

APPENDICES

CAI2024

APPENDIX A: CAI2024 MODEL

This Appendix illustrates the CAI2024 Model and provides a step-by-step guide on how to run the Model.

Modeling Platform

The CAI2024 Model is developed using an Excel-based VBA and includes a Graphic user interface (GUI) to facilitate its use. It consists of different modules for estimating the emissions for different aircraft types, including non-military, military, and agricultural aircraft. The Model has the option to output aircraft emissions in a CEPAM format. The key components and mapping of the CAI2024 Model are shown below in Figure A-1.

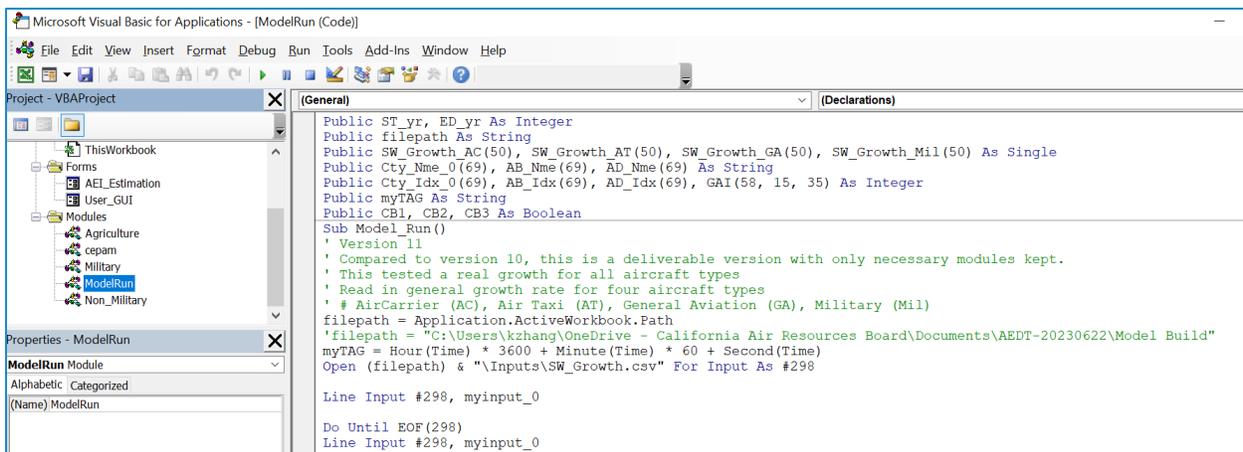

Figure A-1: Key Components of Aircraft Emission Inventory Model

Model Filing System

This Model consists of four folders and one macro-embedded file, as shown in Figure A-2. The Inputs folder contains all input files needed to run the model; the Outputs folder contains the output files generated after each Model run; the Users folder consists of customized files that are airport-specific, such as fleet mix and operations for future years; and the Correction folder contains data for flight stage length correction. Figure A-3 illustrates what the four expanded folders may contain.

Correction	☁	9/9/2024 8:49 AM	File folder	
Inputs	☁	9/9/2024 8:49 AM	File folder	
Outputs	☁	9/9/2024 8:49 AM	File folder	
Users	☁	9/9/2024 8:49 AM	File folder

Figure A-2: Folders in the CAI2024 Model

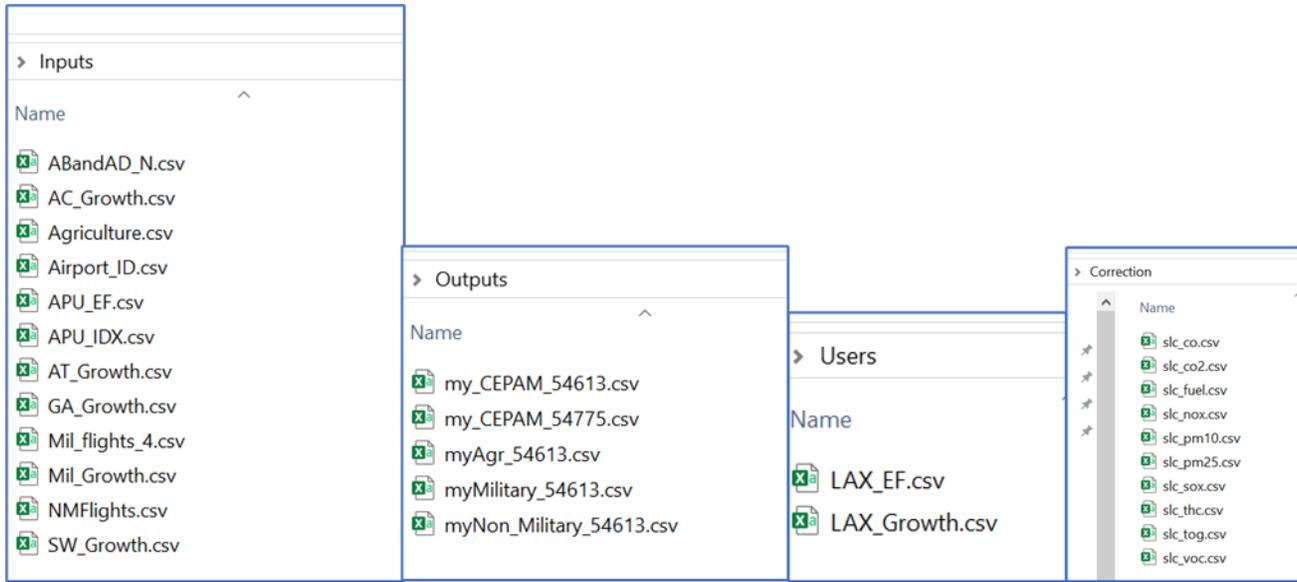

Figure A-3: Expanded Folder Contents of the CAI2024 Model

Steps to run the CAI2024 Model:

To run the Model, save the entire package, including the four folders and one macro-embedded Excel file, onto your local drive, as shown in Figure A-4.

Name	Date modified	Type	Size
Correction	9/12/2024 11:15 AM	File folder	
Inputs	9/12/2024 11:15 AM	File folder	
Outputs	9/12/2024 11:16 AM	File folder	
Users	9/12/2024 11:16 AM	File folder	
Model_AEI_44.xlsm	9/6/2024 2:11 PM	Microsoft Excel Macr...	10,179 KB

Figure A-4: CAI2024 Model Packet

- 1. Once you open the file Model_AEI_45.xlsm, a primary GUI will guide you through the process, as shown in Figure A-5 below.

Figure A-5: Primary GUI from CAI2024

- 2. Click the yellow box labeled "Let's Start Here," and a secondary GUI will appear as shown in Figure A-6. You have the option to confirm your selection to continue running the CAI2024 Model or to exit.

Figure A-6: Secondary GUI from CAI2024

- By clicking "Continue," the tertiary GUI shown below in Figure A-7 will give you the input options, including the Start Year, End Year, and aircraft type. Additionally, there is the option to generate CEPAM output. For the aircraft type, non-military aircraft refers to commercial aircraft, general aviation, and rotorcraft; military aircraft incorporates military jets and military rotorcraft; agricultural aircraft primarily refers to any aircraft type used for agricultural activities. Note that if the option for the CEPAM Output is selected, it will only include the aircraft type selected. For example, if no aircraft types are selected, the Model will output an empty CEPAM file.

2024 California Aircraft Emissions Inventory Model (CAI2024)

Please select the following options for emission inventory estimation

Aircraft Type	Calendar Year (2022-2050)	Seasonality
<input checked="" type="checkbox"/> Agricultural Crop Dusting	Start Year: <input type="text" value="2022"/>	<input checked="" type="radio"/> Annual
<input checked="" type="checkbox"/> All Non-Military Aircraft, including * Air Carrier * Air Taxi * General Aviation * Rotorcraft (Helicopters)	End Year: <input type="text" value="2024"/>	<input type="radio"/> Summer (May - Oct)
<input checked="" type="checkbox"/> Military Aircraft		<input type="radio"/> Winter (Nov - Apr)
<input checked="" type="checkbox"/> CEPAM OUTPUT (Totals of categories selected above)		

Figure A-7: Tertiary GUI from CAI2024

- After selecting all the input parameters, choose the 'Continue' box, and the CAI2024 Model will run. Once the run is complete, click the 'OK' in the 'Done!' message box below in Figure A-8 to return to the primary GUI screen. You may choose to do another Model run or to exit the program. The output files will be in the Outputs folder.

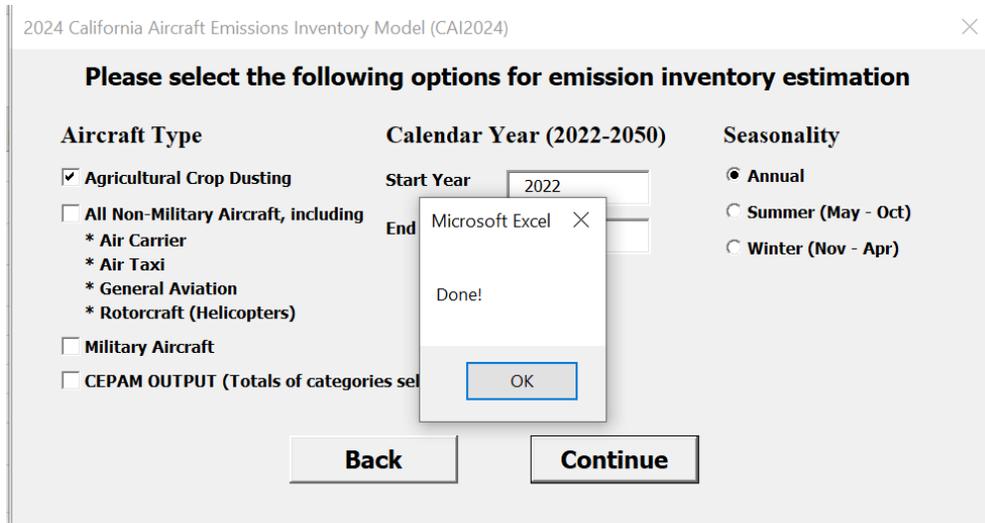

Figure A-8: Completed Model Run (CAI2024)

APPENDIX B: IMPACT OF MIXING HEIGHT ON AIRCRAFT EMISSIONS ESTIMATION

This Appendix presents a case study to evaluate the impact of mixing heights on aircraft LTO emission quantification and then derived the corresponding correction factors.

This study used the fleet mix data of LAX 2037 (provided by SCAQMD) to evaluate the impact of mixing height on aircraft emissions. LTOs consist of one arrival and one departure, and the number of operations for arrival and departure is the same. Thus, the number of LTOs is half of the total annual operations.

Two mixing heights of 1,800 and 3,000 ft and fleet mix data (airframe and engine combination) were used separately for the AEDT run. Modal emissions from individual aircraft (specific airframe/engine combination) for arrival and departure are multiplied by the corresponding number of operations and summed up to obtain the total fuel consumption and emissions.

In 2037, it was projected that LAX's annual operations would be 835,502, with the airframe and engine combination shown in Table B-1.

As shown in Table B-2, the increase in mixing height led to increased LTO fuel consumption and emissions.

Figure B-2: Fuel Consumption and Emissions (tpd) For Varying Mixing Heights (LAX 2037)

MH ^a	OM ^b	Fuel	CO	HC	TOG	ROG	NMHC	NOX	CO2	SOX	PM25	PM10
RD ^c (%)	Arrival	18	18	16	16	16	16	17	18	18	19	19
	LTO	16	8	6	6	6	6	23	16	16	18	18

Note: ^a MH-mixing height; ^b OM-operation mode; ^c RD-relative difference

Depending on the operation mode and pollutant, when comparing a mixing height of 3000 ft to 1800ft, the fuel consumption may increase by 15% to 17.5%, and the emissions may increase by as much as 25%. On average, the LTO emissions for ROG and NOx may increase by 6% and 23%, respectively.

Since the AEDT uses 3,000 ft as the default value for the mixing height, emission factors per LTO derived from the AEDT run are multiplied by a correction factor to adjust the mixing height impact on aircraft emissions. Scalars are derived to adjust for the effect of mixing height on aircraft emissions for all airports in California.

Staff derived the mixing height correction factor by running AEDT at different mixing heights to derive the best-fit linear equation. The mixing height correction by pollutant and operation are listed in Table B-3 below.

Figure B-3: Mixing Height Correction Factors

Operation	Pollutant	Mixing Height Correction Factor Equation
Arrival	ROG	$(0.0651 * \text{mixing height} + 4360.7) / (0.0651 * 3000 + 4360.7)$
