

Organic Gas Speciation Profiles for Gasoline-Powered Vehicle Diurnal Evaporations—E6 Fuel (OG2307 & OG2308)

Wenli Yang, PhD, PE

Air Quality Planning and Science Division

August 21, 2014

1 Introduction

Diurnal evaporative losses are generated from non-operating vehicles as a result of the vehicle's fuel heating and volatilizing during the diurnal ambient temperature cycle. In the current CARB emission inventory, there is no organic speciation profile for diurnal losses. All the diurnal emissions are characterized by the profiles for gasoline headspace vapors. For example, OG683 (Profile for headspace vapor of E6 summer gasoline) is assigned to the diurnal emissions for the summers of 2004 through 2009; and OG684 (Profile for headspace vapor of E6 winter gasoline) is used for the corresponding winter seasons. Since the data of diurnal source tests are available recently, it is necessary to generate specific organic gas speciation profiles for diurnal evaporations based on the testing results.

This memo addresses the development of two new speciation profiles for diurnal evaporations for gasoline-powered vehicle running on E6 fuel, OG2307 (for summer) and OG2308 (for winter). The proposed profiles are generated based on the diurnal SHED (Sealed Hosing for Evaporation Emission Determination) tests performed as part of the Seventeenth CARB Vehicle Surveillance Program (VSP-17) conducted in 2005 and 2006 at CARB Haggen-Smit laboratory in El Monte, California. The new speciation profiles will be used to replace the current profiles, OG683 and OG684, for on-road gasoline vehicle diurnal losses and resting losses and off-road gasoline evaporative categories (Appendix 1) for calendar years 2004 to 2009, during which period E6 fuel was used in California.

2 Methodology

The VSP-17 was conducted by CARB staff to measure criteria pollutant emissions and speciated TOG emissions for vehicles representative of the California vehicle fleet after the transition to ethanol-containing fuels from MTBE-containing fuels in 2005 and 2006. The 24-hour diurnal tests were performed on randomly selected test vehicles in the SHED after the soak period. The test vehicles were fueled with E6 gasoline, including summer-grade fuel and winter-grade fuel.

The C₂-C₁₂ hydrocarbons collected in the Tedlar bags from the SHED were analyzed by using gas chromatography (MLD Methods 1002/1003) [1, 2]. The methanol and ethanol in the samples were collected by flowing exhaust through deionized water contained in glass impingers and the solutions were analyzed by gas chromatography (MLD Method 1001) [3]. Over one hundred organic compounds were detected in the diurnal samples.

The speciation profile for each test vehicle was obtained by dividing the emissions of each species by the total emissions of all measured species. The new diurnal profile OG2307 (for summer) was composited by averaging the seventeen valid speciation profiles developed from individual tests of vehicles running on summer-grade E6 fuel; and the new diurnal profile OG2308 (for winter) was composited by averaging the eighteen valid individual speciation profiles for vehicles running on winter-grade E6 fuel.

3 Results

The details of profiles OG2307 (for summer) and OG2308 (for winter) are tabulated in Appendix 2. The ratios of TOG/THC (total organic gases/total hydrocarbon) are 1.201 for OG2307 and 1.115 for OG2308. These ratios can be used to convert THC emission mass to actual weight TOG. The ROG/TOG (reactive organic gases/total organic gases) ratios are 0.9525 and 0.8773 for OG2307 and OG2308, respectively.

- **Summer diurnal profile (OG2307) vs. winter diurnal profile (OG2308)**

The most abundant species in the summer diurnal profile (OG2307) is ethanol, which is about 25.1% of TOG. The winter diurnal profile (OG2308) only consists of 9.7% ethanol, much less than in the summer profile. Toluene is 8.6% in the summer profiles, higher than in the winter profile (3.1%). However, the content of n-butane is much lower in the summer profile (OG2307) than in the winter one (OG2308) (Figure 1). This is consistent with what was observed in the start exhaust profiles (OG2301 vs. OG2302), running exhaust profiles (OG2303 vs. OG2304) and hot soak profiles (OG2305 vs. OG2306). The main reason of having more n-butane in the winter profiles is because of the higher n-butane content in the higher RVP (Reid Vapor Pressure) winter-grade fuel than summer-grade fuel.

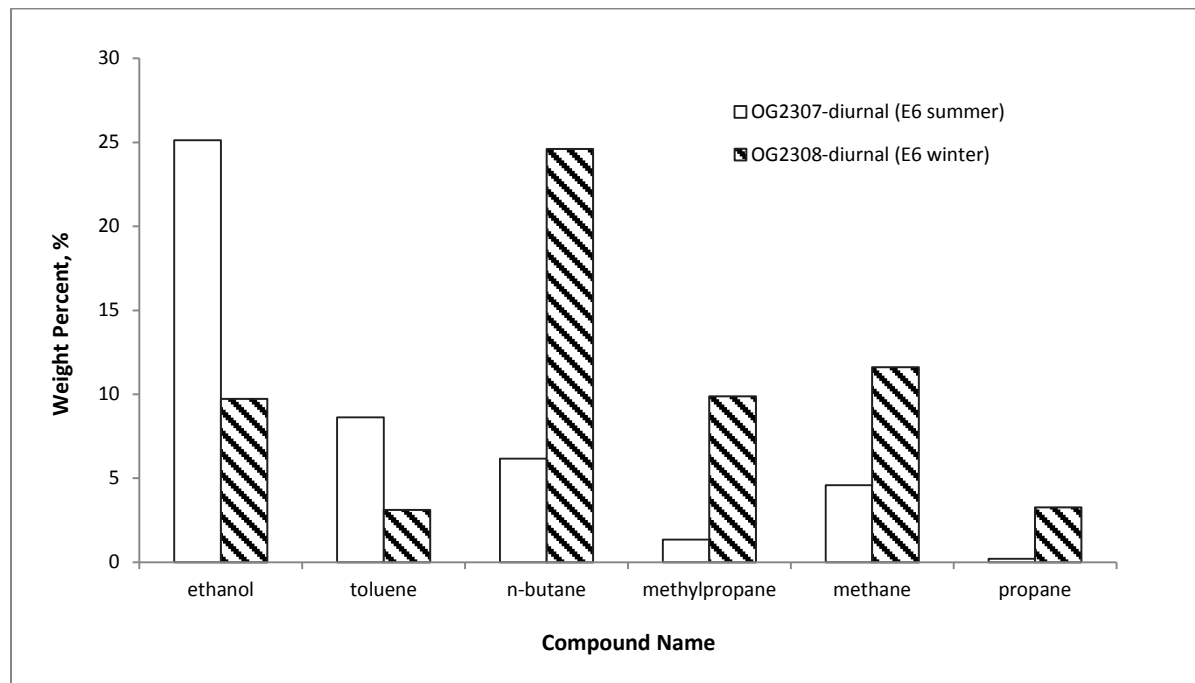

Figure 1. Comparison of selected species between OG2307 and OG2308

- **Diurnal profiles (OG2307 & OG2308) vs. headspace vapor profiles (OG683 & OG684)**

As mentioned previously, the current profiles used for diurnal evaporations for 2004 through 2009 are gasoline headspace vapor profiles: OG683 (for summer) and OG684 (for winter). These two profiles were calculated by applying vapor-liquid equilibrium theory to the E6 liquid gasoline speciation profiles (i.e., OG681 and OG682).

For summer, the diurnal profile (OG2307) has higher ethanol content (25.1% vs. 9.2%) and toluene content (8.6% vs. 2.0%), but much lower isopentane content (13.2% vs. 33.1%) compared with the headspace vapor profile (OG683). There are about 4.6% of TOG is methane shown in the diurnal profile, but no methane is reported for the headspace vapor profile.

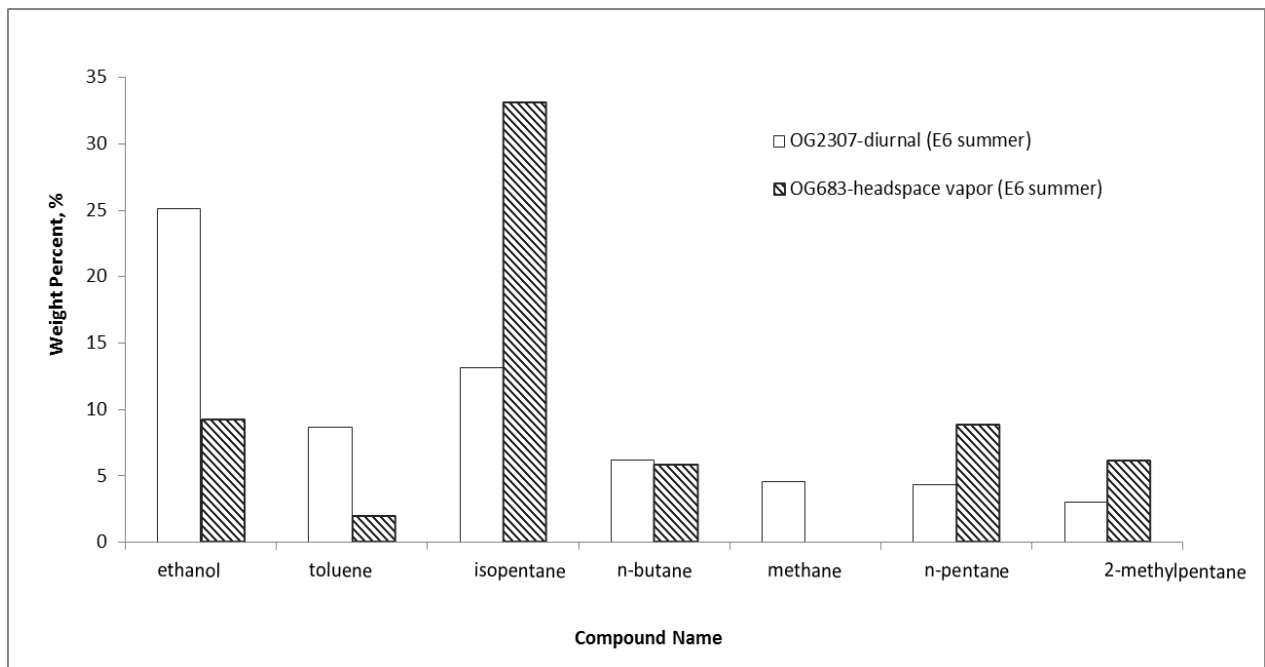

Figure 2. Comparison of selected species between OG2307 and OG683

For winter, the diurnal profile (OG2308) has litter higher ethanol content (9.7% vs. 6.4%) and toluene content (3.1% vs. 1.2%), but much lower isopentane content (11.8% vs. 23.3%), compared with the headspace vapor profile (OG684). There are about 11.6% of TOG is methane in the diurnal profile, but no methane is reported for the headspace vapor profile.

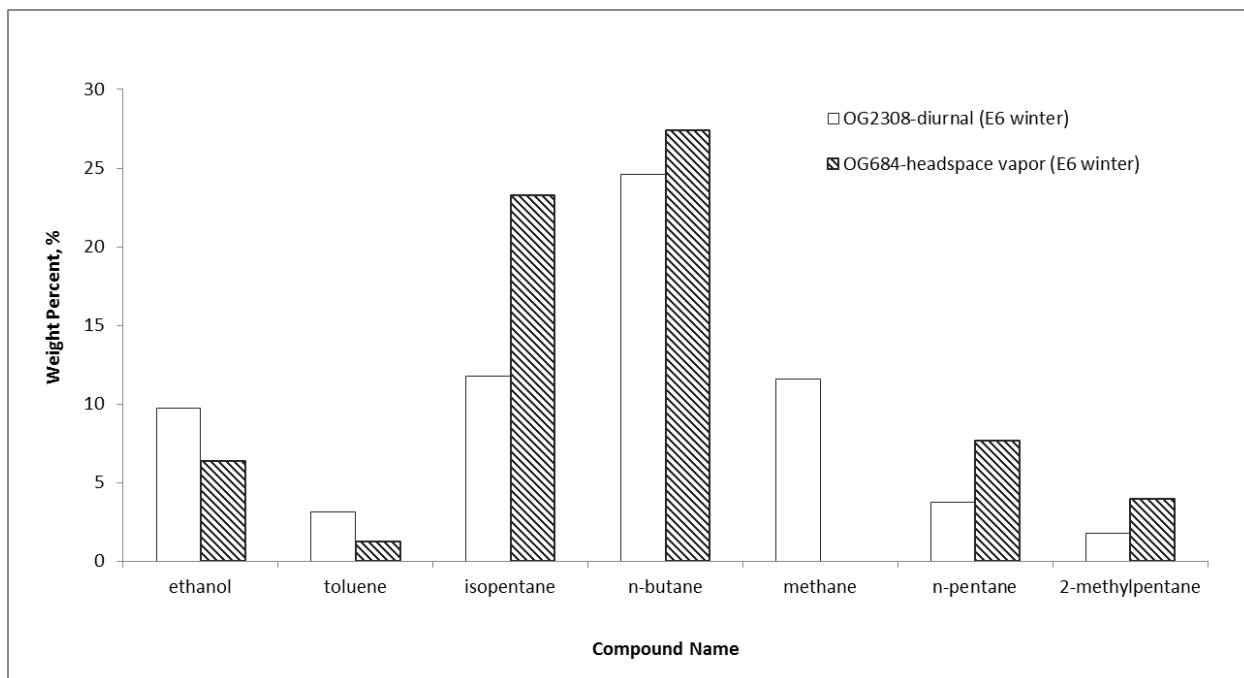

Figure 3. Comparison of selected species between OG2308 and OG684

4 Estimated Impacts of the Profile Update on the Emission Inventory

The newly-developed profiles, OG2307 will replace the current profile OG683 for summer and OG2308 will replace OG684 for winter, for categories associated with on-road gasoline vehicle diurnal and resting losses and off-road gasoline equipment evaporative emissions for year 2004 through 2009. E6 gasoline fuel was in use in California during these years. The summer profile (OG2307) will be used for the months of RVP regulatory control periods; while the winter profile (OG2308) will be used for the rest months of the year. It should be noted that the control period varies for different air basins [4]. The related EIC/SCC (Emission Inventory Code/Source Classification Code) codes for these emission processes are summarized in Appendix 1.

Based on CEPAM [5] data (California 2016 Ozone SIP Baseline Emission Projection, Version 1.00), statewide 2008 annual average TOG emissions of the diurnal profile associated categories will be 145.68 tons/day, which is 2.34% of the grand total statewide TOG emissions [5]. According to the ROG/TOG ratios derived from the new profiles OG2307 and OG2308, the statewide 2008 ROG emissions will be 4.75% and 12.27% lower than the ROG estimated based on the current profiles OG683 and OG684 (ROG/TOG=1.0000) for summer and winter, respectively. The ozone forming potentials (OFP) calculated based on the SAPRC07 mechanism [6] are 2.39 for OG2307, which is slightly higher than the one estimated by using the in-use profile OG683; but the OFP calculated from OG2308 is lower than the one based on OG684. The use of the new diurnal profile OG2307 (for summer) will result in 118.09% more benzene emissions and 336.46% more toluene emissions; the use of OG2308 (for winter) will increase the estimated benzene emissions by 46.15% and the toluene emissions by 156.18% (Table 1).

Table 1. Changes in 2008 emissions of organic gases for categories associated with diurnal profiles OG2307 and OG2308

(a) OG2307 (New E6 summer diurnal) vs. OG683 (Current E6 summer headspace vapor)

Statewide Annual Ave. Emissions		OG683 [Current profile] (tons/day)	OG2307 [New profile] (tons/day)	Change	
				Emission (tons/day)	Percentage
ROG		145.68	138.76	-6.92	-4.75%
Ozone forming potential, MIR (g O3/g ORG)		2.22	2.39	+0.17	+7.66%
Toxics	Benzene	0.94	2.05	+1.11	+118.09%
	Toluene	2.88	12.57	+9.69	+336.46%

(b) OG2308 (New E6 winter diurnal) vs. OG684 (Current E6 winter headspace vapor)

Statewide Annual Ave. Emissions		OG684 [Current profile] (tons/day)	OG2308 [New profile] (tons/day)	Change	
				Emission (tons/day)	Percentage
ROG		145.68	127.81	-17.87	-12.27%
Ozone forming potential, MIR (g O3/g ORG)		2.03	1.88	-0.15	-7.39%
Toxics	Benzene	0.65	0.95	+0.30	+46.15%
	Toluene	1.78	4.56	+2.78	+156.18%

5 Version Control

This section will be completed after management approval and after the CEIDARS FRACTION table and ORGPROFILE table are updated. Version information from CEIDARS FRACTION table will be copied here.
