 10 other vehicles that were found not to be subject to the Truck and Bus Regulation.

Marine Programs

From 2017 to 2019, CARB staff performed 171 inspections for marine regulation enforcement at the Port of Stockton. Descriptions of the related marine enforcement programs are provided in CARB’s Appendix.

Table 5-3 Marine Enforcement in Stockton: 2017-2019

Program	Total Inspections	Violations
CHE	121	23
CHC	21	0
OGV	29	1
Total	171	24

As shown above, marine enforcement focused mainly on the Cargo Handling Equipment (CHE) Regulation. During this period, 24 NOVs were issued for violations of CHE and Ocean Going Vessels (OGV) programs. CARB staff did not find any violations of the Commercial Harbor Craft (CHC) Regulation.

below provides a year-to-year comparison of marine enforcement activities and overall compliance rates from 2017 through 2019.

Figure 5-7 Year-to-Year Comparison of Marine Enforcement in Stockton

Error! Not a valid bookmark self-reference. 5-8 below indicates the approximate locations of the above-mentioned marine program areas at the Port of Stockton. This

map may assist the community in identifying locations that CARB is not aware of or locations where additional inspections can occur.

Figure 5-8 Marine Enforcement Activity at the Port of Stockton: 2017-2019

Consumer Products

Consumer products are chemically formulated products used by household and institutional consumers and can be sources of toxic air contaminants and volatile organic compounds that community members unknowingly bring into their homes.

Examples include:

- Detergents and cleaning compounds
- Polishes and floor finishes
- Cosmetics and personal care products
- Home, lawn and garden products
- Disinfectants and sanitizers
- Aerosol paints and automotive specialty products
- Composite wood products

Consumer product inspections are an important regulatory tool to improve public health in the community. CARB investigators in the Consumer Products program purchase samples of regulated consumer products from outlets all over California. They inspect products for compliance with registration and dating requirements and send selected products to the laboratory for testing.

From 2017 through 2019, CARB conducted 1,883 consumer product inspections statewide. Consumer products are reported statewide because it is assumed these products are sold and delivered throughout the state. Table 5-4 below represents a breakdown of enforcement action in the state.

Table 5-4 Consumer Product Inspections Statewide: 2017-2019

Program	Total Inspections	Violation	Under Investigation
Aerosol Coatings	118	24	72
Antiperspirant/Deodorants	35	4	16
Composite Wood	120	11	50
Other Consumer Products	1,610	73	618
Total	1,883	112	756

Vehicles and Engines

CARB is responsible for evaluating the emission control systems of new vehicles and engines, and evaporative emission control systems of engine-equipped devices. When CARB finds that the vehicle/engine/evaporative emission control system complies with all of California’s emission standards and emissions-related requirements, the vehicle/engine/evaporative emission control system may operate in California.

CARB conducted six Vehicles and Engines inspections in the Stockton AB 617 Community during the 2017-2019 period. CARB staff found zero violations across the three programs listed in Table 5-5 below.

Table 5-5 Vehicles & Engines Program Inspections in Stockton: 2017-2019

Program	Inspections	Violations
49 State	1	0
Recreational Marine Engines	1	0
R134A	4	0
Total	6	0

Fuels Enforcement Program

CARB staff are responsible for setting standards and adopting regulations to achieve the maximum degree of emissions reduction possible from vehicular and other mobile sources. Motor vehicle emissions are responsible for approximately 55 percent of air pollution emissions statewide.

As seen in Table 5-6, from 2017 through 2019, CARB staff conducted 112 fuel inspections in the Stockton community. There were no violations issued for these inspections within the community.

Table 5-6 Fuels Program Inspections in Stockton: 2017-2019

Fuel Type	Inspections	Violations
Gas	75	0
Diesel	28	0
Ethanol	8	0
Bio	1	0
Total	112	0

Case Settlements

This section presents an overview of settlement agreements reached between CARB and companies in violation of CARB regulations in the Stockton community. In 2017, a company that failed to comply with requirements of the CHE Regulation signed a settlement agreement with a penalty of \$170,625.00 that was paid to the California Air Pollution Control Fund. In August 2019, CARB settled a case with the Port of Stockton in the amount of \$8,625.00 for violating the CHE Regulation. For further details on these cases, please visit <https://ww2.arb.ca.gov/our-work/programs/enforcement-policy-reports/enforcement-case-settlements>.

Complaints Summary and Resolution

CARB's previous complaint management system relating to HDDVs lacked the ability to track complaints by specific location. However, CARB staff have begun to work on and track all complaints through the California Environmental Protection Agency (CalEPA) Complaint Reporting System.³¹ This will allow CARB staff to better track complaints by community and to see the resolution of the complaint. Furthermore, this process will enhance CARB's complaint response by encouraging better complaint referrals (e.g. referring complaints to the proper agency and/or identifying complaints that may require multiple agencies to be involved in their resolution). To increase the effectiveness of the complaint program, CARB Enforcement developed a training to help communities identify possible violations and report an enforceable complaint.

Complaints are a vital part of CARB's enforcement program and we encourage the community to report possible violations regularly. In 2019, CARB received eight diesel complaints through CARB's complaint reporting system for the Truck and Bus

³¹ <https://calepacomplaints.secure.force.com/complaints/Complaint>

Regulation and four complaints through CalEPA's reporting system within the Stockton AB 617 Community. CARB referred the complaints received to the appropriate section in a timely manner.

Supplemental Environmental Projects

CARB has a Supplemental Environmental Project (SEP) Policy that allows community-based projects to be funded from a portion, up to 50 percent, of the penalties received during settlement of enforcement actions. Every year CARB initiates cases that result in settlements with monetary penalties. The goal of the SEP program is to improve public health, reduce pollution, increase environmental compliance and raise public awareness in neighborhoods most burdened by environmental harm. In Stockton, there is one school air filtration SEP that is currently pending approval for funding. In addition, there are three SEPs funded in the San Joaquin Valley Air District.

Area	AB617 Community	SEPs	Amount Funded	Funding Status
San Joaquin Valley	South Central Fresno	Healthy Air Neighborhoods-Fresno	\$ 35,000.00	Fully funded
San Joaquin Valley	Southwest Stockton	Installation of Air Filtration Systems in Stockton-Washington Elementary School	\$ 80,000.00	Fully funded
San Joaquin Valley	Shafter	Asthma Impact Model Kern	\$ 113,480.00	Fully funded

CARB's SEP policy can be accessed at <https://ww2.arb.ca.gov/our-work/programs/supplemental-environmental-projects-seps>.

Outreach Materials

In an effort to provide communities with more knowledge, tools, and resources for enhanced enforcement, CARB Enforcement has developed the following outreach materials to further inform community members:

- **CARB's Enforcement Visualization Tool**

This web-based tool allows community members to see a map that details statewide field inspections and case settlements across California. This tool allows you to look up inspections by program, type, zip code, and date. A user guide has been developed to go along with the tool. This is a one-pager on how to use the Visualization Tool in your community. The Visualization Tool is available at <https://webmaps.arb.ca.gov/edvs/>.

- **Complaint Reporting**

- CARB has developed a community-focused training to provide communities with the information necessary to report a complaint. The trainings are tailored to each region within the AB 617 Program. For instance, the training provided in the San Joaquin Valley may differ from training given in West Oakland, based on the types of emission sources within the region, as well as contact information for other regulatory parties.
- As shown in Figure 5-9, CARB has also developed reporting cards (available in both English and Spanish) that include information on where to report complaints and what information to provide when reporting complaints. If the community is interested in receiving CARB's complaint reporting training or obtaining the Complaint Reporting business cards through the CSC or another outlet, please contact COES@arb.ca.gov, or speak to your local CARB Enforcement liaison.

Figure 5-9 CARB Complaint Reporting Business Cards

- **Supplemental Environmental Project Brochures**

The SEP brochure outlines the SEP program and how to apply. It is available in both English and Spanish. To learn more about the SEP program, visit <https://ww2.arb.ca.gov/our-work/programs/supplemental-environmental-projects-seps>.

- **Informational Outreach Materials.** CARB staff are currently working on community outreach materials, including a multi-regulation booklet and a community idling factsheet. The booklet, geared towards community members, aims to provide information on the requirements for trucks and buses operating in their communities. For more information on any of the above outreach and training activities, please contact the Community Outreach and Enforcement Section at COES@arb.ca.gov.

CALEPA EJ INITIATIVE

In 2018 and 2019, CARB staff participated in a multi-agency initiative lead by CalEPA that focused on Stockton. As part of the initiative, CARB provided the City of Stockton with No-Idling signs. As of December 2019, seven signs were posted at various locations identified by the community as having high rates of idling trucks. Of the seven signs posted, three were on South Fresno Avenue, three were on Lincoln Street, near the DMV, and one was on Weber Avenue.

In addition, CARB developed a monitoring plan to help quantify the air pollution burden in the Boggs Tract community with a specific focus on George Washington Elementary School. CARB staff installed two Aeroqual sensors at the George Washington Elementary School and data was collected from July 30, 2019 to August 28, 2019. These sensors measured PM2.5, ozone and NO₂ concentrations in the community.

CARB also conducted mobile monitoring to characterize the air quality and its spatial pattern around the school and to identify possible sources of pollution. CARB staff collected monitoring data using a Mobile Sampling Platform. In total, CARB conducted 7 days of sampling from August 15, 2019 to August 30, 2019, making 19 rounds of the community and surrounding area. CARB concluded that areas in the vicinity of the school and near the port showed higher levels of PM₁₀ (and other coarser PM), which was observed to be consistent with road dust from unpaved roads. Initial analysis of the combined monitoring efforts appeared to show that the highest concentrations of measured pollutants were lower than both the Federal and State air quality standards.

The results of CalEPAs environmental justice initiative are located at the following link: <https://calrecycle.maps.arcgis.com/apps/Cascade/index.html?appid=99f5790b860844668bdef48f45dcfa00>

CARB ENFORCEMENT STRATEGIES

The goal of our enforcement programs is to achieve comprehensive compliance in every regulation CARB adopts. CARB acknowledges that the high compliance rates identified in the enforcement history may not necessarily reflect compliance across the community. In cases where enhanced enforcement activities uncover non-compliance issues, CARB's goal will be to achieve the same or higher compliance rates as observed in CARB inspections throughout the AB 617 Community. In addition, CARB's

goal is to work closely with CSC, SJVACPD, local organizations and other agencies within Stockton (e.g. City government) to address gaps in the enforcement of mobile sources. In the past, CARB focused mobile enforcement on high traffic areas, truck stops, distribution centers and areas where complaints were reported.

To achieve these goals, CARB is committed to enhancing enforcement activities within Stockton by utilizing the following tools:

- An assessment of the enforcement history data
- Emissions inventory
- Air monitoring data
- Groundtruthing observations to assist in targeting areas that may require additional enforcement with guidance from CSC

CARB will utilize current regulations and enforcement programs across all sources CARB regulates to target areas of non-compliance within the Stockton community. Listed below are CARB's enforcement strategies to help improve air quality in the Stockton community:

1. Increase the frequency of compliance inspections with guidance from CSC

CARB will collaborate with the Stockton CSC and the District to actively enhance enforcement activities throughout the community boundary. This will be done through a combination of improved complaint reporting, identifying multiple locations for focused inspections, inventory analysis, and community input. CARB will schedule report-back meetings to update CSC on both the status of inspections and to obtain additional areas of mobile source concerns. CARB will work with CSC to meet annually in order to prioritize enforcement strategies and identify possible locations where non-compliant vehicles, TRUs, and off-road equipment are present. CARB will report to the community the number of inspections performed, mapped locations of the enforcement, and the number of citations and NOVs issued.

As of September 2020, through CSC monthly meetings, the committee and citizens have heard there is a need to focus enforcement efforts in the following areas:

- a. Knife River area
- b. Charter Way and Fresno Avenue
- c. South El Dorado
- d. Boggs Tract
- e. Idling HDDVs near schools and residential areas

The fact that there were only two inspections of TRUs from 2017 to 2019, and both were determined to be non-compliant, warrants an increase of TRU inspections in Stockton. In 2021, with the help of CSC and SJVAPCD, CARB will increase TRU enforcement.

If members of CSC have additional guidance on where CARB staff can enhance enforcement efforts, please reach out to the Community Outreach and Enforcement Section at COES@arb.ca.gov.

2. Provide in-person community specific training

CARB will develop and offer training opportunities to the Stockton AB 617 Community. Information will cover topics like the fundamentals of enforcement, how the enforcement process works, instructions on filing a thorough complaint and what to expect from the enforcement process after filing a complaint. Through this program, community members will be able to better support CARB or SJVAPCD enforcement processes. In light of social distance mandates due to COVID-19, CARB may develop online trainings.

3. Achieve compliance with the Truck and Bus Regulation via SB 1

As mentioned earlier, SB 1 includes a provision that, beginning in 2020, a vehicle must demonstrate compliance with the Truck and Bus Regulation before it can be registered with the DMV. Beginning in 2020, the DMV, in conjunction with data provided by CARB, will deny vehicle registration to non-compliant HDDVs based on the model year of the vehicle. Under this legislation, compliance with the Truck and Bus Regulation will be fully implemented by 2023.

4. Coordinate with other agencies

CARB will seek opportunities to coordinate with other agencies with enforcement authority in Stockton such as the City of Stockton, school districts and other CalEPA agencies. For example, CARB staff may work with the City of Stockton to provide truck *No Idling* signage in areas where community members observe trucks idling. In addition, CARB may provide assistance in other areas such as land-use and urban planning, if needed.

5. Enhance CARB's data management practices

CARB is committed to enhancing the quality of enforcement data for the Stockton community. Moving forward, CARB will maintain the location of enforcement activity and received complaints to provide CSC with the most accurate data available. CARB has recently completed a visualization tool that makes CARB enforcement data more transparent and available. This tool can be accessed online by visiting <https://webmaps.arb.ca.gov/edvs/>.

6. Provide annual report of enforcement activities

CARB's Enforcement Division will provide an annual report to CSC to summarize CARB's enforcement activities within the community and update strategies as require

7. Update enforcement strategies as applicable

CARB staff are committed to updating enforcement strategies as requested by the CSC, if said strategies fall within CARB's jurisdiction and if CARB can reasonably accommodate the request (e.g., additional enforcement training for idling vehicles).

As CARB adopts new regulations, CARB will enforce these measures and integrate associated activities and data into the Stockton enforcement measures.

APPENDIX

ENFORCEMENT PROGRAMS DESCRIPTION

Heavy-Duty Vehicle Inspection Program (HDVIP). The HDVIP requires inspection of heavy-duty trucks and buses for excessive smoke and tampering, and engine certification label compliance. Any heavy-duty vehicle traveling in California, including vehicles registered in other states and foreign countries may be tested. CARB inspection teams perform tests at border crossings, CHP weigh stations, fleet facilities, and randomly selected roadside locations. Owners of trucks and buses found in violation are subject to minimum penalties starting at \$300 per violation and up to \$1,000 a day.

Off-Road Construction Equipment (Off-road Regulation). Construction equipment is a major contributor to air pollution, especially when large construction projects are adjacent to neighborhoods. To address this source of air pollution, CARB adopted the nation's first regulation aimed at cleaning up off-road construction equipment such as bulldozers, graders and backhoes. The Off-Road Regulation requires off-road fleets to meet fleet average emission standards and be equipped with best available control technology.

The Tractor-Trailer GHG Regulation (Smart Way). This regulation requires 53-foot or longer dry van or refrigerated van trailers and the tractors that pull them on California highways to use certain equipment that the U.S. EPA Smart Way program has verified or designated to meet their efficiency standards and reduce fuel consumption.

Solid Waste Collection Vehicles (SWCVs). The SWCV Regulation required vehicle owners to upgrade SWCVs by December 31, 2010. On January 24, 2019, the Board approved amendments that now require reporting for SWCVs with 2006 model year and older engines to avoid unnecessary registration delays at the California DMV starting in 2020 due to SB 1 requirements. The approved amendments also added heavy diesel-fueled on-road single engine cranes to the regulation and became effective on July 1, 2019. These specialized cranes are required to phase-in 2010 or newer model year engines from 2019 to 2027.

Transport Refrigeration Unit (TRU). TRUs are refrigeration systems powered by diesel internal combustion engines designed to refrigerate or heat perishable products that are transported in various containers, including semi-trailers, truck vans, shipping containers, and rail cars. Because diesel particulate matter (diesel PM) is an identified toxic air contaminant, CARB adopted an airborne toxic control measure (ATCM) for TRUs and TRU generator sets. CARB staff inspect TRUs to ensure that the units are meeting labeling and in-use performance standards identified in the TRU Regulation.

Drayage. The Drayage Truck Regulation is part of CARB's ongoing efforts to reduce particulate matter (PM) and oxides of nitrogen (NOx) emissions from diesel-fueled engines and improve air quality associated with goods movement. Heavy-duty vehicles that carry goods to or from a port or intermodal facility are required to be equipped with a 2007 or newer model year engine. This requirement becomes stricter in 2023, when drayage trucks are required to be equipped with a 2010 or newer model year engine, because drayage trucks will be required to meet the standards of the Statewide Truck and Bus Regulation.

Statewide Truck and Bus (STB). The STB Regulation requires diesel trucks with a gross vehicle weight rating (GVWR) greater than 14,000 pounds that operate in California to install diesel particulate filters, or replace older engines with cleaner engine technology, on a schedule based on the model year of the engine and GVWR. The following timeline outlines the engine requirements HDDV must meet to be in compliance with the regulation.

Idling. Idling and opacity inspections are performed to ensure an HDDV is compliant with emission standards and is not violating CARB's Idling Regulation. Idling for more than five minutes is prohibited unless the HDDV is certified clean idle and the vehicle is more than 100 feet away from a school or restricted area (exceptions apply). Vehicle owners and drivers in violation are subject to minimum penalties starting at \$300 per violation and up to \$1000 per day.

FUELS INSPECTIONS

California's reformulated gasoline requirements are designed to reduce emissions from evaporation and the burning of gasoline, and Low Carbon Fuel Standard requirements are designed to reduce GHG emissions by reducing the carbon content of fossil fuels. To enforce these programs, CARB staff conduct inspections and review reporting information. When CARB identifies a violation, staff pursue compliance through corrective action and through the issuance and settlement of NOVs.

VEHICLES AND ENGINES

The New Vehicle/Engine Programs evaluate the emission control systems of new vehicles, engines, and evaporative emission control systems produced for California. When all emissions related requirements are met, CARB issues an Executive Order certifying the vehicle/engine/evaporative emission control system as compliant with California's emissions requirements. Vehicles and engines are not legal for sale in California until certified.

MARINE ENFORCEMENT PROGRAMS DESCRIPTION

Ocean Going Vessel (OGV) Fuels Regulation. The OGV Regulation is intended to reduce PM, diesel PM, NOx, and sulfur oxide emissions from ocean-going vessels. Such vessels are required to switch to a low sulfur distillate fuel within 24 nautical miles of the California coast.

Cargo Handling Equipment (CHE). The Mobile CHE Regulation was adopted in 2005 to reduce toxic and criteria emissions such as diesel PM and NOx to protect public health. As part of CARB's continuing efforts to reduce emissions of air pollution in California, CARB staff conduct compliance inspections of CHE used at ports and intermodal rail yards. CHE transfers goods, performs maintenance and repair activities, and includes equipment such as yard trucks, rubber-tired gantry cranes, top handlers, side handlers, forklifts, and loaders. CARB staff also conduct smoke audits on CHE at regulated facilities to insure equipment is maintained to manufacturer specifications.

Commercial Harbor Craft (CHC). There are several types of harbor craft in California, including crew and supply boats, fishing vessels, ferries, excursion vessels, tug boats, barges, dredges, and other vessel types. The CHC Regulation was adopted in 2007 to reduce emissions of diesel PM, NOx, and Reactive Organic Gases from diesel engines used on CHC operated in Regulated California Waters (within 24 nautical miles of the California coast).

CONSUMER PRODUCTS PROGRAMS DESCRIPTION

Composite Wood Products. CARB's ATCM to control formaldehyde emissions from composite wood specifically focuses on three products: hardwood plywood, particleboard, and medium density fiberboard. Investigators in the Composite Wood Products program purchase samples of regulated products from outlets all over California. They inspect products and packaging for compliance with labeling requirements and send selected products to the laboratory for testing.

Consumer Products. Consumer products are chemically formulated products used by household and institutional consumers. Some examples are detergents and cleaning compounds; polishes and floor finishes; cosmetics and personal care products; home, lawn, and garden products; disinfectants and sanitizers; and aerosol paints and automotive specialty products. Consumer products do not include other paint products, furniture coatings, or architectural coatings. Investigators in the Consumer Products program purchase samples of regulated consumer products from outlets all over California. They inspect product containers for compliance with registration and dating requirements and send selected products to the laboratory for testing.

5.5 LEVERAGING COMMUNITY INVOLVEMENT IN ENFORCING RULES TO REDUCE AIR POLLUTION

Members of the community play an important role in protecting public health by reporting air quality issues that they observe to both the District and CARB. The District and CARB value input from the public who reside and work in the community. The complaint process aids both agencies in identifying issues within the communities and ensuring timely resolution. Filing a complaint is easy. The following is the contact information for the District and CARB.

An effective complaint should contain as much information and as many details as possible as this helps the inspector in responding to the issue and conducting the investigation. The following information is helpful when filing a complaint:

- Time, date, and location of possible violation; including name of facility if known.
- Type of air quality concern. Describe what you see, smell, and feel.
 - See: smoke, fire, dust falling ash, etc.
 - Smell: rotten eggs, gasoline, oil, sweet, sour, smoke, etc.
 - Feel: burning eyes, throat/nose irritation, breathing problem, headache, etc.
- Is the issue still occurring? If not, when did it occur? Is it recurring? If so when?

- Time of day
- Day of week
- Your name and contact information – anonymous complaints can be filed but contact information often helpful in fine tuning the investigation.

To better leverage community involvement, the District and CARB will also assign a dedicated team to work with the Community Steering Committee to follow-up on community concerns, and to conduct community-level compliance assistance, outreach, and education related to compliance and enforcement of local and state rules and regulations. As part of this partnership, the District and CARB will track and report back to the Community Steering Committee on the ongoing enforcement activities within the community to monitor progress in meeting community enforcement measures and to look for innovative strategies to enforcement practices with the goal of increased compliance with air pollution rules and regulations within the community.

5.6 ENFORCEMENT STRATEGIES

5.6.1 DISTRICT ENFORCEMENT STRATEGIES

The District has used the assessment of the three (3) year compliance history in the Stockton AB 617 Community and comments shared by the Community Steering Committee to develop the list of enforcement strategies below which aim to reduce the potential for localized air quality impacts within the Stockton AB 617 Community. During implementation, District staff will provide regular updates on enforcement measures and will solicit guidance and feedback to continue to look for opportunities to evaluate and improve enforcement activities.

1. Enhanced enforcement of District Rule 4901 (*Wood Burning Fireplace and Wood Burning Heaters*) mandatory wood burning curtailments:

This measure is still being considered by the Stockton Steering Committee and may be included in a later draft.

2. Enhanced enforcement of District Rule 4103 (*Open Burning*) to reduce the illegal open burning of residential waste:

To limit the potential for localized PM_{2.5} and toxic impacts associated with the illegal open burning of residential waste, District will conduct targeted surveillance efforts within the Stockton AB 617 Community. Building on the District's existing surveillance and complaint response efforts, the District will conduct additional targeted surveillance efforts in Stockton AB 617 Community at least once per quarter for the next 5 years. The District will work with the Community Steering Committee to focus surveillance efforts in areas where illegal residential open burning has historically occurred.

3. Enhanced inspection frequency of permitted sources:

To limit the potential for localized air quality impacts associated with the failure to comply with emissions standards established by District permit, rule, or regulation, the District will increase the frequency of inspection at each facility that has had an

emission violation over the past three (3) years. These facilities will be inspected at least twice per calendar year for the next five (5) years or until the facility has 4 consecutive inspections without an emission violation, whichever occurs first.

4. Enhanced enforcement of fugitive dust requirements

To limit the potential for localized air quality impacts associated with fugitive dust from construction/earthmoving activities and open areas subject to District Regulation VIII, the District will conduct targeted surveillance efforts within the Stockton AB 617 Community. Building on the District's existing surveillance and complaint response efforts, the District will conduct at least one targeted enforcement effort within the Stockton AB 617 Community during both the 2nd and 3rd quarter for the next five (5) years.

5. Pilot training program for conducting self-inspections at gas stations:

This measure is still being considered by the Stockton Steering Committee and may be included in a later draft.

6. Enhanced enforcement of the state's heavy-duty vehicle anti-idling regulation:

To limit the potential for localized PM_{2.5} and toxic air quality impacts associated with failure to comply with the state's heavy-duty vehicle anti-idling regulation, the District will partner with CARB to conduct additional targeted anti-idling enforcement efforts in Stockton AB 617 Community at least once per quarter for the next 5 years. The District and CARB will work with the Community Steering Committee to identify heavy-duty vehicle idling "hot spots," especially those near schools, to aid in focusing the enforcement efforts.

7. Report back to the Community Steering Committee on Enforcement Activities:

The District will track and provide an annual report to the Community Steering Committee to summarize the District enforcement efforts within the community and to monitor progress in implementing community enforcement measures and meeting enforcement goals.

8. Coordinate with other agencies

The District will seek opportunities to coordinate with other agencies within the Stockton AB 617 Community to address multimedia compliance issues as they arise.

9. Update enforcement strategies as appropriate

The District committed to evaluating the results of ongoing compliance activities within the Stockton AB 617 Community and moving forward will work with the Community Steering Committee to update measures as appropriate.

5.6.2 CARB ENFORCEMENT STRATEGIES

CARB acknowledges that the high compliance rates identified in the enforcement history may not necessarily reflect compliance across the community. In cases where enhanced enforcement activities uncover non-compliance issues, CARB's goal will be

to achieve the same or higher compliance rates as observed in the three-year history. CARB staff will also work closely with the community steering committee, the Air District, and other agencies to address gaps in the enforcement of mobile sources and seek opportunities to close these gaps.

To support achieving these goals, CARB is committed to enhancing enforcement activities within Stockton AB 617 Community by utilizing the following tools:

- An assessment of the enforcement history data
- Targeting areas that may require additional enforcement with guidance from the community steering committee

CARB will utilize current regulations and enforcement programs across all sources CARB regulates to target areas of non-compliance within the Stockton AB 617 Community.

Listed below are CARB's enforcement strategies to help improve air quality in the Stockton AB 617 Community:

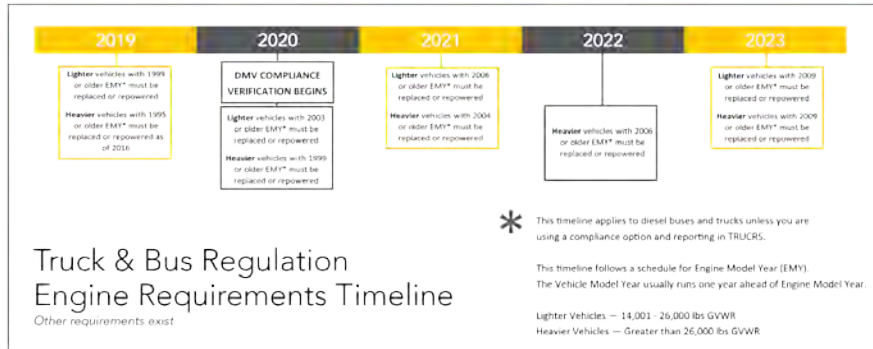

1. Increase the frequency of compliance inspections with guidance from the community steering committee:

CARB will collaborate with the Stockton AB 617 Community steering committee to actively enhance enforcement activities. This will be done through a combination of improved complaint reporting, more focused inspections, and report-back meetings to update the community steering committee on both the status of inspections and to obtain additional areas of mobile source concern. CARB will work with the steering committee to meet annually in order to prioritize enforcement strategies and identify possible locations where non-compliant vehicles are present. CARB will additionally report to the community the number of inspections performed, mapped locations of the enforcement, and the number of citations and/or Notices of Violations issued.

2. Achieve Compliance with the Truck and Bus Regulation via Senate Bill 1:

In April 2017, the Governor signed Senate Bill 1 (SB 1) into law which included a provision that, beginning in 2020, a vehicle must demonstrate compliance with the STB regulation before it can be registered with the Department of Motor Vehicles (DMV). Beginning in 2020, the DMV, in conjunction with data provided by CARB, will deny vehicle registration to non-compliant HDVs based on the model year of the HDV.

Figure 5-10 Truck and Bus Regulation Engine Requirements Timeline

3. Provide Annual Report of Enforcement Activities

CARB’s enforcement division will provide an annual report to the CSC to update and summarize CARB’s enforcement activities within the community.

4. Coordinate with other agencies

CARB will seek opportunities to coordinate with other agencies with enforcement authority in Stockton AB 617 Community.

5. Enhance CARB’s Data Management Practices

CARB is committed to enhancing the quality of enforcement data for the Stockton AB 617 Community. Moving forward, CARB will maintain the location of enforcement activity and received complaints to provide the community steering committee with the most accurate data available. CARB has recently completed a visualization tool that makes CARB enforcement data more transparent and available. The tool can be accessed online by visiting <https://webmaps.arb.ca.gov/edvs/>.

6. Provide in-person community specific training

CARB will develop and implement a new program that will be offered to the Stockton AB 617 Community. Information will cover topics like the fundamentals of enforcement, how the enforcement process works, instructions on filing a thorough complaint, and what to expect from the enforcement process after filing a complaint. Through this program, community members will be able to better support CARB or air district enforcement processes. CARB may also develop online trainings in the future.

7. Update enforcement strategies as applicable

CARB staff are committed to updating enforcement strategies as requested by the community steering committee, if said strategies are enforceable by CARB

staff or if CARB can reasonably accommodate the request (e.g., additional enforcement training for idling vehicles).

6. METRICS TO TRACK PROGRESS

6.1 METRICS FOR FIVE-YEAR MILESTONE EVALUATION

Strategies implemented as a part of this CERP are designed to improve air quality in the community of Stockton. The five-year milestone evaluation is intended, per CARB guidance, to illustrate community scale emissions reductions and air quality trends that may not be evident on an annual reporting basis. To this end, the five year milestone report submitted to CARB for Stockton will include a comprehensive report explaining how air quality data obtained as part of the CAMP and the resulting analyses provided to CSC members helped inform ongoing implementation of CERP strategies and, to the extent possible, how these strategies resulted in lowering emissions in the community of air quality monitoring data obtained in the community throughout the term of the CERP, Additionally, the report will include as well as a complete accounting of all projects, emissions reductions, and associated co-benefits implemented as a result of AB 617 program implementation in the community of Stockton.

Table 6-1 Emission Reduction Targets for Incentives Measures

Measure #	Community Suggested Measures	Unit Type	# of Units	Allocation Amount	Cost per Unit (Averaged)	Direct Reductions Estimated Lifetime (Tons)
Community

7. CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA) PROJECT REVIEW

According to Section 15061 (b)(3) of the California Environmental Quality Act (CEQA) Guidelines, a project is exempt from CEQA if, “the activity is covered by the common sense exemption that CEQA applies only to projects which have the potential for causing a significant effect on the environment. Where it can be seen with certainty that there is no possibility that the activity in question may have a significant effect on the environment, the activity is not subject to CEQA.” Since the Project will result in an air quality benefit to the community, the Project is not expected to result in a significant impact under CEQA. As such, the common sense exemption applies.

In addition, this Project is an action taken by a regulatory agency, the San Joaquin Valley Air District, as authorized by state law for the protection and betterment of air quality in the San Joaquin Valley. CEQA Guidelines §15308 provides a categorical exemption for “actions taken by regulatory agencies, as authorized by state or local ordinance, to assure the maintenance, restoration, enhancement, or protection of the environment where the regulatory process involves procedures for protection of the environment. Construction activities and relaxation of standards allowing environmental degradation are not included in this exemption.” No construction activities or relaxation of standards are included in this project. As such, for this additional reason, the District finds that the Project is exempt from CEQA.

Pursuant to Section 15062 of the CEQA Guidelines, the District will file a Notice of Exemption upon Governing Board approval of the Project.

GLOSSARY

AB 617 – Assembly Bill (AB) 617 (C. Garcia, Chapter 136, Statutes of 2017) directs the state and local air districts to identify communities in California that are exposed to high levels of air pollution and established the Community Air Protection Program. Air districts with input from residents and stakeholders are to develop community focused action plans and community air monitoring plans to address localized air pollution and reduce exposure to particulate matter and toxic air contaminants.

Area Sources – Sources of air pollutants that individually emit relatively small quantities of air pollutants, but that may emit considerable quantities of emissions when combined over a large area. Examples include water heaters, lawn maintenance equipment, and consumer products.

Best Available Control Technology (BACT) – These are the most stringent requirements for new or modified sources. An emissions limitation based on using the most up-to-date methods, systems, techniques, and production processes available to achieve the greatest level of emission reductions.

Best Available Retrofit Control Technology (BARCT) – An emissions limitation based on the maximum degree of reduction achievable for existing sources considering environmental, energy, and economic impacts.

Black Carbon – Black carbon is the sooty black material emitted from gasoline and diesel engines, and other sources that burn fossil fuel. It comprises a significant portion of particulate matter. Inhalation of black carbon is associated with health problems including respiratory and cardiovascular disease, cancer, and birth defects.

California Air Resources Board (CARB) – The State of California agency responsible for air pollution control. Responsibilities include: establishing State ambient air quality standards, setting allowable emission levels for mobile sources of emissions and consumer products.

California Environmental Quality Act (CEQA) – Legislation requiring state and local agencies to disclose the significant environmental impacts of a project through the preparation of an Initial Study, Negative Declaration or Environmental Impact Report, including actions to mitigate any significant environmental project impacts.

Cancer Risk – The likelihood that a person will develop cancer during their lifetime.

Carbon Monoxide (CO) - a colorless, odorless gas emitted from combustion processes like mobile sources.

Cargo Handling Equipment (CHE) – Equipment used to move containers within a marine terminal. Cargo-handling equipment includes rubber-tired gantry (RTG) cranes, yard tractors, side-picks, and top picks. The large ship-to-shore cranes that move

containers from the vessel to the container yard and vice-versa are not included in the definition of CHE.

Concentrations – Pollution in the air is typically expressed as a *concentration*. A concentration is the amount that could be extracted from a given volume of air (like a cubic meter). For example, the amount of particulate matter concentrations in terms of “micrograms per cubic meter ($\mu\text{g}/\text{m}^3$).” This is a measure of the amount of particulate matter collected if you were to draw a cubic meter of air through a clean filter, and then weigh the filter on a scale that can measure millionths of a gram. Today we would expect, on average, to be able to collect about 10 μg of PM_{2.5} from a cubic meter of ambient air.

Control Device – Devices designed to capture, remove and/or reduce pollutants that would otherwise be emitted into the air. Examples are baghouses, scrubbers, dust collectors, direct flame afterburners, vapor recovery units, and water sprayers.

Criteria Air Pollutants – As required by the Clean Air Act, the U.S. Environmental Protection Agency (EPA) identifies and set standards to protect human health and welfare for six pollutants: ozone, carbon monoxide, particulate matter, sulfur dioxide, lead, and nitrogen oxide. The term “criteria pollutants” derives from the requirement that the U.S. EPA must describe the characteristics and potential health and welfare effects of these pollutants. U.S. EPA periodically reviews new scientific data and may propose revisions to the standards as a result.

Diesel Engine – An internal combustion engine in which ignition of the fuel, which is injected into the combustion chamber, is caused by the elevated temperature of the air in the cylinder due to mechanical compression.

Diesel Particulate Matter (DPM) – The particles found in the exhaust of diesel-fueled compression ignition engines. Diesel PM may combine and adsorb other species to form structures of complex physical and chemical properties.

Drayage Trucks – A truck used to haul containers to and from the container terminals. It consists of the tractor unit and a semitrailer consisting of the container on a chassis (wheeled base).

Emissions – A gas or liquid stream containing one or more air contaminants discharging or emitted into the atmosphere.

Enforcement Action – When non-compliance with District rules and regulations and local, state, and federal requirements which the District has authority over.

Environmental Protection Agency (EPA) – The federal agency in charge of creating and enforcing regulations to protect human health and the environment.

Fine Particulate Matter (PM_{2.5}) – Particulate matter (PM) is a mixture of solid particles and liquid droplets suspended in the air. Of these particles, those less than 2.5 micrometers in diameter, called fine PM or PM_{2.5}, pose the greatest risk to health. See particulate matter.

Gasoline Dispensing Facilities (GDF) – Retail service station or private facility that stores and/or dispenses gasoline into fuel tanks.

Greenhouse Gases (GHG) – Any gas that absorbs infrared radiation in the atmosphere. Greenhouse gases include water vapor, carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), halogenated fluorocarbons (HCFCs), ozone (O₃), perfluorocarbons (PFCs), sulfur hexafluoride (SF₆) and hydrofluorocarbons (HFCs).

Health Risk Assessment (HRA) – A detailed comprehensive analysis to evaluate and predict the dispersion of hazardous substances in the environment and the potential for exposure of human populations, and to assess and quantify both the individual and population wide health risks associated with those levels of exposure.

High Efficiency Particulate Air Filters (HEPA filters) – A high efficiency particulate air filter capable of filtering 0.3 micron particles with 99.97 percent efficiency.

Idling - keep the engine of a vehicle running while parked.

Indirect Sources – Land uses and facilities that attract or generate motor vehicle trips and thus result in air pollutant emissions; for example, shopping centers, office buildings, warehouses, and airports.

Minimum efficiency reporting value (MERV) – Developed by the American Society of Heating, Refrigerating and Air Conditioning Engineers, MERV rates the effectiveness of air filters. The higher the number, the finer the filtration.

Mixed Land Use – A range of land uses including residential, commercial, and industrial to be collocated in an integrated way that supports sustainable forms of transportation.

Mobile Sources Of Air Pollution – Any motor vehicle that produces air pollution, e.g., cars, trucks, motorcycles (on-road mobile sources) or airplanes, trains and construction equipment (off-road mobile sources).

National Ambient Air Quality Standards (NAAQS) – The Clean Air Act requires U.S. EPA to set National Ambient Air Quality Standards (NAAQS) at a levels determined to be protective of public health within an adequate margin of safety for six pollutants referred to as criteria pollutants. Standards are set based on scientific research and policy assessments reviewed by the Clean Air Scientific Advisory Committee.

New Source Review (NSR) – A pre-construction permitting review requirement that ensures that when a new source of air pollution is built, or when an existing source is modified, the source will implement effective emission control technology and will comply with related regulatory requirements pertaining to air emissions.

Nitrogen Oxides (NOx) - or “oxides of nitrogen” is a group of gases that are composed of nitrogen and oxygen. Two of the most common nitrogen oxides are nitric oxide (NO) and nitrogen dioxide (NO₂).

Off-Road Vehicles – An off-road vehicle is any type of vehicle which can drive on and off paved or gravel surfaces. They are generally characterized by having large tires, open treads, a flexible suspension or caterpillar tracks. Other vehicles that do not travel public streets or highways are called off-highway vehicles and include tractors, forklifts, cranes, backhoes, bulldozers and golf carts.

On-Road Vehicles – A vehicle designed to legally carry people or cargo on public roads and highways such as buses, cars, trucks, vans, motor homes, and motorcycles.

Ozone (O₃) - ground level or “bad” ozone which is not emitted directly into the air, it is created by chemical reactions between oxides of nitrogen (NO_x) and volatile organic compounds (VOC) in the presence of sunlight.

Particulate Matter (PM) – PM includes a wide range of particles that vary in terms of their size and mass, physical state (solid or liquid), chemical composition, toxicity, and how they behave and transform in the atmosphere. PM is commonly characterized based on particle size. Ultrafine PM includes the very smallest particles less than 0.1 micron in diameter (one micron equals one-millionth of a meter). Fine PM, commonly referred to as -PM_{2.5}, consists of particles 2.5 microns or less in diameter (includes ultrafine PM). Coarse PM refers to particles between 2.5 microns and 10 microns in diameter. The term “coarse” particles may be misleading; it should be emphasized that even “coarse” particles are still very tiny, many times smaller than the diameter of a human hair. PM₁₀ consists of particles 10 microns or less in diameter (includes ultrafine, fine and coarse PM).

Parts per Billion (ppb) – A weight-to-weight ratio used to describe concentrations. Parts per billion (ppb) is the number of units of mass of a contaminant in the air per 1000 million units of total mass.

Parts per Million (ppm) – A weight-to-weight ratio used to describe concentrations. Parts per million (ppm) is the number of units of mass of a contaminant in the air per million units of total mass.

Partial Zero Emission Vehicle (PZEV) – PZEV is an automobile that has zero *evaporative* emissions from its fuel system and meets Super Ultra Low Emissions Vehicle (SULEV) tailpipe-emission standards. Evaporative emissions are the gasoline fumes that escape during refueling or from the fuel tank and supply lines. See also ZEV.

Sensitive Receptors – Members of the population that are particularly sensitive to the effects of air pollutants, such as children, the elderly, and people with illnesses.

Stationary Sources of Air Pollution (Stationary Sources) – A fixed, non-mobile producer of air pollution, usually found at industrial or commercial facilities.

Toxic Air Contaminants (TACs) – TACs are air pollutants, identified by CARB, which may cause or contribute to an increase in deaths or in serious illness, or which may pose a present or potential health hazard. Health effects may occur at extremely low levels of TACs.

Transport Refrigeration Unit (TRU) – Refrigeration systems powered by integral internal combustion engines designed to control the environment of temperature sensitive products that are transported in trucks and refrigerated trailers. TRUs may be capable of both cooling and heating.

Vehicle Miles Traveled (VMT) – One vehicle (whether a car carrying one passenger or a bus carrying 30 people) traveling one mile constitutes a vehicle mile.

Volatile Organic Compounds (VOCs) - are a large group of carbon-based chemicals that easily become vapors or gases. They include both human-made and naturally occurring chemical compounds.

Zero-Emission Vehicle (ZEV) – Vehicles which produce no emissions from the on-board source of power (for example, a fully electric vehicle).

Community Emissions Reduction Program

Stockton

February 3, 2021 Draft

San Joaquin Valley
AIR POLLUTION CONTROL DISTRICT

EXECUTIVE SUMMARY

The air quality challenges that the communities in the San Joaquin Valley face are unmatched by any other region in the nation. The San Joaquin Valley, due to its unique geography, topography, and meteorology, continues to face daunting challenges in meeting the latest federal health-based air quality standards. Since 1992, the San Joaquin Valley Air Pollution Control District (District) has implemented nearly 650 rules and regulations to control air pollution in the Valley Air Basin. Numerous plans to improve Valley air quality and attain state and federal air quality standards have detailed a wide-range of strategies, including regulatory measures, extensive incentive investment to promote clean-air technologies in Valley communities, and other first-of-their kind measures, such as the District's Indirect Source Review regulation which reduces emissions from new construction and development projects, and the nationally recognized Tune-in-Tune Up vehicle repair program. The District also has dedicated field staff that are in communities throughout the Valley conducting inspections and responding and investigating complaints to ensure that Valley businesses and residents are complying with federal, state, and local rules and regulations.

As a result of the District's stringent and comprehensive air quality management strategy, along with significant investments made by Valley businesses and residents, since the District's formation in 1992, PM_{2.5} and ozone levels are now at historically low levels, and the Valley continues to be in attainment of the PM₁₀ federal air quality standard. Emissions from stationary sources have been reduced by 85%, cancer risk from exposure to air pollutants has been reduced by 95%, population exposure to elevated PM_{2.5} levels have been reduced by 85%, and population exposure to elevated ozone levels have been reduced by 90%.

Despite these regional air quality improvements, significant concern has been expressed by the California legislature about potential localized impacts of air pollution in disadvantaged communities throughout the state. In answer to that concern, Assembly Bill (AB) 617, signed into law in July 2017, initiated a state-wide effort to monitor and reduce air pollution, and improve public health, in communities that experience disproportionate burdens from exposure to air pollutants through new community-focused and community-driven actions. The community of Stockton AB 617 Community was prioritized by the Air District and subsequently selected by the California Air Resources Board (CARB) as one of the third-year communities selected in the state to receive clean air resources newly available under AB 617, based on a technical analysis of several pollution and poverty-related criteria.

AB 617 provides mechanisms and resources to implement community-specific air quality monitoring networks; to develop, implement, and track emission reduction programs; to improve availability of data and other technical information; and to invest substantial funding in the community through voluntary incentive funding measures. Importantly, these measures are guided by advice and knowledge of local community

members, through their input and involvement on Steering Committees for each AB 617-selected community.

This Community Emission Reduction Program (CERP) provides a description of the community of Stockton AB 617 Community, including geographical boundaries and describes air quality challenges impacting community residents. A technical analysis describes the sources of pollution impacting the community, as well as the location of sensitive receptors within the community. Sources of pollution that are of particular concern to community members are highlighted, and strategies for reducing air pollution impacts and health risk reduction from these sources were evaluated as part of the public engagement process between the Community Steering Committee (CSC), the District, and the California Air Resources Board. Working closely together as a unified partnership, the CSC developed numerous strategies that were ultimately selected for implementation in the community, including incentive funding measures, public engagement strategies, enforcement strategies, and regulatory strategies. Many of the strategies will require close collaboration with state and local organizations and community based organizations to fully implement them. Also included in this CERP is an implementation schedule and necessary metrics for tracking emission reductions within the community. The metrics for tracking progress will be included in regular updates to the CSC during ongoing meetings, annual reporting, and at the five-year milestone.

This draft CERP anticipates investing over \$36 million in emission reduction incentives, and a variety of other clean air projects in the Stockton AB 617 Community area. Additional measures have been developed to reduce exposure to air pollution for sensitive receptors, including schools and residences. These efforts are projected to achieve up to approximately 67 tons of PM_{2.5} reductions and 970 tons of NO_x reductions as well as significant reductions in air toxics emissions in the community, particularly with respect to diesel particulate matter from mobile sources, the main contributor to community air toxics health risk. Additional regulatory and outreach strategies will provide for further reductions in emissions and exposure, while increasing awareness of the community's air quality challenges and the resources available to help the public and businesses reduce emissions and avoid exposure to air pollution.

Air pollution emission reduction and exposure reduction measures implemented under AB 617 programs will further advance ongoing state and District efforts to reduce regional and community exposure to air pollutants. In the preparation of this CERP, the District has worked closely with the CSC, CARB, and the public. The CSC included, residents, community-based organizations, community members, environmental organizations, regulated industry representatives, other local agencies, and other key stakeholders and worked to develop strategies and an implementation plan to reduce harmful air pollutants in the community of Stockton AB 617 Community. The plan developed through this collaborative process employs proven and innovative strategies, and significant resources, to improve community health by reducing exposure to air pollutants in Stockton AB 617 Community. This CERP and the many air quality improvement strategies it includes would not be possible without the tremendous

commitment and effort shown by Stockton Community Steering Committee members. This engaged group of individuals includes area residents; representatives from community and faith based organizations; owners and employees from businesses operating within the community; the City of Stockton, San Joaquin County, Port of Stockton employees; representatives from schools within the community and others. Additionally, the California Air Resources Board staff, members of state and local agencies including the San Joaquin Council of Government, California Department of Transportation, Housing Authority of the County of San Joaquin have also provided information and guidance to assist the CSC members in the development of the air quality improvement strategies in this CERP. Lastly, the Institute for Local Government should be commended for the excellent meeting facilitation services they provided to guide this process.

1. INTRODUCTION

1.1 IMPLEMENTATION OF AB 617 IN STOCKTON AB 617 COMMUNITY

The implementation of Assembly Bill (AB) 617 (C. Garcia, Chapter 136, Statutes of 2017) has brought additional clean air resources and strategies to Valley environmental justice communities that have been and are currently disproportionately burdened by socioeconomic disadvantages and air pollution, despite significant emissions reductions that have already been achieved regionally. AB 617 provides mechanisms and resources to adopt expedited schedules for the implementation of advanced control technologies for existing stationary source facilities; increased stringency of reporting requirements for stationary sources; develop and implement community-specific air quality monitoring networks; implement, and track localized emission reduction programs; improve availability of data and other technical information; and invest substantial funding in the community through voluntary incentive funding measures. Resources available through this legislation allowed the San Joaquin Valley Air Pollution Control District (District), working in partnership with the Stockton AB 617 CSC, through a comprehensive public outreach and community engagement process, to expand regional programs for community protection and develop a robust plan for reducing local exposure to various forms of air pollution including fine particulate matter and toxic air contaminants in the Stockton AB 617 Community.

Several requirements of AB 617 will serve to reduce air pollution in disadvantaged communities throughout the San Joaquin Valley. AB 617 legislation required districts that are in nonattainment for one or more air pollutants to adopt expedited rule review schedules, by January 2019, for the implementation of Best Available Retrofit Control Technology (BARCT). The District Governing Board adopted this schedule at a public hearing held in December 2018, which set the path forward for the District to research and potentially amend applicable rules. The expedited BARCT implementation schedule is discussed in more detail later in this document. Additionally, AB 617 requires "Stationary Sources" to report their criteria pollutant emissions inventory as well as their air toxics emissions inventory to the State on an annual basis. These emissions inventories will be presented via the Criteria Pollutant and Toxics Emissions Reporting regulation, once fully implemented by California Air Resources Board (CARB). Under AB 617, a Stationary Source is defined as a facility meeting any one of the following:

- Required to submit Greenhouse Gas emissions under the CH&SC § 38530 (Mandatory GHG Emissions Reporting),
- A facility that is authorized by a permit issued by a district to emit 250 or more tons per year of any nonattainment pollutant or its precursors, or
- A facility that receives an elevated prioritization score based on cancer or noncancer health impacts pursuant to Section CH&SC § 44360 (Air Toxics Hot Spots, Chapter 4: Risk Assessment).

The District has worked closely with CARB, regulated entities, and other stakeholders to implement this new reporting requirement in the Valley. Further

information on the implementation of the AB 617 stationary source criteria pollutant emissions inventory reporting requirement is available at: <https://ww2.arb.ca.gov/our-work/programs/criteria-and-toxics-reporting>.

The District's community identification and prioritization analysis for the second year of AB 617 implementation was based on extensive air quality analysis, numerous health indicators from the state's CalEnviroScreen model (version 3.0), and various other socioeconomic indicators. In developing San Joaquin Valley community recommendations for additional clean air resources and public engagement under AB 617, the District conducted a public engagement process to seek input from Valley residents, businesses, agencies, and other stakeholders through public workshops and meetings throughout the Valley.

Based on this extensive public engagement effort, significant interest and support for the Stockton community, and the District's comprehensive identification and prioritization analysis: the Stockton Community was recommended by the District Governing Board as a second-year AB 617 community. Sources that affect Stockton AB 617 Community include mobile sources and freeways, port operations, and industry. The Stockton AB 617 Community has a high cumulative air pollution exposure burden, a significant number of sensitive receptors, and includes census tracts designated as disadvantaged communities. After further technical review and public engagement, the Stockton AB 617 Community was ultimately selected by the CARB Governing Board for the development of a community air monitoring plan and an emissions reduction program designed to reduce pollution impacts in the selected community.

In accordance with the community-driven nature of AB 617 directives, in September of 2019 the District Governing Board directed staff to immediately convene a CSC committee under a set of guiding principles. The CSC is comprised of residents, businesses, community based organizations, environmental justice advocates, and public agencies, working together to craft and develop a community air monitoring plan and a Community Emissions Reduction Program (CERP). To ensure successful implementation of AB 617, residents, businesses, non-profits organizations, state and local agencies, and other stakeholders from all sectors within the selected community were involved in the development of CERP. Towards that end, the District has worked extensively with the CSC to develop innovative strategies that, once implemented, will improve air quality in the Stockton AB 617 community. The District community recommendation for CARB under the second-year implementation can be found here: https://www.valleyair.org/Board_meetings/GB/agenda_minutes/Agenda/2019/September/final/10.pdf

The Stockton AB 617 Community air monitoring map was developed with the advice of the community Steering Committee. The community-specific air monitoring network will provide an expanded monitoring capacity designed to provide scalable, portable, and rapidly deployable air monitoring equipment to the community. This includes a combination of air monitoring platforms equipped with highly specialized analyzers capable of monitoring a full range of criteria and toxic pollutants. Various monitoring

platforms include larger air monitoring trailers, mobile air monitoring vans, and compact air monitoring sensors. Monitoring data from these sensors will be made available to members of the public in real-time on the Stockton AB 617 webpage. The full community air monitoring plan, with further details on selected monitoring equipment and monitoring locations, is available at:

<http://community.valleyair.org/selected-communities/stockton/community-air-monitoring/>

As a culmination of the community-driven actions and engagement called for under AB 617, the Stockton Community Steering Committee has developed a Community Emissions Reduction Program (CERP), in partnership with CARB, residents, affected sources, and local government bodies in the affected community. Steering Committee input and other comments received from the public in the community have provided instrumental information, critical to implementing community-specific measures and addressing community concerns. Strong collaboration between community members, the District, CARB, and other local agencies has resulted in the development of an ambitious plan for reducing localized pollution and associated health impacts in Stockton AB 617 Community.

This CERP provides a description of the Stockton AB 617 Community, including geographical boundaries and socioeconomic factors impacting community residents. A technical analysis describes the sources of pollution impacting the community, as well as the location of sensitive receptors within the community. Sources of pollution that are of particular concern to community members are highlighted, and possible strategies for reducing pollution impacts from these sources are evaluated. The strategies that were ultimately selected for implementation in the community are outlined, including incentive funding measures, public engagement strategies, enforcement strategies, regulatory strategies, and strategies that will be completed in partnership with other agencies and local organizations. Finally, an implementation schedule and metrics for tracking emission reductions in annual reporting and at the five-year milestone are discussed in detail.

1.2 HEALTH BASED AIR QUALITY OBJECTIVES

CERPs implemented under AB 617 are designed to reduce emissions of pollutants that have been shown to have adverse impacts on public health, including fine particulate matter and toxic air contaminants. As specified in CARB's Community Air Protection Program Blueprint, Appendix C: Criteria for Community Emission Reduction Programs (https://ww2.arb.ca.gov/sites/default/files/2018-10/final_community_air_protection_blueprint_october_2018_appendix_c.pdf), this plan will focus on reducing individual criteria air pollutant and toxic air contaminant emissions to address the impacts of community exposure to multiple pollutants. While each community faces distinct health-based challenges, CARB guidance states that broad health-based air quality objectives provide a consistent foundation for determining the appropriate levels of emissions reductions for CERPs statewide.

The U.S. Environmental Protection Agency and the State of California have established ambient air quality standards, which set health-protective levels for the following criteria

pollutants: ozone, particulate matter with a diameter of 10 microns or smaller (PM₁₀), particulate matter with a diameter of 2.5 microns or smaller (PM_{2.5}), carbon monoxide, nitrogen dioxide, sulfur dioxide, and lead. California also has standards for sulfates, vinyl chloride, and hydrogen sulfide. Due to the region's topography and meteorology, the Valley is classified as Serious nonattainment for the federal PM_{2.5} standards, and Extreme nonattainment for federal ozone standards.

Particulate Matter: Particulate matter is a mixture of solid particles and liquid droplets in the air. PM can be emitted directly into the atmosphere (primary PM), or can form as secondary particulates in the atmosphere through the photochemical reactions of precursors (when precursors are energized by sunlight). Thus, PM is made up of a number of components, including acids (such as nitrates and sulfates), organic chemicals, metals, and soil or dust particles. PM₁₀ is particulate matter that is 10 microns or less in diameter, and the PM_{2.5} subset includes smaller particles that are 2.5 microns or less in diameter.

Any particles 10 microns or less are considered respirable, meaning they can be inhaled into the body through the mouth or nose. PM₁₀ can generally pass through the nose and throat and enter the lungs. PM_{2.5}, which is the portion of PM₁₀ that is less than 2.5 microns in size, when inhaled can move deep into the gas exchange tissues of the lungs, where it can be absorbed into the bloodstream and carried to other parts of the body. The potential health impacts of particle pollution are linked to the size of the particles, with the smaller particles having larger impacts. Numerous studies link PM_{2.5} to a variety of health problems, including aggravated asthma, increased respiratory symptoms (irritation of the airways, coughing, difficulty breathing), decreased lung function in children, development of chronic bronchitis, irregular heartbeat, non-fatal heart attacks, increased respiratory and cardiovascular hospitalizations, lung cancer, and premature death. Children, older adults, and individuals with heart or lung diseases are the most likely to be affected by PM_{2.5}.

Many studies have quantified and documented the health benefits of attaining the U.S. Environmental Protection Agency (EPA) air quality standards for PM. The Valley Air Basin is in attainment of the federal standards for PM₁₀, but is currently classified as Serious nonattainment for the federal PM_{2.5} standards. The District, in partnership with CARB, developed the *2018 Plan for the 1997, 2006, and 2012 PM_{2.5} Standards*, which was approved by EPA on June 30, 2020 and details strategies to move the region towards attainment of the federal PM_{2.5} standards. More information is available at: <http://valleyair.org/pmplans>. This plan is also discussed in further detail in Chapter 3.

Ozone: Ozone is a regional air pollutant that is formed through complex chemical reactions in the atmosphere. In contrast, PM_{2.5} concentrations are the result of both local and regional emissions, and reducing localized emissions of PM_{2.5} can reduce disparities in exposure experienced in communities with high cumulative exposure burdens. CARB Office of Community Air Protection guidance states that, because ozone formation is driven by regional rather than localized source contributions, ozone should be addressed in regional air quality improvement efforts through the State

Implementation Plan. Therefore, ozone and related precursors have not been addressed as a part of this CERP development. The District's current plan for attainment of health-based ozone standards throughout the San Joaquin Valley Air Basin can be found here: http://valleyair.org/Air_Quality_Plans/Ozone_Plans.htm

Toxic air contaminants: Toxic air contaminants (TACs) also contribute to a community's cumulative exposure burden. Exposure to TACs can increase the risk of acute and chronic health impacts as well as cancer. Diesel particulate matter is a large concern in areas with high exposure to diesel engine emissions, such as the community of Stockton AB 617 Community. Other toxic air contaminants can contribute to localized health risks, including metals; air toxics related to fossil fuel production, such as benzene and toluene; and compounds associated with combustion, including polycyclic aromatic hydrocarbons and dioxins. The California Office of Environmental Health Hazard Assessment (OEHHA) establishes threshold concentrations for toxic air contaminants at which exposure is not expected to trigger non-cancer health effects. For carcinogens, OEHHA guidance states that there are no safe exposure thresholds. Reducing emissions in the community will be based on identifying technologies and practices that offer the maximum level of toxic air contaminant emissions reductions achievable to address both types of health effects

With the support of community members, this CERP will build upon regional efforts to improve air quality throughout the Valley Air Basin. The Stockton AB 617 Community CERP focuses on reducing emissions of and exposure to PM_{2.5} and toxic air contaminants from localized sources that contribute to cumulative exposure burdens within the community. Pollution reduction strategies, targets, goals, and metrics included in this CERP have been developed in accordance with these health-based air quality objectives and are presented in more detail in Section 4 of this document.

2. COMMUNITY PARTNERSHIPS AND PUBLIC ENGAGEMENT

Meaningful community engagement, significant outreach and a robust public process have guided the development of this Community Emissions Reduction Plan (CERP). Key features of these efforts undertaken by the Community Steering Committee and the District include:

- Community advocates hosted an in-person tour with community residents for District hosted kick-off meeting and conducting initial public outreach; establishing a Community Steering Committee
- District staff and CARB staff to be introduced to the community (Figure 2-1)
- Due to the COVID-19 pandemic, District staff worked with community residents and organizations to develop a virtual community tour for District, CARB staff, and others to be introduced to the community and the air quality challenges they face (<https://youtu.be/UuQuoSy26x4>)
- Used a co-host model to set agendas and meeting logistics
- Held monthly facilitated, bilingual (English and American Sign Language) in-person (prior to March 2020) and virtual meetings (due to COVID-19)
- Live-streamed and recorded all CSC meetings:
- (<http://community.valleyair.org/selected-communities/stockton/steering-committee-meetings/>)
- Surveyed needs and resources of the CSC members and then transitioned to virtual meetings and community engagement due to COVID-19,
- Provided materials via email, mail and a AB 617 community webpage; Developed a Resident member stipend program and implemented it retroactively to the first official CSC meeting to encourage participation in regular meetings
- Produced and posted on the District's Stockton Community webpage a virtual tour of the community, which highlighted the voices of community residents and CSC members as they discussed the challenges facing community residents
- Used interactive online survey tool such as Survey Monkey and Social Pinpoint to encourage active participation and to develop visual aids to share information to the CSC; and
- Shared presentations by the District, CSC members, CARB staff, Port of Stockton, and the City of Stockton

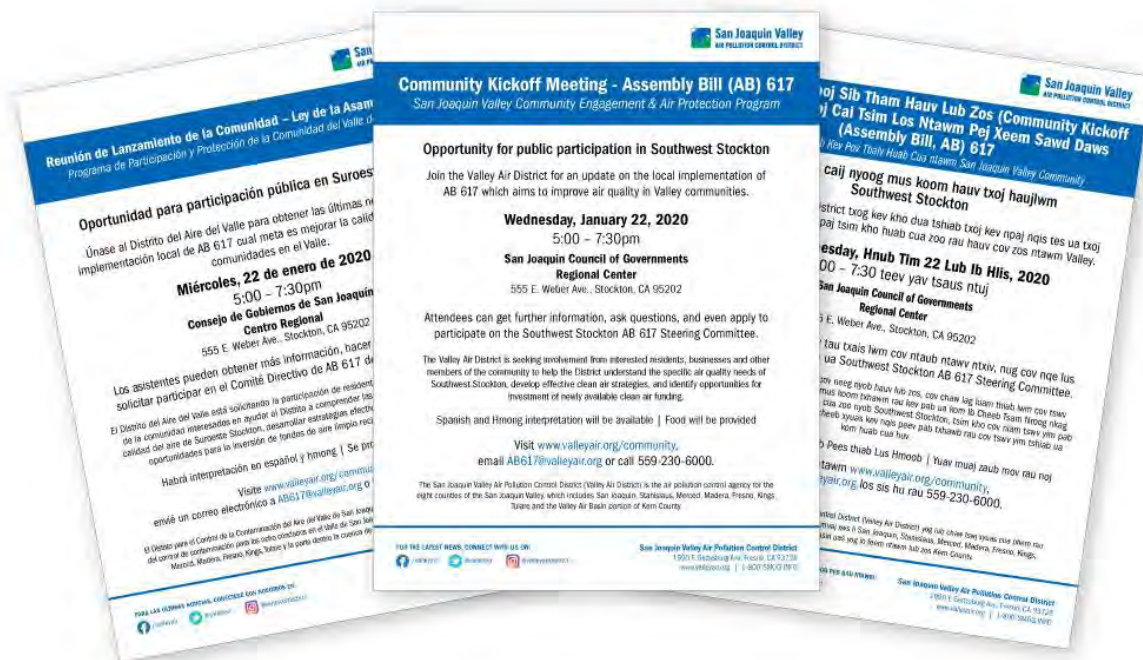

Figure 2-1 Introductory Tour Hosted by Community Advocates and Residents

In addition, numerous interactions between Community Steering Committee members and District staff occurred in one-on-one or small group meetings allowing for in-depth discussions on joint development of the CERP. See the community webpage (<http://community.valleyair.org/selected-communities/stockton/>) for more details.

2.1 COMMUNITY KICK-OFF MEETING

Between October 2019 and January 2020, District staff worked in collaboration with local Environmental Justice organizations to conduct multilingual outreach targeted at the Stockton AB 617 Community zip codes to encourage attendance at the official kick-off meeting in January 2020. The District provided \$5,000 for a program to provide mini-grants to local Environmental Justice organizations to support on-the-ground outreach designed to inform the community of AB 617 and encourage residents to apply to be members of the CSC. In addition, the District distributed trilingual flyers (Figure 2-2) to local media, schools, agencies, and non-profit organizations; and invested over \$8,000 in social media and print advertisements targeted at the Stockton AB 617 Community zip codes to encourage kick-off meeting participation.

Figure 2-2 Trilingual Community Flyers Distributed

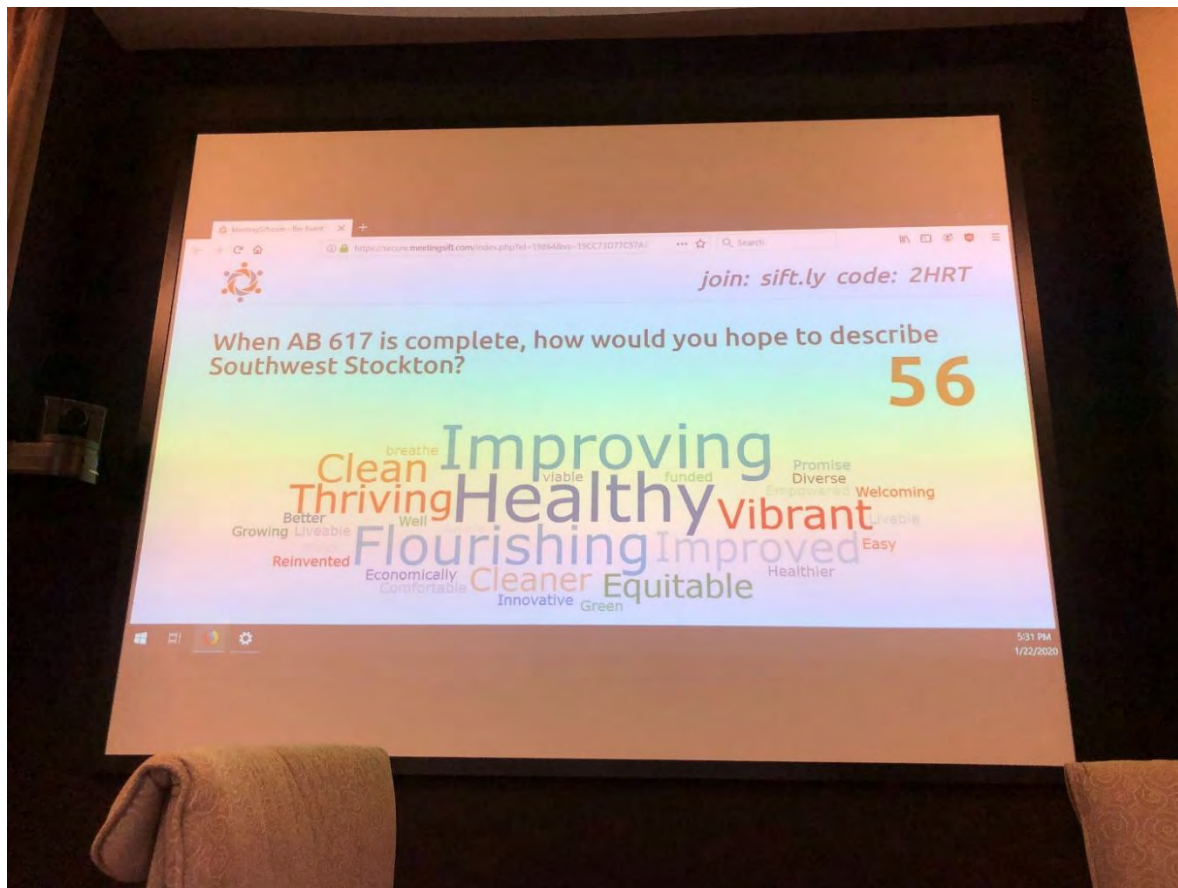

The Community Kick-Off Meeting in the Stockton AB 617 Community was held on Wednesday, January 22, 2020, at the San Joaquin Council of Governments Regional Center (Figure 2-3).

Figure 2-3 Stockton AB 617 Community Kick-off Meeting

Approximately 100 people attended the meeting. In addition to information about AB 617, attendees were invited to participate in an interactive cell-phone based activity to express the community's hopes for the AB 617 program (Figure 2-4).

Figure 2-4 Stockton AB 617 Community Kick-off Meeting Interactive Activity

Attendees were also invited to visit booths, which provided information about monitoring technology, school outreach and District incentive programs. Spanish and Hmong interpretation was provided for the meeting. Community members were encouraged to apply to be on the Stockton AB 617 Community Steering Committee at the Kick-off meeting, and additional time was given for individuals to apply via email or mail.

2.2 COMMUNITY STEERING COMMITTEE

COMMUNITY STEERING COMMITTEE MAKE-UP

Of the 44 individuals who applied to be on the CSC, the final committee consists of 26 community residents; 13 individuals representing environmental justice organizations working in the community, health care organization, educational entity, or a business within the community; and five non-voting government officials. In addition to the regular CSC members, several have alternates should they be unable to attend. A full roster of membership is available at <http://community.valleyair.org/selected-communities/stockton/steering-committee-documents/> and in Table 2-1.

Table 2-1 Stockton AB 617 Community Steering Committee Members

Stockton Community Steering Committee (as of Feb. 17, 2021)				
Primary First Name	Last Name	Alternate	Affiliation	Sector

Prior to the COVID-19 pandemic, the CSC was able to meet in person once and since transitioning to virtual meetings, the CSC has met monthly beginning in April 2020. To ensure successful CERP development, residents, businesses, non-profits, organizations, and other stakeholders within the Stockton community have been fully engaged in CSC meetings. To ensure full engagement by all CSC members, the District assessed language translation needs and determined that there was a need to provide American Sign Language translation at each of the meetings. Commitment demonstrated by the District and CSC members to ensure full and active participation in meetings including:

- Monthly agenda-setting meetings with District, community co-hosts, interested CSC members, CARB staff, and third-party facilitators to collectively set expectations and plan for upcoming CSC meetings
- Real-time interpretation services in all necessary languages
- Expert presentations from partner agencies such as CARB, Port of Stockton, City of Stockton, District staff, and CSC members
- Comprehensive and dedicated Stockton community webpage with tools to view community boundary, committee charter, virtual tour, meeting agendas, sources of community concern, emissions inventories, and other resources
- Neutral meeting facilitation to ensure meetings are inclusive and neutral by bringing out different points of view and preventing individuals from monopolizing discussions
- Through March 2020:
 - Monthly evening meeting at a convenient location in the community
 - Child activity areas and dinner for all attendees
 - All meeting materials in hardcopy and via the comprehensive Stockton community website
- Since April 2020:
 - Monthly evening meetings via Zoom, with technical assistance provided to residents and stakeholders upon request
 - Continued real-time interpretation services through ASL interpreter at each meeting
 - Meeting materials posted ahead of meeting
 - Extra meetings to discuss topics or concerns Community Steering Committee members have
 - Provided laptops and internet service to resident CSC members without these tools to ensure all CSC members have equal opportunities to fully participate

In addition, the District has taken steps over the past several months to better serve CSC members and encourage their active engagement in the meetings and CERP development process. Ensuring effective steering committees requires substantial investment in the form of committee member time, District staff and other resources to schedule, organize, and facilitate frequent after-hours public meetings.

Figure 2-5 Facilitation at a Stockton AB 617 Community Steering Committee meeting

Visit <http://community.valleyair.org/selected-communities/stockton/steering-committee-meetings/> for full documentation of meeting dates, agendas, materials and summaries.

RESPONSE TO COVID-19 STATE OF EMERGENCY

On March 19, 2020, responding to the growing threat of COVID-19 in the state, California Governor Newsom issued Executive Order N-33-20 directing all individuals living in the State of California to stay home except as needed to maintain continuity of operations of the federal critical infrastructure. The result of this order was that the Stockton Community Steering Committee could no longer continue to meet in person.

To address this challenge and to continue moving forward with the important work of developing the Stockton CERP, District staff developed and sent an online survey to all the Stockton Community Steering Committee members to assess the members' ability and willingness to meet virtually. District staff followed up with phone calls to those members that could not complete the survey or who had indicated technological limitations or concerns on the survey to fully understand CSC members' ability to participate in virtual meetings. In addition, District staff, CARB, our Environmental Justice Partners serving on

the committee, and our AB 617 facilitator had multiple conference calls to discuss the challenges related to COVID-19, the results of the surveys and potential solutions based on the Stockton Community Steering Committee member feedback. All the Stockton Community Steering Committee members indicated a strong desire to continue implementing AB 617 and subsequently adopted the use of the online meeting application, Zoom, to meet virtually.

Figure 2-6 Stockton Community Steering Committee Meeting via Zoom

In April 2020, based on these discussions and the results of the surveys, we held a virtual practice meeting via Zoom and via phone with the Stockton Community Steering Committee. During the practice call, the District addressed issues such as ASL interpretation needs and explained how the Stockton Community Steering Committee would use the various available features to provide a high level of discussion and engagement. In addition, the District invested in the online mapping tool Social Pinpoint to facilitate community input in a virtual setting.

COMMUNITY PARTICIPATION AND NEW RESIDENT STIPEND PROGRAM

The Stockton Community Steering Committee meet regularly, requiring ongoing participation and a significant time commitment from community residents, business owners, and other stakeholders. In most cases, steering committee meetings occur in the

evenings and may draw attendees away from their families and other obligations. Community-resident steering committee members are not paid and do not have expenses reimbursed to participate in the process or attend these meetings. Providing stipends to help cover some time and expenses associated with attending meetings is an important way to support this critical participation and encourage sustained and meaningful community engagement throughout these processes. Toward that end, and in response to several residents and community advocates on the Stockton Community Steering Committee, CARB developed new statewide guidance encouraging districts to work with steering committees in developing stipend programs for resident members of steering committees.

On August 20, 2020, the District Governing Board responded to the community needs and approved District staff’s recommendation to provide stipends to eligible resident steering committee members, effective retroactively for participation beginning on January 1, 2020. Under the stipend program developed by District staff in consultation with CSC stakeholders across all San Joaquin Valley AB 617 communities, residents who participate as community steering committee members, who do not receive compensation for their attendance at such meetings, may request a stipend to offset the cost of participating in each regular Community Steering Committee meeting. Eligible residents may receive a \$75 stipend per Community Steering Committee meeting when their attendance is verified on the meeting roll-call list or sign-in sheet and were present for at least 75% of the scheduled meeting (equivalent to missing up to 30 minutes of a scheduled 2 hour meeting). Residents will receive stipends for attending up to fifteen (15) Community Steering Committee meetings in a calendar year, for a total cost of up to \$1,125 per year. The stipends for resident steering committee members are subject to the availability of state AB 617 funding and approved allocation in the District’s Budget on an annual basis.

See Appendix A for full documentation of meeting dates, agendas, materials, attendance and summaries.

2.3 COMMUNITY STEERING COMMITTEE CHARTER

A Charter was developed in consultation with the Stockton AB 617 Community Steering Committee members and a draft was presented to the members at Meeting #1, in March 2020. The Charter and a potential expansion to the community boundary to include the areas of Stockton identified by community members was discussed and approved at the March meeting. The final Charter can be found in Appendix B, and at http://community.valleyair.org/media/1631/03102020_stockton-charter_final_en.pdf.

The final Boundary can be found at

http://community.valleyair.org/media/1615/03042020_southwest-stockton-boundary.pdf.

2.4 STOCKTON COMMUNITY WEBPAGE

A community webpage has been created for the Stockton AB 617 Community, and is regularly updated with new information (<http://community.valleyair.org/selected-communities/stockton/>). The webpage includes information about upcoming meetings, meeting materials (flyers, agendas, presentations, handouts, audio and video links, chat transcripts, meeting summaries), interactive maps, CSC roster, committee charter, membership processes, Community Air Monitoring Plan (CAMP), and CERP documents. A screenshot of the community webpage is shown in Figure 2-8.

Selected Community Profile

Stockton is the largest metropolitan area in the Northern Region of the District, with a current estimated population over 310,000. A number of heavily trafficked freeways pass through the City of Stockton, including interstate 5 and highways 99 and 4, contributing a significant amount of PM2.5 emissions in the community. Specifically, Southwest Stockton (Figure 1) is a densely populated community within the City of Stockton directly impacted by large freeways, the Port of Stockton, freight locomotives, industrial sources, and emissions traveling downwind from the northern portion of the city.

The proposed community of Stockton defined in Figure 1 is approximately 12.2 square miles and has an estimated population of 51,000. The Southwest Stockton community is impacted across a number of health and pollution indicators. Using the State CES tool, all census tracts located within the Southwest Stockton proposed community rank in the top 5% most disadvantaged communities in California, and rank highest in the Valley amongst census tracts not already a part of an AB 617 community. Southwest Stockton also contains the highest ranked census tract in the District's Northern Region (San Joaquin, Stanislaus, and Merced Counties) for overall CES score, which represents a number of health and socioeconomic factors (asthma, cardiovascular disease, low birth weight, educational attainment, housing burdened low-income households, linguistic isolation, poverty, and unemployment).

This community also ranked highest in PM2.5 impacts, and second highest in diesel PM exposure, compared to all other disadvantaged communities in the northern District counties. Specifically, the average overall CES score, PM2.5 exposure, and pollution burden values are all above the 90th percentile. Additionally, most of the community is within the "Rise Stockton" Transformative Climate Community boundary, which allows the District and community to leverage resources to maximize benefits under AB 617.

For assistance or if you have any questions, please contact our central office: [\(559\) 230-6000](tel:5592306000)

In addition to being a portal for access to meeting materials and documents, the webpage also includes interactive maps that present data about the community (<https://sjvapcd.maps.arcgis.com/apps/webappviewer3d/index.html?id=6a8b2a34b0c14748aaee1c69c71c940c>). Figure 2-9 is an example of an interactive map that was created for the Stockton AB 617 Community. These interactive maps provide data on land use, locations of facilities, schools, hospitals, and the air quality concerns identified by the Stockton AB 617 Community Steering Committee and members of the public. This information was provided to help inform and to develop air quality priorities for the CERP.

Figure 2-9 Interactive Map Created for Stockton AB 617 Community Steering Committee

2.5 COMMUNITY PARTNERS

After the Stockton AB 617 CSC identified priorities for the community, partner agencies, and organizations were invited to the meetings to provide updates, input, and presentations on current and future efforts to the work goals of AB 617. CARB staff attended meetings regularly and provided information and updates to the committee. The City of Stockton also attended regularly and provided an update on planning efforts in the community and the TCC program. The City of Stockton agreed to coordinate the TCC program efforts and AB 617 program to leverage the goals of each to best benefit the residents of the Stockton community. Presentations from various CSC members were also an important part of the CERP development process as they provided key insight to the concerns and challenges facing residents of the community. The efforts of the Sierra Club, Little Manila Rising, the Port of Stockton, and others were all presented to the CSC to help provide background information to the participants, highlighting the strengths and challenges of the community.

2.6 ADDITIONAL COMMUNITY ENGAGEMENT

Since late 2020, the CSC and District staff have worked to engage and educate the public with regard to AB 617 and the efforts being made in the Stockton AB 617 Community. Meetings between community members, environmental justice organizations, industry, agency representatives, and other stakeholders have occurred to provide assistance and/or prompt responses to concerns raised regarding the AB 617 process. District staff and CSC members also attended and often made presentations at city and county government meetings, the District's Environmental Justice Advisory Group meetings, the District's Citizens Advisory Committee meetings, the District's Governing Board meetings, environmental justice meetings, and industry professional group meetings to promote participation in the development of the CERP and once completed the implementation of the CERP. In addition, staff often discussed AB 617 at media interviews and during outreach events and health fairs. A full list of outreach efforts is available in Appendix A.

The Stockton AB 617 CSC will continue to work to implement the CERP actions after its adoption by the District Governing Board and the CARB Board, and to provide periodic community updates on implementation progress. Community engagement is essential to the success of the CERP as well as the AB 617 program as a whole, and all parties are committed to build and improve upon existing outreach efforts in the coming months and years.

3. UNDERSTANDING THE COMMUNITY

3.1 COMMUNITY PROFILE

Stockton is the largest metropolitan area in the Northern Region of the District, with a current estimated population over 310,000. A number of heavily trafficked freeways pass through the City of Stockton, including interstate 5 and highways 99 and 4, contributing a significant amount of PM2.5 emissions in the community. Specifically, southwest Stockton is a densely populated community within the City of Stockton directly impacted by large freeways, the Port of Stockton, freight locomotives, industrial sources, and emissions traveling downwind from the northern portion of the city.

Figure 3-1 Stockton AB 617 Community

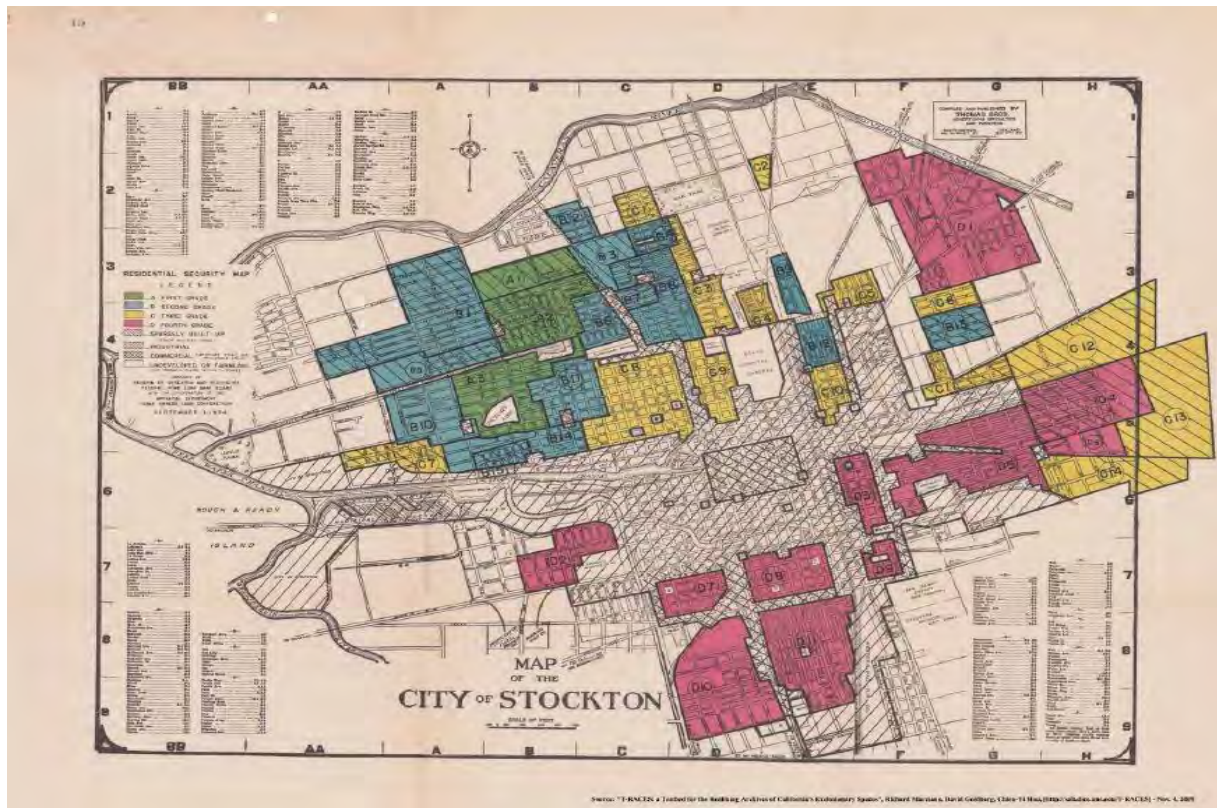

Stockton History

Prior to the 1870s, San Joaquin County lacked access to water for agriculture. The promise of local agriculture resulted in capital investments being made to increase the levels of agriculture in San Joaquin County between 1870-1910. Lack of technological innovation forced agricultural interests to recruit labor globally. People of color, such as Chinese, African-Americans from the South, Japanese, Punjabis, Filipinos, and Mexicans, were forced into labor by employment segregation. Beginning in the late 19th

Century, racially restrictive housing covenants were written into housing deeds to restrict people of color into living in certain zones of the city. These covenants were written into property deeds by developers looking to inflate the values of their homes. Examples of this practice in Stockton was the exclusion of African-American, Indian, Mexican, and Filipino communities south of Main Street and west of Wilson Way. Beginning in the 1930s, the Federal Housing Administration created maps to guide mortgage investment. Intentionally, these maps directed investments away from communities of color, which were deemed risky for investment. This practice is known as “redlining” because the neighborhoods were designated as the color red. Figure 3-2 shows the 1938 Residential Security Map for the City of Stockton.

Figure 3-2 Home Owners’ Loan Corporation Residential Security Map (1938)

Although the racial practice was banned in 1968’s Fair Housing Act, the years preceding contributed to both the built environment and unequal distribution of wealth in the United States today. In the 1930-1940, Stockton experienced huge growth in local industry. Built in 1931 and opened in 1933, the Port of Stockton became the City’s first major industrial center for logistics purposes. Between 1933 and 1940, it grew faster than any port in the U.S. History, doubling tonnage every fiscal quarter. The Port’s success led to business interests in Stockton being perfectly centered for logistical industries, or industries focused on the transportation of products. With the anticipation of future growth in residents and commerce, the City of Stockton actively lobbied for the construction of freeways in Stockton. Between 1955 and the 1970s, I-5, Highway 99, and Highway 4 crosstown freeway were constructed intentionally near low-income

“redlined” communities to reduce the costs of eminent domain. In the 1970s, the construction of the Highway 4 Crosstown freeway demolished a significant portion of the Filipino American

Stockton Air Quality Challenges

The Stockton AB 617 community boundary (Figure 3-1), as designed and approved by the CSC, is approximately 16 square miles and has an estimated population of 132,000. The AB 617 Stockton community is impacted across a number of health and pollution indicators. Using the State CalEnviroScreen (CES) tool, all census tracts located within the Stockton community rank in the top 5% most disadvantaged communities in California. Stockton also contains the highest ranked census tract in the District’s Northern Region (San Joaquin, Stanislaus, and Merced Counties) for overall CES score, which represents a number of health and socioeconomic factors (asthma, cardiovascular disease, low birth weight, educational attainment, housing burdened low-income households, linguistic isolation, poverty, and unemployment).

This community also ranked highest in PM_{2.5} impacts, and second highest in diesel PM exposure, compared to all other disadvantaged communities in the northern District counties. Specifically, the average overall CES score, PM_{2.5} exposure, and pollution burden values are all above the 90th percentile. Additionally, most of the community is within the “Rise Stockton” Transformative Climate Community boundary, which allows the District and community to leverage resources to maximize benefits under AB 617.

The majority of emissions impacting the Stockton AB 617 Community come from passenger vehicle and heavy-duty truck emissions from major freeways, interchanges, and main regional roads that run through the community.

Figure 3-3 Major Freeways Contribute Significant Mobile Source Emissions in the Community

In addition to the emissions originating from mobile sources in the area, this community also includes industrial development and area-wide sources of pollution such as gas stations, commercial cooking, and consumer products that also contribute significantly to the community's emissions levels.

Figure 3-4 Industrial Emissions Sources near Boggs Tract Community

Based on emissions inventory and current air monitoring data in this community, pollutants of concern include particulate matter less than 2.5 micrometers in diameter (PM_{2.5}), Black Carbon (BC), Oxides of Nitrogen (NO_x), Carbon Monoxide (CO), Ozone (O₃) and Volatile Organic Compounds (VOCs). A virtual tour of the Stockton AB 617 community, produced by the Community Steering Committee to highlight some the community's challenges can be viewed here:

<https://www.youtube.com/watch?v=UuQuoSy26x4&feature=youtu.be>.

Based on District air quality analysis modeling, the Stockton AB 617 Community was found to have exceeded the 24-hour average PM_{2.5} concentration prioritization factor levels of 12, 35, 55, and 65 µg/m³ a total of 120, 18, 4, and 3 days, annually, on average during the 2017-2019 period, respectively. In addition, this community was found to have exceeded the 8-hour average ozone concentration prioritization factor levels of 70, 75, and 84 ppb a total of 15, 7, and 1 days, annually, on average during the 2017-2019 period, respectively. Details about the nature and formation of local air pollution and its adverse health impacts on the community of Stockton AB 617 Community is summarized in Appendix G.

It should be noted that, in addition to selection by CARB for the development of community monitoring and a community emissions reduction program, neighborhoods in the AB 617 selected community were also selected by California's Strategic Growth Council for significant investment. In November 2017, the City of Stockton was awarded a \$170,000 Transformative Climate Communities (TCC) Planning Grant by the Strategic Growth Council to support planning activities in the Downtown and South Stockton region. To mobilize this grant Mayor Tubbs' Office, community partners, and the neighborhood residents created the organization Rise Stockton to carry out this work. The Rise Stockton organization worked for nearly a year to develop a The Sustainable Neighborhood Plan <https://drive.google.com/file/d/1E-HjKq5m9KHurEMch3tamySu2Xcnjt7L/view> to translate community concerns and recommendations into shovel-ready projects.

The policies and projects are centered on twelve Transformative Climate Community Goals, several of which mirror the goals of AB 617 (see Figure 3-5).

Figure 3-5 Stockton’s TCC Goals and Project Area Map

Stockton Rising: TCC Project Area Map

The community engagement and planning conducted during the TCC Planning Grant eventually led to the award of a \$10.8 million Implementation Grant in June 2020. Leading up to that award, Rise Stockton repositioned itself to broadly coordinate the Environmental Justice and Green Economy work conducted by Stockton community partners.

Due to the factors discussed above, this CERP includes strategies for emission reductions from mobile sources, commercial and industrial sources, and residential sources that contribute to the Stockton AB 617 Community air quality challenges. These strategies focus on measures that will bring additional economic resources to the residents and businesses located in the community, as well as achieving significant local emissions reductions.

3.2 TECHNICAL ASSESSMENT TO UNDERSTAND COMMUNITY POLLUTION IMPACTS

Conducting a technical assessment is a necessary step in community emissions reduction program development. The technical assessment relies on results from a variety of analyses to characterize emissions in the community and inform community emissions reduction program development and implementation. This assessment will provide the baseline from which emissions reductions can be measured.

The source attribution technical approach established by CARB provides a methodology for assessing, identifying, and estimating the relative contribution of sources or categories of sources, including but not limited to mobile, stationary, and area-wide sources, to elevated exposure to air pollution in impacted communities. The District's source attribution analysis is based on the following:

- Assesses the share of mobile, area-wide, and stationary source emissions generated in the community,
- Is based on best available data in order to characterize the contribution of emissions sources in the community,
- Follows one of CARB's recommended source attribution approaches.

Based on the above, the District has implemented CARB's Community Emissions Inventory Approach. The following section discusses the community emissions inventory approach and summarizes emission sources in the community. A detailed community-level inventory and source apportionment are included in Appendix C.

3.2.1 COMMUNITY EMISSIONS INVENTORY APPROACH

A community level emissions inventory estimates air pollutant emissions from mobile sources (e.g., cars, heavy-duty trucks, locomotives), area-wide sources (e.g., fireplaces, outdoor food cooking, fugitive dust), and stationary sources (e.g., gas stations, auto body shops, manufacturing facilities) within the community.

The community level inventory consists of the mobile and area-wide sources spatially allocated in the community and stationary sources. A community emissions inventory is the compilation of criteria pollutant and air toxics emissions data from air pollution sources that are within the community. The community emissions inventory includes emissions of volatile organic compounds / reactive organic gases (VOC/ROG), oxides of nitrogen (NOx), particulate matter of 2.5 microns (PM2.5), and toxic air contaminants

(e.g. diesel PM).

3.2.2 COMMUNITY EMISSIONS INVENTORY OVERVIEW

Emissions inventories are estimates of the amount and type of pollutants emitted into the atmosphere by mobile sources, stationary sources, and area-wide sources. Additionally, emission inventories are the foundation for any emission reduction program and provide information on the existing air emissions and related air quality in the community, and support development of emission reduction strategies and future emission targets to improve air quality in the community.

Existing traditional criteria pollutant and air toxics emission inventories (that provide combined coverage of mobile and stationary sources) are generally regional in geographic scale and may not adequately characterize emission impacts at the community-level. Developing community-scale emission inventories for understanding existing baseline emissions and tracking future emission reductions within communities selected for Community Emission Reduction Programs and community air monitoring plans is an important piece of AB 617.

3.2.3 AGENCY COLLABORATIONS

CARB and District staff worked in parallel to develop a comprehensive set of emissions inventory data for the community. The District worked with stationary source facilities in the community to develop the point source emission estimates. CARB staff developed the community-level emission inventory for mobile and area-wide sources. CARB worked with several State and local agencies such as the Department of Transportation (Caltrans), the Department of Motor Vehicles (DMV), the Port of Stockton, and the California Energy Commission (CEC) to assemble activity information necessary to develop the community-level mobile and area-wide source emission estimates. CARB and District staff conducted a thorough review of the community inventory to ensure that the emission estimates reflect the most recent data for stationary sources, and that estimates for mobile and area-wide sources are based on the most recent models and methodologies.

The emissions inventory also includes future forecasted values. The forecasted community-level emissions inventory is based on the growth profiles for stationary sources, mobile, and area-wide source categories provided by CARB. Forecasted emissions include growth and control factors that reflect historical trends, current conditions, and recent economic and demographic forecasts.

3.2.4 COMMUNITY EMISSION INVENTORY SUMMARIES

[What types of sources contribute to air pollution in Stockton?](#)

The largest sources of emissions in and around the community include heavy duty vehicles, medium duty vehicles, and passenger cars, as well as trains, and commercial equipment. Permitted stationary sources regulated by the District in the Stockton AB 617 Community include agricultural commodities storage and transfer operations, automotive body repair and paint shops, concrete and construction materials manufacturing, electric power generation, motor vehicle coating; bulk fuel storage and

transfer terminals, chemical receiving, fabricated metal products; gasoline dispensing operations, government services, municipal water treatment operations, health centers, metal parts coating operations, skilled nursing care facilities, and telecommunications facilities. Paved road dust, residential fuel combustion, construction emissions, and commercial cooking also contribute significantly to the community's emissions inventory.

Figure 3-6 Sources of PM2.5 Pollution in the Community

The largest sources of PM2.5 emissions in Stockton AB 617 Community are cooking and on-road mobile vehicles (light and medium-duty vehicles and heavy-duty diesel trucks). Road dust, stationary fuel sources, construction & demolition, and residential wood burning are also significant sources of PM2.5 in the community. Other sources include aircraft, trains, ocean going vessels, commercial harbor craft, recreational boats, off-road recreational equipment, off-road equipment, fuel storage and handling.

Figure 3-7 Sources of NOx Emissions in the Community

Almost three-quarters of NOx emissions in Stockton AB 617 Community are from mobile sources. On road mobile sources account for 49.7% of NOx emissions in Stockton AB 617 Community, including 17% of the NOx inventory from heavy duty diesel trucks and 19.8% from light and medium-duty vehicles. Off road mobile sources, including trains, aircraft, and off-road equipment such as yard trucks, produce 23.9% of the NOx emissions in the community. Fuel combustion at stationary sources is also a significant source of NOx emissions in the community. For more specific information, refer to Appendix C (Stockton Source Apportionment).

PM2.5 Speciation: What type of PM2.5 is in the ambient air?

PM2.5 in Stockton AB 617 Community is comprised of many species that contribute to the total PM2.5 concentration measured by air monitors, as summarized in Table 3-3 below. This complex mixture is attributable to mobile, stationary, and area-wide sources described above, as well as naturally occurring emissions. Although the list of species contributing to PM2.5 in Stockton AB 617 Community is lengthy, it can be grouped into larger representative categories. The following is a brief description of how each of these larger species categories are formed and emitted into the atmosphere. The following figures show the speciation of PM2.5 in the Stockton Community, based on modeling data.

Table 3-1 Summary of PM2.5 Species

PM2.5 Species	Description
Organic carbon (Combustion Carbon)	Directly emitted, primarily from combustion sources (e.g. residential wood combustion). Also, smaller amounts attached to geologic material and road dusts. May also be emitted directly by natural/biogenic sources.
Elemental carbon	Also called soot or black carbon; formed during incomplete combustion of fuels (e.g. diesel engines).
Geologic material (Dust)	Road dust and soil dust that are entrained in the air from activity, such as soil disturbance or airflow from traffic.
Trace metals	Identified as components from soil emissions or found in other particulates having been emitted in connection with combustion from engine wear, brake wear, and similar processes. Can also be emitted from fireworks.
Secondary organic aerosol	Secondary particulates formed from photochemical reactions of organic carbon.
Ammonium nitrate	Reaction of ammonia and nitric acid, where the nitric acid is formed from nitrogen oxide emissions, creating nitric acid in photochemical processes or nighttime reactions with ozone.
Ammonium sulfate	Reaction of ammonia and sulfuric acid, where the sulfuric acid is formed primarily from sulfur oxide emissions in photochemical processes, with smaller amounts forming from direct emissions of sulfur.
Combined water	A water molecule attached to one of the above molecules. Combined water is not included when measuring mass of PM2.5 for regulatory purposes, and is therefore excluded from the following charts.

Figure 3-8 Species Contribution to Annual Average PM2.5 Concentrations in the Community

Combustion carbon, ammonium nitrate, and ammonium sulfate all are significant species of PM2.5 emissions on an average day in the Stockton AB 617 Community.

Figure 3-9 Species Contribution to Peak Day PM2.5 Concentrations in the Community

As shown in the figure above, peak PM2.5 emission days in the community see a large increase in ammonium nitrate, which is created from the chemical reaction of NOx and ammonia, largely from fuel combustion during multiday stagnation events. However, ammonium nitrate is generally regarded as having relatively low toxicity compared to other PM2.5 species like elemental carbon.

How will the community inventory change in the future?

The tables and graphs below summarize the total Stockton AB 617 Community emissions inventories for years 2018, 2025, and 2030: These graphs show the proportion of PM2.5, NOx, and VOC emissions that originate from stationary, area, and mobile sources of emissions. The projected inventories take into account the projected emissions from regional transportation plan projects and compliance with regulatory deadlines. The following figures show how the Stockton AB 617 Community-level inventory is expected to change into the future in years 2025 and 2030.

Figure 3-10 2018 Stockton AB 617 Community Emissions Inventory

Table 3-2 2018 Stockton AB 617 Community Emissions Inventory (updated)

Source Categories	NOx (tpy)	VOC (tpy)	PM2.5 (tpy)
Stationary Sources	276.4	281.1	34.9
Area Source	40.2	247.6	75.1
Mobile Sources	884.1	332.1	40.2

Figure 3-11 2025 Projected Stockton AB 617 Community Emissions Inventory

Table 3-3 2025 Projected Stockton AB 617 Community Emissions Inventory

Source Categories	NOx (tpy)	VOC (tpy)	PM2.5 (tpy)
Stationary Sources	163.4	231.0	8.3
Area Source	36.9	273.7	87.9
Mobile Sources	643.7	244.6	33.3

Figure 3-12 2030 Projected Stockton AB 617 Community Emissions Inventory

Table 3-4 2030 Projected Stockton AB 617 Community Emissions Inventory

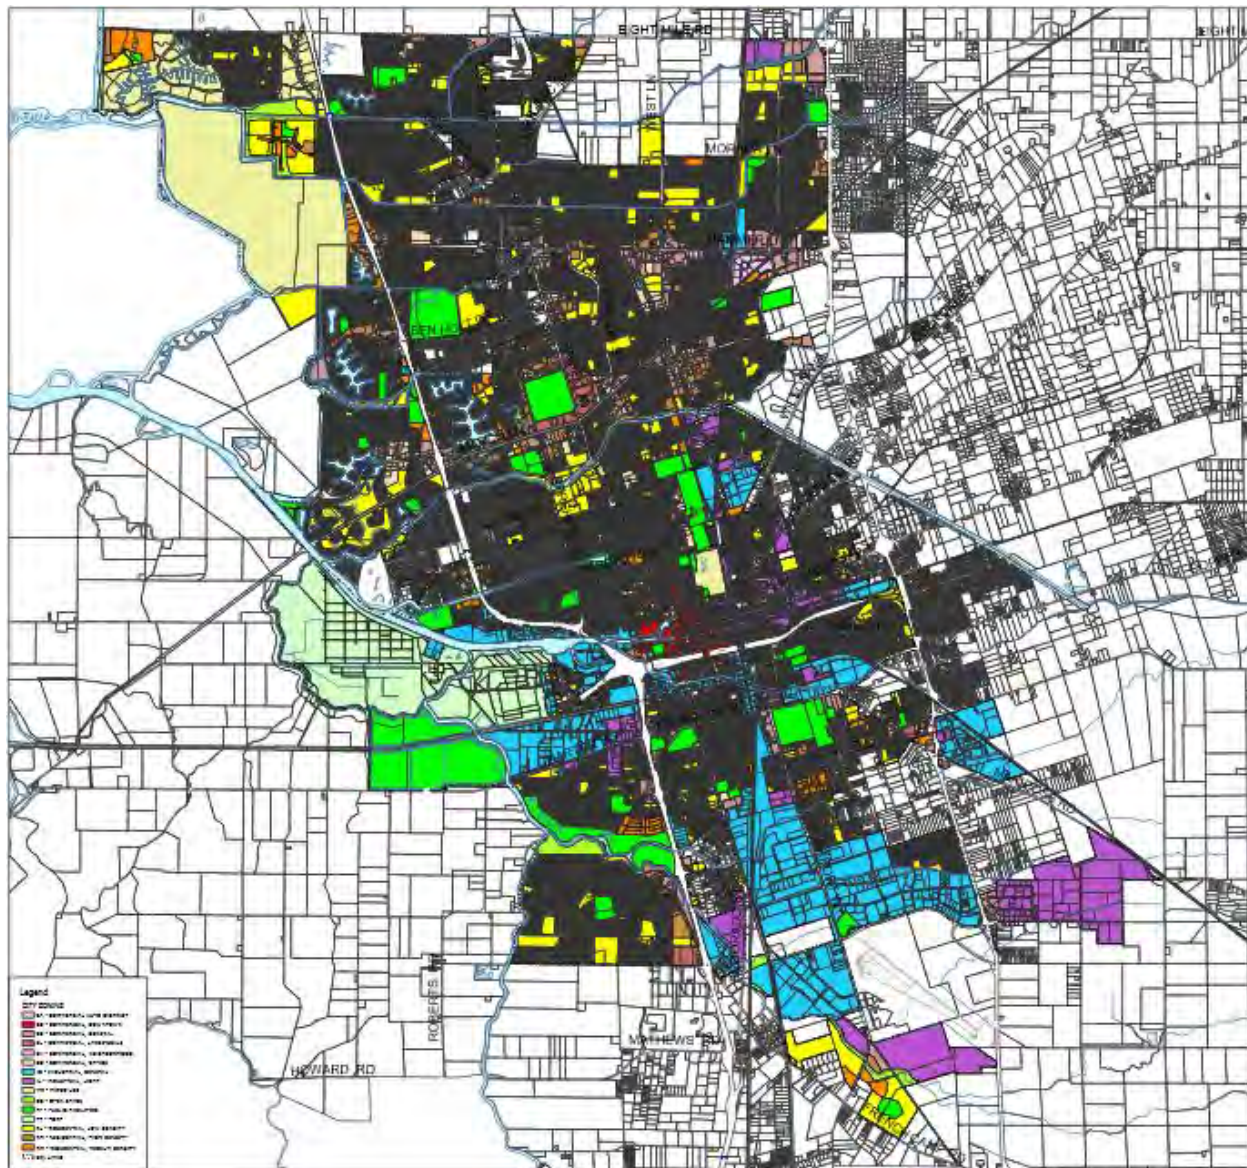

Source Categories	NOx (tpy)	VOC (tpy)	PM2.5 (tpy)
Stationary Sources	169.0	244.9	8.7
Area Source	35.7	290.5	109.1
Mobile Sources	605.4	220.8	33.2

For further information about the emissions inventory for Stockton AB 617 Community, including the stationary source emissions inventory, projected emissions inventory for District permitted facilities, mobile source inventory, and area-wide sources inventory please refer to Appendix C.

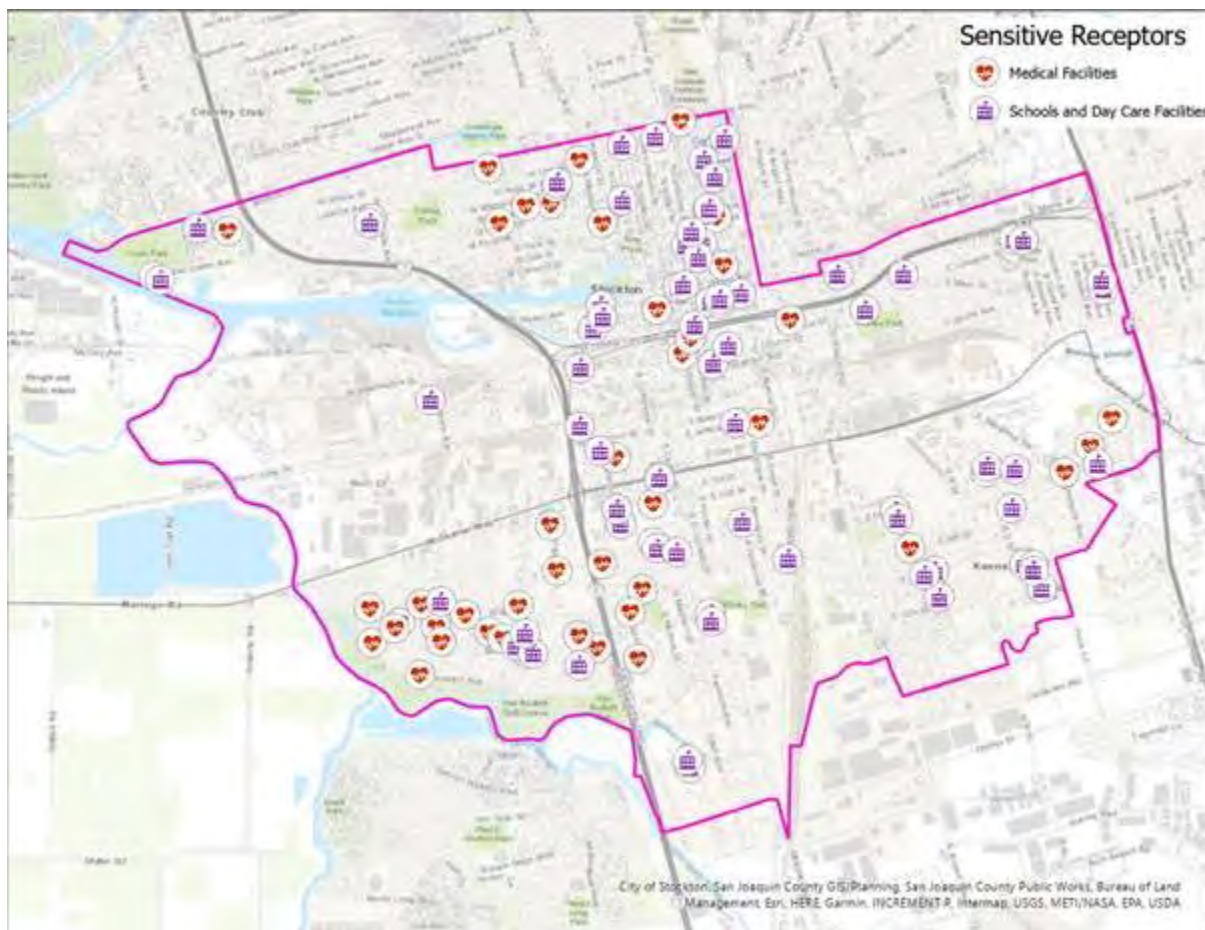

3.2.5 SENSITIVE RECEPTORS AND LAND USE

As illustrated in the City of Stockton General Plan Land Use map, below, the Stockton AB 617 Community contains mixed land uses including light and heavy industrial zoning, commercial areas, residential neighborhoods ranging from low density to urban neighborhoods, and the City's downtown core. Main transportation corridors transect the community, including highways 99, 4, and I5. Areas zoned for heavy industrial use are located in the western and southern portion of the city, with future industrial expansion planned for as detailed in the City's Envision Stockton 2040 General Plan. Further information about the City's General Plan and Specific Plans are available at: <http://www.stockton.gov/government/departments/communityDevelop/cdPlanGenDocs.html>

The below City of Stockton General Plan Land Use map is available with full resolution on the City of Stockton website: <http://www.stockton.gov/files/ZoningDistrictMap.pdf>

Figure 3-13 City of Stockton General Plan Land Use Map

The location of sensitive receptors is important to assess the impacts of emissions on public health. Sensitive Receptors are defined as people that have an increased sensitivity to air pollution or environmental contaminants. Sensitive receptor locations include schools, parks and playgrounds, daycare centers, nursing homes, hospitals, and residential dwelling unit(s). The map below shows sensitive receptor locations within the community. The sensitive receptors currently in the community include 35 schools, 50 licensed daycare facilities, and 45 medical care facilities. Sensitive receptors within the community are located in proximity to mobile on-road sources, train routes, manufacturing and industrial sources, off-road mobile equipment, and residential fuel combustion sources.

Figure 3-14 Sensitive Receptor Locations in Stockton

Where can I get more information about air pollution in Stockton AB 617 Community?

To provide detailed community-level data to the Steering Committee and the general public, District staff have created an interactive mapping tool that shows the locations of sensitive receptors, as well as the locations of and emissions inventory for stationary sources, area sources, and both on-road and off-road mobile emissions. Examples of the emissions data available through this mapping tool are shown in the figures below. Please visit the District website to zoom in and explore the community:

<https://sjvapcd.maps.arcgis.com/apps/webappviewer3d/index.html?id=6a8b2a34b0c14748aaee1c69c71c940c> and

<https://sjvapcd.maps.arcgis.com/apps/View/index.html?appid=26ea6530963f496589be8a4f23f3c8ab>

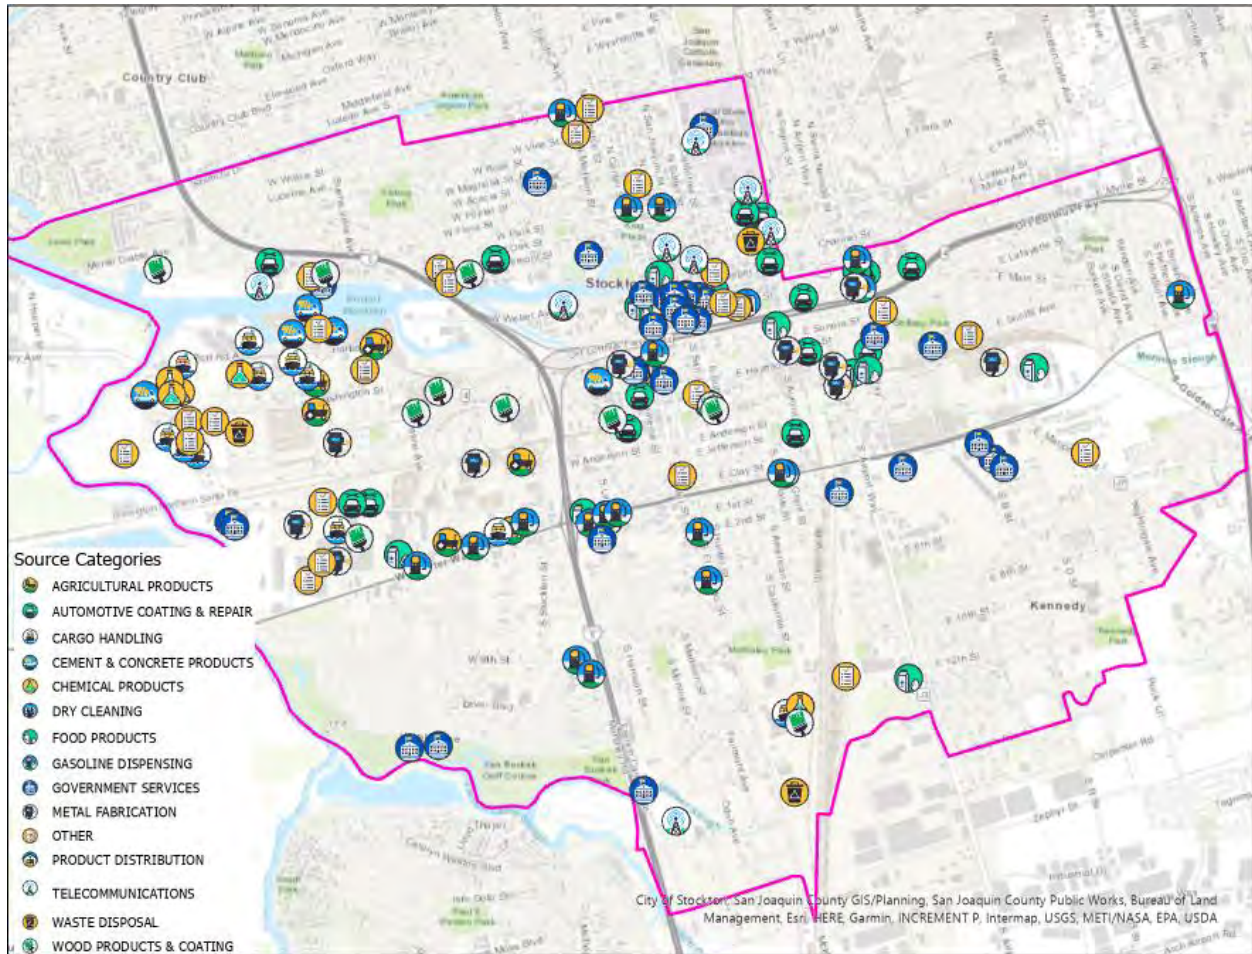

Figure 3-16 District Mapping Tool Showing Concentrations of Area-Wide Emissions within the Community

3.3 EXISTING AIR QUALITY PROGRAMS

District Plans for Attainment of Health-Based Air Quality Standards

For more than two decades, the District has adopted numerous attainment plans to reduce ozone and particulate precursor emissions. The District's multifaceted approach to reducing emissions in the San Joaquin Valley consists of a combination of innovative regulatory and non-regulatory measures. The U.S. Environmental Protection Agency (EPA) periodically reviews and establishes health-based national air quality standards (also referred to as NAAQS) for ozone, particulates, and other criteria air pollutants guided by the Clean Air Act. The District has adopted numerous air quality attainment plans over the years that identify measures needed in the Valley to attain EPA's increasingly stringent health-based NAAQS.

The District's plans include emissions inventories that identify sources of air pollutants, evaluations for feasibility of implementing potential opportunities to reduce emissions, sophisticated computer modeling to estimate future levels of pollution, and a strategy for how air pollution will be further reduced. District plans also include innovative alternative strategies for accelerating attainment through non-regulatory measures such as incentive programs; technology advancement programs; the District's legislative platform; community outreach and education programs; and additional strategies such

as energy efficiency, eco-driving, green purchasing and contracting, supporting urban heat island mitigation efforts, and encouraging cleaner methods of generating electrical energy and mechanical power.

Measures implemented for these Valley-wide strategies also apply to the AB 617 community of Stockton and have resulted in tremendous emissions reductions being achieved, to the benefit of the health of all Valley residents. Most recently, after an extensive 3-year public process, the District, in coordination with CARB and EPA, adopted the *2018 PM2.5 Plan*. This historic plan builds on decades of air quality improvement efforts and establishes a comprehensive strategy for continuing to improve the Valley's air quality and meet the latest federal PM2.5 standards. Further information on the comprehensive rules, regulations, and other programs that have been developed as a part of the District's attainment planning process are detailed in the District's plans for attainment of state and federal air quality standards, with links provided to each attainment plan below:

PM2.5 Plans for Attainment

- [*2018 Plan for the 1997, 2006, and 2012 PM2.5 Standards*](#)
The District adopted the *2018 Plan for the 1997, 2006, and 2012 PM2.5 Standards* on November 15, 2018. This plan addresses the EPA federal 1997 annual PM2.5 standard of 15 µg/m³ and 24-hour PM2.5 standard of 65 µg/m³; the 2006 24-hour PM2.5 standard of 35 µg/m³; and the 2012 annual PM2.5 standard of 12 µg/m³.
- [*2016 Moderate Area Plan for the 2012 PM2.5 Standard*](#)
The District adopted the *2016 Moderate Area Plan for the 2012 PM2.5 Standard* on September 15, 2016. This plan addresses the EPA federal annual PM2.5 standard of 12 µg/m³, established in 2012. This plan includes an attainment impracticability demonstration and request for reclassification of the Valley from Moderate nonattainment to Serious nonattainment.
- [*2015 Plan for the 1997 PM2.5 Standard*](#)
The District adopted the *2015 Plan for the 1997 PM2.5 Standard* on April 16, 2015. This plan addresses EPA's annual PM2.5 standard of 15 µg/m³ and 24-hour PM2.5 standard of 65 µg/m³, established in 1997.
- [*2012 PM2.5 Plan*](#)
The District adopted the *2012 PM2.5 Plan* in December, 2012. This plan addresses EPA's 24-hour PM2.5 standard of 35 µg/m³, which was established by EPA in 2006.
- [*2008 PM2.5 Plan*](#)
The District adopted the *2008 PM2.5 Plan* in April, 2008. This plan addresses EPA's annual PM2.5 standard of 15 µg/m³, which was established by EPA in 1997.

PM10 Plans for Attainment

- [2007 PM10 Maintenance Plan](#)
The District adopted the *2007 PM10 Maintenance Plan* in September 2007, to assure the San Joaquin Valley's continued attainment of EPA's PM10 standard. EPA designated the Valley as an attainment/maintenance area for PM10.

Ozone Plans for Attainment

- [2022 Plan for the 2015 8-hour Ozone Standard \(Upcoming Ozone Plan\)](#)
The attainment plan for the 2015 federal ozone standard will build upon comprehensive strategies already in place from adopted District plans and CARB's statewide strategies. The NOx reduction commitments from the recent *2018 PM2.5 Plan* and *2016 Ozone Plan*, and other ongoing measures will assist the Valley in meeting the 70 ppb federal ozone standard. Strategies for attainment of the *2015 8-hour ozone standard* will be developed through a public process, building on decades of effective control strategies. District staff will present regular updates regarding the development of the plan at public meetings and workshops, including upcoming meetings of the District Governing Board, Citizens Advisory Committee (CAC), and the Environmental Justice Advisory Group (EJAG).
- [2020 RACT Demonstration](#)
The District adopted the *2020 Reasonably Available Control Technology (RACT) Demonstration for the 2015 8-Hour Ozone Standard* on June 18, 2020.
- [2016 Plan for the 2008 8-Hour Ozone Standard](#)
The District adopted the *2016 Plan for the 2008 8-Hour Ozone Standard* in June 2016. This plan satisfies Clean Air Act requirements and ensures expeditious attainment of the 75 parts per billion 8-hour ozone standard.
- [2014 RACT SIP](#)
The District adopted the *Reasonably Available Control Technology (RACT) Demonstration for the 8-Hour Ozone State Implementation Plan* in June, 2014.
- [2013 Plan for the Revoked 1-Hour Ozone Standard](#)
The District adopted the *2013 Plan for the Revoked 1-Hour Ozone Standard* in September, 2013.
- [2009 RACT SIP](#)
The District adopted the *Reasonably Available Control Technology (RACT) Demonstration for Ozone State Implementation Plans (SIP)* in April, 2009.
- [2007 Ozone Plan](#)
The District adopted the *2007 Ozone Plan* in April 2007. This plan addresses EPA's 8-hour ozone standard of 84 parts per billion (ppb), which was established by EPA in 1997.

As a result of the District's stringent and comprehensive air quality management strategy along with significant investments made by Valley businesses and residents, PM2.5 and ozone levels are now at historically low levels, and the Valley continues to be in attainment of the PM10 NAAQS. Emissions from stationary sources have been reduced by 85%, cancer risk from exposure to air pollutants has been reduced by 95%, population exposure to elevated PM2.5 levels have been reduced by 85%, and population exposure to elevated ozone levels have been reduced by 90%. This success in reducing emissions Valley-wide provides assurance that targeted strategies will provide the desired results in helping to improve the air quality in AB 617 selected communities.

Regulatory Measures

The District has implemented a comprehensive regulatory control strategy for decades. Since 1992, the District has adopted nearly 650 rules and rule amendments to implement aggressive control strategies. Many current rules are fourth or fifth generation, meaning that they have been revised and emissions limits have been lowered numerous times, as new emission control technology has become available and cost effective. Building on decades of developing and implementing effective air pollution control strategies, District rules are required, by the Environmental Protection Agency, to implement the most stringent measures, including best available control measures for new and modified permitting projects, and best available retrofit control technologies for existing equipment when feasible to require in the San Joaquin Valley. The District's stringent and innovative rules have set benchmarks for other air agencies throughout California and the nation. Regulations implemented by the District have reduced emissions from stationary sources by over 80% to date and will continue to achieve significant emissions reductions in the coming years.

District rules reduce emissions of criteria air pollutants and toxic air contaminants from sources in and around the community. Permitted stationary sources regulated by the District in the Stockton AB 617 Community include agricultural commodities storage and transfer operations, automotive body repair and paint shops, concrete and construction materials manufacturing, electric power generation, motor vehicle coating operations, bulk fuel storage and transfer terminals, chemical receiving and storage, , fabricated metal parts and products, gasoline dispensing operations, government services, municipal water treatment operations, health care centers, metal parts coating operations, skilled nursing care facilities, and telecommunications facilities. District rules that reduce emissions from local sources in the Stockton AB 617 Community are outlined in the following table:

Table 3-5 District Rules Reducing Stockton AB 617 Community Air Pollution

Rule #	Rule Description
4001	New Source Performance Standards
4002	National Emission Standards for Hazardous Air Pollutants
4101	Visible Emissions
4102	Nuisance
4201	Particulate Matter Concentration
4202	Particulate Matter Emission Rate
4301	Fuel Burning Equipment
4305	Boilers, Steam Generators, And Process Heaters - Phase 2
4306	Boilers, Steam Generators, and Process Heaters - Phase 3
4307	Boilers, Steam Generators, and Process Heaters - 2.0 MMBtu/hr TO 5.0 MMBtu/hr
4309	Dryers, Dehydrators, and Ovens
4311	Flares
4320	Advanced Emission Reduction Options For Boilers, Steam Generators, and Process Heaters Greater than 5.0 MMBtu/hr
4352	Solid Fuel Fired Boilers, Steam Generators, and Process Heaters
4455	Components At Petroleum Refineries, Gas Liquids Processing Facilities, And Chemical Plants
4601	Architectural Coatings
4603	Surface Coating Of Metal Parts And Products, Plastic Parts And Products, And Pleasure Crafts
4606	Wood Products And Flat Wood Paneling Products Coating Operations
4607	Graphic Arts And Paper, Film, Foil And Fabric Coatings
4612	Motor Vehicle And Mobile Equipment Coating Operations
4621	Gasoline Transfer Into Stationary Storage Containers, Delivery Vessels, And Bulk Plants
4622	Gasoline Transfer Into Motor Vehicle Fuel Tanks
4623	Storage Of Organic Liquids
4624	Organic Liquid Loading
4652	Coatings and Ink Manufacturing
4653	Adhesives And Sealants
4661	Organic Solvents
4672	Petroleum Solvent Dry Cleaning Operations
4684	Polyester Resin Operations
4692	Commercial Charbroiling
4693	Bakery Ovens
4701	Internal Combustion Engines - Phase 1
4702	Internal Combustion Engines
4801	Sulfur Compounds
4901	Wood Burning Fireplaces and Wood Burning Heaters
4902	Residential Water Heaters
4905	Natural Gas-Fired, Fan-Type Central Furnaces
8011	General Requirements
8021	Construction, Demolition Excavation, Extraction, and Other Earthmoving Activities
8031	Bulk Materials
8041	Carryout and Trackout
8051	Open Areas
8061	Paved and Unpaved Roads
8071	Unpaved Vehicle/Equipment Traffic Areas
8081	Agricultural Sources
9310	School Bus Fleets

Rule #	Rule Description
9410	Employer Based Trip Reduction
9510	Indirect Source Review

While California and the federal government have direct authority to regulate tailpipe emissions from mobile sources, the District has also adopted innovative regulations such as the Rule 9510 - Indirect Source Review (discussed in more detail later in this section) and Rule 9410 - Employer-based Trip Reduction to reduce emissions from mobile sources within the District's limited jurisdiction over these sources. A complete listing of the District's current rules and regulations is available at the following link: <http://www.valleyair.org/rules/1ruleslist.htm>

For the recently adopted *2018 Plan for the 1997, 2006, and 2012 PM2.5 Standards* 2018 PM2.5 Plan, the District performed an exhaustive evaluation of all potential additional opportunities for reducing emissions and committed to amend several rules to achieve expeditious attainment of the health-based federal PM2.5 air quality standards (see Section IV). This comprehensive analysis also demonstrated that the District's rules and regulations are at least as stringent, if not more stringent, than all other rules in the nation. Furthermore, in accordance with AB 617 requirements, the District adopted an expedited schedule in December, 2018, for performing further determination of BARCT to ensure that applicable sources are utilizing the cleanest technologies feasible (see Chapter 4).

District New and Modified Stationary Source Review

Beyond District rules that apply to specific categories of stationary sources, District Rule 2201 (New and Modified Stationary Sources Review) applies to all new stationary sources and all modifications to existing stationary sources that are subject to District permit requirements. District Rule 2201, and the associated permitting process, ensure that new or modified stationary sources of air pollution are subject to the most effective emissions controls feasible for implementation; that emissions from the project do not create a public health risk (including a modeled analysis of cancer risks resulting from the project and possible health hazard risks resulting from both acute and chronic exposure to emissions for nearby residences and worksites); and that the project does not increase the potential for a violation of State or National Ambient Air Quality Standards. More information about the District's rigorous permitting process is available at <http://www.valleyair.org/busind/pto/ptoprocess.htm>, and is also summarized below. Under Rule 2201, new facilities or facilities modifying equipment must obtain an Authority to Construct (ATC) permit prior to construction, and are subject to stringent requirements, including:

- Best Available Control Technology (BACT)
- Risk Management Review (RMR)
- Toxic Best Available Control Technology (T-BACT)
- Ambient Air Quality Analysis (AAQA)

Best Available Control Technology (BACT): For each emissions unit (specific piece of equipment) that has the potential to emit over the 2 lb/day BACT threshold, the

District requires the use of the best available air pollution control technology commonly used to control emissions from similar types of equipment. The District also conducts an analysis to determine if, based on specific criteria, cleaner technologies that are not commonly used for these type of equipment could be used to further reduce emissions from the proposed equipment. This very stringent requirement ensures that the most effective air pollution control technique is utilized resulting in reduced public exposure to air pollutants and toxic air contaminants.

As a part of the District's BACT Policy (publicly available at <https://www.valleyair.org/busind/pto/bact/bactidx.htm>), District staff maintain a BACT Clearinghouse, updated and published quarterly, that includes available control technologies and operation methods that meet one of the following conditions:

- A. The control technologies or operation methods have been achieved in practice for an emissions unit and class of source; or
- B. Are contained in any SIP approved by the EPA for an emissions unit category and class of source; or
- C. Are any other emission limitation or control technique, including process and equipment changes of basic or control equipment, found to be technologically feasible for such class or category of sources or for a specific source.

AB 617 legislation requires that CARB develop and maintain a state-wide Technology Clearinghouse for BACT and T-BACT. Once available, District staff will review the Technology Clearinghouse as an additional resource when updating the District's BACT Clearinghouse.

Risk Management Reviews: The District conducts Risk Management Reviews to ensure that the public exposure to toxic air contaminants from projects required to obtain an ATC is less than significant. Very complex computer models and the most conservative assumptions are used to assess the project's maximum impact on resident's health. Projects resulting in estimated significant health risk for the public are not approved. Additional information regarding risk management reviews may be found here: https://www.valleyair.org/policies_per/Policies/apr-1905.pdf

Toxic Best Available Control Technology (T-BACT): When T-BACT is triggered under a Risk Management Review analysis, the District conducts a T-BACT analysis to ensure the most stringent control technique is utilized resulting in reduced public exposure to toxic air contaminants. T-BACT is required for units emitting air toxic emissions that result in a cancer risk of greater than one-in-a-million nearby residences or businesses. Projects resulting in estimated significant health risk for the public are not approved.

Ambient Air Quality Analysis (AAQA): The U.S. Environmental Protection Agency (EPA) and the California Air Resources Board (CARB) have established National Ambient Air Quality Standards (NAAQS) and California Ambient Air Quality Standards (CAAQS), respectively, for numerous pollutants. Under Rule 2201, the District conducts AAQAs to ensure that project related emissions would not cause or make worse a violation of the State or National ambient air quality standard. This

analysis ensures that the public exposure to certain criteria air pollutants is less than the maximum allowed concentration in outdoor air without harm to public.

AB 2588 (Air Toxics Hot Spots Information and Assessment Act)

The District's implementation of [AB 2588](#), California's Air Toxics "Hot Spots" Information and Assessment Act, has resulted in dramatic reductions in emissions of air toxics from existing sources in the San Joaquin Valley. Under this right-to-know law, the District has worked with 7,228 Valley facilities to quantify emissions of air toxics, determine the health risk caused by those emissions, report emissions and any significant risks through written public reports and neighborhood public meetings, and take steps to reduce such risks. As a result of these efforts, and the subsequent reductions in air toxics, since 2007 there have been no Valley facilities that pose a significant risk to any Valley resident under the "Hot Spots" program. A detailed discussion of AB 2588 and facility risk reduction audits conducted to date in the community is included in Chapter 4.

Implementation of State Airborne Toxic Control Measures

The District's integrated air toxics program incorporates Airborne Toxic Control Measure (ATCM) regulations promulgated by CARB. State-issued ATCMs are designed to reduce toxic air emissions from various types or categories of equipment by imposing prescribed air pollution control measures. Implementing ATCMs result in reductions of toxics exposure from targeted facility types or categories that could cause significant risks at a regional level. These ATCMs are implemented primarily through the District's permitting process. Examples of emissions sources that have drastically reduced toxic air contaminant emissions in the San Joaquin Valley because of such rules and regulations include dry cleaners, chrome plating operations, gas stations, and diesel internal combustion engines.

Implementation of Federal National Emissions Standards for Hazardous Air Pollutants (NESHAP) and Maximum Achievable Control Technology (MACT) Standards

The District's integrated air toxics program fulfills federal mandates under Title III of the federal Clean Air Act, which requires specific types of sources of air toxic emissions to directly reduce emissions through federal NESHAP and MACT standards. These standards apply to a variety of source categories, ranging from diesel internal combustion engines to chrome platers, and from refineries to power plants.

Implementation of Federal New Source Performance Standards (NSPS)

The District also fulfills federal mandates under Title I of the federal Clean Air Act, which requires specific types of new, modified, and reconstructed facilities subject to NSPS to directly reduce emissions of criteria air pollutants. These standards apply to a variety of source categories, ranging from hot mix asphalt facilities to sewage treatment plants, and from landfills to boilers.

District Indirect Source Requirements

District Rule 9510 is the only rule of its kind in the State of California and throughout the nation which applies to new residential and commercial development projects. The District's rule is recognized as the benchmark, or best available control, for regulating these indirect sources of emissions, such as from construction equipment and mobile sources associated with new developments. This rule requires mitigation of the growth in emissions from mobile and area sources associated with construction and operation of new development projects in the Valley.

District Air Quality Assistance and Guidance to Public Agencies

The District provides assistance and guidance to other public agencies, including cities and counties in the San Joaquin Valley, to help them assess, minimize, and mitigate air quality impacts of projects undergoing their land-use approval processes, over which the District has no statutory authority. For instance, the District provides comments under the California Environmental Quality Act (CEQA) to public agencies on hundreds of proposed projects each year. District provided CEQA comments are designed to minimize project related air quality impacts. In addition, the District maintains and makes available an extensive suite of guidance documents and tools for assessing and mitigating air quality impacts, including criteria and air toxic emissions, from stationary source projects and other development projects.

Mobile Source Regulations

Mobile source emissions make up over 85% of the Valley's NO_x emissions, the primary driver in the formation of particulate and ozone pollution, therefore, reductions in mobile source emissions have become an ever-increasingly important part of the Valley's attainment strategy of federal air quality standards. States and the federal government, unlike the District, have the authority to directly regulate tailpipe emissions from mobile sources. CARB has adopted toughened regulations for heavy-duty trucks, off-road equipment, and other mobile sources. Additionally, the District has adopted innovative regulations such as the Indirect Source Review and Employer-based Trip Reduction rules to reduce emissions from mobile sources within the District's limited jurisdiction over these sources. Local air districts do not have the authority to implement regulations requiring ultra-low tailpipe emissions standards on mobile sources.

With authority to regulate mobile source emissions, CARB has adopted and amended a number of regulations aimed at reducing exposure to diesel PM and NO_x from fuel sources, freight transport sources like heavy-duty diesel trucks, transportation sources like passenger cars and buses, and off-road sources like large construction equipment. Phased implementation of these regulations will produce emission reduction benefits in the coming years as the regulated fleets are retrofitted, and as older and dirtier fleet units are replaced with newer and cleaner models at an accelerated pace. CARB's ongoing comprehensive measures to reduce emissions from mobile sources throughout the state are detailed further in Chapter 4, "Statewide Strategies" section.

District Incentive-Based Emission Reduction Programs

The District has increasingly relied on its advocacy efforts to secure state and federal funding sources, and locally-generated funding to implement incentive programs that have become a vital component of the District's overall strategy for achieving the emissions reductions necessary to bring the Valley into attainment with state and federal air quality standards and to protect public health. These programs provide an effective way to accelerate emissions reductions and encourage technology advancement, particularly from mobile sources, a sector not directly under the District's regulatory jurisdiction. Considering over 85% of the NOx emissions in the Valley come from mobile sources, these successful voluntary incentive grant programs help the Valley achieve highly cost-effective emissions reductions that are surplus of the regulatory emissions reductions.

The District operates one of the largest and most well-respected voluntary incentive programs in California. Since the District's inception in 1992, considerable funding has been invested into thousands of clean-air projects throughout the Valley. The District's incentive programs offer Valley businesses and residents the opportunity to replace their older, higher polluting equipment with newer, cleaner models. These incentive programs include options for replacing older diesel powered trucks, ag engines, tractors, locomotives, and construction equipment as well as options for replacing wood burning devices, lawn equipment and passenger vehicles. These projects have achieved significant emissions reductions with corresponding air quality and health benefits. The incentive programs listed in the table below have been implemented in the community of Stockton AB 617 Community as of October 7, 2020, achieving over 1,200 tons of combined PM, NOx, and VOC emissions reductions in the community.

Table 3-6 Grant Funding Invested in Stockton AB 617 Community- Oct 7, 2020

Stockton AB 617 Community Grant Funding: Incentive Program	Units	Sum of Grant Amount	Total Tons PM, NOx, VOC Emissions Reduced
Bicycle Infrastructure Bike Bath Class I,II,III	2	\$100,000	10.45
Burn Cleaner Wood Stove Change Out New Device	77	\$230,500	18.09
CAP & Trade Demonstration New Electric Vehicle	2	\$2,324,790	0.00
Heavy-Duty Ag-UTV Vehicle Replacement	1	\$13,722	0.31
Heavy-Duty Forklift New Electric Vehicle	1	\$31,780	1.56
Heavy-Duty Locomotive Engine Repower	2	\$3,750,000	177.59
Heavy-Duty Locomotive New Vehicle	2	\$4,825,624	305.04
Heavy-Duty Locomotive Replacement	1	\$1,729,000	97.83
Heavy-Duty Off-Road Ag Vehicle Replacement	1	\$19,000	1.36
Heavy-Duty Off-Road Engine Repower	1	\$279,350	40.36
Heavy-Duty On-Road DERA Vehicle Replacement	7	\$373,728	0.0
Heavy-Duty On-Road Engine Repower	2	\$164,106	45.55
Heavy-Duty On-Road New Vehicle	1	\$28,000	0

Stockton AB 617 Community Grant Funding: Incentive Program	Units	Sum of Grant Amount	Total Tons PM, NOx, VOC Emissions Reduced
Heavy-Duty On-Road Trade Up	3	\$300,00	3.63
Heavy-Duty On-Road Prop 1B Vehicle Replacement	47	\$2,880,000	423.84
Heavy-Duty On-Road Truck Replacement	3	\$195,062	11.16
Heavy-Duty On-Road TVP Engine Retrofit	1	\$20,000	0.04
Heavy-Duty On-Road TVP Vehicle Replacement	21	\$1,336,292	93.01
Heavy-Duty On-Road VIP Vehicle Replacement	6	\$330,000	3.07
Lawn & Garden Residential New Purchase	7	\$533	0.00
Lawn & Garden Residential Replacement	73	\$28,505	0.00
Light-Duty Charge Up EV Charger-Private	1	\$6,000	0.00
Light-Duty Charge Up EV Charger-Public	7	\$312,000	0.00
Light-Duty Drive Clean EV Vehicle Rebate	42	\$246,000	0.79
Light-Duty EFMP Replacement	132	\$1,504,948	1.66
Light-Duty TITU Repairs	670	\$371,326	0.00
Light-Duty Van Pool Voucher	2	\$1,260.00	0.18
Public Benefit Alternative Fuel New Vehicle	53	\$1,015,413	0.00
Remove II Light and Medium Duty EV Purchase	1	\$3,000	0.04
Remove II Pearl Data New Vehicle Purchase	1	\$12,000	0.00
Special Projects Short Sea Shipping	1	\$750,000	0.00
Total	1,171	\$22,881,939	1,235.56

District Technology Advancement Efforts

The District Governing Board approved creation of the Technology Advancement Program in March, 2010, to accelerate development of technologies that can help reduce emissions in the Valley. Meeting EPA's increasingly stringent ozone and PM2.5 air quality standards requires significant advancements in low-emissions technologies from mobile and stationary sources. The Technology Advancement Program provides a strategic and comprehensive means to identify, solicit, and support technology advancement opportunities. Ongoing refinement of the program's technology focus areas targets efforts to achieve the greatest impact on the Valley's attainment and other health-based goals. This program has resulted in the development and deployment of electric feed mixers for dairy operations, clean fuel technologies for trucks, and solar-electric truck refrigeration units. Many of these advanced clean-air technologies are currently operating in the community of Stockton AB 617 Community.

Public Air Quality Education and Outreach

Providing accurate and up to date air quality information to Valley residents is a top priority for the District, especially when circumstances such as wildfires overwhelm all clean air measures and lead to high pollution concentrations. Under these circumstances, the best course of action is to provide notifications to Valley residents so that sensitive individuals, in particular, can take precautions to minimize exposure. The

District has expended significant resources on public notification and risk prevention measures, such as the Real-Time Air Advisory Network (RAAN) and Real-Time Outdoor Activity Risk (ROAR) Guidelines. The following are some additional examples of District outreach programs designed to help Valley residents understand air quality and what they can do to reduce their own impacts:

- Healthy Air Living Schools
 - <http://www.healthyairliving.com/schools>
- Real-Time Air Quality Display (READ)
- Web-based Archived Air Quality System (WAAQS)
 - <https://www.valleyair.org/waaqs/>
- Healthy Air Living
 - <http://www.healthyairliving.com/>
- Healthy Air Living Partners
- Check Before You Burn
 - <http://www.valleyair.org/aqinfo/cbyb.htm>
- Air Alerts
 - https://www.valleyair.org/AirAlert/AirAlert_Landing.htm

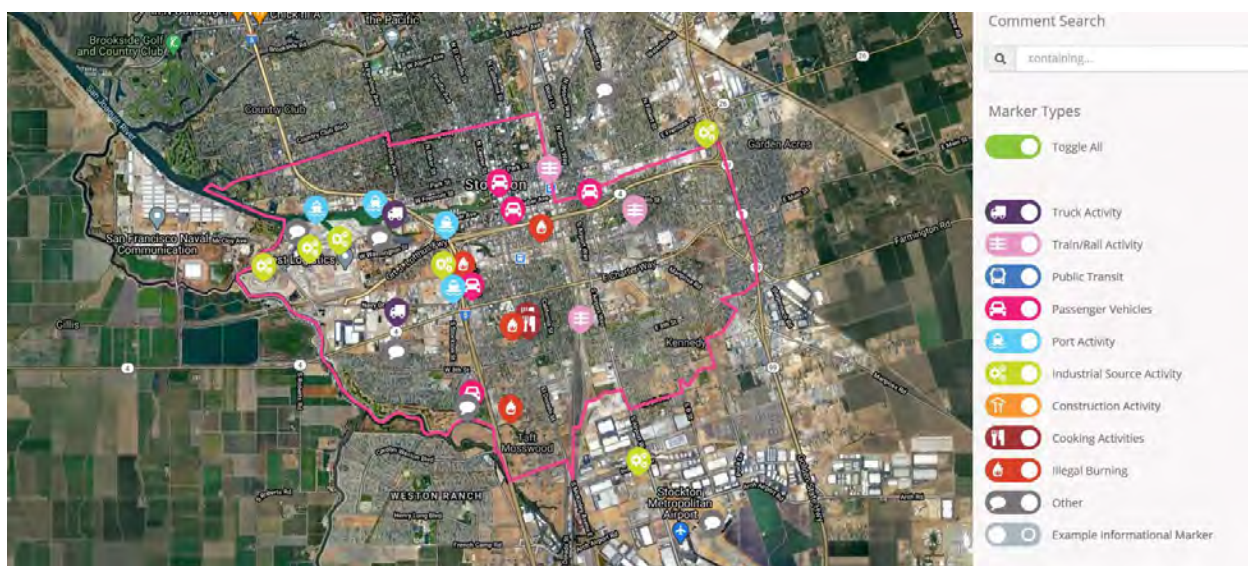

The above programs are available to community members, and have helped residents and school administrators take health protective action during poor air quality episodes.

4. STRATEGIES TO REDUCE THE CUMULATIVE EXPOSURE BURDEN IN STOCKTON

COMMUNITY IDENTIFIED AIR QUALITY PRIORITIES

During the June 3, 2020 Community Steering Committee (CSC) meeting, Stockton committee members and public attendees participated in a District-facilitated exercise to identify and prioritize their air pollution sources of concern. Participants were placed in groups and were asked to share their thoughts regarding air pollution sources which they believed impacted their community the most, or was of most concern to the individual or entity they represented. The results of these group exercises were then placed into an online mapping tool to create a visual representation of the common pollution sources of concern (Figure 4-1). An online version of the exercise was also sent to the committee and posted to the District's community webpage <http://community.valleyair.org> to allow for additional opportunity to participate in identifying source categories of concern.

Figure 4-1 Results of Sources of Concern Exercise

Through these exercises, some top emission sources categories of concern in Stockton include:

Based on emissions inventory, current air monitoring data, and top sources of concern in this community, pollutants of concern include particulate matter less than 2.5 micrometers in diameter (PM_{2.5}), Black Carbon (BC), Oxides of Nitrogen (NO, NO₂, NO_x), Hydrogen Sulfide (H₂S), Carbon Monoxide (CO), Ozone, and Volatile Organic Compounds (VOCs). In addition, a variety of toxic compounds, including toxic organics and particulate matter, were also identified as pollutants of concern.

To provide additional information about existing control programs for community members not familiar with ongoing air pollution control efforts, District staff prepared an informational document titled, "*Public Resource: Existing Control of Air Pollution Sources of Concern*," (included for reference as Appendix D), and gave several presentations about existing District control programs. Additionally, the Community Co-Hosts are provided the opportunity to share their own experiences and areas of concern during CSC meetings and their thoughts on opportunities to improve air quality within the community. The CSC meetings have served to build the knowledge base of the CSC members and to assist in developing a Community Emission Reduction Program (CERP) which includes specific measures to reduce exposure to harmful air pollution within the community.

In partnership with the CSC members, community based organizations, businesses in the community, and state and local agencies, a suite of targeted measures to reduce and mitigate harmful air pollution emissions from community identified sources of concern has been developed. In addition to the emission reductions which will be achieved through expedited implementation of best available retrofit control technology

by facilities within the community, the adoption of rule amendments that will further reduce PM_{2.5} and toxics in the Valley, and enhanced enforcement in the community, these local measures provide accelerated emissions reductions in the community.

AB 617 legislation requires that a CERP identifies cost-effective measures to achieve emission reduction targets in the community. During CSC discussions to review potential strategies for implementation in the community, Committee members consistently supported and prioritized measures that would reduce emissions from residential sources, while also providing tangible benefits to residents in the community. To that end, in addition to measures that reduce emissions from stationary, area, and mobile sources that are large contributors to the community emissions inventory, many of the measures supported by the Steering Committee and proposed for implementation in the Stockton CERP include targeted incentive programs and interagency partnerships that provide co-benefits in the community, in addition to air quality improvements. The measures described in this chapter encompass a range of strategies to reduce community level exposure burden, including regulatory, enforcement, outreach and education, voluntary incentive-based programs, as well as partnerships with other agencies to address issues outside of the District's direct regulatory authority.

It should be noted that the identified funding amounts for each measure are designed assuming that future-year state budget appropriations and funding allocations are similar to those approved by the legislature and CARB for current use in the AB 617 program, and are available in future District budget appropriations.

Incentive program guidelines also generally contain strict requirements that include specific project types and funding amounts. To maximize emission reductions in the AB 617-selected community of Stockton, the CERP includes measures that also leverage existing District incentive funding allocations, above and beyond funding amounts available through AB 617-related funding allocations.

Some of the incentive measures included in the CERP are proposed to operate under existing authority and approved program guidelines, while other measures will require the development of new program guidelines and associated approval by the District Governing Board and CARB. As the CARB Blueprint states, CARB and the District will continue developing regulatory and incentive actions through separate public processes. Subsequent implementation of proposed CERP measures will be conditional on the successful completion of applicable public processes, necessary financing approvals, technical feasibility analyses, economic competitiveness, safety, and environmental reviews.

The District will continue to work with the CSC to receive community input as program guidelines are developed and projects are implemented within the community. As experience is gained in implementing the measures contained in the CERP, it may become evident that certain measures are more successful than others in reducing emissions and/or exposure, and are more popular with the community. Committee input on these considerations, and discussions about funding availability and cost-

effectiveness of projects, may lead to adjustments to strategy goals and/or funding amounts to achieve overall emission reduction targets of the CERP. A possible example includes the collection and sharing of community air monitoring data, which could lead to additional discussion with the CSC, which could lead to additional CERP strategy development. During CERP implementation, the CSC will be provided regular updates on implementation progress and their feedback and guidance requested. Based on the updates, it is possible that new strategies could be identified or revisions to existing strategies may be appropriate.

The sections that follow provide detailed information about emission and exposure reduction strategies developed for each source category of concern to the community.

EXPOSURE REDUCTION STRATEGIES FOR SENSITIVE RECEPTORS

Proximity to emission sources can pose health risks for community members, particularly for sensitive groups such as children, the elderly, and those with cardiovascular diseases. Sensitive receptors located in Stockton include schools, daycare facilities, and medical facilities, as shown in the map below. The CARB Blueprint contains several suggested measures that can be implemented to reduce exposure to emissions in areas where these sensitive receptors may be particularly vulnerable to exposure, which are referred to as proximity-based goals.

Figure 4-2 Sensitive Receptors in the Community

In discussions about possible exposure reduction measures to implement in the AB 617-selected community, the Stockton Steering Committee placed a high priority on measures that would protect the health of children, including installing advanced filtration systems at schools and providing indoor air filtration devices to community residents near sources of concern. Other measures prioritized by the Steering Committee included reducing idling near sensitive receptors, and increasing community member knowledge about actions individuals can take to protect their health.

The Steering Committee also suggested additional urban greening, installing vegetative barriers next to industrial sites and along major roadways, and rerouting of heavy-duty trucks corridors near these sensitive receptors. The District has engaged with local

government agencies, CARB, and appropriate state agencies that have the authority to implement these strategies.

Reducing exposure for sensitive receptors will be accomplished through the implementation of the following measures related to school air filtration, home indoor air quality filtration, urban greening, and vegetative barriers.

VEGETATIVE BARRIERS

BACKGROUND

Vegetative barriers, also known as windbreaks, are composed of one or more rows of trees or shrubs that may be planted in specific areas of concern in order to improve air quality in the immediate area by intercepting airborne particles, dust, chemicals, and odors. Pollutants directly emitted from cars, trucks, and other motor vehicles are found in higher concentrations near major roads. In addition, stationary sources such as industrial facilities, factories, and other industrial processes can also contribute air pollutants to their surrounding areas. While various emission control techniques and programs exist to reduce these pollutants from mobile and stationary sources, vegetative barriers have been shown to be an additional measure to potentially reduce a population's exposure to air pollution through the interception of airborne particles and the uptake of gaseous pollutants. Examples of vegetative barriers include trees, bushes, shrubs, or a mix of these. Generally, a higher and thicker vegetative barrier with full coverage will result in greater reductions in downwind pollutant concentrations. In addition to air quality benefits, vegetative barriers can improve aesthetics, increase property values, reduce heat, control surface water runoff, and reduce noise pollution.¹

Characteristics of a vegetative barrier that should be considered include the porosity/density of the vegetative barrier, the characteristics of the vegetation during different seasons, leaf surface characteristics, vegetation air emissions (e.g. biogenic VOCs), and the resistance of the vegetative barrier to air pollution. Other considerations include: soil characteristics, availability of water, control of water runoff, maintenance of the vegetative barrier, use of native and non-invasive species, and roadway safety. Vegetative barriers may also be used with solid barriers to increase mitigation. Research is ongoing as to the effectiveness of vegetative barriers in reducing exposure to pollutants, but a recent study has found that vegetative barrier installations may reduce downwind exposure to carbon monoxide and fine particulate matter by at least 23%.²

The US EPA has produced a fact sheet with further information on vegetative barriers, available here: https://19january2017snapshot.epa.gov/sites/production/files/2016-08/documents/recommendations_for_constructing_roadside_vegetation_barriers_to_improve_near-road_air_quality.pdf

Latest Google Map Information

COMMUNITY CONCERNS AND COMMENTS

The Stockton Steering Committee has identified Vegetative Barriers as a priority for air pollutant mitigation. The committee has expressed the need for the installation of vegetative barriers (and sound walls) around and near sources of concern such as schools, along truck routes, near the Port of Stockton, Charter Way, Boggs Tract and El Dorado with an additional priority along Interstate 5. The committee has expressed the need to enforce existing mitigation plans associated with specific industries.

CURRENT PROGRAMS

The Valley Air District, the City of Stockton, the California Department of Transportation (Caltrans), and other local partners have promoted the use of vegetative barriers for reducing exposure to air pollutants, mitigating the urban heat island effect, and improving aesthetics. The District's Fast Track Action Plan includes the strategic use of tree and vegetation planting as a potential measure to improve air quality.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

Based on community interest in vegetative barriers, the following measure was developed for implementation as a part of the Stockton CERP.

The following is a suggested measure not within the Air District's jurisdiction to directly implement:

VB.1: INCENTIVE PROGRAM FOR THE INSTALLATION OF VEGETATIVE BARRIERS AROUND/NEAR SOURCES OF CONCERN

Overview: The purpose of this strategy is to provide incentives for the installation and maintenance of vegetative barriers around sources of concern to reduce particulate matter, odor, and other emissions, as feasible. Based on community interest in vegetative barriers, the District will also look to partner with other agencies to identify additional grant funding to support the installation of vegetative barriers at/near industrial facilities and along major transportation and goods movement corridors.

It should be noted that the SJVAPCD has no authority over how agencies allow land under their jurisdiction to be used. These land-use decisions, such as whether to allow or require vegetative barriers in specific locations, are historically the responsibility, under state law, of cities and counties, or, in some cases, state and federal agencies responsible for transportation corridors, state and federal parks, and other properties. AB 617 does not provide the District with new land-use regulatory authority, so land-use authority remains with cities, counties, and state and federal land-use agencies, as discussed in CARB's Blueprint (see "Who Has the Authority to Implement Actions?", page 26 of the Blueprint), the District is committed to working with these agencies and the CSC to see this measure implemented this measure.

Implementing Agency: SJVAPCD, CDOT, City, County, Port of Stockton, other local partners

Type of Action: Partnership, Incentives

Implementation: 2021-2025

Budgeted Amount: \$1,000,000

Quantifiable emission reduction: Estimated 5-year emissions reductions associated with this measure includes up to 0.11 tons of PM_{2.5} and NO₂ per year

URBAN GREENING

URBAN GREENING SOURCES IN STOCKTON

Urban greening is one way to help improve air quality and public health in addition to enhancing the overall beautification of the community with drought resistant low maintenance greenery. Trees and vegetation help reduce the impacts of heat islands by increasing the amount of shade and cooling the air by evapotranspiration.³ Careful placement and choice of vegetation will maximize its cooling benefits. Shade provided by trees and other vegetation prevents sunlight from reaching heat-absorbing surfaces such as sidewalks and parking lots, cooling the area by 2 to 9 degrees Fahrenheit. Air quality also benefits from a decrease in energy usage. The less energy used, the fewer power plants running and emitting ozone precursors.⁴ The total net savings when considering energy, ozone, and PM reduced from vegetation were valued at \$210/tree.

Figure 4-5 Urban Heat Island Effect Illustrated (Source: EPA, 1992)

COMMUNITY CONCERNS AND COMMENTS

The steering committees expressed an interest in opportunities for increased urban greening and forestry in the community of Stockton specifically at Charter Way, Boggs Tract, and El Dorado as a strategy to reduce exposure from emissions that occur along local transportation corridors while keeping in mind water and maintenance issues.

CURRENT PROGRAMS

The District Fast Track Action Plan identified Heat Island Mitigation as a measure to be implemented with the goal to increase urban forest canopy shading and increase the albedo of structures and pavement. This guidance includes a model resolution and policy statement for use by businesses, government, and organizations who desire to commit to heat island mitigation strategies.

³ EPA (1994) *Using Trees and Vegetation to Reduce Heat Islands*. Retrieved 1/21/21 from <https://www.epa.gov/heatislands/using-trees-and-vegetation-reduce-heat-islands>

⁴ EPA (2008) *Heat Island Compendium*. Retrieved 1/21/21 from <https://www.epa.gov/heatislands/heat-island-compendium>

Due to the benefits of urban greening, there are several programs available to support urban greening in communities. Below are the ongoing efforts to promote Urban Greening by other agencies, as well as programs committed to be implemented in future State and/or Valley-wide programs.

- **Transformative Climate Communities (TCC) Program:** The (TCC) Program funds development and infrastructure projects that achieve major environmental, health, and economic benefits in California's most disadvantaged communities. TCC is one of many California Climate Investments programs
- **Fathers & Families of San Joaquin:** Fathers & Families of San Joaquin's Health Justice Tree Planting/ReLeaf program plants trees in disadvantaged communities, trading gray concrete spaces into vibrant green spaces to promote a canopy of healthy environments and reduce greenhouse gases.
- **PUENTES:** PUENTES empowers at risk urban families by providing opportunities to enhance their environment with trees and stewardship for natural resources, foster local food chain viability, employment and entrepreneurship, and reinforce the sense of community involvement and physical wellbeing through volunteer participation in farming and forestry.
- **California ReLeaf Grants:** California ReLeaf seeks and provides pass-through grants to ReLeaf Network Members and other community groups interested in planting and caring for trees in California and offers grant programs through the Social Equity Grant Program and California Arbor Week Grant.
- **California Natural Resources Agency Urban Greening Grant Program:** Consistent with AB 32, the Urban Greening Program will fund projects that reduce greenhouse gases. This program includes urban heat island mitigation projects and energy conservation efforts related to shade tree projects.
- **Cal Fire:** Through the California Climate Investments (CCI) Urban & Community Forestry Grant Program, CALFIRE works to optimize the benefits of trees and related vegetation through multiple-objective projects as specified in the California Urban Forestry Act of 1978.
- **Active Transportation Program (ATP): California Department of Transportation (CALTRANS):** Urban forestry, such as trees and other vegetation, are significant components of several eligible projects under the ATP, including parks, trails, and safe-routes-to-schools.
- **California Urban Forests Council (CAUFC):** As a coalition, CAUFC is dedicated to the expansion and perpetuation of sustainable urban and community forests to enhance the quality of life for all Californians.

Non-profit organizations such as One Tree Planted, River Partners, the San Joaquin River Conservancy, and others provide the public the ability to donate to support tree planting and also advocate for the allocation of state and federal funding towards tree planting or replanting in forest, river, and/or urban areas in California.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

Due to the community's interest in increased urban greening, the District will be working with other agency partners to bring increased funding for urban greening to the AB 617 selected communities, as further described in the following measure.

The following is a suggested measure not within the Air District's jurisdiction to directly implement:

UG.1 URBAN GREENING AND FORESTRY

Overview: The purpose of this strategy is to identify and support efforts to increase urban greening/forestry to improve air quality for residents in the Stockton community. The focus areas will include, Charter Way, Boggs Tract, and El Dorado. This measure is supported by scientific studies that have shown urban trees and forestry can help with the removal of air pollutants and reduced emissions of volatile organic compounds (VOC's). The effects of urban trees on fine particulate matter (PM2.5) was modeled for ten U.S. cities, with total annual PM2.5 removal varying from 5.2 tons in Syracuse to 71.1 tons in Atlanta. Overall air quality improvements attributed to urban trees ranged between 0.05% in San Francisco to 0.24% in Atlanta (Nowak, Hirabayashi, Bodine, Hoehn, 2013). Based on a study to assess the effects of urban trees on air quality have found that urban vegetation can attribute to temperature reduction, removal of air pollutants, reduced emission of VOCs, and building energy conservation (United States Department of Agriculture Forest Service, 2002). The measure would also include an on-going maintenance program with the city.

The District has long been supportive of the public benefits provided from planting of trees and vegetation. The District's Fast Track Action Plan, adopted by the Governing Board to reduce ozone pollution in the Valley, identified strategic use of tree and vegetation planting as a potential measure to reduce ozone. There has also been significant efforts at the federal, state, and local levels to promote and increase urban greening and forestry through funding opportunities, programs, and projects.

It should be noted that, while the District has no direct authority over how agencies allow land, under their jurisdiction, to be used. These land-use decisions on whether to allow or require urban greening in specific locations, are the responsibility, under state law, of cities and counties, or, in some cases, state and federal agencies responsible for transportation corridors, state and federal parks, and other properties. While AB 617 does not provide the District with new land-use regulatory authority, so land-use authority continues to remain with cities, counties, and state and federal land-use agencies, as discussed in CARB's Blueprint (see "Who Has the Authority to Implement Actions?", page 26 of the Blueprint), the District is committed to working with these agencies and the CSC to see this measure implemented this measure.

Implementing Agency: SJVAPCD, CDOT, City, County, Port of Stockton, other local partners

Type of Action: Partnership, Incentives

Implementation: 2021-2025

Budgeted Amount: \$1,000,000

Quantifiable emission reduction: CARB has an established methodology through the Urban & Community Forestry Program

EXPOSURE REDUCTION STRATEGIES FOR SCHOOLS

SCHOOLS IN THE STOCKTON COMMUNITY

The Stockton Unified School District is the primary district serving the Stockton AB 617 community. In addition to the 32 schools within the Stockton Unified School District, three private schools also operate within the boundaries. Enlisting the participation and support of these schools in the effort to reduce children's exposure is key to ensuring that benefits are as widespread as possible. Targeting schools like Washington Elementary School protects the most vulnerable populations. All children, but especially young children, are considered sensitive receptors with respect to air pollution and it is vital that their protection from unhealthy air during their developing years is made a priority.

COMMUNITY CONCERNS AND COMMENTS

A primary concern expressed by Steering Committee members is to ensure cleaner air both indoors and outdoors for children at school while fully engaging local school districts and parents in clean-air efforts. Committee members expressed a desire to prioritize schools in neighborhoods with the highest risk of exposure to pollutants, such as those near the Stockton Port and near existing truck routes, and to enlist the cooperation and support of Stockton Unified School District as programs are further developed during the implementation phase of the CERP. The Steering Committee also requested incorporating an "Emissions Free Zone" model into the outreach strategies developed.

CURRENT CONTROL PROGRAMS

The District's Healthy Air Living (HAL) Schools program empowers participating schools to make informed decisions about outdoor activities based on real-time air quality conditions. School staff sign up for automated notifications when air quality becomes harmful using the Real-time Air Advisory Network (RAAN) tool, and receive health-protective recommendations for the modification or cancellation of outdoor activities accordingly through the Real-time Outdoor Activity Risk (ROAR) guidelines. The program includes access to resources like anti-idling signs, air quality widgets for school websites, bilingual informational materials, and bilingual educational speakers for students, parents, and staff. This program will be expanded to include an "Emissions Free Zone" model into the coordination with schools.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

Strategies developed to reduce the exposure of children within the community require a twofold approach: increasing enrollment of schools in the HAL School program protects children from exposure to unhealthy outdoor air through the widespread adoption of RAAN and ROAR; further, establishing a program that offers incentive funds to install advanced air filtration systems in community schools reduces exposure to potentially unhealthy indoor air quality.

The following are proposed measures that are within the Air District's statutory jurisdiction to implement:

SC.1 INCENTIVE PROGRAM TO INSTALL ADVANCED AIR FILTRATION SYSTEMS IN COMMUNITY SCHOOLS

Overview: The goal of this strategy is to reduce the impact of air pollution on children at schools. Air filtration reduces the concentration of particulate contaminants from indoor air and is an important component of a school's Heating Ventilation and Air Conditioning (HVAC) system. Reducing airborne particles is important due to the negative impacts to human health, especially that of sensitive populations such as children and the elderly.

This strategy would provide up to \$2,640,000 in incentive funding for schools within the Stockton boundary to install advanced air filtration systems, utilizing existing Community Air Protection Program guidelines. Proposed funding amounts would provide local schools with funding to install HVAC filters with a minimum efficiency reporting value (MERV) rating of 14 or greater or the highest MERV filter the current HVAC system can handle and/or standalone air filtration units as determined through an assessment performed by the trained school district staff or third party vendor. The MERV rating reflects the filter's ability to capture particles in the air, the higher the MERV rating, the better the filter is at trapping particles.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Budgeted Amount: \$2,640,000

SC.2: REDUCE CHILDREN'S EXPOSURE THROUGH INCREASED ENROLLMENT IN THE HEALTHY AIR LIVING SCHOOLS PROGRAM AND THE ESTABLISHMENT OF EMISSION FREE ZONES

Overview: The goal of this strategy is to reduce children's exposure to unhealthy air by increasing the enrollment of schools in the Healthy Air Living (HAL) Schools program to decrease vehicle idling, limit children's outdoor activity during episodes of poor air quality, and educate student about protecting our air. Additionally, the strategy is to work with school staff and students to educate the public, educators and parents regarding having an "Emission Free Zone" around schools, thereby reducing negative health impacts on student's health caused by emissions generated from vehicle idling. To help in this effort, "No Idling" signage in English and Spanish will be distributed to schools within the boundary. Additionally, informational videos will be used as an outreach tool and will be made available in languages such as Spanish, Tagalog, and others on an as needed basis.

Implementing Agency: SJVAPCD

Strategy Type: Outreach

Emission Outcome: Reduction

INDOOR AIR QUALITY

Indoor Air Quality refers to the air quality within buildings and structures, especially as it relates to the health of building occupants. Some health effects may show up shortly after a single exposure or repeated exposures to a pollutant. These include irritation of the eyes, nose, and throat, headaches, dizziness, and fatigue. Such immediate effects are usually short-term and treatable. Sometimes the treatment is simply eliminating the person's exposure to the source of the pollution, if it can be identified. Soon after exposure to some indoor air pollutants, symptoms of some diseases such as asthma may show up, be aggravated, or worsened.

Outdoor air enters and leaves a building by: infiltration, natural ventilation, and mechanical ventilation. In a process known as infiltration, outdoor air flows into buildings through openings, joints, and cracks in walls, floors, and ceilings, and around windows and doors. In natural ventilation, air moves through opened windows and doors. Mechanical ventilation is the use of ducts and fans to circulate air.

Americans spend over 90 per cent of their time indoors, and poor indoor air quality is considered a top environmental health risk. Mitigation programs should focus on achieving measurable improvements in reducing risks from indoor pollutants.

Weatherization measures, such as installing weather-stripping and caulking around windows and doors, can reduce the amount of outdoor air infiltrating into a home and decrease energy costs associated with heating and cooling. In addition, using a portable air cleaner and/or upgrading the air filter in your furnace or central heating, ventilation, and air-conditioning (HVAC) system can help to improve indoor air quality. Portable air cleaners, also known as air purifiers or air sanitizers, are designed to filter the air in a single room or area. Central furnace or HVAC filters are designed to filter air throughout a home. Portable air cleaners and HVAC filters can reduce indoor air pollution; however, they cannot remove all pollutants from the air.

COMMUNITY CONCERNS AND COMMENTS

Community commenters have noted that providing community residents with information about existing weatherization programs, should be augmented with incentives to assist residents in improving indoor air quality through a residential air filtration program.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

Based on interest from the community and a growing understanding at the state level of the need to improve indoor air quality the following strategy has been developed for implementation as a part of the Stockton CERP.

The following is a suggested measure not within the Air District's jurisdiction to directly implement:

IAQ.1: INCENTIVE PROGRAM FOR RESIDENTIAL AIR FILTRATION AND WEATHERIZATION

Overview: The goal of this strategy is to reduce the impact of and exposure to air pollution on community residents near sources of pollution within their homes. Indoor air filtration devices can be of assistance in improving indoor air quality in homes. While air cleaning devices alone cannot adequately remove all indoor pollutants from homes, they can be very helpful when large amount of pollution enter a home during unusual events, such as during a wildfire. Weatherization of a home (improving seals around doors and windows, increasing the amount of home insulation, and improving home HVAC systems) can reduce outside pollutants moving into the home and decrease the overall energy demand for residents.

Due to the ability for some residential air filtrations systems, such as electrostatic precipitator and ionizers, to generate ozone as a byproduct, which is a criteria air pollutant and causes lung irritation¹. In some cases, the use of these types of air filters can increase indoor ozone concentrations beyond public health standards. For this reason, this strategy will focus on the use of mechanical air filtration that relies on using filter media to remove indoor air pollution.

This strategy would establish an incentive program for residential air filtration for community residents near sources of air pollution, and increase outreach and access to programs available for low-income residents in Stockton to receive weatherization services.

Implementing Agency: SJVAPCD, partner agencies such as San Joaquin County Human Services Agency: Home Energy Assistance Program (HEAP)

Strategy Type: Incentive

Budgeted Amount: \$1,000,000

Emission Outcome: Reduction

¹Residential Air Cleaners – A Technical Summary – US EPA
(https://www.epa.gov/sites/production/files/2018-07/documents/residential_air_cleaners_-_a_technical_summary_3rd_edition.pdf)

COMMUNITY OUTREACH STRATEGIES

CURRENT OUTREACH PROGRAMS

The District's Outreach and Communications team conducts air quality outreach throughout all eight counties of the San Joaquin Valley. The District coordinates events, delivers presentations, responds to the media 24/7, manages social networks, pilots outreach campaigns like the Healthy Air Living (HAL) Schools and the winter residential "No Burn" programs, and connects with the public in multiple languages across any medium. In addition to offering media interviews, answering questions posed by the public, partnering with local institutions, and accepting speaking engagements, the District also conducts paid advertising and informational campaigns regularly to spread air quality awareness across social media, digital networks, television, radio, billboards, and other venues. Through the development of innovative tools like RAAN and the Valley Air App, over 10,000 registered users receive automated notifications when the air quality at any location they choose to follow becomes unhealthy, allowing them to make informed decisions about their outdoor activities to limit their own exposure.

COMMUNITY CONCERNS AND COMMENTS

The Committee recommended that the District engage in a wide variety of multi-lingual outreach efforts via both traditional and social media to allow community members to see and learn about air quality issues, take advantage of grant programs, and provide real-time access to information from air monitoring equipment deployed as part of the AB 617 process. Members of the Steering Committee acknowledged the District's ongoing air quality outreach and education efforts, but expressed concern about effectiveness given perceived public indifference. Effectiveness could be improved by increasing the volume and types of outreach, focusing it to a truly localized level, and using partnerships with key local organizations to better understand how to deliver needed information to the Stockton community residents.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

The Community Air Quality Outreach Strategies go beyond current outreach efforts to provide community-specific information about local conditions and measures the public can take to protect themselves during episodes of poor air quality through new media campaigns, workshops hosted in partnership with local civic and community organizations, and other outreach methods as identified by the community and the District.

O.1: MULTILINGUAL OUTREACH TO INCREASE COMMUNITY AWARENESS AND KNOWLEDGE OF AIR QUALITY

Overview: The goal of this strategy is to increase community awareness of available tools to keep informed of real-time changes in air quality, clean air efforts and how communities can get involved through multi-lingual educational campaigns, videos and partner workshops. The strategy looks to focus outreach on areas of Stockton CSC and

resident concerns, including fireworks, illegal burning, trash burning, educating trucking operations about impacts of idling, promotion of biking (including bike paths and trails), public transportation (including, bus, rail, ferry, and others) and other topics of concern/interest. An understanding of what conditions constitute poor air quality, the relative seriousness of a poor air quality episode, and any potential health impacts is necessary for the public to make informed decisions about how and when to limit their exposure.

This strategy would aim to increase Valley Air App downloads and social media followers among members of the community. A partnership with local civic and community organizations would be established to host workshops at locations commonly available to the public such as libraries, schools, and community, health, or recreation centers. Both the social media outreach and live workshops would promote real-time tools such as myRAAN website, the Valley Air App, the Real-time Outdoor Activity Risk (ROAR) Guidelines, the wildfire page of the District's website, as well as information about general air quality education, wildfire smoke impacts, health effects, and similar topics. This strategy would aim to increase myRAAN website registrations, Valley Air App downloads, and social media followers among members of the community. In addition, this strategy would increase awareness of air quality issues with workshops hosted in locations commonly available to the public such as libraries, schools, and community, health, or recreation centers and on Zoom or other online platforms.

Annual goals for these actions include:

- Attend/host 4 community meetings, in-person or online, to share information
- 1 community targeted social media campaign

Implementing Agency: SJVAPCD

Strategy Type: Outreach

LAWN AND GARDEN EQUIPMENT

LAWN AND GARDEN EQUIPMENT IN STOCKTON

Small off-road engines (SORE) which are typically utilized in gas powered lawn and garden equipment emit oil-based particulates, PM_{2.5}, NO_x, and a mixture of hydrocarbons, which combine with other gases to form ozone, carbon monoxide and other toxic air contaminants. This equipment can also cause a significant amount of fugitive dust and can increase fugitive emissions including PM, toxic air contaminants, and ultrafine particles resulting in negative health impacts for the user.

According to a 2003 study by the California Air Resources Board, there are over 11.4 million pieces of residential lawn and garden equipment operating throughout the state. In the Stockton community the emissions from this sector total 6.4 tons per year (TPY) of NO_x, 37.3 TPY of VOC and 0.80 TPY of PM_{2.5}. These total emissions contribute 0.6 % of the NO_x inventory, 3.4 % of the VOC inventory, and 0.1% of the PM_{2.5} inventory.

Figure 4-6 Electric Yard Equipment Reduces Emissions near Homes and Places of Business

COMMUNITY CONCERNS AND COMMENTS

Community Steering Committee comments regarding Lawn and Garden equipment included better outreach to inform community members of available incentives and increased incentives for the equipment as well as providing opportunities for residents to receive free electric lawn mowers. In addition, Community Steering Committee comments suggested prioritizing residential equipment replacements and ensuring that commercial equipment operated primarily within the boundaries of the AB617 community.

CURRENT CONTROL PROGRAMS

CARB has a SORE program, which includes lawn and garden equipment. CARB is continuing to consider new standards for small engines to help California meet its goal of reducing smog-forming pollutant emissions from mobile sources by 80 percent by 2031.

<https://ww2.arb.ca.gov/our-work/programs/small-off-road-engines-sore>

In addition, the District offers incentives to help reduce emissions from gas-powered lawn and garden equipment. The Clean Green Yard Machines (CGYM) program provides funding for the following options:

- The residential CGYM provides rebates for the replacement of an old gas-powered mower with a new electric mower and for the purchase of eligible new electric lawn and garden electric equipment without replacements. To date, this program has replaced over 7,400 lawn mowers with over \$1.5 million in funding. <http://www.valleyair.org/grants/cgym.htm>
- The Commercial CGYM launched in May 2019 and provides funding for the replacement of eligible old gas-powered lawn and garden equipment with battery-powered options for public agencies, private entities, and businesses. <http://valleyair.org/grants/cgym-commercial.htm>

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

In order to achieve additional emission reductions from the Lawn and Garden category the District will provide enhanced outreach and access to Stockton residents or businesses who would like to participate in our available incentive programs. For the residential program, the District proposes to cover the full cost of an electric lawn mower purchase when replacing an existing gas powered mower.

The following are proposed measures that are within the Air District's statutory jurisdiction to implement:

LG.1: INCENTIVE PROGRAM FOR THE REPLACEMENT OF RESIDENTIAL LAWN AND GARDEN EQUIPMENT

Overview: The goal of this strategy is to reduce NOx and PM2.5 emissions from residential lawn and garden equipment by replacing existing gas powered units with battery powered zero emission models. The District's existing Residential Clean Green Yard Machines program focuses on this goal by offering incentive funding ranging from \$100-250 for the replacement of existing gas powered units with battery powered zero emission models. Additionally, the District offers up to \$50 for the purchase of a new eligible electric lawn care equipment without requiring an old piece of equipment to be turned in. Using existing District Board-approved criteria, this strategy will provide enhanced outreach and education as well as higher incentive funds to local Stockton residents to encourage participation and maximize local emission reductions within the community. This strategy will increase outreach and access to incentive funding while providing rebates up to 100% of the equipment cost of a new electric lawn mower when replacing an existing gas powered model. The goal is to replace 50 gas powered units at an expected cost of \$400 per unit.

Implementing Agency: SJVAPCD

Strategy Type: Incentives and Outreach

Budgeted Amount: XX\$20,000

Emission Outcome: Reduction

Quantifiable Emission Reductions: Estimated emissions reductions associated with this measure includes up to 0.012 tons of PM2.5 and 0.018 tons of NOx..

LG.2: INCENTIVE PROGRAM FOR THE REPLACEMENT OF COMMERCIAL LAWN AND GARDEN EQUIPMENT

Overview: The goal of this strategy is to reduce NOx and PM2.5 emissions from commercial landscaping operations, in the Stockton AB 617 community (Stockton community), by replacing existing gas powered equipment with battery powered zero emission models. Emissions from commercial lawn care equipment directly impact equipment operators and community residents. The District currently offers a commercial lawn and garden equipment replacement program which offers incentive funding ranging from \$200-\$15,000 for the replacement of gas powered lawn equipment with battery operated zero emission technology. In addition, the program provides incentive funds for up to two batteries and one charger to ensure that the equipment is capable of operating for a full day of work. Additionally, the District will focus on increased participation from small, locally owned businesses and schools in the Stockton community to generate immediate emission reductions which directly impact local residents on a frequent basis. This strategy will provide enhanced outreach and access to available incentive funds offered by the District, utilizing Board-approved criteria. The goal of this measure is to replace 5 pieces of commercial grade gas powered lawn and garden equipment at an expected cost of up to \$20,000 per unit. Emission reductions associated with this measure will be calculated at a later time.

Implementing Agency: SJVAPCD

Strategy Type: Incentive and Outreach

Budgeted Amount: \$100,000

Emission Outcome: Reduction

Quantifiable Emissions Reductions: Estimated emissions reductions associated with this measure will be calculated based on a methodology currently being developed by CARB.

EMISSIONS EXPOSURE AND LAND USE

LAND USE IN THE COMMUNITY

Land use is the characterization of land based on what can be built on it and what the land can be used for. It is important to note that local air districts do not have authority over land use. Land use decisions are directly under the authority of Land use Agencies (e.g. City and County government agencies and Port of Stockton). Land use agencies have jurisdiction over land use, and as such develop land use plans and make decisions about how they grow and expand. The design of development projects in a community significantly influences how people travel, and land use agencies typically have principal responsibility for approving development projects within their jurisdictions for a variety of land use types such as residential (single or multi-family, etc.), commercial (fast food, shopping center, retail, etc.), and industrial (warehouse distribution centers, port operations, etc.). Through the land use approval process, these agencies are responsible for implementing land use strategies that promote increased walkability, commute alternatives and cleaner transit fleets resulting in air quality benefits within a community.

Land use strategies may result in the reduction of vehicle trips by designing development to be more suitable for walking, bicycling, and transit. These land use strategies are typically outlined as measures and goals within a City or County general plan, which is the primary “long range” planning document used to locate future development and provides the framework within which decisions on how to grow, provide public services and facilities, and protect and enhance the environment are made. For information about the City of Stockton General Plan, please refer to Chapter 3, Understanding the Community. Land use agencies’ decisions are critical in contributing to the improvement in air quality within a community and should be geared towards promoting strategies aimed at reducing vehicle miles travelled by increasing community walkability, implementing commute alternatives, and supporting infrastructure for cleaner transit fleets.

COMMUNITY CONCERNS AND COMMENTS

A primary concern expressed by Steering Committee members during meeting discussions was that heavy duty truck exhaust, specifically attributable to truck traffic and idling at the Port of Stockton and from highways and freeways, result in increased exposure to emissions for residents that live near these heavy duty trucking corridors and major thoroughfares in the community. To address community member concerns, measures included in this section will focus both on strategies to reduce conflicting land uses in the community, as well as transportation strategies that reduce exposure to mobile source emissions resulting from land use decisions.

For example, suggestions from community steering committee members included the installation of vegetative barriers to inhibit emission transport from thoroughfares into neighboring communities, increasing opportunities for bicycle path infrastructure projects, support for car sharing programs, supporting the replacement of older truck

fleets with cleaner technologies and strategizing land use planning to minimize or reduce vehicle miles traveled.

As the majority of these suggestions relate to land use issues for which the District does not have authority, the District's approach is to provide support to develop fueling infrastructure for zero and near-zero-emission vehicles, provide incentives for alternative modes of transportation, and to support the land use planning process through the California Environmental Quality Act (CEQA). The District is supportive of measures and policies the land use agency can implement toward making the communities more transit-, bicycle-, and pedestrian-friendly, avoid land use conflicts that lead to toxics and nuisance problems, and minimizing the need to and/or mitigate air quality impacts of individual development proposals.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN THE COMMUNITY

Several strategies have been identified under this Land Use and Transportation section that span from advocating issues, providing incentives, collaborating with the local land use agency (i.e. City, County, and Port of Stockton), to providing input through the land use process. Land use and transportation strategies developed to reduce emissions due to conflicting land uses are further detailed below.

The following are proposed measures that are within the Air District's statutory jurisdiction to implement:

LU.1: SUPPORT PROJECTS THAT REDUCE VEHICLE MILES TRAVELED

Overview: The purpose of this measure is to facilitate inter-agency collaboration between the City of Stockton, San Joaquin County, and San Joaquin Council of Governments to promote environmentally mindful alternative commute options through early discussion of related land use planning initiatives.

Mobile source emissions represent the vast majority of NO_x emissions within the Stockton Community. Reducing emissions from motor vehicles through the implementation of alternate modes of transportation directly contributes to decreasing public exposure to vehicle emissions, such as diesel particulate matter which adversely impacts human health.

Land use decisions are critical in contributing to the improvement in air quality within a community and should be geared towards promoting strategies aimed at reducing vehicle miles traveled by increasing community walkability. Examples of such strategies are listed below:

- Bicycle infrastructure
- Infrastructure to support alternative modes of transportation (electrical vehicles, near-zero emissions vehicles)

- Satellite offices/telecommuting centers to reduce or eliminate employee commutes

Implementing Agency: SJVAPCD, City of Stockton, San Joaquin County, San Joaquin Council of Governments

Strategy Type: Land Use

Emission Outcome: Mitigation

LU.2: BIKE PATH INFRASTRUCTURE FUNDING

Overview: Assess current bike path infrastructure and seek out additional funding opportunities to make the community more bike and walk friendly.

Reducing emissions from motor vehicles through the implementation of alternate modes of transportation, including bicycling, is important to reduce the public's exposure to vehicle emissions including NOx and PM2.5. This strategy would provide incentive funding for the development and construction of Class 1, Class 2, and Class 3 bicycle paths, lane striping, and routes. The proposed funding level of this measure would be consistent with established District guidelines from the District's REMOVE and Public Benefit Grants Programs. Additionally, the District will work with transportation agencies in the Stockton area, and seek to assist these agencies to help identify and leverage existing funds, in addition to AB 617 funding.

Implementing Agencies: SJVAPCD, City of Stockton, San Joaquin County, and San Joaquin Council of Governments

Strategy Type: Incentives

Emission Outcome: Reduction

Budgeted Amount: \$500,000

Quantifiable Emission Reductions: Estimated lifetime emissions reductions associated with this measure includes up to 2 tons of PM, 3 tons of NOx, and 6 tons of VOC.

LU.4: COLLABORATE WITH THE CITY OF STOCKTON, SAN JOAQUIN COUNTY, AND SAN JOAQUIN COUNCIL OF GOVERNMENTS TO IMPLEMENT INTEGRATED TRANSPORTATION DEVELOPMENT PLANNING TO IMPROVE HEALTH AND QUALITY OF LIFE THROUGH A VARIETY OF STRATEGIES SUCH AS SMART LONG-TERM PLANNING AND BUFFER ZONES AROUND SENSITIVE SITES

Overview: The goal of this strategy is to enhance inter-agency and community collaboration to reduce the impact of pollution from motor vehicles by prioritizing pedestrian-friendly land-use design elements around downtown Stockton.

Mobile source emissions represent the vast majority of NOx emissions within the Stockton Community. Reducing emissions from motor vehicles through the implementation of alternate modes of transportation, including pedestrian-friendly accommodations, directly contributes to decreasing public exposure to vehicle emissions, such as diesel particulates which negatively impact human health.

Land use decisions are critical in contributing to the improvement in air quality within a community and should be geared towards promoting strategies aimed at reducing vehicle miles traveled by removing barriers to pedestrian transportation. Examples of such strategies include:

- Bicycle infrastructure
- Dedicated pedestrian crossings
- Satellite offices/telecommuting centers to reduce or eliminate employee commutes

Implementing Entities: SJVAPCD, City and County, SJCOG

Strategy Type: Land Use

Emission Outcome: Reduction

HEAVY DUTY MOBILE SOURCES

HEAVY DUTY MOBILE SOURCES IN STOCKTON

There are a variety of heavy-duty mobile sources operating in and around the City of Stockton. These can range from on-road trucks, school and transit buses, off-road equipment, including agricultural and construction equipment, line-haul, short-haul and switcher locomotives. This equipment is primarily powered by diesel engines and, depending on the specific category, is regulated by one or more statewide regulations.

Emissions from this source category include oxides of nitrogen (NO_x) and combustion PM from the internal combustion engines. Mobile sources account for more than 85% of the NO_x inventory throughout the Valley. In the Stockton community, 328.08 tons per year of NO_x, 26.44 tons per year of VOC and 9.34 tons per year of PM_{2.5} are attributed to on-road heavy-duty equipment. In addition, 133.08 tons per year of NO_x, 20.49 tons per year of VOC and 6.21 tons per year of PM_{2.5} are attributed to off-road heavy-duty equipment referenced in these measures.

Figure 4-7 Examples of Heavy Duty Mobile Sources

COMMUNITY CONCERNS AND COMMENTS

During the committee discussions regarding heavy-duty mobile sources, a majority of the committee ranked this source as a high priority to address. Committee member comments and suggestions included providing incentives to replace older trucks, alternative fueling infrastructure development, clean fleet requirements, and shifting trucking routes away from residents.

CURRENT CONTROL PROGRAMS

The District does not have regulatory authority of emissions from mobile sources, including heavy duty vehicles and equipment, locomotives, school and transit buses. Diesel powered on-road heavy duty vehicles are subject to the statewide CARB Truck and Bus Regulation which requires all equipment to get progressively cleaner over time. Off-road heavy-duty equipment is similarly controlled through the CARB Off-Road

Regulation, which requires all fleets to be upgraded to newer, cleaner technologies over time. However, at this time, there are no regulatory requirements in place at the state or federal level controlling emissions from locomotives (for more information, see Section 5.6.2 - CARB Enforcement Strategies).

Due to the large amount of pollution that can be attributed to mobile sources, the District has implemented a broad suite of voluntary incentive programs, targeted at reducing emissions from heavy-duty engines operating throughout the Valley.

Heavy Duty Trucks/Buses:

The District currently offers a variety of programs targeted at replacing or upgrading older, high-polluting trucks and buses with cleaner technology.

- The Heavy Duty Truck Replacement Program <http://valleyair.org/grants/truck-replacement.htm>. This program provides incentives for the replacement of existing heavy-duty diesel trucks with new, zero or near-zero-emission technology.
- Program for Heavy-Duty Alternative Fuel Infrastructure which provides local businesses and agencies incentive funding to install alternative fueling infrastructure (electric, natural gas, hydrogen, etc.) to support the increased deployment of heavy-duty advanced clean technology vehicles.
- Electric School Bus Incentive Program - <http://valleyair.org/grants/electric-school-bus.htm>. This program is operated by the District and provides incentives for the replacement of existing older, higher-polluting school buses with new, electric school buses.
- Volkswagen Mitigation Trust – <http://vwbusmoney.valleyair.org/>
The VW Mitigation Trust has \$130 million in funds to replace older, high-polluting transit, school, and shuttle buses with new battery-electric or fuel-cell buses. Replacing an older bus with a zero-emission bus eliminates particulate matter and other pollutants that impact children and residents riding the buses, as well as residents throughout California communities. This statewide program is being administered by the District.

Locomotives:

Freight locomotives are regulated by the U.S. EPA. The current regulation requires that all locomotives purchased in or after 2015 be at least a Tier 4 emission level. Older, lower Tier engines, which comprise the majority of Class 1 fleets, are still permitted to run. Additionally, CARB is planning actions to address freight locomotive emissions within the State. More details can be found in the 2019 March CARB Board Meeting Informational Update: <https://www.arb.ca.gov/board/books/2019/032119/19-3-2pres.pdf>

The District offers two incentive programs for locomotive fleets interested in transitioning to newer, clean technology, including:

- Heavy Duty Program – <http://valleyair.org/grants/locomotive.htm>. Locomotive replacements can be funded as an eligible project category utilizing funding provided to support AB 617. These projects are administered according to Carl Moyer Program guidelines and are subject to additional requirements contained within the approved AB 617 Community Air Protection Guidelines. This program is operated by the District.
- Proposition 1B - <http://valleyair.org/grants/locomotives-prop1b.htm>. This program incentivizes the reduction of emissions and health risks associated with freight movement along California's trade corridors via upgrading to cleaner technologies or installation of emissions capture and control systems.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

Due to the priority that community members placed on reducing emissions from this source category and the large amount of emissions, including PM_{2.5} and toxic air contaminants (particularly diesel PM) that originate from heavy duty mobile sources in and around the community, the following strategies have been developed for implementation in the Stockton community.

The following are proposed measures that are within the Air District's statutory jurisdiction to implement:

HD.1: INCENTIVE PROGRAM FOR HEAVY DUTY TRUCKS REPLACEMENT WITH ZERO AND NEAR ZERO EMISSION TECHNOLOGY

Overview: The goal of this strategy is to reduce emissions from heavy duty diesel trucks operating in the Stockton community. This strategy would provide enhanced outreach and access to incentive funding for zero and near-zero emissions, clean truck technologies that are domiciled and operating within the community. District Board-approved methodology and funding levels can be utilized and the District will encourage small business owners to participate in the program while also promoting the selection of all electric, zero emission technology. This measure would replace 50 older, heavy duty diesel trucks operating in Stockton with zero or near-zero emission technology at an expected cost of up to \$200,000 per truck. Where feasible and available for the truck type and duty-cycle, the District will prioritize funding for replacement with zero-emissions electric vehicle technologies. By reducing or eliminating emissions from heavy duty diesel trucks, significant PM_{2.5}, diesel particulate matter, and NO_x emissions reductions can be achieved.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Emission Outcome: Reduction

Budgeted Amount: \$10,000,000

Quantifiable emission reductions: Estimated emissions reductions associated with this measure includes up to 4 tons of PM (including toxic diesel particulate matter), 191 tons of NOx, and 14 tons of VOCs.

HD.3 SUPPORT PLANNING AND DEVELOPMENT OF HEAVY-DUTY ELECTRIC VEHICLE CHARGING INFRASTRUCTURE

Overview: The goal of this strategy is to provide support for planning and development of fueling infrastructure for heavy-duty zero emission vehicles and transportation refrigeration units to support broader deployment of clean vehicles operating throughout the community and reduce the impact of emissions from the idling of heavy duty diesel trucks at distribution centers, warehouses, or other freight facilities where trucks are being loaded or unloaded. Utilizing Board-approved methodology and funding levels the District will work closely with businesses, public agencies, and fueling providers to support and incentivize the development of clean-vehicle fueling infrastructure in the area of the community. This action will prioritize incentive funding to support the development and construction of new electric infrastructure within the community. This includes increased outreach to businesses and public agencies operating vehicles within the community as well as prioritized funding for projects that serve vehicles operating in the community.

Depending on the size, throughput and configuration of the fueling infrastructure, the proposed funding amount of \$1,000,000 would incentivize the development of a new electric charging station.

Implementing Agency: SJVAPCD

Strategy Type: Incentives and Outreach

Emission Outcome: Reduction

Budgeted Amount: \$1,000,000

HD.5: TRUCK IDLING PLUG-INS

Overview: The goal of this strategy is to reduce emissions from heavy duty diesel truck idling and reduce the use of diesel-fueled internal combustion auxiliary power systems at truck stops where diesel trucks congregate in the Stockton community. Truck stop electrification allows a vehicle operator to "plug in" their vehicle and draw electricity directly from the power grid to provide cab heating and cab cooling, to power cab appliances, and to charge the vehicle's battery.

This strategy would provide funding to launch a program in the Stockton community. The District would leverage experience from the Proposition 1B Goods Movement Emission Reduction Program in order to design a program that would fund the purchase and installation of electrical infrastructure and/or equipment to enable heating, cooling, and other use of cab power for parked trucks at truck stops in the Stockton area. This measure would provide \$10,000 in funding per unit, for 33 units. The emission reductions associated with this measure will come from HD.1, as this measure serves to support the deployment of zero and near-zero technology.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Emission Outcome: Reduction

Budgeted Amount: \$100,000

HD.6: ENHANCED ENFORCEMENT OF THE STATEWIDE ANTI-IDLING REGULATION

Overview: The goal of this strategy is to limit the potential for localized emissions from heavy duty vehicles for failure to comply with the state's heavy duty anti-idling regulation. Historically, the District has partnered with CARB to conduct anti-idling enforcement throughout valley communities.

The state's anti-idling Airborne Toxic Control Measure limits nonessential (or unnecessary) vehicle idling to specific time limits. It is applicable to all diesel-fueled commercial motor vehicles with a gross vehicular weight rating of greater than 10,000 pounds. The diesel exhaust from excessive idling has the potential to impose significant adverse health and environmental impacts. Therefore, efforts to ensure compliance with the anti-idling regulation, especially near schools and residential areas, are important to reduce the potential for localized impacts within the community.

The District will partner with CARB to conduct additional targeted anti-idling enforcement efforts in the Stockton community with established benchmarks. These benchmarks include anti-idling surveillance to occur at least once per quarter for the next 5 years. The District and CARB will work with the Community Steering Committee to identify heavy-duty vehicle idling "hot spots," especially those near schools, to aid in focusing the enforcement efforts.

Implementing Agency: SJVAPCD and CARB

Strategy Type: Enforcement

Emission Outcome: Reduction in PM_{2.5}, PM₁₀, NO_x, VOC, and CO emissions through higher compliance rates with the state regulation

HD.7: INCENTIVE PROGRAM FOR REPLACING OLDER DIESEL SCHOOL BUSES WITH ZERO EMISSION SCHOOL BUSES

This measure is still being considered by the Stockton Steering Committee.

To provide increased outreach and access to incentive funding for the replacement of older, high polluting school buses with new zero-emission school buses operating within the Stockton Unified School District.

Replacing older school buses is important to reduce children's exposure to diesel emissions including NO_x and PM_{2.5} and these pollutants negatively impact human health, especially for sensitive populations such as children. New, zero-emission battery electric and near-zero emission natural gas powered school buses are significantly cleaner than older diesel buses.

Emissions from school buses are regulated by the California Air Resources Board Statewide Truck and Bus Regulation that requires transition to cleaner technology over time. Generally phased in by model year.

<https://www.arb.ca.gov/msprog/onrdiesel/onrdiesel.htm>

This measure would cover up to 100% of the cost of replacing up to 10 diesel school buses with electric buses at \$400,000 each.

Implementing Agency: SJVAPCD

Type of Action: Incentives

Implementation: 2021-2025

Emission Outcome: PM, NO_x, and VOC reductions

Budgeted Amount: \$4,000,000

Quantifiable emission reductions: Estimated lifetime emissions reductions associated with this measure includes up to 0.3 tons of PM, 18 tons of NO_x, and 4 tons of VOCs.

HD.10: INCENTIVE PROGRAM FOR REPLACING OLDER DIESEL SWITCHER LOCOMOTIVES WITH NEW CLEAN-ENGINE TECHNOLOGY

This measure is still being considered by the Stockton Steering Committee

Overview: To provide incentive funding for the replacement of older, high polluting switcher locomotives with new clean-technology switcher locomotives operating within and surrounding the Stockton community.

Replacing older switcher locomotives is important to reduce the public's exposure to diesel emissions including NOx and PM2.5. These pollutants negatively impact human health, especially for sensitive populations such as children and the elderly. New, clean-technology railcar movers and/or switcher locomotives are significantly cleaner than older uncontrolled diesel railcar movers and/or switcher locomotives.

The goal of this action is to replace up to 4 older, high-polluting switcher locomotives operating within and surrounding the community. The proposed funding amount would cover up to 95% of the cost of replacing up to 4 diesel switcher locomotives at up to \$1,700,000 each.

Implementing Agency: SJVAPCD

Type of Action: Incentives

Implementation: 2021-2025

Emission Outcome: PM, NOx, and VOC reductions

Budgeted Amount: \$6,700,000

Quantifiable emission reductions: Estimated lifetime emissions reductions associated with this measure includes up to 12 tons of PM (including toxic diesel particulate matter), 502 tons of NOx, and 31 tons of VOC.

The following are additional suggested measures not within the Air District's jurisdiction to directly implement:

HD.11: HEAVY DUTY TRUCK REROUTING

Overview: Community Steering Committee members have suggested that a study should be performed to assess the existing heavy-duty diesel truck routes in and around the Port of Stockton and the nearby neighborhoods, including the Boggs Tract neighborhood. The study will focus on whether there are other routes which will result in reduced exposure to toxic air contaminants by residents in the nearby neighborhoods. The District will work with the City, County, and all other appropriate land-use and transportation agencies regarding this and the desire of the CSC for inclusion in the Stockton CERP. The District will work with the City of Stockton and other appropriate agencies to seek funding to support this study.

Jurisdictional Issues: It should be noted that the District has no authority over how agencies allow land under their jurisdiction to be used. These so-called “land-use” decisions, such as truck rerouting, are historically the responsibility, under state law, of cities and counties, or, in some cases, state and federal agencies responsible for transportation corridors, state and federal parks, and other properties. AB 617 does not provide the District with new land-use regulatory authority, so land-use authority remains with cities, counties, and state and federal land-use agencies, as discussed in CARB’s Blueprint (see [“Who Has the Authority to Implement Actions?”](#), page 26 of the Blueprint). However, the District is committed to working with the implementing agencies to identify additional possible funding sources for the study up to \$500,000, developing the scope of work for the study, and coordinating conversations with the implementing agencies and the CSC as necessary.

Implementing Agency: City, County, San Joaquin COG, Caltrans, Port of Stockton

Strategy Type: Partnership

Emission Outcome: Mitigation

Budgeted Amount: \$350,000

OLDER/HIGH POLLUTING PASSENGER CARS

OLDER/HIGH POLLUTING PASSENGER CARS IN STOCKTON COMMUNITY

Mobile source emissions account for over 85% of the overall NO_x inventory in the San Joaquin Valley. With no regulatory authority over these sources, the District has relied on voluntary incentive programs to transition older, higher emitting vehicles to newer, cleaner and more fuel efficient models. With limited public transportation options available to residents driving is more prevalent in the Valley than in other areas of the state. Vehicles registered in the Valley are typically older and have higher mileage than statewide averages.

Emissions from light duty vehicles in Stockton total 114.08 tons per year (tpy) of NO_x, 138.23 tpy of VOC, and 12.74 tpy PM_{2.5}. These total emissions contribute 10.5% of the NO_x inventory, 17.5% of the VOC inventory, and 10.3% of the PM_{2.5} inventory.

Figure 4-8 The District's Drive Clean in the San Joaquin Repair and Replacement Program

COMMUNITY CONCERNS AND COMMENTS

Community Steering Committee comments regarding passenger vehicles included increased outreach and incentives for low income residents, increasing charging infrastructure in the community, and questions about the effectiveness of existing programs for low-income individuals. As detailed below, to address these concerns District staff have developed new programs, specifically for Stockton community members, to provide incentive funding for clean-air vehicles, to bring car share programs to the community, and to incentivize the purchase of electric vehicles by the primary local ride share service.

CURRENT CONTROL PROGRAMS

The District does not have regulatory authority of emissions from mobile sources, however, due to the large amount of pollution that originates from passenger vehicles

the District has implemented a suite of programs to reduce pollution from mobile sources. These programs include the following measures:

- Tune In Tune Up vehicle repair program which provides incentive funds to repair high emitting vehicles.
<http://valleyair.org/drivecleaninthesanjoaquin/repair/>
- Vehicle replacement program which provides funding to replace older, high emitting vehicles with newer, cleaner and more fuel efficient models.
<https://www.valleyair.org/drivecleaninthesanjoaquin/replace/>
- The vehicle rebate program provides rebates for the purchase or lease of a new clean air vehicle including battery electric, fuel cell, plug in hybrid, zero emission motorcycles, and advanced technology natural gas vehicles.
<https://www.valleyair.org/drivecleaninthesanjoaquin/rebate/>
- Incentives are available for publically accessible charging infrastructure through the District's Charge Up! Program <http://valleyair.org/grants/chargeup.htm>
- The District's Healthy Air Living school program promotes no idling while picking up children at school and provides no idling signs to schools to encourage drivers to turn off their engines.
- District Indirect Source Rule (9510) accounts for mobile source emissions from construction and new development projects and ensures that emissions from these activities are mitigated.
- District Employer based Trip Reduction Rule (9410) requires large employers to implement measures to encourage employees to take alternative transportation to work in order to reduce single occupancy vehicle trips.
- CARB mobile source strategy calls for increasing the deployment of plug in hybrid, battery electric, and fuel cell vehicles in order to attain federal ozone standards, reducing greenhouse gas emissions, minimizing health risks, reducing petroleum usage and increasing energy efficiency.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

Due to the high priority that community members placed on reducing criteria pollutant and toxic air contaminant emissions that originate from passenger vehicles operating in and around the community, District staff and the Steering Committee have developed targeted strategies for implementation in the Stockton community. As further detailed below, measures developed include additional incentive funding intended to increase the deployment of electric vehicles through the replacement of gas powered vehicles currently in use; launching an electric vehicle car sharing program; providing additional charging infrastructure throughout the community; providing for electric vehicle

maintenance training to increase available repair facilities and job skills; and repairing high polluting passenger vehicles.

The following are proposed measures that are within the Air District’s statutory jurisdiction to implement:

TP.1: INCENTIVE PROGRAM TO HOST A LOCAL TUNE IN TUNE UP EVENTS TO REDUCE EMISSIONS FROM OLDER, HIGH POLLUTING CARS

Overview: The goal of this strategy is to reduce emissions of high emitting passenger vehicles that may be in need of repair by providing funding for up to 5 “Drive Clean in the San Joaquin” Repair Program events within the Stockton AB 617 community in. Under this program, financial incentives up to \$850 will be available for emissions related testing and repairs for eligible high emitting vehicles. Through the program, weekend testing events, if possible, will be held to determine if vehicles are in need of emissions related repairs. Due to the ongoing pandemic, an online and telephone process will be used to provide residents the opportunity to participate until such a time that in-person events can be held safely. Approved participants are provided vouchers which can be utilized for the necessary smog tests, diagnostic work and emissions related repairs at participating STAR certified smog shops. Reducing emissions from passenger vehicles is important due to their contribution to the formation of ozone in the Valley.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Emission Outcome: Reduction

Budgeted Amount: \$300,000

Quantifiable Emission Reductions: Estimated emissions reductions associated with this measure includes up to 3.7 tons of NOx.

TP.2: INCENTIVE PROGRAM FOR THE REPLACEMENT OF PASSENGER VEHICLES WITH BATTERY ELECTRIC OR PLUG IN HYBRID VEHICLES

Overview: The goal of this strategy is to reduce emissions associated with passenger vehicles by replacing 100 vehicles with newer, more fuel efficient models, and providing additional incentives for Level 2 residential chargers in the Stockton community. Emission reductions from passenger vehicles provide benefits to area residents as well as assist in reducing ozone formation in the Valley. Enhanced outreach would be conducted in the Stockton community to ensure that residents are fully aware of

available incentive options and community residents would be provided priority access through the program in order to complete projects as quickly as possible. Through the District's existing Board approved "Drive Clean in the San Joaquin" replacement program, incentives are currently offered for low to moderate income residents of disadvantaged communities to replace their older, high polluting vehicle with a newer, cleaner model. The program currently offers up to \$9,500 towards the purchase on an eligible replacement vehicle, with an additional \$2,000 provided to participating residents who purchase or lease a plug-in hybrid electric or a battery-electric vehicle and want to install a Level 2 charger in their home.

Implementing Agency: SJVAPCD

Strategy Type: Incentives and Outreach

Emission Outcome: Reduction

Budgeted Amount: \$800,000

Quantifiable Emission Reductions: Estimated emissions reductions associated with this measure includes up to 0.2 tons of NOx.

TP.3: INCENTIVE PROGRAM FOR INSTALLATION OF ELECTRIC VEHICLE CHARGING INFRASTRUCTURE

Overview: The goal of this strategy is to provide electric vehicle charging infrastructure necessary to support the deployment of battery electric and plug in hybrid vehicles. The District's Charge Up program currently provides \$5,000 for a Level 2 Single Port, \$6,000 for a Level 2 Dual Port, and \$25,000 for a Level 3/DC Fast Charger with a cap of \$50,000 per applicant and/or site. Having the appropriate charging infrastructure available for Stockton residents will encourage the growth of zero emission passenger vehicles in the community.

This strategy would provide incentive funding for publically accessible charging infrastructure to private and public entities in the Stockton community. This strategy would utilize the existing Charge Up program guidelines and funding amounts. The goal of this measure is to install up to 15 electric vehicle charging stations, including Level 2 and Level 3 chargers, in Stockton at an expected cost of up to \$25,000 per station. This measure is an important part of a long term solution. There are no direct emission reductions associated with this measure, however, this measure supports the emission reductions associated with electric vehicle deployment.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Emission Outcome: Indirect Reduction

Budgeted Amount: \$375,000

TP.4: INCENTIVE PROGRAM FOR EDUCATIONAL TRAINING FOR ELECTRIC VEHICLE MECHANICS

Overview: The goal of this strategy is to provide opportunities to develop and advance the education of personnel on the mechanics, safe operation, and maintenance of alternative fuel vehicles and infrastructure. To support and to encourage ongoing deployment of electric vehicles in the Stockton community it will be necessary to have qualified, trained personnel available to provide service as needed to these vehicles.

This strategy will provide up to \$15,000 per training course for at least 10 alternative fuel mechanic training courses provided by an appropriate entity. While there are no direct emission reductions associated with this measure, this measure supports the emission reductions associated with additional electric vehicle deployment.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Emission Outcome: Indirect Reduction

Budgeted Amount: \$150,000

TP. 5: INCENTIVE PROGRAM FOR THE LAUNCH OF A CAR SHARING PROGRAM IN THE STOCKTON COMMUNITY

Overview: The goal of this strategy is to reduce emissions from passenger vehicles by launching an electric car sharing program in the Stockton community. These types of programs offer access to electric vehicles for a defined period of time at a minimal cost to the user. In addition these programs may allow for a resident to eliminate the use of a gas powered vehicle providing a benefit to community residents by reducing NOx and VOC emissions that would otherwise occur.

This strategy provides funding for a partnering car share provider to launch a program in the Stockton community. The District would leverage experience with existing ride share programs operating in the Valley in order to expand to the Stockton area. This measure would provide \$1,000,000 in funding. Projects will include electric vehicles, related infrastructure and subsidies to help minimize the initial cost to the end user. The emission reductions associated with this measure would be calculated in coordination with the project partners once a specific project location is selected by the CSC.

Implementing Agency: SJVAPCD, Housing Authority of San Joaquin, others

Strategy Type: Incentives

Emission Outcome: Reduction

Budgeted Amount: \$1,000,000

RESIDENTIAL BURNING

BACKGROUND

The wood burning fireplaces and wood burning heaters source category includes emissions from wood burning fireplaces, wood burning heaters, and outdoor wood burning devices. This source category contributes 5.4 tons per year of PM2.5 towards area sources of emissions in the community of Stockton, representing 4.3% of the total PM2.5 inventory. During winter, residential wood burning, including illegal open burning, is one of the largest sources of particulate pollution. Given the significant localized health impacts associated with residential wood smoke, reducing emissions from residential wood burning is a high priority for Stockton. Many scientific studies have found that prolonged inhalation of wood smoke contributes to adverse impacts on human health, especially among children, elderly, and people with certain medical conditions, and individuals who are sensitive to the impacts of air pollution. A number of environmental justice communities experience a disproportionately high level of directly emitted PM2.5 emissions from residential wood burning.

COMMUNITY CONCERNS AND COMMENTS

The community of Stockton raised concerns with residential wood smoke, both from the use of wood burning fireplaces and wood burning heaters and illegal open outdoor burning. The CSC provided recommendations to implement the enhanced financial incentives for residents to replace existing wood burning devices and pellet stoves with natural gas or electric technologies which will reduce the smoke impacts associated with residential wood burning for downwind communities. The Stockton community made recommendations to ensure significant efforts are made to conduct outreach and education in support of this measure and to increase compliance rates with District Rules 4901 – *Wood Burning Fireplaces and Wood Burning Heaters* and Rule 4103 – *Open Burning*.

CURRENT CONTROL PROGRAMS

The District's comprehensive strategy to reduce emissions from residential wood burning includes implementation of stringent wood burning curtailment requirements through Rule 4901, strong outreach and education to establish the necessary public support, and deployment of financial incentives to transition away from wood burning to cleaner alternatives. This approach that combines regulatory and incentive based strategies is designed to improve the public health by reducing toxic wood smoke emissions in Valley neighborhoods during the peak PM2.5 winter season (November through February). The District has continually enhanced the strategy since adopting the first regulation in 1993. Today, the District has the toughest and most effective residential wood burning strategy in the nation as it reduces emissions when and where most needed, such as during multi-day periods of stagnation, in the evening hours, and in neighborhoods where residents live and play. Additionally, the District enforces the requirements of Rule 4103 which prohibits the use of open outdoor fires for the purpose of disposing of waste materials.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

Due to the priority that the Steering Committee and members of the public placed on reducing PM2.5 and toxic air contaminant emissions that originate from residential burning in and around the community, targeted measures have been developed to reduce emissions from this source category. Building upon the effective implementation of the District's wood burning emission reduction strategy, the District commits to providing enhanced incentives to replace existing wood burning devices and increased outreach efforts to educate the public about harmful impacts of wood smoke and specific actions they can take to reduce pollution and comply with District requirements.

The following are proposed measures that are within the Air District's statutory jurisdiction to implement:

RB.1: INCENTIVE PROGRAM FOR THE REPLACEMENT OF EXISTING WOOD BURNING DEVICES AND PELLET STOVES WITH NATURAL GAS OR ELECTRIC TECHNOLOGIES

Overview: The goal of this strategy is to reduce the impact of PM2.5 pollution associated with residential wood burning by replacing approximately 100 wood burning devices in Stockton with new natural gas devices or electric heat pumps. During the winter months, one of the largest sources of particulate pollution comes from residential wood burning. Emissions are the result of incomplete combustion and are emitted into Valley neighborhoods where residents live and play. Multiple scientific studies show that prolonged inhalation of wood smoke has adverse impacts on human health. Inhalation of wood smoke contributes to lung disease, and pulmonary arterial hypertension, which can eventually lead to heart failure. Through the District's existing Board approved Burn Cleaner program, incentives are currently offered to replace existing wood or pellet burning inserts or free-standing stoves with new natural gas devices or electric heat pumps. The proposed program under this strategy would offer up to \$3,000 to replace an existing wood burning device with a natural gas device and up to \$4,000 for an eligible electric heating source, such as an electric heat pump.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Emission Outcome: Reduction

Budgeted Amount: \$300,000

Quantifiable Emission Reductions: Estimated emission reductions associated with this measure includes up to 49tons of PM2.5.

RB.2: EDUCATE PUBLIC REGARDING HARMFUL EFFECTS OF RESIDENTIAL WOOD BURNING FIREPLACE AND WOOD BURNING HEATER SMOKE

Overview: The goal of this strategy is to conduct outreach in the community to educate residents regarding the harmful health effects of residential fireplace wood burning and wood burning heater smoke and the importance of reducing it. Residential wood burning education is important because airborne particles produced by wood smoke (such as PM 2.5) negatively impact human health, especially sensitive populations such as children and seniors who may live in areas where residents burn wood for heating, cooking, or recreation. This strategy's focus includes providing information about programs available to support the transition to natural gas and electric devices, as well as the winter no wood-burning season and District Rule 4901.

This strategy would create a series of four (4) public workshops to educate Stockton residents about wood burning topics and to address questions and concerns interactively and accessibly within a forum setting. Workshops would take place in locations commonly available to the public such as libraries, schools, and community, health, or recreation centers. Depending on circumstances, workshops could also be held in a virtual environment such as Zoom. Wood burning infographics and educational materials would also be circulated to at least six (6) community spaces throughout the Stockton community and the surrounding community with the goal of continuing to spread awareness and increasing applications for incentive funds supporting the transition to natural gas and electric devices. The District will look to coordinate and work with the CSC, community based organizations, and Stockton residents to develop the materials and to provide outreach for the events.

Implementing Agency: SJVAPCD

Strategy Type: Outreach

Emission Outcome: Reduction in localized PM2.5, PM10, NOx, VOC, and CO emissions through higher compliance rates

RB.4: REDUCE ILLEGAL BURNING THROUGH RESIDENTIAL OPEN BURNING EDUCATION

Overview: The goal of this strategy is to reduce illegal burning of residential waste, such as trash, through outreach and education while focusing on areas of concern identified by the CSC, including residential areas and homeless encampments. It is important to continue to educate residents of the localized, harmful emissions created through the burning of residential garbage and how it negatively effects health. Smoke from burning trash and yard waste contain toxic pollutants which are harmful to human health.

This strategy would include working with the City of Stockton and the fire agencies to better understand the illegal open burning issues within the AB 617 community,

establish a series of public workshops to educate Stockton residents about illegal open burning, the health impacts of burning waste, and to address questions and concerns interactively and accessibly within a forum setting either in person or in an online platform such as Zoom. In person workshops would take place in locations commonly available to the public such as libraries, schools, and community, health, or recreation centers when possible. Videos will be used as an outreach tool and be available in languages such as Spanish, Tagalog and others.

Implementing Agency: SJVAPCD, City of Stockton, and local fire agencies

Strategy Type: Outreach

Emissions Outcome: Reduction in localized PM2.5, PM10, NOx, VOC, and CO emissions through higher compliance rates

PORT OF STOCKTON

The Port of Stockton (Port) is a deep-water river port located on the Stockton Ship Channel of the Pacific Ocean and is an inland port located approximately 70 nautical miles from the ocean. The Port is a hybrid public/private entity and is governed by a commission appointed by the City of Stockton and San Joaquin County. The Port serves as lead agency under the California Environmental Quality Act (CEQA) for projects within its jurisdiction. Cargo is delivered to and from the Port by ships, trucks, and trains. With four major freeways, two transcontinental railroads, an international waterway, and a regional airport, the Port handles liquid and dry bulk, break bulk, and agricultural commodities⁵.

In 2017, nearly 4.7 million tons of cargo moved through the Port of Stockton, and that number is expected to continue to grow. The Port is the fourth busiest in the state and as a result, it has an important role in the local and regional economy, including directly and indirectly supporting thousands of jobs⁶. The Port works with upwards of fifty-five different countries, with goods flowing in both directions.

Figure 4-9 Port of Stockton

COMMUNITY CONCERNS AND COMMENTS

The Stockton community identified the activities associated with the Port as an air quality concern. Sources of air pollution include heavy-duty vehicle traffic, ocean-going vessels, commercial harbor craft, cargo handling equipment (such as yard trucks, forklifts, reach stackers, and other equipment) and stationary sources located there. The Community Steering Committee (CSC) have recommended placing air monitors to

⁵ Port of Stockton, *About Navigating Success*. Retrieved 1/25/2021 from <https://www.portofstockton.com/about/>

⁶ Port of Stockton, *Port Facts & Figures: By the Numbers*. Retrieved 1/25/2021 from <https://www.portofstockton.com/port-facts-figures/>

identify major emission contributors, a comprehensive plan to reduce exposures and emissions, and continued residential involvement on the Port's emission reduction planning efforts.

CURRENT CONTROL PROGRAMS

The District does not have regulatory authority of emissions from the following Port of Stockton sources which are subject to statewide CARB regulations. Ongoing efforts to reduce emissions from the Port of Stockton, include the following CARB regulations. For more information, refer to *Statewide Strategies Overview of California Air Resources Board's Statewide Actions*.

- **Ocean Going Vessel Fuel Regulations**

Adopted in August 2020 and is an updated version of the CARB's At-Berth Regulation that supersedes the existing At-Berth Regulation, as specified, and is designed to achieve further emissions reductions from vessels at berth to improve air quality in communities surrounding ports and terminals throughout California. Emissions reductions will be achieved through the inclusion of new vessel categories (such as vehicle carriers and tanker vessels), new ports, and independent marine terminals, and through updated control requirements, among other provisions.

<https://ww2.arb.ca.gov/our-work/programs/ocean-going-vessel-fuel-regulation>

- **Commercial Harbor Craft Regulation**

CARB's existing commercial harbor craft regulation was adopted in 2007 and will be fully implemented by the end of 2022. CARB is working through a public process to consider additional amendments that may further reduce emissions and pursue more stringent in-use standards, with consideration for Tier 4 engine technology and near-zero and zero emission technologies. For more information on the regulation and potential new regulatory concepts, visit:

<https://ww2.arb.ca.gov/our-work/programs/commercial-harbor-craft>.

- **Mobile Cargo Handling Equipment**

Mobile cargo handling equipment is any motorized vehicle used to handle cargo or perform routine maintenance activities at California's ports and intermodal rail yards. The type of equipment includes yard trucks (hostlers), rubber-tired gantry cranes, container handlers, forklifts, etc. The Mobile Cargo Handling Equipment (CHE) Regulation was adopted in 2005 to reduce toxic and criteria emissions to protect public health and was fully implemented by the end of 2017. CARB staff is currently assessing the availability and performance of zero-emission technology to further reduce emissions. For more information on the regulation, visit: <https://ww2.arb.ca.gov/our-work/programs/cargo-handling-equipment>.

- **Drayage Truck Regulation**

This regulation reduces air toxics and criteria pollutant emissions from drayage trucks. A drayage truck is any in-use on-road vehicle with a gross vehicle weight rating of greater than 26,000 pounds used for transporting cargo to and from ports and intermodal railyards. The regulation requires all drayage trucks to operate with an engine that is a 2007 model year or newer. Drayage trucks must also meet the requirements of the CARB Truck and Bus Regulation, which

requires that all drayage trucks must have 2010 model year or newer engines by January 1, 2023.

<https://ww2.arb.ca.gov/our-work/programs/drayage-trucks-seaports-railyards>

- **Transport Refrigeration Units Regulations**

Transport refrigeration units congregate at distribution centers, railyards, and other facilities, resulting in the potential for health risks to those that live and work nearby. CARB is working through a public process to consider new requirements to transition the transport refrigeration units fleet to zero emission operations by requiring both zero emission technology and supporting infrastructure. For more information on this new regulation, visit: <https://ww2.arb.ca.gov/our-work/programs/transport-refrigeration-unit/new-transport-refrigeration-unit-regulation>.

- **Enforcement of Heavy-Duty Vehicles Inspection Programs**

When emissions control systems are not operating correctly, in-use emissions can increase. CARB's current inspection programs include the roadside Heavy-Duty Vehicle Inspection Program and the fleet Periodic Smoke Inspection Program. These regulations require heavy-duty vehicles operating in California be inspected for excessive smoke and tampering. In July 2018, CARB approved amendments to the Heavy-Duty Vehicle Inspection Program and the Periodic Smoke Inspection Program to reduce the smoke opacity limits to levels more appropriate for today's modern engine technology. CARB is now exploring the development of a more comprehensive heavy-duty inspection and maintenance program that would help ensure all vehicle emissions control systems are maintained adequately throughout the vehicles' operating lives. For more information on existing heavy-duty maintenance programs, visit <https://ww2.arb.ca.gov/our-work/programs/heavy-duty-diesel-inspection-periodic-smoke-inspection-program>.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN THE COMMUNITY

Several strategies have been identified under this Port section that span from advocating issues, air monitoring placement, collaborating with the City, County, and Port of Stockton, to providing input through resident involvement in a sustainable planning process. Collaborative Port strategies developed to reduce emissions are further detailed below.

The following are proposed measures that are not within the Air District's statutory jurisdiction to implement:

P.1: COLLABORATING TO FACILITATE ENHANCED PLATFORMS FOR DISCUSSION AND INFORMATION SHARING BETWEEN THE COMMUNITY AND THE PORT OF STOCKTON AS PORT-RELATED PROGRAMS AND PROJECTS ARE DEVELOPED

Overview: The purpose of this strategy is to provide a platform for discussion between Port of Stockton, CSC members, residents, community-based organizations, and other stakeholders to ensure air quality impacts associated with future development projects

related to the Port of Stockton are taken into consideration.

The South Stockton CSC has prioritized the need for better facilitation of local involvement, and community notification regarding Port of Stockton development projects. In keeping with that priority, the Port has committed to adopting a Community Environmental Committee (CEC) geared toward improving their relationship with the community by implementing new engagement platforms.

This measure would include the following commitments by the Port:

1. Establishing a recurring CEC, in 2021, CEC, in 2021, to build collaboration and improve dialogue between concerned citizens in the community and environmental justice organizations to allow them a forum to raise awareness of health-related concerns regarding emissions from existing and future operations at the Port of Stockton. The goals of the CEC will be to encourage additional community engagement, bring community insights to the Port's environmental improvement efforts, and work on select environmental projects within the Port's jurisdiction to help preserve, protect, and improve the environment. Prospective future projects that would be brought before the CEC include:
 - a. Discussion of future Port of Stockton projects and expansion
 - b. Port of Stockton emission reduction strategy development
 - c. Environmental event planning
 - d. Community outreach support
 - e. Program development
2. Utilizing the Port of Stockton's website to broadcast outward-facing communications through quarterly updates, and to add website functionality for submitting comments, questions, and complaints.
3. Providing routine updates to the CSC regarding ongoing projects happening at the Port of Stockton.

Implementing Agency: Port of Stockton

Strategy Type: Partnership

P.2: INCENTIVE PROGRAM FOR THE DEPLOYMENT OF CLEAN HEAVY-DUTY MOBILE EQUIPMENT OPERATING AT PORTS, INTERMODAL RAILYARDS AND DISTRIBUTION CENTERS

This measure is still being considered by the Stockton Steering Committee

Overview: The goal of this strategy is to reduce emissions from old, high-polluting diesel engines in heavy-duty mobile off-road equipment operating at the Port of Stockton.

Diesel pollution from on-road and off-road operations greatly impacts the health of the community surrounding the Port. Funding will be offered to replace diesel mobile cargo handling equipment used to handle cargo or perform routine maintenance activities at the Port with new, zero and near-zero emissions technologies. Based on CSC priorities, zero-emissions will be prioritized for funding where applicable to the equipment type. Established methodology through the [Carl Moyer Program](#) will be used to quantify the emission reductions for funded projects, but an estimate of potential project reductions is summarized below.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Emission Outcome: NOx & PM reductions

Budget Amount: \$2,000,000

Quantifiable emissions reductions: Estimated emission reductions associated with this measure includes up to 2 tons of NOx.

The following are additional suggested measures not within the Air District's jurisdiction to directly implement:

P.3: TUG BOAT REPLACEMENT/REPOWER

Overview: This measure is still being considered by the Stockton Steering Committee

The goal of this strategy is to reduce emissions from old, high-polluting diesel engines in tugboats operating at the Port of Stockton. Diesel pollution from freight transport operations greatly impacts the health of the community surrounding the Port. Funding will be offered to repower the existing propulsion and auxiliary engines with new diesel engines. The new engines will have the highest tier rating available that will fit within the confines of their engine compartments. Established methodology through the [Carl Moyer Program](#) will be used to quantify the emission reductions for funded projects.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Emission Outcome: NOx & PM reductions

Budget Amount: \$1,000,000

Quantifiable emissions reductions: Estimated emission reductions associated with this measure includes up to 1 ton of PM and 29 tons of NOx.

P.4: MARINE EXHAUST INTAKE BONNET EMISSIONS CONTROL

Overview: This measure is still being considered by the Stockton Steering Committee. The goal of this strategy is to reduce emissions from the diesel engines of marine vessels while berthed at the Port of Stockton. Diesel pollution from freight transport operations greatly impacts the health of the community surrounding the Port. Funding will be offered to purchase and install a marine vessel exhaust capture and control system. This system will work with marine vessels to reduce PM and NOx emissions while at berth. Available exhaust capture and control systems can reduce PM2.5 up to 95% and NOx up to 90%. Emission reductions for these projects will be quantified using state approved calculation methodology.

Implementing Agency: SJVAPCD

Strategy Type: Incentives

Emission Outcome: NOx reductions

Budget Amount: \$2,000,000

Quantifiable emissions reductions: Estimated emission reductions associated with this measure include up to 240 tons of NOx

P.5: UNDERSTANDING AND MITIGATING THE IMPACT OF ALGAL BLOOMS ON AIR QUALITY

Overview: Algal blooms can produce airborne nitrogen compounds like nitrogen oxides that contribute to the formation of other air pollutants such as ground-level ozone, a component of smog which can restrict visibility. Wind and weather can carry ozone many miles from urban to rural areas.⁷ The goal of this strategy is to better understand, and where feasible, mitigate the impact of algae blooms on air quality. While the District, the City of Stockton and the Central Valley Regional Water Quality Control Board (CVWB) have committed to extensive interagency cooperation and action in this Stockton Community Emission Reduction Program (CERP), additional opportunities may present themselves in future discussions involving the CSC, the public, the City, and the District, especially as implementation of the CERP progresses.

This measure is the District's commitment to continue to work with local, water-focused organizations, CVWB, the Port, the City, and academic institutions to facilitate

<https://www.epa.gov/nutrientpollution/effects-environment>

discussions between the community and the involved agencies to better understand, and where feasible mitigate, the impact of algae blooms on air quality. Currently, CVWB has developed a workgroup called the California Cyanobacteria and Harmful Algal Bloom (CCHAB) Network. The CCHAB Network includes federal, state, and local agencies, tribes, academia, and non-governmental organizations working to develop a comprehensive coordinated program to address the causes and impacts of harmful algal blooms (HABs) in the state.⁸ As part of the coordinated program, the State Water Resources Control Board's Surface Water Ambient Monitoring Program (SWAMP) developed the Freshwater HAB Program.⁹ The Central Valley Water Board participates in the statewide Freshwater HAB effort by:

- Collecting information on blooms
- Sampling and analyzing HABs
- Providing information on blooms to local waterbody managers and health officers
- Conducting outreach and education to the general public
- Collaborating with academia and interested stakeholders to better understand the causes of HABs

Implementing Agency: SJVAPCD, Central Valley Regional Water Quality Control Board, Port of Stockton, and City of Stockton

Strategy Type: Partnership

Emission Outcome: Mitigation

STATIONARY SOURCES

STATIONARY SOURCES IN STOCKTON

There are a variety of industrial sources located in and around the Stockton Community. These sources range from smaller operations like gasoline dispensing facilities (GDFs), commercial cooking operations, and auto body coating operations to medium sized operations like wood products and agricultural products processing operations, to larger operations like the biomass power facility, bulk gasoline storage, and cement and concrete products facilities; which include equipment like ovens, internal combustion (IC) engines, boilers/steam generators, and many others.

Criteria pollutant emissions from this source category include NO_x, SO_x, PM₁₀/PM_{2.5}, CO, and VOC, and toxic air contaminants (TACs) like benzene, toluene, xylene, arsenic, and dioxins. Within the Stockton community, 161.57 tons per year of NO_x, 210.08 tons per year of VOC and 7.93 tons per year of PM_{2.5} are attributed to stationary sources.

COMMUNITY CONCERNS AND COMMENTS

During committee discussions regarding industrial sources, committee members identified commercial cooking operations, a wood products manufacturing facility, a biomass facility, a cement products processing facility, and visible dust emissions and odors from operations in and around the port as sources of concern, with suggestions ranging from providing “incentives” to replace older, higher polluting equipment and the evaluation of existing state and District regulatory measures.

CURRENT CONTROL PROGRAMS

For more than 25 years, the District has implemented several generations of emissions control regulations for stationary and area sources under its regulatory jurisdiction. These control measures represent the nation’s toughest air pollution regulations and have greatly contributed to reducing ozone and particulate matter concentrations in the Valley. Stringent and innovative rules, such as those for indirect source review, residential wood burning, glass manufacturing, and agricultural burning, have set benchmarks for California and the nation. While there has been significant progress in reducing air pollution with these regulations, which have been greatly aided by the pollution reduction efforts and financial investments of valley businesses and residents, the District continues to adopt and modify rules to achieve ongoing emissions reductions and advance our progress toward clean air.

Gasoline Dispensing Facilities (GDFs):

Gasoline dispensing facilities in the San Joaquin Valley are subject to District Rule 4621 – *Gasoline Transfer into Stationary Storage Containers, Delivery Vessels, and Bulk Plants* and Rule 4622 – *Gasoline Transfer Into Motor Vehicle Fuel Tanks*.

The purpose of Rule 4621 is to limit VOC emissions from stationary storage containers, delivery vessels, and bulk plants. This rule applies to gasoline storage containers with capacities greater than 250 gallons and has requirements to install CARB certified

vapor control systems. The purpose of Rule 4622 is to limit emissions of gasoline vapors from the transfer of gasoline into motor vehicle fuel tanks. This rule applies to any gasoline storage and dispensing operation or mobile fueler from which gasoline is transferred into motor vehicle fuel tanks. This rule also requires the installation of CARB certified vapor control systems. GDFs are subject to stringent enforcement provisions, including ongoing monitoring of equipment and annual inspections.

Commercial Cooking Operations:

Commercial cooking operations are subject to Rule 4692 – *Commercial Charbroiling* and District Rule 4693 – *Bakery Ovens*. The purpose of Rule 4692 is to limit VOC and PM10 emissions from charbroiling cooking operations. The purpose of Rule 4693 is to limit VOC emissions from the baking of yeast-leavened food products. These rules have very stringent emission limits, periodic monitoring, and source testing requirements.

Commercial cooking operations are subject to stringent enforcement provisions, including ongoing recordkeeping of materials processed and regular inspections.

Auto Body Coating Operations:

Auto body coating operations in the San Joaquin Valley are subject to District Rule 4612 – *Motor Vehicle and Mobile Equipment Coating Operations* and Rule 4101 – *Visible Emissions*.

The purpose of Rule 4612 is to limit VOC emissions from the coating of motor vehicles, mobile equipment, associated parts and components, and associated organic solvent cleaning, storage, and disposal. This rule applies to any person who supplies, sells, offers for sale, manufacturers, or distributes any automotive coating for use within the District, as well as any person who uses, applies, or solicits the use or application of any automotive coating within the District. The rule requires the sale and use of low VOC coatings and solvents, in addition to stringent requirements for the application of these coatings. Auto body coating operations are subject to stringent enforcement provisions, including ongoing recordkeeping of coatings/solvents used and regular inspections. They also must demonstrate continued compliance with additional visible emissions requirements as described in Rule 4101.

Wood Products Processing Operations:

Wood products processing operations are subject to Rule 4101 – *Visible Emissions*, Rule 4201 – *Particulate Matter Concentration*, Rule 4202 – *Particulate Matter – Emission Rate*, Rule 4306/4320 – *Boilers, Steam Generators, and Process Heaters*, and District Rule 4702 – *Internal Combustion Engines*. The purpose of Rules 4101, 4201, and 4202 is to limit particulate matter emissions from exhaust stacks and industrial processes. The purpose of Rules 4306, 4320, and 4702 is to limit emissions of NO_x, CO, VOC, SO_x, and PM10 from fossil fuel combustion in boilers, steam generators, process heaters, and stationary internal combustion engines commonly used in these types of facilities. These rules have very stringent emission limits, periodic monitoring, and source testing requirements.

Wood products processing facilities are subject to stringent enforcement provisions, including ongoing recordkeeping of materials processed and regular inspections.

Agricultural Products Processing Operations:

Agricultural products processing operations are subject to Rule 4101 – *Visible Emissions*, Rule 4201 – *Particulate Matter Concentration*, Rule 4202 – *Particulate Matter – Emission Rate*, and Rule 4306/4320 – *Boilers, Steam Generators, and Process Heaters*. The purpose of Rules 4101, 4201, and 4202 is to limit particulate matter emissions from exhaust stacks and both indoor and outdoor industrial processes. The purpose of Rules 4306 and 4320 is to limit emissions of NO_x, CO, SO_x, and PM₁₀ from natural gas combustion in boilers, steam generators, and process heaters. These rules have very stringent emission limits, periodic monitoring, and source testing requirements.

Agricultural products processing facilities are subject to stringent enforcement provisions, including ongoing recordkeeping of materials processed and annual inspections.

Cement and Concrete Products Operations:

Cement and concrete processing operations are subject to Rule 4101 – *Visible Emissions*, Rule 4201 – *Particulate Matter Concentration*, and Rule 4202 – *Particulate Matter – Emission Rate*. The purpose of Rules 4101, 4201, and 4202 is to limit particulate matter and visible emissions from exhaust stacks, process equipment, and conveying equipment. These rules have very stringent emission limits, periodic monitoring, and source testing requirements.

Cement and concrete products processing facilities are subject to stringent enforcement provisions, including ongoing recordkeeping of materials processed and annual inspections.

Biomass Power Facilities:

Biomass power facilities in the San Joaquin Valley are subject to District Rule 4352 – *Solid Fuel Fired Boilers, Steam Generators, and Process Heaters* and Rule 4101 – *Visible Emissions*.

The purpose of Rule 4352 is to limit emissions of NO_x and CO from solid fuel fired boilers, steam generators and process heaters. This rule applies to any boiler, steam generator or process heater fired on solid fuels, such as biomass. This rule has very stringent emission limits, periodic monitoring, and source testing requirements.

Biomass power facilities are subject to stringent enforcement provisions, including ongoing recordkeeping of materials burned and annual inspections. These facilities must demonstrate continued compliance with additional visible emissions requirements as described in Rule 4101.

Organic Liquid (Gasoline) Terminal Facilities:

Bulk gasoline terminal facilities in the San Joaquin Valley are subject to District Rule 4623 – *Storage of Organic Liquids* and Rule 4624 – *Organic Liquid Loading*.

The purpose of Rule 4623 is to limit VOC emissions from the storage of organic liquids. This rule applies to any tank with a capacity of 1,100 gallons or greater in which any organic liquid is placed, held, or stored. The purpose of Rule 4624 is to limit VOC emissions from the transfer of organic liquids. This rule applies to organic liquid transfer facilities. Facilities that store or transfer organic liquids, such as gasoline pipeline terminals are subject to stringent enforcement provisions, including quarterly leak inspection requirements and annual inspections.

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN THE COMMUNITY

Due to the priority that community members placed on reducing PM2.5 and toxic air contaminant emissions that originate from industrial sources in and around the community, the following strategies have been developed for implementation in the Stockton community.

The following are proposed measures that are within the Air District’s statutory jurisdiction to implement:

SS.4: ENHANCED STATIONARY SOURCE INSPECTION FREQUENCY

Overview: The goal of this strategy is to limit the potential for localized air quality impacts at permitted facilities that have had emissions violations in the last three years.

The District conducts inspections and investigations of permitted sources to determine compliance with a multitude of health-protective local, state, and federal air quality regulations that target both criteria and toxic pollutants. The District closely monitors these sources and strictly enforces applicable requirements. Compliance inspections are unannounced whenever possible and involve both a physical inspection of the facility and a review of their records. When a violation of a District permit, rule, or regulation is identified, the District takes an appropriate level of enforcement action.

The District reviewed the enforcement history over a three year period (2017-2020) for the permitted facilities in the Stockton community, and determined that 51 enforcement actions were issued to facilities (not including gas stations) for violations resulting in excess emissions. These violations occurred at 13 permitted facilities in the area and 1 ocean-going vessel. The District also issued 18 enforcement actions at 14 gas stations in the Stockton community for violations resulting in excess emissions. The District believes that more frequent inspections for these 27 facilities would help to limit the potential for air quality impacts associated with emissions violations.

The District will increase the frequency of inspection at each facility within the Stockton community that has had an emission-based violation over the past three (3) years. These facilities will be inspected at least twice per calendar year for the next five (5)

years or until the facility has four (4) consecutive inspections without an emissions violation, whichever occurs first.

Implementing Agency: SJVAPCD

Strategy Type: Enforcement

Emission Outcome: Reduction in excess PM2.5, PM10, NOx, VOC, and CO emissions through higher compliance rates

SS.8: REGULATORY ACTIONS: EVALUATION OF RULES TO DETERMINE WHETHER ADDITIONAL REDUCTIONS ARE POSSIBLE FOR SOURCES OF NOx AND PM2.5

Overview: In addition to the Best Available Retrofit Control Technology (BARCT) implementation schedule above, the District will be analyzing District Rule 4352 - *Solid Fuel-Fired Boilers, Steam Generators and Process Heaters* to pursue additional emission reduction opportunities beyond BARCT.. This rule amendment will be reviewed on the schedule included in the District's *2018 PM2.5 Plan* adopted by CARB into the State Implementation Plan.

Emissions reductions achieved through the implementation of more stringent limits potentially required through these rule amendments will further contribute to reduced exposure to air pollution in the community. Community Steering Committee members, members of the AB 617-selected community, and the general public are encouraged to be involved in the upcoming rulemaking process for these rules.

Implementing Agency: SJVAPCD

Strategy Type: Regulatory

Emission Outcome: Reduction

SS.9: REGULATORY ACTIONS: EXPEDITED FACILITY RISK ASSESSMENT AND RISK REDUCTION UNDER DISTRICT IMPLEMENTATION OF THE AIR TOXICS HOT SPOTS INFORMATION AND ASSESSMENT ACT (AB 2588)

Overview: This strategy will expedite the review of stationary sources of pollution in the community that are currently being reassessed under the Air Toxics "Hot Spots" Information and Assessment Act (AB 2588).

Under AB 2588, all facilities located within the boundaries of the District are required to report toxic substances released into the air by their operation to the District. The District's responsibilities under the state's Air Toxics "Hot Spots" program are to:

- Identify Valley facilities that release toxic air contaminants as a result of their day to day operations,
- Collect and quantify emission data from equipment located at permitted facilities,
- Identify facilities causing localized health impacts on nearby residents,
- Determine facility-wide health risks resulting from the emission of toxic air contaminants,
- Notify nearby residents and businesses of significant risk facilities in their vicinity, and
- Require that significant risk facilities reduce their risks to a level that no longer constitutes a significant risk to nearby residences and businesses.

The District's implementation of AB 2588, California's Air Toxics "Hot Spots" Information and Assessment Act, has resulted in major reductions in emissions of air toxics from existing sources in the San Joaquin Valley. Under this right-to-know law, the District has worked with Valley facilities to quantify emissions of air toxics, determine the health risk caused by those emissions, report emissions and any significant risks through written public reports and neighborhood public meetings, and take steps to reduce such risks.

This measure will result in the expedited AB 2588 reviews for facilities located within the Stockton AB 617 Community. More information about this effort can be found later in the section, "Additional Regulatory Measures to Reduce Emissions in the Community" found later in this chapter. Please refer to Appendix E for additional details about the District's Health Risk Assessment Process, and a table identifying the AB 2588 reassessment status of each facility within the community as of December 21, 2020.

Implementing Agency: SJVAPCD

Strategy Type: Regulatory

Emission Outcome: Reduction

DUST IN THE COMMUNITY

BACKGROUND

In the Stockton community sources of dust emissions include from construction, open areas, and other earthmoving activities. Construction, demolition and other earthmoving activities emit 10.57 tons per year of PM_{2.5} in the community. Unpaved road dust and dust from open areas also have minor PM_{2.5} emissions in the area.

COMMUNITY CONCERNS AND COMMENTS

The Community Steering Committee expressed an interest in evaluating air quality impacts and felt it important to look to reduce dust from construction projects and other sources of dust in the community.

CURRENT CONTROL PROGRAMS

Regulation VIII (Fugitive PM₁₀ Prohibition) / Dust Control Plan (DCP): The District's Regulation VIII series (Fugitive PM₁₀ Prohibitions) was adopted in November 2001, and subsequently amended in 2004. This rule series contains a comprehensive suite of rules designed to reduce fugitive PM₁₀ emissions from a range of sources including:

- Specified outdoor fugitive dust sources.
- Construction or demolition related disturbances of soil, including land clearing, grubbing, scraping, excavation, extraction, land leveling, grading, cut and fill operations, travel on the site, travel access roads to and from the site, and demolition activities.
- Outside storage and handling of any unpackaged material, which emits or has the potential to emit dust when stored or handled.
- Prevention and cleanup of mud and dirt whenever it is deposited (carryout and trackout) onto public paved roads
- Open areas 0.5 acres or more within urban areas, or 3.0 acres or more within rural areas that contain at least 1,000 square feet of disturbed surface area.
- Any paved, unpaved, or modified public or private road, street highway, freeway, alley way, access drive, access easement, or driveway.
- Unpaved vehicle/equipment areas, including parking, fueling, service, shipping, receiving, and transfer areas.
- "Off-field" agricultural sources including, but not limited to, unpaved roads, unpaved vehicle/equipment traffic areas, and bulk materials.

The Regulation VIII rules are implemented via the District's Dust Control Plan (DCP) program: https://www.valleyair.org/busind/comply/PM10/compliance_PM10.htm

STRATEGIES DEVELOPED FOR IMPLEMENTATION IN COMMUNITY

Due to the priority that the Steering Committee placed on reducing dust in the community, specific a specific strategy has been developed to target emission reductions from fugitive dust sources. The District is proposing increased enforcement

of Regulation VIII rules to reduce fugitive dust from construction and earthmoving activities within the community.

The following proposed strategy is within the Air District's statutory jurisdiction to implement:

FD.1: ENHANCED ENFORCEMENT OF DISTRICT REGULATION VIII FUGITIVE DUST REQUIREMENTS

Overview: The goal of this strategy is to limit the potential for localized air quality impacts associated with fugitive dust from construction/earthmoving activities and open areas subject to District Regulation VIII.

District rules limit fugitive dust emissions from construction, demolition, and earthmoving; bulk material storage; open areas; and unpaved roads and vehicle/equipment traffic areas. Furthermore, District rules restrict carryout and trackout of dirt and dust onto paved public roadways. Regulation VIII does not limit emissions from vehicles used in these projects.

Regulation VIII requires, a Construction Notification or Dust Control Plan for all construction activities in the District involving one or more acre of disturbed surface area. District staff reviews each Construction Notification and Dust Control Plan prior to the start of construction, to ensure that operators have planned to utilize required work practices to reduce fugitive dust emissions to within rule limitations. Additionally, District staff surveys and inspects such sites, responds to complaints regarding fugitive dust, and provides training classes for those required to submit Dust Control Plans.

In reviewing the compliance history for the Stockton community, it was determined that the District had received 26 complaints regarding fugitive dust related issues over the last 3 years, with the majority pertaining to construction/earthmoving activities and open areas. Building on the District's existing surveillance and complaint response efforts, the District will conduct at least one targeted enforcement effort within the Stockton community during both the 2nd and 3rd quarters for the next five (5) years. This fugitive dust reduction enforcement strategy is being included in the CERP in response concerns raised by CSC members regarding fugitive dust emissions in the community and the complaint history analysis performed by the District.

Implementing Agency: SJVAPCD

Type of Action: Enforcement

ADDITIONAL INFORMATION ABOUT REGULATORY MEASURES TO REDUCE EMISSIONS IN THE COMMUNITY

Due to the nonattainment status of the Valley Air Basin for the criteria pollutants of fine particulate matter and ozone, the District requires that permitted facilities implement the most stringent control measures feasible for implementation to control criteria pollutants and associated precursor emissions. Beyond the regulations and stringent permitting requirements that are already implemented Valley-wide, the following sections detail enhanced regulatory strategies that will be implemented in the AB 617-selected community.

BARCT EXPEDITED SCHEDULE

In addition to community monitoring and emission reduction program requirements, AB 617 requires that air districts located in non-attainment areas perform a Best Available Retrofit Control Technology (BARCT) analysis for all categories of units at facilities subject to the state Cap-and-Trade program. In accordance with AB 617 requirements, the District adopted an expedited schedule for performing further determination of BARCT requirements in December, 2018.

The District utilized an extensive evaluation process to make an initial determination of whether the rules that apply to Cap-and-Trade facilities meet all state BARCT requirements, as mandated by AB 617. While District rules are expected to meet BARCT due to the District's ongoing extensive regulatory evaluations, the proposed BARCT implementation schedule includes commitments to establish updated BARCT determinations for District rules as required under AB 617. The proposed schedule was prepared through a public process, which included two public workshops. In addition to the BARCT implementation schedule, the District will be proceeding with amending a number of District rules included as commitments in the District's *2018 PM_{2.5} Plan*, as discussed earlier in the CERP, that are also subject to the AB 617 BARCT implementation requirement.

In conjunction with District rules applicable to stationary source equipment, under the District's New Source Review permitting regulation, new facilities or facilities modifying equipment that emit air pollutants greater than 2 pounds per day (lb/day), are subject to stringent emissions control requirements. For each piece of equipment that has the potential to emit over the 2 lb/day threshold, the District requires the use of the best available air pollution control technology (BACT) used to control emissions from similar types of equipment. As part of this BACT analysis, the District determines if cleaner technologies that are not generally used for the equipment being analyzed could be used to further reduce emissions from the proposed equipment. This very stringent requirement ensures that the most effective air pollution control technique is utilized, resulting in the least amount of air pollution possible.

In addition to these stringent requirements on new sources of air pollution, rules adopted in the San Joaquin Valley are regularly analyzed for compliance with the state's BARCT requirements.

Best Available Retrofit Control Technology (BARCT)

Existing stationary sources in non-attainment areas such as the San Joaquin Valley have been subject to BARCT requirements since the 1980s, as opposed to some nonattainment areas in California relying on market-based criteria pollutant emission reduction programs and where facilities were not required to comply with BARCT. Although AB 617 does not specifically define BARCT, California Health and Safety Code (CH&SC) Section 40406 defines BARCT as follows:

Best Available Retrofit Control Technology (BARCT) is an air emission limit that applies to existing sources and is the maximum degree of reduction achievable, taking into account environmental, energy and economic impacts by each class or category of source.

Unlike other regions in the state, the District has not relied on market-based systems such as South Coast AQMD's RECLAIM program to achieve regional emissions reductions needed for attainment. Such market-based systems allow sources of pollution to avoid installing BARCT-level controls if regional emissions are reduced at an established rate. This potential path to avoiding installing the best air pollution controls in other air districts was a significant portion of the genesis of this BARCT requirement of AB 617.

In contrast, businesses in the San Joaquin Valley have always had to comply with BARCT in accordance to the implementation schedules established in District rules. When developing attainment plans or amending prohibitory rules, the District evaluates all applicable sources of emissions for potential strategies to reduce emissions. These evaluations include an exhaustive search of air quality regulations throughout the nation, review of existing emission control technologies, and analysis of advanced emission control technologies that may soon be available, to identify potential technologically and economically feasible emission reduction measures. The District's attainment planning efforts rely on these processes to demonstrate on an ongoing basis that District rules meet state and federal emission control requirements, including BARCT and Most Stringent Measures, which exceeds BARCT requirements. Therefore, given the District's ongoing and extensive work to identify and apply most stringent measures necessary to attain the ever-tightening federal health-based standards under the Clean Air Act, it is anticipated that most if not all District rules satisfy BARCT requirements.

The District recognizes that emission control technologies are continually evolving, and therefore, robust and ongoing analysis is necessary to demonstrate that the District's rules continue to meet BARCT and other requirements on an ongoing basis. Furthermore, in the context of the 2016 Ozone attainment plan, the recently adopted PM2.5 attainment plan, and upcoming plans, future rule development actions will be required and, in this process, rules that have recently been determined to meet BARCT during this AB 617 analysis may be subject to further analysis to ensure they continue to meet BARCT requirements. Additionally, in those instances where the District is

made aware of new technology, further case specific and rule specific BARCT determinations may be conducted.

Affected Rules Included in the District's Expedited BARCT Implementation Schedule

As captured in Section 40920.6 of the Health and Safety Code, AB 617 identifies specific requirements for the District to meet when establishing the expedited BARCT implementation schedule. AB 617 requires the schedule to apply to each industrial source that, as of January 1, 2017, was subject to a specified market-based compliance mechanism and give highest priority to those permitted units that have not modified emissions-related permit conditions for the greatest period of time.

Based on information provided by CARB, as of January 1, 2017, 109 facilities within the District were identified as being subject to the state Cap-and-Trade program for greenhouse gas emissions, a market-based compliance mechanism adopted by the state board pursuant to subdivision (c) of Section 38562, and therefore AB 617 BARCT requirements. Evaluating the 109 affected facilities, the District identified that approximately 4,500 active permit units are within the scope of this BARCT analysis. From the 4,500 active permit units, the District determined that 32 District rules that apply to specific source categories of equipment were subject to the BARCT analysis required under AB 617.

District staff performed analysis of 32 affected rules and determined that:

- 5 rules were superseded by a more stringent rule known to meet BARCT or by a rule subject to further BARCT analysis,
- 5 rules were determined to meet Most Stringent Measures (MSM) for NO_x, the only relevant pollutant for these affected rules and, therefore, meet BARCT, and
- 19 rules were specifically determined to meet BARCT through an extensive rule and source category evaluation that compared our rule requirements with federal and state air quality regulations and with regulations of other air districts in California.
- While the remaining 13 rules likely already meet BARCT due to the District's ongoing and extensive regulatory evaluations and enhancements, the proposed BARCT implementation schedule includes commitments to establish updated BARCT determinations for these rules, which will occur in the 2020-2022 timeframe.

Prioritization Criteria for Expedited BARCT Analysis Schedule

Section 40920.6(c)(3) of the Health and Safety Code requires Districts to give highest priority to conduct the BARCT analysis to those rules affecting permitted units that have not modified emissions-related permit conditions for the greatest period of time. To assist in further prioritization, the District also considered local public health, clean air benefits to the surrounding community, and regional air quality and attainment benefits by prioritizing units that emit NO_x and are located within communities selected for action under AB 617. In addition, while cost-effectiveness of controls can't be fully analyzed until each rule is addressed during the development of a BARCT rule, the District also

prioritized rules with the greatest number of potentially affected units, which, when coupled to the law's requirement of prioritizing based on the length of time since the units were last modified, provides some consideration of the most likely controls to be cost-effective.

Public Process

As a part of the public process associated with establishing this schedule, the District conducted a public scoping meeting on June 14, 2018, to solicit input from stakeholders regarding the District's proposed methodology to address the AB 617 requirement to adopt an expedited BARCT analysis schedule by the end of 2018.

The District held a public workshop on November 1, 2018, to solicit input from the stakeholders regarding the District's proposed expedited BARCT Rule implementation schedule. No comments were received from stakeholders after this workshop.

In addition, the District held a public workshop on July 30, 2020, to provide an update on the Best Available Control Technology (BARCT) analysis of District rules as required under AB 617 and the District's Expedited BARCT Implementation Schedule.

Expedited BARCT Implementation Schedule

Through this public process and in accordance with AB 617 requirements, the District has adopted the following expedited BARCT implementation schedule:

Table 4-1 Expedited BARCT Implementation Schedule

Rule	Title	BARCT Determination Status	BARCT Determination Schedule	BARCT Rulemaking Schedule (if necessary)
4454	Refinery Process Unit Turnaround	Rule determined to meet BARCT	2019	---
4641	Cutback, Slow Cure, And Emulsified Asphalt, Paving And Maintenance Operations	Rule determined to meet BARCT	2019	---
4104	Reduction of Animal Matter	Rule determined to meet BARCT	2019	---
4409	Components at Light Crude Oil Production Facilities, Natural Gas Production Facilities, and Natural Gas Processing Facilities	BARCT evaluation completed, rule development process necessary	2019	Public scoping meeting held in Dec 2020, Rule development process to be completed in 2021.
4455	Components at Petroleum Refineries, Gas Liquids Processing Facilities, and Chemical Plants	BARCT evaluation completed, rule development process necessary	2019	
4702	Internal Combustion Engines (VOC only)	Scheduled (in conjunction with PM2.5 Plan commitment)	2020	Rule amendment scheduled for early 2021
4623	Storage of Organic Liquids	BARCT evaluation completed, rule development process necessary	2020	Public scoping meeting held in Dec 2020, Rule development process to be completed in 2021.

4694	Wine Fermentation and Storage Tanks	Rule determined to meet BARCT	2020	-----
4624	Transfer of Organic Liquid	BARCT evaluation completed, rule development process necessary	2020	Public scoping meeting held in Dec 2020, Rule development process to be completed in 2021.
4603	Surface Coating of Metal Parts and Products, Plastic Parts and Products, and Pleasure Crafts	Rule determined to meet BARCT	2020	-----
4601	Architectural Coatings	Rule determined to meet BARCT	2020	-----
4401	Steam-Enhanced Crude Oil Production Wells	BARCT evaluation completed, rule development process necessary	2021	Public scoping meeting held in Dec 2020, Rule development process to be completed in 2021.
4566	Organic Material Composting Operations	Scheduled	2021	-----
4625	Wastewater Separators	Scheduled	2021	-----
4621	Gasoline Transfer Into Stationary Storage Containers, Delivery Vessels, and Bulk Plant	Scheduled	2021	-----
4402	Crude Oil Production Sumps	Scheduled	2021	-----
4351	Boilers, Steam Generators, and Process Heaters - Phase 1	Rule superseded by more stringent rules, District Rules 4305,	---	---

		4306, and 4320		
4405	Oxides of Nitrogen Emissions from Existing Steam Generators Used in Thermally Enhanced Oil Recovery - Central and Western Kern County Fields	Rule superseded by more stringent rules, District Rules 4305, 4306, and 4320	---	---
4406	Sulfur Compounds from Oil-Field Steam Generators - Kern County	Rule superseded by more stringent rules, District Rules 4305, 4306, and 4320	---	---
4305	Boilers, Steam Generators, and Process Heaters - Phase 2	Rule superseded by District Rules 4306 and 4320, more stringent rules	---	---
4701	Internal Combustion Engines - Phase 1	Rule superseded by District Rule 4702, a more stringent rule	---	---
4309	Dryers, Dehydrators, and Ovens	Rule determined to meet BARCT	---	---
4703	Stationary Gas Turbines	Rule determined to meet BARCT	---	---
4306	Boilers, Steam Generators, and Process Heaters - Phase 3	Rule determined to meet BARCT	---	---
4307	Boilers, Steam Generators, and Process Heaters - 2.0 MMBtu/hr to 5.0 MMBtu/hr	Rule determined to meet BARCT	---	---
4320	Advanced Emission Reduction Options for Boilers, Steam Generators, and	Rule determined to meet BARCT	---	---

	Process Heaters Greater Than 5.0 MMBtu/hr			
4311	Flares	Rule determined to meet BARCT	---	---
4354	Glass Melting Furnaces	Rule determined to meet BARCT	---	---
4408	Glycol Dehydration Systems	Rule determined to meet BARCT	---	---
4453	Refinery Vacuum Producing Devices or Systems	Rule determined to meet BARCT	---	---
4612	Motor Vehicle and Mobile Equipment Coating Operations	Rule determined to meet BARCT	---	---
4622	Gasoline Transfer into Motor Vehicle Fuel Tanks	Rule determined to meet BARCT	---	---

UPCOMING 2018 PM2.5 PLAN RULE AMENDMENT EFFORTS

In addition to the BARCT implementation schedule above, the District will be proceeding with amending two District rules to pursue additional emission reduction opportunities beyond BARCT, included as commitments in the District's *2018 PM2.5 Plan* adopted by CARB into the State Implementation Plan:

Emissions reductions achieved through the implementation of more stringent limits potentially required through these rule amendments will further contribute to reduced exposure to air pollution in the community. Community Steering Committee members, members of the AB 617-selected community, and the general public are encouraged to be involved in the upcoming rulemaking process for these rules.

Table 4-2 Scheduled District Rule Amendments to Reduce PM2.5

Rule	Title	BARCT Status	PM2.5 Plan Rulemaking Schedule
4901	Wood Burning Fireplaces and Wood Burning Heaters	No units subject to AB 617 BARCT analysis. Rule amended in June, 2019.	2019 (Completed)
4311	Flares	Rule meets or exceeds BARCT	2020 (Completed)

Rule	Title	BARCT Status	PM2.5 Plan Rulemaking Schedule
4306 and 4320	Boilers, Steam Generators, and Process Heaters - Phase 3 and Advanced Emission Reduction Options for Boilers, Steam Generators, and Process Heaters Greater than 5.0 MMBtu/hr	Rule meets or exceeds BARCT	2020 (Completed)
4692	Commercial Charbroiling	No units subject to AB 617 BARCT analysis	2020 (Completed)
4702	Internal Combustion Engines	Rule meets or exceeds BARCT for NOx, updated AB 617 BARCT determination scheduled for VOCs	2021
4352	Solid Fuel-Fired Boilers, Steam Generators and Process Heaters	No units subject to AB 617 BARCT analysis	2021
4354	Glass Melting Furnaces	Rule meets or exceeds BARCT	2021

Further information on the District's expedited BARCT schedule and rule analyses can be found in the staff report presented to the District Governing Board in December, 2018:

http://www.valleyair.org/Board_meetings/GB/agenda_minutes/Agenda/2018/December/final/13.pdf

PERMITTING: BACT AND T-BACT DETERMINATIONS

The California Air Resources Board (CARB) is developing a Technology Clearinghouse of best available control technology (BACT) and best available control technology for toxic air contaminants (T-BACT) determinations for air districts throughout California. The District will use this Technology Clearinghouse as an additional resource for BACT determinations, and will reference this information when developing BACT and T-BACT technology determinations for any new or modified source permitting processes, including those in the Stockton community. More information about the District's stringent new and modified source review process is available in Chapter 3.

FACILITY RISK REDUCTION AUDITS UNDER AB 2588 (AIR TOXICS HOT SPOTS INFORMATION AND ASSESSMENT ACT)

Background

The Air Toxics "Hot Spots" Information and Assessment Act (AB 2588) was enacted in September 1987. Under this act, stationary sources are required to report the types and quantities of certain toxic substances their facilities routinely release into the air. The goals of the Air Toxics "Hot Spots" Act are to:

- Identify Valley facilities that release toxic air contaminants as a result of their day-

- to-day operations,
- Collect and quantify emission data from equipment located at permitted facilities,
 - Identify facilities causing localized health impacts on nearby residents,
 - Determine facility-wide health risks resulting from the emission of toxic air contaminants,
 - Notify nearby residents and businesses of significant risk facilities in their vicinity, and
 - Require significant risk facilities to reduce their risks below the level of significance in accordance with the provisions of the “Emissions Inventory Criteria and Guidelines Report” adopted by the Air Resources Board.

District’s Implementation of AB 2588

The District’s implementation of AB 2588, California’s *Air Toxics “Hot Spots” Information and Assessment Act*, has resulted in major reductions in emissions of air toxics from existing sources in the San Joaquin Valley. Under this right-to-know law, the District has worked with Valley facilities to quantify emissions of air toxics, determine the health risk caused by those emissions, report emissions and any significant risks through written public reports and neighborhood public meetings, and take steps to reduce such risks. As a result of this effort, and the resulting emissions reductions, no Valley facility currently poses a significant risk under this program.

The District’s integrated air toxics program fulfills the state AB 2588 Hot Spots mandates, aimed at quantifying and assessing localized health risk, notifying affected residents, and reducing risk from facilities with high risk caused by air toxic emissions. In addition, the District’s integrated air toxics program incorporates Airborne Toxic Control Measure (ATCM) regulations promulgated by the Air Resources Board, requiring prescribed control measures for various source categories that cause significant risks at a regional level. Furthermore, the District’s integrated program fulfills federal mandates under Title III of the federal Clean Air Act, requiring Maximum Available Control Technology (MACT) for sources of air toxics.

In addition to the state and federal mandates, the District’s integrated air toxics program also implements the more stringent local permitting and California Environmental Quality Act (CEQA) requirements, specifically to ensure installation of Best Available Control Technology (BACT) for air toxics and that new permits or modifications to existing facilities will not result in a significant increase in health risk to the public.

The District has spent the last two decades implementing a wide variety of methods to reduce toxic air contaminant emissions in the San Joaquin Valley. Based on the latest California Toxics Inventory, 52% of toxic air contaminants come from mobile sources such as cars and trucks, 34% are emitted from area-wide sources like road dust, paints, solvents, and other consumer products, and 14% of all air toxics in the San Joaquin Valley are emitted from stationary sources of pollution under the direct control and regulation of the District. Mobile and area-wide sources of emissions are generally under the regulatory authority of the State of California and the federal government.

The District's integrated approach to addressing and reducing risks from toxic air contaminants has taken three main paths:

- Reducing air toxic emissions from existing stationary sources of emissions,
- Preventing the creation of new or modified stationary sources of significant risk, and
- Finding creative and cooperative methods of reducing risk from emissions sources that the District does not typically regulate.

In 2015, the District began implementing the state Office of Environmental Health Hazard Assessment's (OEHHA's) revised Guidance on Preparation of Health Risk Assessments that was adopted by OEHHA in early March 2015. Following OEHHA revised guidelines, the District began a health risk reassessment of all facilities located in the San Joaquin Valley. The health risk reassessment follows the phased processing schedule outlined in AB 2588, which was originally implemented in the late 80's and early 90's. AB 2588 subjected three major categories (or phases) of facilities to the regulation based upon their level of annual emissions.

Reassessment of facilities subject to the AB2588 Hot Spots regulation is a multi-year process that started in 2016, following the phases identified below:

- Phase I Facilities (≥ 25 tons emissions per year)
- Phase II Facilities ($10 \leq$ tons emissions per year < 25)
- Phase III Facilities (< 10 tons emissions per year)
- Phase IV Facilities (Industry-wide and agricultural facilities)

Prioritizing Facility Health Risks

Based on the emissions inventory, the District is prioritizing each facility's health risk based on established statewide guidelines using a computerized modeling program. A "prioritization" is a conservative health risk assessment screening analysis, resulting in a facility prioritization score used to determine if a more refined health risk assessment is necessary based on the results of the modeling program. As part of this process, very conservative assumptions are utilized, with many safety factors built in to determine the worst-case health risk to possible receptors. The purpose of these safety factors is to ensure that the most sensitive receptors (children, elderly, pregnant women, and people with weakened immune systems) are protected. Facilities ranked as high priority are required to perform health risk assessments. The District prioritizes and ranks the health risk posed by a facility as "low", "intermediate", or "high" priority, based on the following:

- Low Priority: Prioritization Score ≤ 1
Facility Exempt from further AB 2588 requirements
- Intermediate Priority: 1 < Prioritization Score ≤ 10
Facility required to provide updated summary every four years

- High Priority: Prioritization Score > 10
Facility required to perform a refined Health Risk Assessment

Health Risk Assessment Process

When a facility's prioritization score exceeds 10, the facility is classified as "High Priority" and a Health Risk Assessment (HRA) is required for the facility, and such facility is required to submit an HRA for District approval. The District and State Office of Environmental Health Hazard Assessment (OEHHA) are required by the Air Toxics "Hot Spots" Act to review each HRA. Understanding that risk calculations involves a level of uncertainty due to limited data in many areas requiring the use of assumptions. With a focus on health protection, very conservative assumptions are utilized, with many safety factors built in to determine the worst-case risk to possible receptors. The purpose of these safety factors is to ensure that the most sensitive receptors (children, elderly, pregnant women, and people with weakened immune systems) are protected. Therefore, while the actual risk may be much less than the calculated risk, it is very unlikely to be higher than calculated.

Upon approval of facility HRA, the District determines the facility's health risk status, which is classified as a low risk, intermediate risk, high risk, or risk reduction required, based on the following HRA scores:

- Low Risk: HRA cancer risk ≤ 1 in a million, and
HRA total hazard index of < 0.1
(Facility Exempt from further AB 2588 requirements)
- Intermediate Risk: $1 \leq$ HRA cancer risk < 10 in a million, or
 $0.1 \leq$ HRA total hazard index ≤ 1.0
(Facility required to provide update summary on a quadrennial basis)
- High Risk: HRA cancer risk ≥ 10 in a million, or
HRA total hazard index of > 1.0
(Public Notice)
- Risk Reduction Required: HRA cancer risk ≥ 100 in a million cancer, or
HRA total hazard index of > 5.0
(Public Notice and Risk Reduction Audit Plan)

Facilities that pose health risks above District action levels are required to submit plans to reduce their risk. The Risk Reduction Audit Plan (RRAP) trigger level for cancer risk is 100 cases per million exposed persons, based on the maximum exposure beyond facility boundaries at a residence or business. The action level (Risk Reduction Audit Plan) for non-cancer risk is a hazard index of 5 at any point beyond the facility boundary where a person could reasonably experience exposure to such a risk.

The District's review of completeness of the facility's RRAP includes a substantive analysis of the emission reduction measures included in the plan, and the ability of those measures to achieve emission reduction goals as quickly as feasible. If the District determines that the RRAP does not meet those requirements, the District shall remand the audit and plan to the facility and specify the deficiencies. A facility operator shall submit a RRAP addressing the deficiencies identified by the District within 90 days of receipt of a deficiency notice. An updated prioritization and/or health risk assessment shall be determined based on the approved RRAP.

Risk Reduction Audit and Plan Facilities within the District

Based on facility information, as of October 1, 2020, no District permitted facilities in the Stockton AB 617 community present a significant risk for toxic air pollutants and are not required to perform a Risk Reduction Audit and Plan.

AB 617 Community Facility Lists with Associated AB 2588 Designations

Assembly Bill 617 requires the CARB and air districts to develop and implement emissions reporting for disadvantaged communities. With the establishment of the selected community boundaries, the District has put into effect a plan to expedite and streamline the AB 2588 reassessments for facilities located within the selected community of Stockton.

Community-Based AB 2588 Reassessments

Based on previous AB 2588 analyses and on the on-going District's integrated air toxics program, no Valley facilities have been determined to pose significant risk. Therefore, no existing facility(s) have or have been required to prepare a Risk Reduction Audit Plan. However, as mentioned above, the District is currently in the process of reassessing Valley facilities under AB 2588, which includes those located in the selected community of Stockton.

Please refer to Appendix E for further details about the District's Health Risk Assessment Process, and a table identifying the AB 2588 reassessment status of each facility within the community as of December 21, 2020.

STATEWIDE INCENTIVE AND REGULATORY STRATEGIES

This section provided by the California Air Resources Board

Overview of California Air Resources Board's Statewide Actions

Community-scale air pollution exposure is caused by many factors, including the cumulative impacts from multiple pollution sources. Effective solutions require multiple strategies at both the statewide and local level to deliver new emissions reductions directly within these communities.

The California Air Resources Board (CARB) has adopted a number of comprehensive air quality and climate plans over the last several years that lay out new emissions reduction strategies. These plans include the State Strategy for the State Implementation Plan,¹⁰ the California Sustainable Freight Action Plan,¹¹ California's 2017 Climate Change Scoping Plan,¹² and the Short-Lived Climate Pollutants Reduction Strategy,¹³ along with a suite of incentive programs. The Community Air Protection Blueprint¹⁴ further identified additional actions to reduce the air pollution burden in heavily impacted communities throughout the State. Together, these plans provide a foundation for the new actions identified as part of this community emissions reduction program.

This section illustrates CARB's statewide role in the community emissions reduction program, by broadly describing the regulatory and incentive-based foundational actions CARB has taken to reduce emissions statewide. It also highlights specific actions that address areas of concern identified by the Stockton community. CARB's potential enforcement strategies are described in Chapter 5 of this CERP.

INCENTIVE PROGRAMS

CARB operates incentive programs that reduce the costs of developing, purchasing, and operating cleaner technologies. The programs help ensure cleaner cars, trucks,

equipment, and facilities are operating in our neighborhoods. Specifically, these program accelerate the introduction of advanced technology vehicles and equipment, accelerate the turnover of older and higher emitting vehicles and equipment, and increase access to clean vehicles and transportation in disadvantaged communities and lower-income households.

Examples of CARB incentive programs include the Carl Moyer Memorial Air Quality Standards Attainment Program¹⁵ and the Community Air Protection Incentives,¹⁶ Proposition 1B: Goods Movement Emission Reduction Program,¹⁷ Funding Agricultural Replacement Measures for Emission Reductions Program,¹⁸ and Low Carbon Transportation Investments and Air Quality Improvement Program (which includes the Hybrid and Zero-Emission Truck and Bus Voucher Incentive Project).¹⁹ While CARB is responsible for program oversight, some of these programs are implemented as a partnership with local air districts.

Community Air Protection Incentives

Since 2017 the California Legislature has budgeted \$704 million to support Assembly Bill (AB) 617 (C. Garcia, Chapter 136, Statutes of 2017) with incentives directed by local air districts to put advanced technologies to work for cleaner air in the California communities that are most heavily impacted by disproportionate levels of air pollution.

The Legislature designated the initial appropriation of \$250 million in 2017 for immediate benefits in heavily impacted communities while the other aspects of AB 617 were created and implemented. In order to ensure swift action, the Legislature directed that air districts must spend funds according to two existing mobile source incentive programs: the Carl Moyer Memorial Air Quality Standards Attainment Program, and the Proposition 1B Goods Movement Emission Reduction Program. Air districts have been using the resulting Community Air Protection Funds Supplement to the Carl Moyer Program 2017 Guidelines since it was approved by the Board on April 27, 2018.

The Legislature appropriated an additional \$245 million in 2018 and provided additional direction for new opportunities for stationary source incentives as well as Community-Identified Projects consistent with Community Emissions Reduction Programs. The approved 2019 California State Budget contains another appropriation of \$209 million

¹⁷ For more information on the Proposition 1B: Goods Movement Emission Reduction Program, visit: <https://ww2.arb.ca.gov/our-work/programs/proposition-1b-goods-movement-emission-reduction-program>.

¹⁸ For more information on the Funding Agricultural Replacement Measures for Emission Reductions Program, visit: <https://ww2.arb.ca.gov/our-work/programs/farmer-program>.

¹⁹ For more information on the Low Carbon Transportation Investments and Air Quality Improvement Program, visit: <https://ww2.arb.ca.gov/our-work/programs/low-carbon-transportation-investments-and-air-quality-improvement-program>.

for continued incentives to support the Community Air Protection Program, with Legislative direction matching the previous year's appropriation.

Subsequently, staff developed the Community Air Protection (CAP) Incentives 2019 Guidelines²⁰ to provide eligibility and funding criteria for two new project categories, this represents CARB's first steps in providing incentives to clean up stationary sources of air pollution. The new project categories aim to reduce hexavalent chromium emissions from chrome plating activities, as well as include a suite of project types to reduce exposure at public schools. These guidelines will continue to be expanded with new categories of projects, to be responsive to the needs of the most heavily impacted communities across the State.

At the May 2019 Board hearing, CARB staff was directed to provide more flexibility within the Community Air Protection Incentives Guidelines to allow communities and air districts the ability to develop specific Project Plans to quickly address unique local air quality concerns.

Unlike traditional Moyer projects, Stationary and Community-Identified projects do not lend themselves to the same type of cost effectiveness evaluation. Therefore, the proposed criteria for stationary and Community-Identified projects will focus on community involvement, transparency, and consistency. Air Districts will work with communities to identify project categories needed to address community problems and general concepts. Air districts will then develop Project Plans that:

- Document community support – Community members will evaluate whether there has been sufficient community involvement
- Detail the project selection process
- Set participant requirements
- Establish funding amounts and project costs
- Quantify expected emissions/exposure reductions

To ensure reporting requirements are met CARB will be responsible for:

- Assisting districts with development of technical details
- Helping districts be consistent in quantifying benefits
- Confirming that project plans are consistent with statutory requirements
- Ensuring transparency for communities regarding projects funded, dollars spent, and benefits expected

For more information on air pollution incentives, grants, and credit programs, visit: <https://ww2.arb.ca.gov/our-work/topics/incentives>.

²⁰ For more information on the Community Air Protection (CAP) Incentives 2019 Guidelines, visit: <https://ww2.arb.ca.gov/resources/documents/community-air-protection-incentives-guidelines>

REGULATORY PROGRAMS

Federal, State, and local air quality agencies all work together to reduce emissions. At the federal level, the U.S. Environmental Protection Agency (U.S. EPA) has primary authority to control emissions from certain mobile sources, including sources that are all or partly under federal jurisdiction (e.g., some farm and construction equipment, aircraft, marine vessels, locomotives), which it shares in some cases with air districts and CARB. The U.S. EPA also establishes ambient air quality standards for some air pollutants.

At the State level, CARB is responsible for controlling emissions from mobile sources and consumer products (except where federal law preempts CARB's authority), controlling toxic emissions from mobile and stationary sources, controlling greenhouse gases from mobile and stationary sources, developing fuel specifications, and coordinating State-level air quality planning strategies with other agencies.

Regionally, air districts are primarily responsible for controlling emissions from stationary and indirect sources (with the exception of consumer products in most cases) through rules and permitting programs within their regions.

CARB regulatory programs are designed to reduce emissions to protect public health, achieve air quality standards, reduce greenhouse gas emissions, and reduce exposure to toxic air contaminants. CARB establishes regulatory requirements for cleaner technologies (both zero and near-zero emissions) and their deployment into the fleet, for cleaner fuels, and to ensure in-use performance. CARB's regulatory programs are broad – impacting stationary sources, mobile sources, and multiple points within product supply chains from manufacturers to distributors, retailers, and end-users. CARB's regulations affect cars, trucks, ships, off-road equipment, consumer products, fuels, and stationary sources.

One important and relevant regulatory authority of CARB's is to adopt measures to reduce emissions of toxic air contaminants from mobile and non-mobile sources, known as Airborne Toxic Control Measures (ATCM).²¹ These regulatory measures include process requirements, emissions limits, or technology requirements. Additionally, the Statewide Air Toxics "Hot Spots" Program²² addresses the health risk from toxic air contaminants at individual facilities across the State. The Air Toxics "Hot Spots" Program includes several components to collect emissions data, identify facilities having localized impacts, ascertain health risks, notify nearby residents of significant risks, and reduce those significant risks to acceptable levels.

²¹ California Health and Safety Code § 39650 et seq.

²² Assembly Bill 2588, Air Toxics "Hot Spots" Information and Assessment Act, Connolly, Statutes of 1987, California Health and Safety Code § 44300 et seq.

Under the Air Toxics “Hot Spots” Program, air districts are required to set a threshold for facilities that pose a significant health risk and prioritize facilities for health risk assessments. Air districts also establish a risk value above which facilities must conduct a risk reduction audit and emissions reduction plan. Facilities must develop these health risk assessments, risk reduction audits, and emission reduction plans. CARB provides technical guidance to support smaller businesses conducting health risk assessments and developing emissions reduction plans.

Additionally, in some instances CARB has pursued enforceable agreements with industry that result in voluntary but enforceable adoption of the cleanest technologies or practices and provide assurance that emissions reductions will be realized. CARB’s agreement with the Union Pacific Railroad Company and BNSF Railway Company to accelerate introduction of cleaner locomotives in the South Coast Air Basin is an example of an enforceable agreement.

CARB ACTIONS RELATED TO THE STOCKTON COMMUNITY

This section highlights CARB actions that specifically relate to the Stockton community. This list should not be interpreted as comprehensive or exhaustive, but rather illustrative of some of the major statewide strategies driving emissions reductions in conjunction with those local level strategies identified in this community emissions reduction program. Additional CARB foundational strategies can be found in Appendix D and Appendix F of the Community Air Protection Blueprint.²³

Recently Adopted CARB Regulations

CARB adopted the **Advanced Clean Trucks Rule**²⁴ in June 2020 requiring truck manufacturers to transition from producing diesel trucks and vans to electric zero-emission trucks including heavy-duty vehicles beginning in 2024. Manufacturers who certify Class 2b-8 chassis or complete vehicles with combustion engines are required to sell zero-emission trucks as an increasing percentage of their annual California sales from 2024 to 2035. By 2035, zero-emission truck/chassis sales will need to be 55% of Class 2b – 3 truck sales, 75% of Class 4 – 8 straight truck sales, and 40% of truck tractor sales. This rule also requires that fleets report information on a one-time basis about their vehicles to support future zero-emission fleet rules.

In August 2020 CARB adopted the **Heavy-Duty Engine and Vehicle Omnibus Regulation and Associated Amendments**²⁵ which require manufacturers to comply

²³ California Air Resources Board, *Final Community Air Protection Blueprint for Selecting Communities, Preparing Community Emissions Reduction Programs, Identifying Statewide Strategies, and Conducting Community Air Monitoring*, October, 2018, available at: <https://ww2.arb.ca.gov/capp-blueprint>.

²⁴ For more information on the Advanced Clean Trucks Rule, visit: <https://ww2.arb.ca.gov/our-work/programs/advanced-clean-trucks>.

²⁵ For more information on the Heavy-Duty Engine and Vehicle Omnibus Regulation and Associated Amendments, visit: <https://ww2.arb.ca.gov/our-work/programs/heavy-duty-low-nox>

with tougher emissions standards, overhaul engine testing procedures, and further extend engine warranties to ensure that emissions of NO_x (oxides of nitrogen, a key component of smog) are reduced to help California meet federal air quality standards and critical public health goals. The regulation is expected to have a significant impact on communities adjacent to railyards, ports and warehouses that typically experience heavy truck traffic. These trucks often idle, move slowly and make frequent stops – all actions that increase NO_x emissions. Today's heavy-duty trucks do not control NO_x effectively during such “low load” conditions. The new standards will reduce NO_x emissions by 90 percent or more when trucks are operating under these low load real-world operations. All components of the new rule will be phased-in, allowing engine manufacturers time to prepare for compliance. The NO_x standards that engines must meet will be cut to approximately 75 percent below current standards beginning in 2024, and 90 percent below current standards in 2027.

The **Control Measure for Ocean-Going Vessels At Berth**²⁶ was also adopted in August 2020 and is an updated version of the CARB's At-Berth Regulation that supersedes the existing At-Berth Regulation, as specified, and is designed to achieve further emissions reductions from vessels at berth to improve air quality in communities surrounding ports and terminals throughout California. Emissions reductions will be achieved through the inclusion of new vessel categories (such as vehicle carriers and tanker vessels), new ports, and independent marine terminals, and through updated control requirements, among other provisions.

Upcoming CARB Regulations

Commercial Harbor Craft Regulation Amendments – CARB's existing commercial harbor craft regulation was adopted in 2007 and will be fully implemented by the end of 2022. CARB is working through a public process to consider additional amendments that may further reduce emissions and pursue more stringent in-use standards, with consideration for Tier 4 engine technology and near-zero and zero emission technologies. For more information on the regulation and potential new regulatory concepts, visit: <https://ww2.arb.ca.gov/our-work/programs/commercial-harbor-craft>.

Heavy-Duty Vehicle Inspection and Maintenance – When emissions control systems are not operating correctly, in-use emissions can increase. CARB's current inspection programs include the roadside Heavy-Duty Vehicle Inspection Program and the fleet Periodic Smoke Inspection Program. These regulations require heavy-duty vehicles operating in California be inspected for excessive smoke and tampering. In July 2018, CARB approved amendments to the Heavy-Duty Vehicle Inspection Program and the Periodic Smoke Inspection Program to reduce the smoke opacity limits to levels more appropriate for today's modern engine technology. CARB is now exploring the

²⁶ For more information on the Control Measure for Ocean-Going Vessels At Berth, see: <https://ww2.arb.ca.gov/our-work/programs/ocean-going-vessels-berth-regulation>, and the At Berth Factsheet: https://ww2.arb.ca.gov/sites/default/files/2020-08/External%20At-Berth%20Fact%20Sheet%20August%202020%20ADA_0.pdf

development of a more comprehensive heavy-duty inspection and maintenance program that would help ensure all vehicle emissions control systems are maintained adequately throughout the vehicles' operating lives. For more information on existing heavy-duty maintenance programs, visit: <https://ww2.arb.ca.gov/our-work/programs/heavy-duty-diesel-inspection-periodic-smoke-inspection-program>. For more information on the development of a comprehensive heavy-duty inspection and maintenance program, visit: <https://ww2.arb.ca.gov/our-work/programs/heavy-duty-inspection-and-maintenance-program>.

Cargo Handling Equipment Regulation Amendments – Mobile cargo handling equipment is any motorized vehicle used to handle cargo or perform routine maintenance activities at California's ports and intermodal rail yards. The type of equipment includes yard trucks (hostlers), rubber-tired gantry cranes, container handlers, forklifts, etc. The Mobile Cargo Handling Equipment (CHE) Regulation was adopted in 2005 to reduce toxic and criteria emissions to protect public health and was fully implemented by the end of 2017. CARB staff is currently assessing the availability and performance of zero-emission technology to further reduce emissions. For more information on the regulation, visit: <https://ww2.arb.ca.gov/our-work/programs/cargo-handling-equipment>.

Advanced Clean Fleet Rules – CARB is developing a medium and heavy-duty zero-emission fleet regulation with the goal of achieving a zero-emission truck and bus California fleet by 2045 everywhere feasible and significantly earlier for certain market segments such as last mile delivery and drayage applications. For more information, visit: <https://ww2.arb.ca.gov/our-work/programs/advanced-clean-fleets>.

Transport Refrigeration Unit Regulations – Transport refrigeration units congregate at distribution centers, railyards, and other facilities, resulting in the potential for health risks to those that live and work nearby. CARB is working through a public process to consider new requirements to transition the transport refrigeration units fleet to zero emission operations by requiring both zero emission technology and supporting infrastructure. For more information on this new regulation, visit: <https://ww2.arb.ca.gov/our-work/programs/transport-refrigeration-unit/new-transport-refrigeration-unit-regulation>.

Small Off-Road Engines – In 2020, CARB will consider new standards for small off-road engines (SORE), which are spark-ignition engines rated at or below 19 kilowatts and used primarily for lawn, garden, and other outdoor power equipment. For more information on the strategy, visit: <https://ww2.arb.ca.gov/our-work/programs/small-off-road-engines-sore>

Advanced Clean Cars II – CARB staff is developing the Advanced Clean Cars II regulations, which will seek to reduce criteria and greenhouse gas emissions from new light- and medium-duty vehicles beyond the 2025 model year, and increase the number of zero emission vehicles for sale. For more information on these new regulations, visit: <https://ww2.arb.ca.gov/our-work/programs/advanced-clean-cars-program>.

Commercial Cooking Suggested Control Measure – This strategy consists of a two-phase process to evaluate California’s current emission reduction requirements for commercial cooking operations that prepare food for human consumption, and if necessary, make improvements to achieve additional reductions in particulate matter 10 microns or less in diameter (PM10), particulate matter 2.5 microns or less in diameter (PM2.5) and volatile organic compound emissions that contribute to ozone formation. For more information on the strategy, visit: [Blueprint Appendix F](#) – pages F-8 & F-9.

ESTIMATED EMISSIONS REDUCTIONS FROM CARB MEASURES

CARB has estimated the emissions reduction benefits for some of the proposed statewide measures as shown in Table 4-3 for the 2025 and 2030 milestone years for the Stockton Community. Note the emissions reductions from the recently adopted Ocean-Going Vessels At Berth Amendment and Low NOx Omnibus Regulation are not reflected in the emissions inventory presented in Chapter 3 or Appendix C.

Table 4-3 Estimated Emissions Reductions from CARB Measures in the Stockton Community

Proposed Statewide Measures	Emissions Reduction (tons per year)							
	PM2.5		DPM		NOx		VOC	
	2025	2030	2025	2030	2025	2030	2025	2030
Ocean-Going Vessels At Berth Amendment	0.00	0.18	0.00	0.20	0.00	11.45	0.00	0.56
Advanced Clean Car 2		0.02		0.00		1.00		0.38
Heavy-Duty Inspection and Maintenance	0.34	0.38	0.35	0.40	23.25	27.7		
Low NOx Engine Standard					1.88	14.17		
Small Off-Road Engine Amendment	0.15	0.92	0.12	0.28	17.03	27.09	8.28	28.31

5. ENFORCEMENT PLAN

5.1 INTRODUCTION

Enforcement of air quality rules and regulations by the San Joaquin Valley Air Pollution Control District (District) and the California Air Resources Board (CARB) is critical to continuing air quality progress and achieving the air quality goals contained in the Valley's State Implementation Plans. Compliance with federal, state, and local air quality rules and regulations is ensured by operating robust inspection programs along with a full range of educational and compliance assistance programs.

This Enforcement Plan describes the stationary and mobile source enforcement history for the Stockton AB 617 Community. In addition, the plan describes the overall enforcement programs operated by the District and CARB. Based on the analysis of the enforcement history and input from the Community Steering Committee, the Community Emissions Reduction Plan (CERP) includes focused enforcement measures to enhance enforcement and compliance assistance activities within the community in support of the emission reduction commitments in the CERP.

5.2 OVERVIEW OF SAN JOAQUIN VALLEY AIR POLLUTION CONTROL DISTRICT ENFORCEMENT PROGRAM

The District's mission is to improve the health and quality of life for all Valley residents through efficient, effective, and entrepreneurial air quality management strategies. The District's Enforcement Department seeks to aid in achieving this mission through fair, consistent, and comprehensive enforcement utilizing a full suite of enforcement and compliance assistance related activities to ensure compliance with District, state and federal rules and regulations. The program objectives for the Enforcement Department are set forth in federal and state law and the District's air quality attainment plans. In order to meet these program objectives, District staff perform inspections at approximately 9,200 permitted facilities and responds to approximately 3,000 public complaints, and verifies emissions reductions at thousands of locations where emission reduction incentive projects have been implemented.

The major functions of the District's Enforcement Department are as follows:

Inspections of Stationary Sources

The District performs thousands of comprehensive on-site inspections each year to ensure compliance with federal, state, and District requirements. These compliance evaluations are unannounced whenever possible and play a key part to meeting clean air requirements. The frequency of regular inspections depends on the type of facility. When considering limited resources, priority is given to federal Title V (Major) sources, facilities that emit non-attainment criteria or toxic pollutants, facilities with equipment that is more susceptible to upsets, compliance history of operation, etc. Under this scenario, a chrome plating facility will be inspected more frequently than a back-up, emergency generator which only operates a few hours per year.

Compliance inspections are conducted by well-trained District air quality inspectors. Inspections include a physical inspection of the facility and equipment, a review of operating and monitoring records, and the use of advanced detection equipment, where appropriate, to determine compliance with permitted emission limits. During the inspection, District staff ensures that the equipment is permitted appropriately, and that the facility is operating in compliance with all permit requirements and applicable local, state, and federal regulations. If the facility is determined to be in non-compliance, the inspector issues the facility an enforcement action that requires prompt correction of the issue and generally results in the imposition of a civil penalty to dissuade from any non-compliance in the future.

Complaint Investigations

The District receives thousands of complaints each year for which timely responses and investigations of alleged sources of non-compliance are top priorities. Inspectors are on-call 24 hours per day, seven days a week and use automated voicemail and computer systems to facilitate the timely response to complaints in order to abate non-compliance with District rules, including potential public nuisances. Along these same lines, the District added the ability to easily submit complaints, including video and photographs, online and through mobile smartphone applications. District staff are required to keep the reporting party apprised of the investigation findings until it has been completed. The District provides a bilingual (Spanish-English) telephone complaint line and also has the capability to utilize multilingual translation services, in the field or over the telephone, to ensure that all communities and groups within the Valley are properly served.

Emissions Testing

District inspectors oversee hundreds of third-party emissions tests conducted at stationary sources each year for the purpose of measuring air pollutants and ensuring compliance with established standards from stationary sources of air pollution. District staff have three main tasks when overseeing source tests at stationary source sites. First they review the source test protocol, submitted by the third party source testing contractor, which outlines the testing methods that testing period. District staff reviews the protocol to ensure the proper testing methods will be used and that the source test contractor has the proper equipment and certifications to conduct the test. The second task is to witness the test to ensure the source test contractor follows the correct testing procedures. Lastly, District staff reviews the source test results to ensure the data is properly reported and to act promptly on any compliance issues related to the testing.

In addition, the District utilizes its monitoring van and portable exhaust gas analyzers to assess the emissions from internal combustion engines, boilers, and other combustion devices to ensure they are operating according to specifications and complying with all permitted and/or rule emission limits.

Gasoline Station Permitting, Inspecting and Testing Program

Gasoline stations, in aggregate, are one of the largest potential sources of volatile organic compounds in the Valley. A comprehensive and effective permitting, inspection

and testing program is important to ensure the vapor recovery systems operate as designed and the Valley realizes the emission reductions anticipated in Rule 4621 (Gasoline Transfer Into Stationary Storage Containers, Delivery Vessels and Bulk Plants) and Rule 4622 (Gasoline Transfer into Motor Vehicle Fuel Tanks).

District staff continues to inspect gasoline station vapor recovery systems on a routine basis looking for torn hoses, damaged nozzles, and missing parts. However, during recent years there have been many changes in vapor recovery technology and state laws such that the simple visual inspections are no longer sufficient. More emphasis is now being placed on performance tests that evaluate gasoline station equipment effectiveness. As a result, the District implemented a gasoline dispensing tester certification and training program to ensure qualified third party contractors are available for operators of this equipment.

Wood Burning Heaters and Fireplaces

Further reducing residential wood smoke emissions is a high priority under the District's 2018 PM2.5 Plan given the significant localized health impacts associated with residential wood smoke. Scientific studies show that prolonged inhalation of wood smoke contributes to lung disease, pulmonary arterial hypertension, and pulmonary heart disease, which can eventually lead to heart failure. District Rule 4901 is designed to improve public health by reducing toxic wood smoke emissions in Valley neighborhoods during the peak PM2.5 winter season (November through February).

Since 2004, the District has had a robust enforcement program for designated wood burning curtailment days to ensure the District is achieving the expected emission reductions as a result of the requirements of the rule. This includes having a significant portion of field staff mandatorily assigned to conduct proactive surveillance in counties with declared wood burning curtailments. The District also conducts surveillance in counties with curtailments on days that District offices are closed and performs periodic night-time surveillance throughout the Check Before You Burn season.

In the District's ongoing efforts to utilize the latest forms of technology to improve efficiency and effectiveness, the District tested several technologies for nighttime fireplace and wood burning heater enforcement. The District purchased ultra-low light cameras, which have the greatest capacity to capture non-compliance through photographic and video evidence. The use of the cameras are able to clearly document smoke coming from chimneys in extremely low-light conditions in a way that previous technologies used and tested were unable to match.

Compliance Assistance

The District believes in working closely with businesses and residents to assist in achieving compliance with air pollution rules and regulations. The Compliance Assistance program has emphasized an educational approach to help Valley residents and businesses comply with a variety of air pollution regulations. Businesses and individuals throughout the Valley are provided with:

- **Individualized Assistance:** Personal, one-on-one help is provided to thousands of businesses and residents to ensure they understand the federal, state, and District's requirements.
- **Compliance Assistance Bulletins:** Actively evaluate upcoming rule compliance dates and develop educational materials that are sent to affected groups including, but not limited to, residents, realtors, building departments, contractors, and industrial and commercial facilities.
- **Compliance Schools:** The District provides training classes regarding information on the topics of open burning, gasoline vapor recovery, and wood burning fireplaces and wood burning heaters to individuals who have received a Notice of Violation from the District. In addition to discussing the aforementioned specific topics, the courses also provide general air pollution training, discuss the air quality challenges of the San Joaquin Valley, and opportunities for them to contribute to improving air quality in the Valley.
- **Gasoline Station Tester Training:** Ongoing training for contractors is provided for those wishing to perform vapor recovery tests within the District. District rules require testers be certified to ensure there are a qualified pool of contractors from which businesses can choose to perform their equipment's testing.
- **Asbestos Training:** Comprehensive assistance on asbestos regulations is provided to the public, building industry, building departments, fire departments, and realtors. Staff continues to spend considerable time providing one-on-one assistance, in addition to group trainings, to the regulated community. The District has also developed online tools and resources to educate the public on asbestos notification requirements in the Valley.
- **Residential Wood Burning Heater Professional Training:** Training requirements for qualified individuals (those people having either a certification from the Fireplace Investigation Research and Education, Chimney Safety Institute of America, or the National Fireplace Institute or has documentation demonstrating they are qualified to perform inspections, maintenance and cleaning activities on wood burning heaters) who may be hired to perform inspections of wood burning heaters and pellet stoves to ensure they can be operated in a compliant manner prior for individuals who voluntarily request to register their wood burning heaters and pellet stoves.
- **Fugitive Dust Education:** Staff organizes and conducts classroom training for all groups required to submit dust control plans for construction activities and provides ongoing training and outreach as needed and as requested to businesses and entities that may be subject to the requirements.
- **Prescribed Burning Outreach:** The District meets periodically with the land managers of the USDA Forest Service, National Park Service, US Fish and Wildlife

Service, Bureau of Land Management, California Department of Forestry and Fire Protection, and Southern California Edison Company in order to minimize impacts of smoke from prescribed burns and wildfires. Compliance staff participate on the daily calls during fire season to keep abreast of wildfire and prescribed burn activities throughout the area.

- **Access to District Policies:** District policies are available on the internet for stakeholders to review, comment on, and use to assist them with complying with District requirements. The internet is updated regularly with new or modified policies to ensure availability of current information.

Emission Reduction Incentive Program Inspections

To ensure that the emission reduction projects funded by the District's incentive programs are real and permanent, the District monitors the pre-contract and post-contract performance of grant recipients. Thousands of field inspections are conducted to verify that equipment is appropriately replaced or controlled, adequately maintained, and also verifies that older equipment has been properly disposed of.

Incentive projects requiring compliance inspections include the replacement of older trucks with new less polluting ones, school bus replacements, agricultural pump engine replacements, emissions controls on trucks, and other related control strategies. Each funded project requires a minimum of two initial inspections and several types of projects require ongoing inspections and recordkeeping requirements to assure emission reductions are realized for the life of the project.

5.3 SAN JOAQUIN VALLEY AIR POLLUTION CONTROL DISTRICT ENFORCEMENT HISTORY IN STOCKTON AB 617 COMMUNITY

The District's enforcement presence within the Stockton AB 617 Community is comprised of many different facets including, but not limited to, performing facility inspections, investigating complaints from the public, investigating breakdowns, and overseeing third-party emissions testing at facilities. Since 2017, the District has conducted inspections of 2,409 equipment units during 1,121 inspections at permitted facilities within the Stockton AB 617 Community, has received and responded to 131 air quality complaints from the public, and has issued 212 enforcement actions associated with violations of air pollution rules and regulations. A listing of the facilities, inspections, complaints, and enforcement actions can be found in Appendix F.

5.3.1 RESPONSE TO PUBLIC AIR POLLUTION COMPLAINTS

The public plays an important role in protecting public health by reporting local air quality issues that they observe in their communities. Often these complaints serve as the first warning of an air pollution compliance issue that needs to be addressed. The District places the highest priority of responding to complaints from the public and responds to each and every complaint received. In addition, the District operates an "on-call" program to ensure that complaints received outside of normal business hours can be appropriately addressed since air pollution related issues are not bound by

normal business hours. The process of responding to a complaint can be unique for each complaint received depending on factors such as whether the issue is currently in progress, whether the issue is a recurring/ongoing issue, the type of source, the time of day, and the number of complaints received about the issue. Figure 5-1 shows the number of complaints received by the District each year since 2017

Figure 5-1 Number of Complaints by Year from 2017-2020

Based on the resulting complaint investigations, the District confirmed a violation of District rules or regulations and took enforcement action in 18 of the complaints, determined that the issue did not constitute a violation of any federal, state, or local air quality rule in 29 of the complaints, referred 2 complaints to the proper agency with jurisdiction over the issue, and was unable to confirm whether or not a violation occurred in the 82 remaining complaints (at times, the issues associated with public complaints can be transient in nature and the information provided by the reporting party may lack sufficient information to track down and confirm the issue). Of the 18 enforcement actions taken as the result of public complaints, 7 were for illegal residential open burning of waste, 2 were for illegal use of a residential fireplace or outdoor wood burning device, 2 were for fugitive dust related issues, 3 were for permitting/registration related issues, 1 were for agricultural open burns, and 3 was for work practices issues at an automobile coating operation

Figure 5-2 below details the complaints received by type since 2017. Complaints concerning odor nuisance and residential open burning each made up 23% of the total complaints received in the community. Complaints regarding fugitive dust made up approximately 20% of the complaints received in the community. In total, these three categories made up over 66% of the complaints received.

Figure 5-2 Number of Complaints by Type from 2017-2020

The District received and responded to 39 complaints regarding residential open burning and residential fireplace/outdoor wood burning devices during this period. The District confirmed illegal open burning and took enforcement action in 8 of these cases, determined that 3 were not a violation (permissible fireplace burn day or outdoor cooking fire), and was unable to confirm 28 of the complaints. In addition to the complaints received in these categories, members of the Community Steering Committee have suggested increased outreach/education and enforcement in these categories. The District has included specific enhanced enforcement and outreach/education measures as part of the CERP to reduce the potential for localized air quality impacts associated with failure to comply with District rules pertaining to residential open burning and residential fireplace/outdoor wood burning devices.

The District received 31 odor complaints during this period and determined that none of the complaints resulted in a violation failing under the District’s jurisdiction. Under state law, odors are regulated under public nuisance requirements. To become a violation, an odor must cause “injury, detriment, nuisance, or annoyance” to a considerable number of people or the public. Each of the odor complaints were separate instances from a single party; and therefore, did not rise to the level of a public nuisance under state law. Three of the complaints fell outside of the District’s jurisdiction and were referred to the appropriate agency.

Of the 26 fugitive dust complaints received, the District issued an enforcement action in 2 of the cases. In 2 of the instances, the District determined that the operation was complying with the District's Regulation VIII fugitive dust rules and public nuisance rules. In 22 of the instances, the District was unable to confirm the complaint. The complaints that did not result in enforcement actions or were unable to be confirmed were primarily associated with construction/ earthmoving activities track out or open areas. The District has included specific enhanced enforcement measures as part of the CERP to reduce the potential for localized air quality impacts associated with fugitive dust from construction/earthmoving activities and open areas subject to District Regulation VIII. Since the majority of the complaints have been received between April and September, these enhanced enforcement efforts will be conducted during the 2nd and 3rd calendar quarters.

The District received 11 complaints associated with commercial/industrial open burning. The District found that 9 were cooking fires which are exempt from open burning rules, 1 was a spontaneous combustion fire, and in the 1 remaining the District was either unable to locate the burn or the responsible party for the burn. The enhanced enforcement and outreach/education CERP measures for residential open burning will aid in compliance with the rules pertaining to illegal open outdoor burning.

The District received 9 complaints regarding federal asbestos requirements associated with regulated demolitions and renovations. The District issued enforcement actions in 3 of these instances, the District was unable to confirm 3 complaints in this category. The District took no enforcement action in 3 cases as the projects were either complying with federal asbestos requirements or were exempt under federal law.

The District received 2 complaints regarding visible emissions from equipment at facilities within the community. The District was unable to confirm whether or not a violation occurred in the 2 complaints in this category. As discussed below under the District Enforcement Action section, the District has included specific enhanced enforcement measures as part of the CERP to address failure to comply with emission standards at permitted facilities.

5.3.2 DISTRICT ENFORCEMENT ACTIONS

Federal and state law, along with local rules, require the enforcement of air quality rules and regulations. The District takes formal enforcement action for all violations of applicable federal, state, and local rules and regulations within its jurisdiction. In addition, the District enforces conditional permit requirements, Hearing Board orders, and at times seeks delegation to enforce statewide mobile source and greenhouse gas measures. Generally a Notice of Violation (NOV), which normally results in a civil penalty, is issued to document a violation. Under the limited circumstances specified in District Rule 1180, a Notice to Comply (NTC) may be issued for first-time, minor violations. An NTC does not carry a monetary penalty but does require quick resolution of the minor violation. Should a party not correct the violation within the timeframe established by the NTC, an NOV will be issued.

Over the past 3 years, the District has issued 175 NOVs and 37 NTCs in the Stockton AB 617 Community. Figure 5-3 shows the annual breakdown of NOVs and NTCs since 2017.

Figure 5-3 Number of Enforcement Actions Issued by Year (2017-2020)

Figure 5-4 shows the enforcement actions categorized by type. Since 2017, 88 of the 212 enforcement actions resulted from violations of administrative requirements such as recordkeeping, late report submittal, operating with a suspended permit, or operating without a permit. The District issued 51 enforcement actions for violations resulting in excess emissions from facilities (not including gas stations). These violations occurred at 13 permitted facilities in the area and 1 ocean-going vessel. The District also issued 18 enforcement actions to gas stations for violations resulting in excess emissions and 1 gas station certification enforcement action. These violations occurred at 14 gas stations in the area. The District believes that more frequent inspections for these 27 facilities would be prudent to limit the potential for air quality impacts associated with failure to comply with emission standards established by District permit, rule, or regulation.

In addition, the District believes a new pilot training program for conducting self-inspections of equipment at gas stations may help to limit the potential for air quality impacts associated with vapor recovery defects at gasoline dispensing operations. Accordingly, the District has included a compliance assistance CERP measure to develop a new training program to instruct gas station operators on conducting thorough self-inspections to aid in the identifications and timely repair of system defects. The District will provide the hands on training to each gas station operator in the community.

Figure 5-4 Enforcement Actions by Type from 2017-2020

A review of the data also shows that the District has issued 7 violations for residential open burning, and 16 enforcement actions for fireplace/outdoor wood burning heater violations. This further demonstrates the need to include the aforementioned enhanced enforcement and outreach/education CERP measures.

5.4 CALIFORNIA AIR RESOURCES BOARD PROGRAM OVERVIEW AND ENFORCEMENT HISTORY IN STOCKTON

Section 5.4 Provided by the California Air Resources Board

The California Air Resources Board (CARB) enforcement programs cover the vehicles we drive, the diesel engines that power our economy, consumer products that we purchase and greenhouse gas (GHG) emissions from our industries and activities. The goal of Stockton's enforcement programs is to achieve comprehensive compliance in every regulation CARB adopts. Through enforcement, CARB works to bring responsible parties into compliance, and in doing so, achieves a level playing field across industry so that no company can benefit from non-compliance at the expense of another. CARB also works to deter industries from future violations and takes compliance seriously, because the success of our programs and the protection of public health depend on it.

CARB applies enforcement programs professionally in accordance with our enforcement policy,²⁷ which was updated in 2017. CARB uses program data, complaints and inspections to identify potential non-compliance, and then investigates each case. Once a violation is identified, CARB notifies the responsible party and evaluates what happened. CARB works with the party to achieve compliance and measure the relevant facts and circumstances of each case, relative to the eight statutory factors as described in our enforcement policy, to determine an appropriate penalty. The case is settled when the responsible party has achieved compliance and both parties have agreed upon an appropriate penalty. If a mutual settlement cannot be reached, CARB refers the case to California's Attorney General for civil litigation.

Field inspectors are a critical component of CARB's Heavy-Duty Diesel Enforcement Program. The inspectors work across the state to inspect trucks and other equipment for compliance with CARB's diesel regulations, such as the Heavy-Duty Diesel Vehicle Inspection Program (HDVIP), Drayage Truck, Truck and Bus Regulation, SmartWay and Transport Refrigeration Unit (TRU) Air Toxic Control Measure. Field inspectors also conduct inspections for compliance with In-Use Off-Road and School Bus Idling regulations. CARB inspectors examine heavy-duty vehicles and equipment at numerous locations throughout California, such as at California Highway Patrol (CHP) scale facilities, warehouses, fleet yards, construction sites, random roadside locations, truck stops, rest areas, ports and rail yards.

CARB'S THREE YEAR ENFORCEMENT HISTORY IN STOCKTON

The following section provides an overview of CARB enforcement actions across several enforcement programs within the Stockton Assembly Bill 617 (AB 617) community boundary for years 2017 through 2019.

Under the heavy-duty vehicles and marine enforcement program sub-sections, CARB staff provide overviews of enforcement activities along with maps to display the approximate locations of program inspections, which may help to determine gaps in CARB enforcement activity as well as locations where enhanced enforcement is necessary to deter potential violators within the community. Additional sub-sections include overviews of CARB's fuel enforcement activities, statewide consumer product enforcement activities, case settlements, Supplemental Environmental Projects, and more.

CARB will work closely with the Community Steering Committee (CSC) to determine areas of non-compliance within the Stockton AB 617 area that needs an enforcement presence. CARB acknowledges enforcement presence can be increased in this area and will work with CSC and the San Joaquin Valley Air Pollution Control District (SJVAPCD) to identify opportunities for enhanced enforcement.

²⁷ <https://ww2.arb.ca.gov/resources/documents/enforcement-policy>

Heavy-Duty Vehicles Programs

Over the last three years, CARB has conducted 244 inspections on Heavy-Duty Diesel Vehicles (HDDV) within the selected Stockton AB 617 Community. These inspections occurred across 7 of 12 CARB HDDV enforcement programs, as described in Appendix 4.1.

Table 5-1 below summarizes HDDV enforcement actions in Stockton from 2017 to 2019. Of the five citations issued to HDDVs within the community boundary, four were for emissions violations and one was for a non-emissions violation. Emissions violations further contribute to air pollution while non-emissions violations do not (e.g., a truck not meeting labeling or reporting requirements). CARB is working to compile information on the resolution of violations issued in Stockton and will provide this data to CSC as it becomes available.

Table 5-1 HDDV Enforcement in Stockton: 2017-2019

Program	Inspections	Violations	
		Emissions	Non-Emissions
Drayage	25	0	1
Heavy-Duty Vehicle Inspection Program (HDVIP)	134	0	0
Idling	31	0	0
Off-Road	3	0	0
Smart Way	33	0	0
Transportation Refrigeration Unit (TRU)	2	2	0
Truck and Bus	16	3	0
Total	244	5	1

Figure 5-5 below provides a year-to-year comparison of HDDV enforcement actions and overall compliance rates from 2017 to 2019. Although overall compliance remains high (at and above 96 percent) over the three-year period, the low number of total inspections under the Drayage, Off-Road, TRU and Truck and Bus programs, demonstrate the need for more targeted inspections in the Stockton community. CARB will work closely with CSC to determine methods to identify areas of non-compliance by evaluating emissions inventory, air monitoring data, CARB's three-year history and community groundtruthing information within the Stockton AB 617 boundary.

Figure 5-5 Year-to-Year Comparison of HDDV Enforcement in Stockton

Figure 5-6 below shows the approximate locations (indicated by the truck icons) of the above-mentioned HDDV program inspections in the Stockton community boundary. Visualizing inspection locations helps CARB staff to determine any locations where enhanced enforcement is needed within the community. In the past, CARB staff would target areas with large concentrations of HDDVs such as truck stops and distribution centers. It is important to note that each location represents multiple inspections across the various HDDV programs. In addition, implementing random roadside inspections can be difficult because field staff, in coordination with the California Highway Patrol, must have enough space to perform inspections safely on the side of the road.

Figure 5-6 Map of Heavy-Duty Diesel Vehicle Inspections in Stockton: 2017-2019

In April 2017, the Governor signed into law Senate Bill 1 (SB 1),²⁸ a legislative package meant to generate significant funding for transportation projects (e.g., to repair local streets, bridges, and roadways) across California. SB 1 includes a provision that aims to bring old, polluting buses and trucks into compliance with applicable emission standards as outlined in the Statewide Truck and Bus Regulation, and authorizes DMV to deny registration to non-compliant heavy-duty vehicles²⁹ starting January 1, 2020, through December 31, 2023. By the end of 2023, 100 percent of trucks and buses registered in California, which are subject to the rule, will comply with this regulation.

In response to the legislation, CARB began a streamlined enforcement process to increase outreach to owners of heavy-duty diesel trucks and buses and provide an opportunity for vehicle owners to demonstrate compliance. Those with older vehicle models that could potentially be out of compliance were sent Notices of Non-Compliance (NC) and Notices of Violation (NOV)³⁰ from 2018 through 2019. In the last quarter of 2019, CARB sent warning letters to fleet owners who appeared to have vehicles that could potentially be out of compliance beginning January 1, 2020. HDDV owners are now required to show proof of compliance to Department of Motor Vehicles (DMV) with their vehicle registrations.

²⁸ https://leginfo.ca.gov/faces/billNavClient.xhtml?bill_id=201720180SB1

²⁹ The regulation applies to nearly all diesel-fueled trucks, buses, and school buses with a gross vehicle weight rating (GVWR) greater than 14,000 pounds.

³⁰ A Notice of Non-Compliance letter is sent to request proof of compliance. If compliance cannot be verified, a Notice of Violation is sent.

Table 5-2 Summary of letters sent under SB 1 in Stockton: 2018-2019

Type of Letter	Number of Letters Sent
Warning letters	189
NC and NOV letters	157
Total	346

In Stockton, CARB identified 1,512 HDDVs within the Stockton community. As shown in Table 5-2 above, CARB issued 189 warning letters and 157 NCs and NOVs to owners of vehicles within the area in 2019. Of the 157 vehicle owners sent NCs or NOVs, 29 demonstrated compliance, whereas 118 vehicles were found to be non-compliant and were issued registration holds by DMV and were removed from the road. In total, CARB issued warning letters or took enforcement action against 346 vehicle owners. No enforcement action was taken on 10 other vehicles that were found not to be subject to the Truck and Bus Regulation.

Marine Programs

From 2017 to 2019, CARB staff performed 171 inspections for marine regulation enforcement at the Port of Stockton. Descriptions of the related marine enforcement programs are provided in CARB's Appendix.

Table 5-3 Marine Enforcement in Stockton: 2017-2019

Program	Total Inspections	Violations
CHE	121	23
CHC	21	0
OGV	29	1
Total	171	24

As shown above, marine enforcement focused mainly on the Cargo Handling Equipment (CHE) Regulation. During this period, 24 NOVs were issued for violations of CHE and Ocean Going Vessels (OGV) programs. CARB staff did not find any violations of the Commercial Harbor Craft (CHC) Regulation.

below provides a year-to-year comparison of marine enforcement activities and overall compliance rates from 2017 through 2019.

Figure 5-7 Year-to-Year Comparison of Marine Enforcement in Stockton

Error! Not a valid bookmark self-reference. 5-8 below indicates the approximate locations of the above-mentioned marine program areas at the Port of Stockton. This

map may assist the community in identifying locations that CARB is not aware of or locations where additional inspections can occur.

Figure 5-8 Marine Enforcement Activity at the Port of Stockton: 2017-2019

Consumer Products

Consumer products are chemically formulated products used by household and institutional consumers and can be sources of toxic air contaminants and volatile organic compounds that community members unknowingly bring into their homes.

Examples include:

- Detergents and cleaning compounds
- Polishes and floor finishes
- Cosmetics and personal care products
- Home, lawn and garden products
- Disinfectants and sanitizers
- Aerosol paints and automotive specialty products
- Composite wood products

Consumer product inspections are an important regulatory tool to improve public health in the community. CARB investigators in the Consumer Products program purchase samples of regulated consumer products from outlets all over California. They inspect products for compliance with registration and dating requirements and send selected products to the laboratory for testing.

From 2017 through 2019, CARB conducted 1,883 consumer product inspections statewide. Consumer products are reported statewide because it is assumed these products are sold and delivered throughout the state. Table 5-4 below represents a breakdown of enforcement action in the state.

Table 5-4 Consumer Product Inspections Statewide: 2017-2019

Program	Total Inspections	Violation	Under Investigation
Aerosol Coatings	118	24	72
Antiperspirant/Deodorants	35	4	16
Composite Wood	120	11	50
Other Consumer Products	1,610	73	618
Total	1,883	112	756

Vehicles and Engines

CARB is responsible for evaluating the emission control systems of new vehicles and engines, and evaporative emission control systems of engine-equipped devices. When CARB finds that the vehicle/engine/evaporative emission control system complies with all of California's emission standards and emissions-related requirements, the vehicle/engine/evaporative emission control system may operate in California.

CARB conducted six Vehicles and Engines inspections in the Stockton AB 617 Community during the 2017-2019 period. CARB staff found zero violations across the three programs listed in Table 5-5 below.

Table 5-5 Vehicles & Engines Program Inspections in Stockton: 2017-2019

Program	Inspections	Violations
49 State	1	0
Recreational Marine Engines	1	0
R134A	4	0
Total	6	0

Fuels Enforcement Program

CARB staff are responsible for setting standards and adopting regulations to achieve the maximum degree of emissions reduction possible from vehicular and other mobile sources. Motor vehicle emissions are responsible for approximately 55 percent of air pollution emissions statewide.

As seen in Table 5-6, from 2017 through 2019, CARB staff conducted 112 fuel inspections in the Stockton community. There were no violations issued for these inspections within the community.

Table 5-6 Fuels Program Inspections in Stockton: 2017-2019

Fuel Type	Inspections	Violations
Gas	75	0
Diesel	28	0
Ethanol	8	0
Bio	1	0
Total	112	0

Case Settlements

This section presents an overview of settlement agreements reached between CARB and companies in violation of CARB regulations in the Stockton community. In 2017, a company that failed to comply with requirements of the CHE Regulation signed a settlement agreement with a penalty of \$170,625.00 that was paid to the California Air Pollution Control Fund. In August 2019, CARB settled a case with the Port of Stockton in the amount of \$8,625.00 for violating the CHE Regulation. For further details on these cases, please visit <https://ww2.arb.ca.gov/our-work/programs/enforcement-policy-reports/enforcement-case-settlements>.

Complaints Summary and Resolution

CARB's previous complaint management system relating to HDDVs lacked the ability to track complaints by specific location. However, CARB staff have begun to work on and track all complaints through the California Environmental Protection Agency (CalEPA) Complaint Reporting System.³¹ This will allow CARB staff to better track complaints by community and to see the resolution of the complaint. Furthermore, this process will enhance CARB's complaint response by encouraging better complaint referrals (e.g. referring complaints to the proper agency and/or identifying complaints that may require multiple agencies to be involved in their resolution). To increase the effectiveness of the complaint program, CARB Enforcement developed a training to help communities identify possible violations and report an enforceable complaint.

Complaints are a vital part of CARB's enforcement program and we encourage the community to report possible violations regularly. In 2019, CARB received eight diesel complaints through CARB's complaint reporting system for the Truck and Bus

³¹ <https://calepacomplaints.secure.force.com/complaints/Complaint>

Regulation and four complaints through CalEPA's reporting system within the Stockton AB 617 Community. CARB referred the complaints received to the appropriate section in a timely manner.

Supplemental Environmental Projects

CARB has a Supplemental Environmental Project (SEP) Policy that allows community-based projects to be funded from a portion, up to 50 percent, of the penalties received during settlement of enforcement actions. Every year CARB initiates cases that result in settlements with monetary penalties. The goal of the SEP program is to improve public health, reduce pollution, increase environmental compliance and raise public awareness in neighborhoods most burdened by environmental harm. In Stockton, there is one school air filtration SEP that is currently pending approval for funding. In addition, there are three SEPs funded in the San Joaquin Valley Air District.

Area	AB617 Community	SEPs	Amount Funded	Funding Status
San Joaquin Valley	South Central Fresno	Healthy Air Neighborhoods-Fresno	\$ 35,000.00	Fully funded
San Joaquin Valley	Southwest Stockton	Installation of Air Filtration Systems in Stockton-Washington Elementary School	\$ 80,000.00	Fully funded
San Joaquin Valley	Shafter	Asthma Impact Model Kern	\$ 113,480.00	Fully funded

CARB's SEP policy can be accessed at <https://ww2.arb.ca.gov/our-work/programs/supplemental-environmental-projects-seps>.

Outreach Materials

In an effort to provide communities with more knowledge, tools, and resources for enhanced enforcement, CARB Enforcement has developed the following outreach materials to further inform community members:

- **CARB's Enforcement Visualization Tool**

This web-based tool allows community members to see a map that details statewide field inspections and case settlements across California. This tool allows you to look up inspections by program, type, zip code, and date. A user guide has been developed to go along with the tool. This is a one-pager on how to use the Visualization Tool in your community. The Visualization Tool is available at <https://webmaps.arb.ca.gov/edvs/>.

- **Complaint Reporting**

- CARB has developed a community-focused training to provide communities with the information necessary to report a complaint. The trainings are tailored to each region within the AB 617 Program. For instance, the training provided in the San Joaquin Valley may differ from training given in West Oakland, based on the types of emission sources within the region, as well as contact information for other regulatory parties.
- As shown in Figure 5-9, CARB has also developed reporting cards (available in both English and Spanish) that include information on where to report complaints and what information to provide when reporting complaints. If the community is interested in receiving CARB’s complaint reporting training or obtaining the Complaint Reporting business cards through the CSC or another outlet, please contact COES@arb.ca.gov, or speak to your local CARB Enforcement liaison.

Figure 5-9 CARB Complaint Reporting Business Cards

- **Supplemental Environmental Project Brochures**

The SEP brochure outlines the SEP program and how to apply. It is available in both English and Spanish. To learn more about the SEP program, visit <https://ww2.arb.ca.gov/our-work/programs/supplemental-environmental-projects-seps>.

- **Informational Outreach Materials.** CARB staff are currently working on community outreach materials, including a multi-regulation booklet and a community idling factsheet. The booklet, geared towards community members, aims to provide information on the requirements for trucks and buses operating in their communities. For more information on any of the above outreach and training activities, please contact the Community Outreach and Enforcement Section at COES@arb.ca.gov.

CALEPA EJ INITIATIVE

In 2018 and 2019, CARB staff participated in a multi-agency initiative lead by CalEPA that focused on Stockton. As part of the initiative, CARB provided the City of Stockton with No-Idling signs. As of December 2019, seven signs were posted at various locations identified by the community as having high rates of idling trucks. Of the seven signs posted, three were on South Fresno Avenue, three were on Lincoln Street, near the DMV, and one was on Weber Avenue.

In addition, CARB developed a monitoring plan to help quantify the air pollution burden in the Boggs Tract community with a specific focus on George Washington Elementary School. CARB staff installed two Aeroqual sensors at the George Washington Elementary School and data was collected from July 30, 2019 to August 28, 2019. These sensors measured PM_{2.5}, ozone and NO₂ concentrations in the community.

CARB also conducted mobile monitoring to characterize the air quality and its spatial pattern around the school and to identify possible sources of pollution. CARB staff collected monitoring data using a Mobile Sampling Platform. In total, CARB conducted 7 days of sampling from August 15, 2019 to August 30, 2019, making 19 rounds of the community and surrounding area. CARB concluded that areas in the vicinity of the school and near the port showed higher levels of PM₁₀ (and other coarser PM), which was observed to be consistent with road dust from unpaved roads. Initial analysis of the combined monitoring efforts appeared to show that the highest concentrations of measured pollutants were lower than both the Federal and State air quality standards.

The results of CalEPAs environmental justice initiative are located at the following link: <https://calrecycle.maps.arcgis.com/apps/Cascade/index.html?appid=99f5790b860844668bdef48f45dcfa00>

CARB ENFORCEMENT STRATEGIES

The goal of our enforcement programs is to achieve comprehensive compliance in every regulation CARB adopts. CARB acknowledges that the high compliance rates identified in the enforcement history may not necessarily reflect compliance across the community. In cases where enhanced enforcement activities uncover non-compliance issues, CARB's goal will be to achieve the same or higher compliance rates as observed in CARB inspections throughout the AB 617 Community. In addition, CARB's

goal is to work closely with CSC, SJVACPD, local organizations and other agencies within Stockton (e.g. City government) to address gaps in the enforcement of mobile sources. In the past, CARB focused mobile enforcement on high traffic areas, truck stops, distribution centers and areas where complaints were reported.

To achieve these goals, CARB is committed to enhancing enforcement activities within Stockton by utilizing the following tools:

- An assessment of the enforcement history data
- Emissions inventory
- Air monitoring data
- Groundtruthing observations to assist in targeting areas that may require additional enforcement with guidance from CSC

CARB will utilize current regulations and enforcement programs across all sources CARB regulates to target areas of non-compliance within the Stockton community. Listed below are CARB's enforcement strategies to help improve air quality in the Stockton community:

1. Increase the frequency of compliance inspections with guidance from CSC

CARB will collaborate with the Stockton CSC and the District to actively enhance enforcement activities throughout the community boundary. This will be done through a combination of improved complaint reporting, identifying multiple locations for focused inspections, inventory analysis, and community input. CARB will schedule report-back meetings to update CSC on both the status of inspections and to obtain additional areas of mobile source concerns. CARB will work with CSC to meet annually in order to prioritize enforcement strategies and identify possible locations where non-compliant vehicles, TRUs, and off-road equipment are present. CARB will report to the community the number of inspections performed, mapped locations of the enforcement, and the number of citations and NOVs issued.

As of September 2020, through CSC monthly meetings, the committee and citizens have heard there is a need to focus enforcement efforts in the following areas:

- a. Knife River area
- b. Charter Way and Fresno Avenue
- c. South El Dorado
- d. Boggs Tract
- e. Idling HDDVs near schools and residential areas

The fact that there were only two inspections of TRUs from 2017 to 2019, and both were determined to be non-compliant, warrants an increase of TRU inspections in Stockton. In 2021, with the help of CSC and SJVAPCD, CARB will increase TRU enforcement.

If members of CSC have additional guidance on where CARB staff can enhance enforcement efforts, please reach out to the Community Outreach and Enforcement Section at COES@arb.ca.gov.

2. Provide in-person community specific training

CARB will develop and offer training opportunities to the Stockton AB 617 Community. Information will cover topics like the fundamentals of enforcement, how the enforcement process works, instructions on filing a thorough complaint and what to expect from the enforcement process after filing a complaint. Through this program, community members will be able to better support CARB or SJVAPCD enforcement processes. In light of social distance mandates due to COVID-19, CARB may develop online trainings.

3. Achieve compliance with the Truck and Bus Regulation via SB 1

As mentioned earlier, SB 1 includes a provision that, beginning in 2020, a vehicle must demonstrate compliance with the Truck and Bus Regulation before it can be registered with the DMV. Beginning in 2020, the DMV, in conjunction with data provided by CARB, will deny vehicle registration to non-compliant HDDVs based on the model year of the vehicle. Under this legislation, compliance with the Truck and Bus Regulation will be fully implemented by 2023.

4. Coordinate with other agencies

CARB will seek opportunities to coordinate with other agencies with enforcement authority in Stockton such as the City of Stockton, school districts and other CalEPA agencies. For example, CARB staff may work with the City of Stockton to provide truck *No Idling* signage in areas where community members observe trucks idling. In addition, CARB may provide assistance in other areas such as land-use and urban planning, if needed.

5. Enhance CARB's data management practices

CARB is committed to enhancing the quality of enforcement data for the Stockton community. Moving forward, CARB will maintain the location of enforcement activity and received complaints to provide CSC with the most accurate data available. CARB has recently completed a visualization tool that makes CARB enforcement data more transparent and available. This tool can be accessed online by visiting <https://webmaps.arb.ca.gov/edvs/>.

6. Provide annual report of enforcement activities

CARB's Enforcement Division will provide an annual report to CSC to summarize CARB's enforcement activities within the community and update strategies as require

7. Update enforcement strategies as applicable

CARB staff are committed to updating enforcement strategies as requested by the CSC, if said strategies fall within CARB's jurisdiction and if CARB can reasonably accommodate the request (e.g., additional enforcement training for idling vehicles).

As CARB adopts new regulations, CARB will enforce these measures and integrate associated activities and data into the Stockton enforcement measures.

APPENDIX

ENFORCEMENT PROGRAMS DESCRIPTION

Heavy-Duty Vehicle Inspection Program (HDVIP). The HDVIP requires inspection of heavy-duty trucks and buses for excessive smoke and tampering, and engine certification label compliance. Any heavy-duty vehicle traveling in California, including vehicles registered in other states and foreign countries may be tested. CARB inspection teams perform tests at border crossings, CHP weigh stations, fleet facilities, and randomly selected roadside locations. Owners of trucks and buses found in violation are subject to minimum penalties starting at \$300 per violation and up to \$1,000 a day.

Off-Road Construction Equipment (Off-road Regulation). Construction equipment is a major contributor to air pollution, especially when large construction projects are adjacent to neighborhoods. To address this source of air pollution, CARB adopted the nation's first regulation aimed at cleaning up off-road construction equipment such as bulldozers, graders and backhoes. The Off-Road Regulation requires off-road fleets to meet fleet average emission standards and be equipped with best available control technology.

The Tractor-Trailer GHG Regulation (Smart Way). This regulation requires 53-foot or longer dry van or refrigerated van trailers and the tractors that pull them on California highways to use certain equipment that the U.S. EPA Smart Way program has verified or designated to meet their efficiency standards and reduce fuel consumption.

Solid Waste Collection Vehicles (SWCVs). The SWCV Regulation required vehicle owners to upgrade SWCVs by December 31, 2010. On January 24, 2019, the Board approved amendments that now require reporting for SWCVs with 2006 model year and older engines to avoid unnecessary registration delays at the California DMV starting in 2020 due to SB 1 requirements. The approved amendments also added heavy diesel-fueled on-road single engine cranes to the regulation and became effective on July 1, 2019. These specialized cranes are required to phase-in 2010 or newer model year engines from 2019 to 2027.

Transport Refrigeration Unit (TRU). TRUs are refrigeration systems powered by diesel internal combustion engines designed to refrigerate or heat perishable products that are transported in various containers, including semi-trailers, truck vans, shipping containers, and rail cars. Because diesel particulate matter (diesel PM) is an identified toxic air contaminant, CARB adopted an airborne toxic control measure (ATCM) for TRUs and TRU generator sets. CARB staff inspect TRUs to ensure that the units are meeting labeling and in-use performance standards identified in the TRU Regulation.

Drayage. The Drayage Truck Regulation is part of CARB's ongoing efforts to reduce particulate matter (PM) and oxides of nitrogen (NOx) emissions from diesel-fueled engines and improve air quality associated with goods movement. Heavy-duty vehicles that carry goods to or from a port or intermodal facility are required to be equipped with a 2007 or newer model year engine. This requirement becomes stricter in 2023, when drayage trucks are required to be equipped with a 2010 or newer model year engine, because drayage trucks will be required to meet the standards of the Statewide Truck and Bus Regulation.

Statewide Truck and Bus (STB). The STB Regulation requires diesel trucks with a gross vehicle weight rating (GVWR) greater than 14,000 pounds that operate in California to install diesel particulate filters, or replace older engines with cleaner engine technology, on a schedule based on the model year of the engine and GVWR. The following timeline outlines the engine requirements HDDV must meet to be in compliance with the regulation.

Idling. Idling and opacity inspections are performed to ensure an HDDV is compliant with emission standards and is not violating CARB's Idling Regulation. Idling for more than five minutes is prohibited unless the HDDV is certified clean idle and the vehicle is more than 100 feet away from a school or restricted area (exceptions apply). Vehicle owners and drivers in violation are subject to minimum penalties starting at \$300 per violation and up to \$1000 per day.

FUELS INSPECTIONS

California's reformulated gasoline requirements are designed to reduce emissions from evaporation and the burning of gasoline, and Low Carbon Fuel Standard requirements are designed to reduce GHG emissions by reducing the carbon content of fossil fuels. To enforce these programs, CARB staff conduct inspections and review reporting information. When CARB identifies a violation, staff pursue compliance through corrective action and through the issuance and settlement of NOVs.

VEHICLES AND ENGINES

The New Vehicle/Engine Programs evaluate the emission control systems of new vehicles, engines, and evaporative emission control systems produced for California. When all emissions related requirements are met, CARB issues an Executive Order certifying the vehicle/engine/evaporative emission control system as compliant with California's emissions requirements. Vehicles and engines are not legal for sale in California until certified.

MARINE ENFORCEMENT PROGRAMS DESCRIPTION

Ocean Going Vessel (OGV) Fuels Regulation. The OGV Regulation is intended to reduce PM, diesel PM, NOx, and sulfur oxide emissions from ocean-going vessels. Such vessels are required to switch to a low sulfur distillate fuel within 24 nautical miles of the California coast.

Cargo Handling Equipment (CHE). The Mobile CHE Regulation was adopted in 2005 to reduce toxic and criteria emissions such as diesel PM and NOx to protect public health. As part of CARB's continuing efforts to reduce emissions of air pollution in California, CARB staff conduct compliance inspections of CHE used at ports and intermodal rail yards. CHE transfers goods, performs maintenance and repair activities, and includes equipment such as yard trucks, rubber-tired gantry cranes, top handlers, side handlers, forklifts, and loaders. CARB staff also conduct smoke audits on CHE at regulated facilities to insure equipment is maintained to manufacturer specifications.

Commercial Harbor Craft (CHC). There are several types of harbor craft in California, including crew and supply boats, fishing vessels, ferries, excursion vessels, tug boats, barges, dredges, and other vessel types. The CHC Regulation was adopted in 2007 to reduce emissions of diesel PM, NOx, and Reactive Organic Gases from diesel engines used on CHC operated in Regulated California Waters (within 24 nautical miles of the California coast).

CONSUMER PRODUCTS PROGRAMS DESCRIPTION

Composite Wood Products. CARB's ATCM to control formaldehyde emissions from composite wood specifically focuses on three products: hardwood plywood, particleboard, and medium density fiberboard. Investigators in the Composite Wood Products program purchase samples of regulated products from outlets all over California. They inspect products and packaging for compliance with labeling requirements and send selected products to the laboratory for testing.

Consumer Products. Consumer products are chemically formulated products used by household and institutional consumers. Some examples are detergents and cleaning compounds; polishes and floor finishes; cosmetics and personal care products; home, lawn, and garden products; disinfectants and sanitizers; and aerosol paints and automotive specialty products. Consumer products do not include other paint products, furniture coatings, or architectural coatings. Investigators in the Consumer Products program purchase samples of regulated consumer products from outlets all over California. They inspect product containers for compliance with registration and dating requirements and send selected products to the laboratory for testing.

5.5 LEVERAGING COMMUNITY INVOLVEMENT IN ENFORCING RULES TO REDUCE AIR POLLUTION

Members of the community play an important role in protecting public health by reporting air quality issues that they observe to both the District and CARB. The District and CARB value input from the public who reside and work in the community. The complaint process aids both agencies in identifying issues within the communities and ensuring timely resolution. Filing a complaint is easy. The following is the contact information for the District and CARB.

San Joaquin Valley Air Pollution Control District
Stationary Sources - Smoke, Dust, Odors or Other Contaminants
Phone: 1-800-870-1037
Valley Air Smart Phone App
Online: <https://www.valleyair.org/busind/comply/onlinecomplaint.htm>

California Air Resources Board
Automobiles, Trucks, Off-road Equipment, or Other Vehicles
Phone: 1-800-END-SMOG
Online: <https://calepa.ca.gov/enforcement/complaints/>

An effective complaint should contain as much information and as many details as possible as this helps the inspector in responding to the issue and conducting the investigation. The following information is helpful when filing a complaint:

- Time, date, and location of possible violation; including name of facility if known.
- Type of air quality concern. Describe what you see, smell, and feel.
 - See: smoke, fire, dust falling ash, etc.
 - Smell: rotten eggs, gasoline, oil, sweet, sour, smoke, etc.
 - Feel: burning eyes, throat/nose irritation, breathing problem, headache, etc.
- Is the issue still occurring? If not, when did it occur? Is it recurring? If so when?

- Time of day
- Day of week
- Your name and contact information – anonymous complaints can be filed but contact information often helpful in fine tuning the investigation.

To better leverage community involvement, the District and CARB will also assign a dedicated team to work with the Community Steering Committee to follow-up on community concerns, and to conduct community-level compliance assistance, outreach, and education related to compliance and enforcement of local and state rules and regulations. As part of this partnership, the District and CARB will track and report back to the Community Steering Committee on the ongoing enforcement activities within the community to monitor progress in meeting community enforcement measures and to look for innovative strategies to enforcement practices with the goal of increased compliance with air pollution rules and regulations within the community.

5.6 ENFORCEMENT STRATEGIES

5.6.1 DISTRICT ENFORCEMENT STRATEGIES

The District has used the assessment of the three (3) year compliance history in the Stockton AB 617 Community and comments shared by the Community Steering Committee to develop the list of enforcement strategies below which aim to reduce the potential for localized air quality impacts within the Stockton AB 617 Community. During implementation, District staff will provide regular updates on enforcement measures and will solicit guidance and feedback to continue to look for opportunities to evaluate and improve enforcement activities.

1. Enhanced enforcement of District Rule 4901 (*Wood Burning Fireplace and Wood Burning Heaters*) mandatory wood burning curtailments:

This measure is still being considered by the Stockton Steering Committee and may be included in a later draft.

2. Enhanced enforcement of District Rule 4103 (*Open Burning*) to reduce the illegal open burning of residential waste:

To limit the potential for localized PM_{2.5} and toxic impacts associated with the illegal open burning of residential waste, District will conduct targeted surveillance efforts within the Stockton AB 617 Community. Building on the District's existing surveillance and complaint response efforts, the District will conduct additional targeted surveillance efforts in Stockton AB 617 Community at least once per quarter for the next 5 years. The District will work with the Community Steering Committee to focus surveillance efforts in areas where illegal residential open burning has historically occurred.

3. Enhanced inspection frequency of permitted sources:

To limit the potential for localized air quality impacts associated with the failure to comply with emissions standards established by District permit, rule, or regulation, the District will increase the frequency of inspection at each facility that has had an

emission violation over the past three (3) years. These facilities will be inspected at least twice per calendar year for the next five (5) years or until the facility has 4 consecutive inspections without an emission violation, whichever occurs first.

4. Enhanced enforcement of fugitive dust requirements

To limit the potential for localized air quality impacts associated with fugitive dust from construction/earthmoving activities and open areas subject to District Regulation VIII, the District will conduct targeted surveillance efforts within the Stockton AB 617 Community. Building on the District's existing surveillance and complaint response efforts, the District will conduct at least one targeted enforcement effort within the Stockton AB 617 Community during both the 2nd and 3rd quarter for the next five (5) years.

5. Pilot training program for conducting self-inspections at gas stations:

This measure is still being considered by the Stockton Steering Committee and may be included in a later draft.

6. Enhanced enforcement of the state's heavy-duty vehicle anti-idling regulation:

To limit the potential for localized PM_{2.5} and toxic air quality impacts associated with failure to comply with the state's heavy-duty vehicle anti-idling regulation, the District will partner with CARB to conduct additional targeted anti-idling enforcement efforts in Stockton AB 617 Community at least once per quarter for the next 5 years. The District and CARB will work with the Community Steering Committee to identify heavy-duty vehicle idling "hot spots," especially those near schools, to aid in focusing the enforcement efforts.

7. Report back to the Community Steering Committee on Enforcement Activities:

The District will track and provide an annual report to the Community Steering Committee to summarize the District enforcement efforts within the community and to monitor progress in implementing community enforcement measures and meeting enforcement goals.

8. Coordinate with other agencies

The District will seek opportunities to coordinate with other agencies within the Stockton AB 617 Community to address multimedia compliance issues as they arise.

9. Update enforcement strategies as appropriate

The District committed to evaluating the results of ongoing compliance activities within the Stockton AB 617 Community and moving forward will work with the Community Steering Committee to update measures as appropriate.

5.6.2 CARB ENFORCEMENT STRATEGIES

CARB acknowledges that the high compliance rates identified in the enforcement history may not necessarily reflect compliance across the community. In cases where enhanced enforcement activities uncover non-compliance issues, CARB's goal will be

to achieve the same or higher compliance rates as observed in the three-year history. CARB staff will also work closely with the community steering committee, the Air District, and other agencies to address gaps in the enforcement of mobile sources and seek opportunities to close these gaps.

To support achieving these goals, CARB is committed to enhancing enforcement activities within Stockton AB 617 Community by utilizing the following tools:

- An assessment of the enforcement history data
- Targeting areas that may require additional enforcement with guidance from the community steering committee

CARB will utilize current regulations and enforcement programs across all sources CARB regulates to target areas of non-compliance within the Stockton AB 617 Community.

Listed below are CARB's enforcement strategies to help improve air quality in the Stockton AB 617 Community:

1. Increase the frequency of compliance inspections with guidance from the community steering committee:

CARB will collaborate with the Stockton AB 617 Community steering committee to actively enhance enforcement activities. This will be done through a combination of improved complaint reporting, more focused inspections, and report-back meetings to update the community steering committee on both the status of inspections and to obtain additional areas of mobile source concern. CARB will work with the steering committee to meet annually in order to prioritize enforcement strategies and identify possible locations where non-compliant vehicles are present. CARB will additionally report to the community the number of inspections performed, mapped locations of the enforcement, and the number of citations and/or Notices of Violations issued.

2. Achieve Compliance with the Truck and Bus Regulation via Senate Bill 1:

In April 2017, the Governor signed Senate Bill 1 (SB 1) into law which included a provision that, beginning in 2020, a vehicle must demonstrate compliance with the STB regulation before it can be registered with the Department of Motor Vehicles (DMV). Beginning in 2020, the DMV, in conjunction with data provided by CARB, will deny vehicle registration to non-compliant HDVs based on the model year of the HDV.

Figure 5-10 Truck and Bus Regulation Engine Requirements Timeline**3. Provide Annual Report of Enforcement Activities**

CARB's enforcement division will provide an annual report to the CSC to update and summarize CARB's enforcement activities within the community.

4. Coordinate with other agencies

CARB will seek opportunities to coordinate with other agencies with enforcement authority in Stockton AB 617 Community.

5. Enhance CARB's Data Management Practices

CARB is committed to enhancing the quality of enforcement data for the Stockton AB 617 Community. Moving forward, CARB will maintain the location of enforcement activity and received complaints to provide the community steering committee with the most accurate data available. CARB has recently completed a visualization tool that makes CARB enforcement data more transparent and available. The tool can be accessed online by visiting <https://webmaps.arb.ca.gov/edvs/>.

6. Provide in-person community specific training

CARB will develop and implement a new program that will be offered to the Stockton AB 617 Community. Information will cover topics like the fundamentals of enforcement, how the enforcement process works, instructions on filing a thorough complaint, and what to expect from the enforcement process after filing a complaint. Through this program, community members will be able to better support CARB or air district enforcement processes. CARB may also develop online trainings in the future.

7. Update enforcement strategies as applicable

CARB staff are committed to updating enforcement strategies as requested by the community steering committee, if said strategies are enforceable by CARB

staff or if CARB can reasonably accommodate the request (e.g., additional enforcement training for idling vehicles).

6. METRICS TO TRACK PROGRESS

6.1 METRICS FOR FIVE-YEAR MILESTONE EVALUATION

Strategies implemented as a part of this CERP are designed to improve air quality in the community of Stockton. The five-year milestone evaluation is intended, per CARB guidance, to illustrate community scale emissions reductions and air quality trends that may not be evident on an annual reporting basis. To this end, the five year milestone report submitted to CARB for Stockton will include a comprehensive report of air quality monitoring data obtained in the community throughout the term of the CERP, as well as a complete accounting of all projects, emissions reductions, and associated co-benefits implemented as a result of AB 617 program implementation in the community of Stockton.

Table 6-1 Emission Reduction Targets for Incentives Measures

Measure #	Community Suggested Measures	Unit Type	# of Units	Allocation Amount	Direct Reductions Estimate Lifetime (Tons)
Community					
VB.1	Vegetative Barriers	Projects	2	\$ 1,000,000	0.5
UG.1	Trees and Urban Greening	Projects	2	\$ 1,000,000	-
LG.1	Residential Lawn and Garden Equipment	Equipment	50	\$ 20,000	0.3

7. CALIFORNIA ENVIRONMENTAL QUALITY ACT (CEQA) PROJECT REVIEW

According to Section 15061 (b)(3) of the California Environmental Quality Act (CEQA) Guidelines, a project is exempt from CEQA if, “the activity is covered by the common sense exemption that CEQA applies only to projects which have the potential for causing a significant effect on the environment. Where it can be seen with certainty that there is no possibility that the activity in question may have a significant effect on the environment, the activity is not subject to CEQA.” Since the Project will result in an air quality benefit to the community, the Project is not expected to result in a significant impact under CEQA. As such, the common sense exemption applies.

In addition, this Project is an action taken by a regulatory agency, the San Joaquin Valley Air District, as authorized by state law for the protection and betterment of air quality in the San Joaquin Valley. CEQA Guidelines §15308 provides a categorical exemption for “actions taken by regulatory agencies, as authorized by state or local ordinance, to assure the maintenance, restoration, enhancement, or protection of the environment where the regulatory process involves procedures for protection of the environment. Construction activities and relaxation of standards allowing environmental degradation are not included in this exemption.” No construction activities or relaxation of standards are included in this project. As such, for this additional reason, the District finds that the Project is exempt from CEQA.

Pursuant to Section 15062 of the CEQA Guidelines, the District will file a Notice of Exemption upon Governing Board approval of the Project.

GLOSSARY

AB 617 – Assembly Bill (AB) 617 (C. Garcia, Chapter 136, Statutes of 2017) directs the state and local air districts to identify communities in California that are exposed to high levels of air pollution and established the Community Air Protection Program. Air districts with input from residents and stakeholders are to develop community focused action plans and community air monitoring plans to address localized air pollution and reduce exposure to particulate matter and toxic air contaminants.

Area Sources – Sources of air pollutants that individually emit relatively small quantities of air pollutants, but that may emit considerable quantities of emissions when combined over a large area. Examples include water heaters, lawn maintenance equipment, and consumer products.

Best Available Control Technology (BACT) – These are the most stringent requirements for new or modified sources. An emissions limitation based on using the most up-to-date methods, systems, techniques, and production processes available to achieve the greatest level of emission reductions. **Best Available Retrofit Control Technology (BARCT)** – An emissions limitation based on the maximum degree of reduction achievable for existing sources considering environmental, energy, and economic impacts.

Black Carbon – Black carbon is the sooty black material emitted from gasoline and diesel engines, and other sources that burn fossil fuel. It comprises a significant portion of particulate matter. Inhalation of black carbon is associated with health problems including respiratory and cardiovascular disease, cancer, and birth defects.

California Air Resources Board (CARB) – The State of California agency responsible for air pollution control. Responsibilities include: establishing State ambient air quality standards, setting allowable emission levels for mobile sources of emissions and consumer products.

California Environmental Quality Act (CEQA) – Legislation requiring state and local agencies to disclose the significant environmental impacts of a project through the preparation of an Initial Study, Negative Declaration or Environmental Impact Report, including actions to mitigate any significant environmental project impacts.

Cancer Risk – The likelihood that a person will develop cancer during their lifetime.

Carbon Monoxide (CO) - a colorless, odorless gas emitted from combustion processes like mobile sources.

Cargo Handling Equipment (CHE) – Equipment used to move containers within a marine terminal. Cargo-handling equipment includes rubber-tired gantry (RTG) cranes, yard tractors, side-picks, and top picks. The large ship-to-shore cranes that move containers from the vessel to the container yard and vice-versa are not included in the definition of CHE.

Concentrations – Pollution in the air is typically expressed as a *concentration*. A concentration is the amount that could be extracted from a given volume of air (like a cubic meter). For example, the amount of particulate matter concentrations in terms of “micrograms per cubic meter ($\mu\text{g}/\text{m}^3$).” This is a measure of the amount of particulate matter collected if you were to draw a cubic meter of air through a clean filter, and then weigh the filter on a scale that can measure millionths of a gram. Today we would

expect, on average, to be able to collect about 10 µg of PM_{2.5} from a cubic meter of ambient air.

Control Device – Devices designed to capture, remove and/or reduce pollutants that would otherwise be emitted into the air. Examples are baghouses, scrubbers, dust collectors, direct flame afterburners, vapor recovery units, and water sprayers.

Criteria Air Pollutants – As required by the Clean Air Act, the U.S. Environmental Protection Agency (EPA) identifies and set standards to protect human health and welfare for six pollutants: ozone, carbon monoxide, particulate matter, sulfur dioxide, lead, and nitrogen oxide. The term "criteria pollutants" derives from the requirement that the U.S. EPA must describe the characteristics and potential health and welfare effects of these pollutants. U.S. EPA periodically reviews new scientific data and may propose revisions to the standards as a result.

Diesel Engine – An internal combustion engine in which ignition of the fuel, which is injected into the combustion chamber, is caused by the elevated temperature of the air in the cylinder due to mechanical compression.

Diesel Particulate Matter (DPM) – The particles found in the exhaust of diesel-fueled compression ignition engines. Diesel PM may combine and adsorb other species to form structures of complex physical and chemical properties.

Drayage Trucks – A truck used to haul containers to and from the container terminals. It consists of the tractor unit and a semitrailer consisting of the container on a chassis (wheeled base).

Emissions – A gas or liquid stream containing one or more air contaminants discharging or emitted into the atmosphere.

Enforcement Action – When non-compliance with District rules and regulations and local, state, and federal requirements which the District has authority over

Environmental Protection Agency (EPA) – The federal agency in charge of creating and enforcing regulations to protect human health and the environment.

Fine Particulate Matter (PM_{2.5}) – Particulate matter (PM) is a mixture of solid particles and liquid droplets suspended in the air. Of these particles, those less than 2.5 micrometers in diameter, called fine PM or PM_{2.5}, pose the greatest risk to health. See particulate matter.

Gasoline Dispensing Facilities (GDF) – Retail service station or private facility that stores and/or dispenses gasoline into fuel tanks.

Greenhouse Gases (GHG) – Any gas that absorbs infrared radiation in the atmosphere. Greenhouse gases include water vapor, carbon dioxide (CO₂), methane (CH₄), nitrous oxide (N₂O), halogenated fluorocarbons (HCFCs), ozone (O₃), perfluorocarbons (PFCs), sulfur hexafluoride (SF₆) and hydrofluorocarbons (HFCs).

Health Risk Assessment (HRA) – A detailed comprehensive analysis to evaluate and predict the dispersion of hazardous substances in the environment and the potential for exposure of human populations, and to assess and quantify both the individual and population wide health risks associated with those levels of exposure.

High Efficiency Particulate Air Filters (HEPA filters) – A high efficiency particulate air filter capable of filtering 0.3 micron particles with 99.97 percent efficiency.

Idling - keep the engine of a vehicle running while parked.

Indirect Sources – Land uses and facilities that attract or generate motor vehicle trips and thus result in air pollutant emissions; for example, shopping centers, office buildings, warehouses, and airports.

Minimum efficiency reporting value (MERV) – Developed by the American Society of Heating, Refrigerating and Air Conditioning Engineers, MERV rates the effectiveness of air filters. The higher the number, the finer the filtration.

Mixed Land Use – A range of land uses including residential, commercial, and industrial to be collocated in an integrated way that supports sustainable forms of transportation.

Mobile Sources Of Air Pollution – Any motor vehicle that produces air pollution, e.g., cars, trucks, motorcycles (on-road mobile sources) or airplanes, trains and construction equipment (off-road mobile sources).

National Ambient Air Quality Standards (NAAQS) – The Clean Air Act requires U.S. EPA to set National Ambient Air Quality Standards (NAAQS) at a levels determined to be protective of public health within an adequate margin of safety for six pollutants referred to as criteria pollutants. Standards are set based on scientific research and policy assessments reviewed by the Clean Air Scientific Advisory Committee.

New Source Review (NSR) – A pre-construction permitting review requirement that ensures that when a new source of air pollution is built, or when an existing source is modified, the source will implement effective emission control technology and will comply with related regulatory requirements pertaining to air emissions.

Nitrogen Oxides (NOx) - or “oxides of nitrogen” is a group of gases that are composed of nitrogen and oxygen. Two of the most common nitrogen oxides are nitric oxide (NO) and nitrogen dioxide (NO₂).

Off-Road Vehicles – An off-road vehicle is any type of vehicle which can drive on and off paved or gravel surfaces. They are generally characterized by having large tires, open treads, a flexible suspension or caterpillar tracks. Other vehicles that do not travel public streets or highways are called off-highway vehicles and include tractors, forklifts, cranes, backhoes, bulldozers and golf carts.

On-Road Vehicles – A vehicle designed to legally carry people or cargo on public roads and highways such as buses, cars, trucks, vans, motor homes, and motorcycles.

Ozone (O₃) - ground level or “bad” ozone which is not emitted directly into the air, it is created by chemical reactions between oxides of nitrogen (NO_x) and volatile organic compounds (VOC) in the presence of sunlight.

Particulate Matter (PM) – PM includes a wide range of particles that vary in terms of their size and mass, physical state (solid or liquid), chemical composition, toxicity, and how they behave and transform in the atmosphere. PM is commonly characterized based on particle size. Ultrafine PM includes the very smallest particles less than 0.1 micron in diameter (one micron equals one-millionth of a meter). Fine PM, commonly referred to as PM_{2.5}, consists of particles 2.5 microns or less in diameter (includes ultrafine PM). Coarse PM refers to particles between 2.5 microns and 10 microns in diameter. The term “coarse” particles may be misleading; it should be emphasized that even “coarse” particles are still very tiny, many times smaller than the diameter of a human hair. PM₁₀ consists of particles 10 microns or less in diameter (includes ultrafine, fine and coarse PM).

Parts per Billion (ppb) – A weight-to-weight ratio used to describe concentrations. Parts per billion (ppb) is the number of units of mass of a contaminant in the air per 1000 million units of total mass

Parts per Million (ppm) – A weight-to-weight ratio used to describe concentrations. Parts per million (ppm) is the number of units of mass of a contaminant in the air per million units of total mass.

Partial Zero Emission Vehicle (PZEV) – PZEV is an automobile that has zero *evaporative* emissions from its fuel system and meets Super Ultra Low Emissions Vehicle (SULEV) tailpipe-emission standards. Evaporative emissions are the gasoline fumes that escape during refueling or from the fuel tank and supply lines. See also ZEV.

Sensitive Receptors – Members of the population that are particularly sensitive to the effects of air pollutants, such as children, the elderly, and people with illnesses.

Stationary Sources of Air Pollution (Stationary Sources) – A fixed, non-mobile producer of air pollution, usually found at industrial or commercial facilities.

Toxic Air Contaminants (TACs) – TACs are air pollutants, identified by CARB, which may cause or contribute to an increase in deaths or in serious illness, or which may pose a present or potential health hazard. Health effects may occur at extremely low levels of TACs.

Transport Refrigeration Unit (TRU) – Refrigeration systems powered by integral internal combustion engines designed to control the environment of temperature sensitive products that are transported in trucks and refrigerated trailers. TRUs may be capable of both cooling and heating.

Vehicle Miles Traveled (VMT) – One vehicle (whether a car carrying one passenger or a bus carrying 30 people) traveling one mile constitutes a vehicle mile

Volatile Organic Compounds (VOCs) - are a large group of carbon-based chemicals that easily become vapors or gases. They include both human-made and naturally occurring chemical compounds.

Zero-Emission Vehicle (ZEV) – Vehicles which produce no emissions from the on-board source of power (for example, a fully electric vehicle).

Community Emissions Reduction Program

Stockton

February 3, 2021 Draft

San Joaquin Valley
AIR POLLUTION CONTROL DISTRICT

EXECUTIVE SUMMARY

The air quality challenges that the communities in the San Joaquin Valley face are unmatched by any other region in the nation. The San Joaquin Valley, due to its unique geography, topography, and meteorology, continues to face daunting challenges in meeting the latest federal health-based air quality standards. Since 1992, the San Joaquin Valley Air Pollution Control District (District) has implemented nearly 650 rules and regulations to control air pollution in the Valley Air Basin. Numerous plans to improve Valley air quality and attain state and federal air quality standards have detailed a wide-range of strategies, including regulatory measures, extensive incentive investment to promote clean-air technologies in Valley communities, and other first-of-their kind measures, [such as the District's Indirect Source Review regulation which reduces emissions from new construction and development projects, and the nationally recognized Tune-in-Tune Up vehicle repair program](#). The District also has dedicated field staff that are in communities throughout the Valley conducting inspections and responding and investigating complaints to ensure that Valley businesses and residents are complying with federal, state, and local rules and regulations.

As a result of the District's stringent and comprehensive air quality management strategy, along with significant investments made by Valley businesses and residents, [since the District's formation in 1992](#), PM2.5 and ozone levels are now at historically low levels, and the Valley continues to be in attainment of the PM10 federal air quality standard. Emissions from stationary sources have been reduced by 85%, cancer risk from exposure to air pollutants has been reduced by 95%, population exposure to elevated PM2.5 levels have been reduced by 85%, and population exposure to elevated ozone levels have been reduced by 90%.

Despite these regional air quality improvements, significant concern has been expressed by the California legislature about potential localized impacts of air pollution in disadvantaged communities throughout the state. In answer to that concern, Assembly Bill (AB) 617, signed into law in July 2017, initiated a state-wide effort to monitor and reduce air pollution, and improve public health, in communities that experience disproportionate burdens from exposure to air pollutants through new community-focused and community-driven actions. The community of Stockton AB 617 Community was prioritized by the Air District and subsequently selected by the California Air Resources Board (CARB) as one of the third-year communities selected in the state to receive clean air resources newly available under AB 617, based on a technical analysis of several pollution and poverty-related criteria.

AB 617 provides mechanisms and resources to implement community-specific air quality monitoring networks; to develop, implement, and track emission reduction programs; to improve availability of data and other technical information; and to invest substantial funding in the community through voluntary incentive funding measures. Importantly, these measures are guided by advice and knowledge of local community

members, through their input and involvement on Steering Committees for each AB 617-selected community.

This Community Emission Reduction Program (CERP) provides a description of the community of Stockton AB 617 Community, including geographical boundaries and [socioeconomic-describes air quality challengesfactors](#) impacting community residents. A technical analysis describes the sources of pollution impacting the community, as well as the location of sensitive receptors within the community. Sources of pollution that are of particular concern to community members are highlighted, and strategies for reducing air pollution impacts and health risk reduction from these sources were evaluated as part of the public engagement process between the Community Steering Committee (CSC), the District, and the California Air Resources Board. Working closely together as a unified partnership, the CSC developed numerous strategies that were ultimately selected for implementation in the community, including incentive funding measures, public engagement strategies, enforcement strategies, and regulatory strategies. Many of the strategies will require close collaboration with state and local organizations and community based organizations to fully implement them. Also included in this CERP is an implementation schedule and necessary metrics for tracking emission reductions within the community. The metrics for tracking progress will be included in regular updates to the CSC during ongoing meetings, annual reporting, and at the five-year milestone.

This draft CERP anticipates investing over \$XX-36 million in emission reduction incentives, and a variety of other clean air projects in the Stockton AB 617 Community area. Additional measures have been developed to reduce exposure to air pollution for sensitive receptors, including schools and residences. These efforts are projected to achieve up to approximately XXX-67 tons of PM2.5 reductions and XXX-970 tons of NOx reductions as well as significant reductions in air toxics emissions in the community, particularly with respect to diesel particulate matter from mobile sources, the main contributor to community air toxics health risk. Additional regulatory and outreach strategies will provide for further reductions in emissions and exposure, while increasing awareness of the community's air quality challenges and the resources available to help the public and businesses reduce emissions and avoid exposure to air pollution.

Air pollution emission reduction and exposure reduction measures implemented under AB 617 programs will further advance ongoing state and District efforts to reduce regional and community exposure to air pollutants. In the preparation of this CERP, the District has worked closely with the CSC, CARB, and the public. The CSC included, residents, community-based organizations, community members, environmental organizations, regulated industry representatives, other local agencies, and other key stakeholders and worked to develop strategies and an implementation plan to reduce harmful air pollutants in the community of Stockton AB 617 Community. The plan developed through this collaborative process employs proven and innovative strategies, and significant resources, to improve community health by reducing exposure to air pollutants in Stockton AB 617 Community.

This CERP and the many air quality improvement strategies it includes would not be possible without the tremendous commitment and effort shown by Stockton Community Steering Committee members. This engaged group of individuals includes area residents; representatives from community and faith based organizations; owners and employees from businesses operating within the community; the City of Stockton, San Joaquin County, Port of Stockton employees; representatives from schools within the community and others. Additionally, the California Air Resources Board staff, members of state and local agencies including the San Joaquin Council of Government, California Department of Transportation, Housing Authority of the County of San Joaquin have also provided information and guidance to assist the CSC members in the development of the air quality improvement strategies in this CERP. Lastly, the Institute for Local Government should be commended for the excellent meeting facilitation services they provided to guide this process.

1. INTRODUCTION

1.1 IMPLEMENTATION OF AB 617 IN STOCKTON AB 617 COMMUNITY

The implementation of Assembly Bill (AB) 617 (C. Garcia, Chapter 136, Statutes of 2017) has brought additional clean air resources and strategies to Valley environmental justice communities that have been and are currently disproportionately burdened by socioeconomic disadvantages and air pollution, despite significant emissions reductions that have already been achieved regionally. AB 617 provides mechanisms and resources to adopt expedited schedules for the implementation of advanced control technologies for existing stationary source facilities; increased stringency of reporting requirements for stationary sources; develop and implement community-specific air quality monitoring networks; implement, and track localized emission reduction programs; improve availability of data and other technical information; and invest substantial funding in the community through voluntary incentive funding measures. Resources available through this legislation allowed the San Joaquin Valley Air Pollution Control District (District), working in partnership with the Stockton AB 617 CSC, through a comprehensive public outreach and community engagement process, to expand regional programs for community protection and develop a robust plan for reducing local exposure to various forms of air pollution including fine particulate matter and toxic air contaminants in the ~~AB 617~~ Stockton AB 617 Community.

Several requirements of AB 617 will serve to reduce air pollution in disadvantaged communities throughout the San Joaquin Valley. AB 617 legislation required districts that are in nonattainment for one or more air pollutants to adopt expedited rule review schedules, by January 2019, for the implementation of Best Available Retrofit Control Technology (BARCT). The District Governing Board adopted this schedule at a public hearing held in December 2018, which set the path forward for the District to research and potentially amend applicable rules. The expedited BARCT implementation schedule is discussed in more detail later in this document. Additionally, AB 617 requires "Stationary Sources" to report their criteria pollutant emissions inventory as well as their air toxics emissions inventory to the State on an annual basis. These emissions inventories will be presented via the Criteria Pollutant and Toxics Emissions Reporting regulation, once fully implemented by California Air Resources Board (CARB). Under AB 617, a Stationary Source is defined as a facility meeting any one of the following:

- Required to submit Greenhouse Gas emissions under the CH&SC § 38530 (Mandatory GHG Emissions Reporting),
- A facility that is authorized by a permit issued by a district to emit 250 or more tons per year of any nonattainment pollutant or its precursors, or
- A facility that receives an elevated prioritization score based on cancer or noncancer health impacts pursuant to Section CH&SC § 44360 (Air Toxics Hot Spots, Chapter 4: Risk Assessment).

The District has worked with closely with CARB, regulated entities, and other stakeholders to implement this new reporting requirement in the Valley. Further

information on the implementation of the AB 617 stationary source criteria pollutant emissions inventory reporting requirement is available at: <https://ww2.arb.ca.gov/our-work/programs/criteria-and-toxics-reporting>.

The District's community identification and prioritization analysis for the second year of AB 617 implementation was based on extensive air quality analysis, numerous health indicators from the state's CalEnviroScreen model (version 3.0), and various other socioeconomic indicators. In developing San Joaquin Valley community recommendations for additional clean air resources and public engagement under AB 617, the District conducted a public engagement process to seek input from Valley residents, businesses, agencies, and other stakeholders through public workshops and meetings throughout the Valley.

Based on this extensive public engagement effort, significant interest and support for the Stockton community, and the District's comprehensive identification and prioritization analysis: the Stockton Community was recommended by the District Governing Board as a second-year AB 617 community. Sources that affect Stockton AB 617 Community include mobile sources and freeways, port operations, and industry. The Stockton AB 617 Community has a high cumulative air pollution exposure burden, a significant number of sensitive receptors, and includes census tracts designated as disadvantaged communities. After further technical review and public engagement, the Stockton AB 617 Community was ultimately selected by the CARB Governing Board for the development of a community air monitoring plan and an emissions reduction program designed to reduce pollution impacts in the selected community.

In accordance with the community-driven nature of AB 617 directives, in September of 2019 the District Governing Board directed staff to immediately convene a CSC committee under a set of guiding principles. The CSC is comprised of residents, businesses, ~~non-governmental organizations~~[community based organizations](#), [environmental justice advocates](#), and public agencies, working together to craft and develop a community air monitoring plan and a Community Emissions Reduction Program (CERP). To ensure successful implementation of AB 617, residents, businesses, non-profits organizations, state and local agencies, and other stakeholders from all sectors within the selected community were involved in the development of CERP. Towards that end, the District has worked extensively with the CSC to develop innovative strategies that, once implemented, will improve air quality in the Stockton AB 617 community. [The District community recommendation for CARB under the second-year implementation can be found here:](#)
https://www.valleyair.org/Board_meetings/GB/agenda_minutes/Agenda/2019/September/final/10.pdf

The Stockton AB 617 Community air monitoring map was developed with the advice of the community Steering Committee. The community-specific air monitoring network will provide an expanded monitoring capacity designed to provide scalable, portable, and rapidly deployable air monitoring equipment to the community. This includes a

combination of air monitoring platforms equipped with highly specialized analyzers capable of monitoring a full range of criteria and toxic pollutants. Various monitoring platforms include larger air monitoring trailers, mobile air monitoring vans, and compact air monitoring sensors. Monitoring data from these sensors will be made available to members of the public in real-time on the Stockton AB 617 webpage. The full community air monitoring plan, with further details on selected monitoring equipment and monitoring locations, is available at:

<http://community.valleyair.org/selected-communities/stockton/community-air-monitoring/>

As a culmination of the community-driven actions and engagement called for under AB 617, the Stockton Community Steering Committee has developed a Community Emissions Reduction Program (CERP), in partnership with CARB, residents, affected sources, and local government bodies in the affected community. Steering Committee input and other comments received from the public in the community have provided instrumental information, critical to implementing community-specific measures and addressing community concerns. Strong collaboration between community members, the District, CARB, and other local agencies has resulted in the development of an ambitious plan for reducing localized pollution and associated health impacts in Stockton AB 617 Community.

This CERP provides a description of the Stockton AB 617 Community, including geographical boundaries and socioeconomic factors impacting community residents. A technical analysis describes the sources of pollution impacting the community, as well as the location of sensitive receptors within the community. Sources of pollution that are of particular concern to community members are highlighted, and possible strategies for reducing pollution impacts from these sources are evaluated. The strategies that were ultimately selected for implementation in the community are outlined, including incentive funding measures, public engagement strategies, enforcement strategies, regulatory strategies, and strategies that will be completed in partnership with other agencies and local organizations. Finally, an implementation schedule and metrics for tracking emission reductions in annual reporting and at the five-year milestone are discussed in detail.

1.2 HEALTH BASED AIR QUALITY OBJECTIVES

CERPs implemented under AB 617 are designed to reduce emissions of pollutants that have been shown to have adverse impacts on public health, including fine particulate matter and toxic air contaminants. As specified in CARB's Community Air Protection Program Blueprint, Appendix C: Criteria for Community Emission Reduction Programs (https://ww2.arb.ca.gov/sites/default/files/2018-10/final_community_air_protection_blueprint_october_2018_appendix_c.pdf), this plan will focus on reducing individual criteria air pollutant and toxic air contaminant emissions to address the impacts of community exposure to multiple pollutants. While each community faces distinct health-based challenges, CARB guidance states that broad health-based air quality objectives provide a consistent foundation for determining the appropriate levels of emissions reductions for CERPs statewide.

The U.S. Environmental Protection Agency and the State of California have established ambient air quality standards, which set health-protective levels for the following criteria pollutants: ozone, particulate matter with a diameter of 10 microns or smaller (PM10), particulate matter with a diameter of 2.5 microns or smaller (PM2.5), carbon monoxide, nitrogen dioxide, sulfur dioxide, and lead. California also has standards for sulfates, vinyl chloride, and hydrogen sulfide. Due to the region's topography and meteorology, the Valley is classified as Serious nonattainment for the federal PM2.5 standards, and Extreme nonattainment for federal ozone standards.

Particulate Matter: Particulate matter is a mixture of solid particles and liquid droplets in the air. PM can be emitted directly into the atmosphere (primary PM), or can form as secondary particulates in the atmosphere through the photochemical reactions of precursors (when precursors are energized by sunlight). Thus, PM is made up of a number of components, including acids (such as nitrates and sulfates), organic chemicals, metals, and soil or dust particles. PM10 is particulate matter that is 10 microns or less in diameter, and the PM2.5 subset includes smaller particles that are 2.5 microns or less in diameter.

Any particles 10 microns or less are considered respirable, meaning they can be inhaled into the body through the mouth or nose. PM10 can generally pass through the nose and throat and enter the lungs. Due to its small size, PM2.5, which is the portion of PM10 that is less than 2.5 microns in size, when can be inhaled can move deep into the gas exchange tissues of the lungs, where it can be absorbed into the bloodstream and carried to other parts of the body. The potential health impacts of particle pollution are linked to the size of the particles, with the smaller particles having larger impacts. Numerous studies link PM2.5 to a variety of health problems, including aggravated asthma, increased respiratory symptoms (irritation of the airways, coughing, difficulty breathing), decreased lung function in children, development of chronic bronchitis, irregular heartbeat, non-fatal heart attacks, increased respiratory and cardiovascular hospitalizations, lung cancer, and premature death. Children, older adults, and individuals with heart or lung diseases are the most likely to be affected by PM2.5.

Many studies have quantified and documented the health benefits of attaining the U.S. Environmental Protection Agency (EPA) air quality standards for PM. The Valley Air Basin is in attainment of the federal standards for PM10, but is currently classified as Serious nonattainment for the federal PM2.5 standards. The District, in partnership with CARB, developed the *2018 Plan for the 1997, 2006, and 2012 PM2.5 Standards*, which was approved by EPA on June 30, 2020 and details strategies to move the region towards attainment of the federal PM2.5 standards. More information is available at: <http://valleyair.org/pmplans>. This plan is also discussed in further detail in Chapter 3.

Ozone: Ozone is a regional air pollutant that is formed through complex chemical reactions in the atmosphere. In contrast, PM2.5 concentrations are the result of both local and regional emissions, and reducing localized emissions of PM2.5 can reduce disparities in exposure experienced in communities with high cumulative exposure

burdens. CARB Office of Community Air Protection guidance states that, because ozone formation is driven by regional rather than localized source contributions, ozone should be addressed in regional air quality improvement efforts through the State Implementation Plan. Therefore, ozone and related precursors have not been addressed as a part of this CERP development. The District's current plan for attainment of health-based ozone standards throughout the San Joaquin Valley Air Basin can be found here: http://valleyair.org/Air_Quality_Plans/Ozone_Plans.htm
