greenhouse gas reductions from petroleum

Scope 1 and 2 emissions are the most common for companies to report in their GHG inventories. Scope 1 emissions are direct GHG emissions that occur from sources that are owned or controlled by the company, such as emissions from combustion in owned or controlled boilers, furnaces, vehicles, etc. Scope 2 emissions are indirect GHG emissions associated with the purchase of electricity, steam, heat, or cooling. Although scope 2 emissions are physically produced at the facility where they occur, they are accounted for in an organization's GHG inventory because they are a result of the organization's energy use.
