- Develop a rapid and robust network of ZEV refueling infrastructure to support the needed transition to ZEVs.
- Ensure that the transition to ZEV technology is affordable for low-income households and communities of color, and meets the needs of communities and small businesses.[309]
- Prioritize incentive funding for heavy-duty ZEV technology deployment in regions of the state with the highest concentrations of harmful criteria and toxic air contaminant emissions.[310]
- Promote private investment in the transition to ZEV technology, undergirded by regulatory certainty such as infrastructure credits in the Low Carbon Fuel Standard for hydrogen and electricity[311] and hydrogen station grants from the CEC's Clean Transportation Program[312] pursuant to Executive Order B-48-18.[313]
- Evaluate and continue to offer incentives similar to those through FARMER,[314] Carl Moyer,[315] the Clean Fuel Reward Program,[316] the Community Air Protection Program,[317] and Low Carbon Transportation,[318] including CORE.[319] Where feasible, prioritize and increase funding for clean transportation equity programs.[320]
- Continue and accelerate funding support for zero emission vehicles and refueling infrastructure through 2030 to ensure the rapid transformation of the transportation sector.

- Evaluate and align with this Scoping Plan relevant CARB policies such as Advanced Clean Cars II,[321] Innovative Clean Transit,[322] Zero Emission Airport Shuttle,[323] California Phase 2 GHG Standards,[324] Advanced Clean Trucks, Advanced Clean Fleets, Zero Emission Forklifts,[325] In-use Locomotives,[326] the Off-Road Zero-Emission Targeted Manufacturer rule, Clean Off-Road Fleet Recognition Program, In-use Off-Road Diesel-Fueled Fleets Regulation,[327] Commercial Harbor Craft,[328] Off-Road Zero-Emission Targeted Manufacturer rule, Clean Off-Road Fleet Recognition Program, Amendments to the In-use Off-Road Diesel-Fueled Fleets Regulation,[329] carbon pricing through the Cap-and-Trade Program,[330] and the Low Carbon Fuel Standard.[331]
- Identify and address permitting and market barriers to successful rapid ZEV technology deployment while protecting public health and the environment.

Fuels

Transitioning away from conventional ICE vehicles is part of the solution, but we must ensure that an adequate supply of zero-carbon alternative fuel and distribution is available to power these vehicles. Electricity and hydrogen are currently the primary fuels for ZEVs,

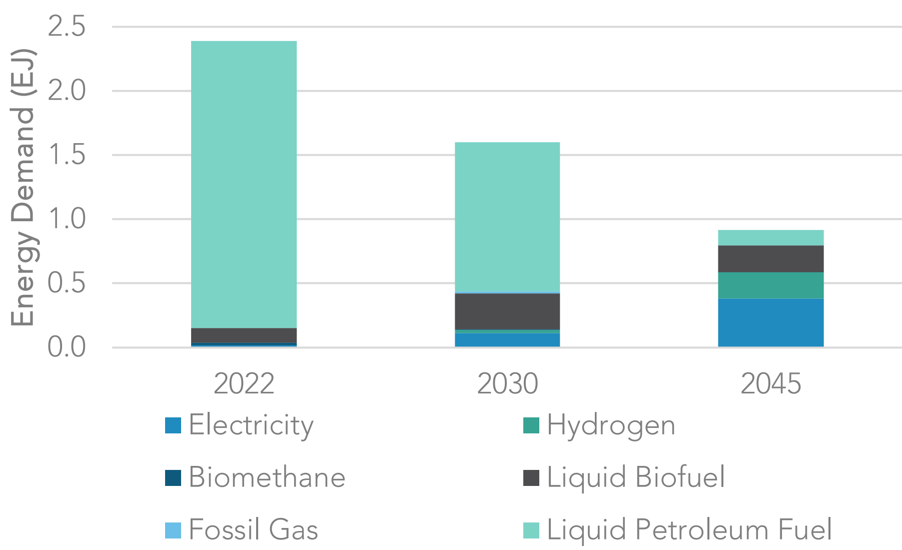
and both fuels must be produced using low-carbon technology and feedstocks to minimize upstream emissions.

The transition to complete ZEV technology will not happen overnight. Conventional ICE vehicles from legacy fleets will remain on the road for some time, even after all new vehicle sales have transitioned to ZEV technology. In addition, some equipment types are only now in the initial stages of development of ZEV technology for propulsion, such as commercial aircraft or ocean-going vessels. In addition to building the production and distribution infrastructure for zero-carbon fuels, the state must continue to support low-carbon liquid fuels during this period of transition and for much harder sectors for ZEV technology such as aviation, locomotives, and marine applications. Biomethane currently displaces fossil fuels in transportation and will largely be needed for hard-to-decarbonize sectors but will likely continue to play a targeted role in some fleets while the transportation sector transitions to ZEVs. Figure 4-2 provides the detail on fuels used in 2020 and the fuel mix under the Scoping Plan Scenario for 2035 and 2045.

Figure 4-2: Transportation fuel mix in 2022, 2030, and 2045 in the Scoping Plan Scenario[332]



Private investment in alternative fuels will play a key role in diversifying the transportation fuel supply away from fossil fuels. The Low Carbon Fuel Standard is the primary mechanism for transforming California's transportation fuel pool with low-carbon

---

332 See https://ww2.arb.ca.gov/sites/default/files/2022-11/2022-sp-PATHWAYS-data-E3.xlsx for transportation fuels by year.

alternatives and has fostered a growing alternative fuel market. Partially as a result of the powerful market signals from the LCFS, fuels like renewable diesel, sustainable aviation fuel, biomethane, and electricity have all gained significant market shares and continue to displace gasoline and diesel in both on- and off-road vehicles. In addition, Executive Order N-79-20 calls on state agencies to support the transition of existing fuel production facilities away from fossil fuels and directs that this transition also protect and support workers, public health, safety, and the environment. In line with this direction, existing refineries could be repurposed to produce sustainable aviation fuel, renewable diesel, and hydrogen. This trend has already begun, and continuing to develop fuel production capacity in-state to support the energy transition while making the most efficient use of existing assets is critical to avoiding emissions leakage. If fuel demand persists after fuel production facilities have ceased operations, fuel demand will have to be met through imports.

As we transition or build new energy production facilities and infrastructure, it will be important to ensure low-income communities, tribes, and communities of color do not experience increases in existing air pollution disparities and continue to experience a reduction in the air pollution disparities that exist today. California must use the best available science to ensure that raw materials used to produce transportation fuels do not incentivize feedstocks with little to no GHG reductions from a life cycle perspective. A dramatic increase in alternative fuel production must not come at the expense of global deforestation, unsustainable land conversion, or adverse food supply impacts, to name a few examples. CARB will continue to monitor scientific findings on these topics to ensure that California policies, such as the LCFS, send the appropriate market signals and do not result in unintended consequences.[333]

Strategies for Achieving Success

- Accelerate the reduction and replacement of fossil fuel production and consumption in California.[334]
- Incentivize private investment in new zero-carbon fuel production in California.
- Incentivize the transition of existing fuel production and distribution assets to support deployment of low- and zero-carbon fuels while protecting public health and the environment.
- Invest in the infrastructure to support reliable refueling for transportation such as electricity and hydrogen refueling.

---

[333] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, F1E. finalejacrecs.pdf (arb.ca.gov).

[334] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, F3. finalejacrecs.pdf (arb.ca.gov).

- Evaluate and propose, as needed, changes to strengthen the Cap-and-Trade Program.
- Initiate a public process focused on options to increase the stringency and scope of the LCFS:
  - Evaluate and propose accelerated carbon intensity targets pre-2030 for LCFS.
  - Evaluate and propose further declines in LCFS post-2030 carbon intensity targets to align with this 2022 Scoping Plan.
  - Consider integrating opt-in sectors into the program.
  - Provide capacity credits for hydrogen and electricity for heavy-duty fueling.
- Monitor for and ensure that raw materials used to produce low-carbon fuels or technologies do not result in unintended consequences.[335]

Vehicle Miles Traveled

Transforming the transportation sector goes beyond phasing out combustion technology and producing cleaner fuels. Managing total demand for transportation energy by reducing the miles people need to drive on a daily basis is also critical as the state aims for a sustainable transportation sector in a carbon neutral economy. Though GHG emissions are declining due to cleaner vehicles and fuels, rising VMT can offset the effective benefits of adopted regulations.

Even under full implementation of Executive Order N-79-20 and CARB's Advanced Clean Cars II Regulations, with 100 percent ZEV sales in the light-duty vehicle sector by 2035, a significant portion of passenger vehicles will still rely on ICE technology, as demonstrated in Figure 4-2 above. Accordingly, VMT reductions will play an indispensable role in reducing overall transportation energy demand and achieving the state's climate, air quality, and equity goals. After a significant pandemic-induced reduction in VMT during 2020, passenger VMT has steadily climbed back up and is now closing in on pre-pandemic levels.[336] Driving alone with no passengers remains the primary mode of travel in California, amounting to 75 percent of the mode share for daily commute trips. Conversely, the transit industry, which was significantly impacted during

---

[335] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, F1E. finalejacrecs.pdf (arb.ca.gov).

[336] U.S. Department of Transportation. 2021. December 2021 Traffic Volume Trends. Figure 3 - Seasonally Adjusted Vehicle Miles Traveled by Month. https://www.fhwa.dot.gov/policyinformation/travel_monitoring/21dectvt/figure3.cfm.

the lockdown months, and has struggled to recover; ridership only averages two-thirds of pre-pandemic levels,[337] [338] and service levels also lag behind.

Sustained VMT reductions have been difficult to achieve for much of the past decade, in large part due to entrenched transportation, land use, and housing policies and practices. Specifically, historic decision-making favoring single-occupancy vehicle travel has shaped development patterns and transportation policy, generating further growth in driving (and making transit, biking and walking less viable alternatives). These policies have also reinforced long-standing racial and economic injustices that leave people with little choice but to spend significant time and money commuting long distances, placing a disproportionate burden on low-income Californians, who pay the highest proportion of their wages on housing and transportation. While CARB has included VMT reduction targets and strategies in the Scoping Plan and appendices, these targets are not regulatory requirements, but would inform future planning processes. CARB is not setting regulatory limits on VMT in the 2022 Scoping Plan; the authority to reduce VMT largely lies with state, regional, and local transportation, land use, and housing agencies, along with the Legislature and its budgeting choices.

Appendix E (Sustainable and Equitable Communities) elaborates on reasons for reducing VMT and identifies a series of policies that, if implemented by various responsible authorities, could help to achieve the recommended VMT reduction trajectory included in this Scoping Plan (and related mode share increases for transit and active transportation). These policies aim to advance four strategic objectives:

1. Align current and future funding for transportation infrastructure with the state's climate goals, preventing new state-funded projects from inducing significant VMT growth and supporting an ambitious expansion of transit service and other multimodal alternatives.
2. Move funding for transportation beyond the gasoline and diesel taxes and implement fuel-agnostic pricing strategies that accomplish more productive uses of the roadway network and generate revenues to further improve transit and other multimodal alternatives.
3. Deploy autonomous vehicles, ride-hailing services, and other new mobility options toward high passenger-occupancy and low VMT-impact service models that complement transit and ensure equitable access for priority populations.
4. Encourage future housing production and multi-use development in infill locations and other areas in ways that make future trip origins and destinations

---

[337] U.S. Government Accountability Office. January 25, 2022. During COVID-19, Road Fatalities Increased and Transit Ridership Dipped. https://www.gao.gov/blog/during-covid-19-road-fatalities-increased-and-transit-ridership-dipped.
[338] American Public Transportation Association. APTA - Ridership Trends. https://transitapp.com/APTA.

closer together and create more viable environments for transit, walking, and biking.

The pace of change to reduce VMT must be accelerated. Certainly, structural reform will be challenging, but California has demonstrated time and again that it possesses the collective leadership and commitment to break away from ideas that no longer represent Californians' values and their aspirations for the many generations to come.

Strategies for Achieving Success

- Achieve a per capita VMT reduction of at least 25 percent below 2019 levels by 2030 and 30 percent below 2019 levels by 2045. [339]
- Reimagine new roadway projects that decrease VMT in a way that meets community needs and reduces the need to drive.
- Invest in making public transit a viable alternative to driving by increasing affordability, reliability, coverage, service frequency, and consumer experience.[340]
- Implement equitable roadway pricing strategies based on local context and need, reallocating revenues to improve transit, bicycling, and other sustainable transportation choices.[341]
- Expand and complete planned networks of high-quality active transportation infrastructure.[342]
- Channel the deployment of autonomous vehicles, ride-hailing services, and other new mobility options toward high passenger-occupancy and low VMT-impact service models that complement transit and ensure equitable access for priority populations.
- Streamline access to public transportation through programs such as the California Integrated Travel Project.
- Ensure alignment of land use, housing, transportation, and conservation planning in adopted regional plans, such as regional transportation plans (RTP)/ sustainable communities strategies (SCS), regional housing needs assessments (RHNA), and local plans (e.g., general plans, zoning, and local transportation plans), and develop tools to support implementation of these plans.

[342] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, F1F. *finalejacrecs.pdf (arb.ca.gov)*.

- Accelerate infill development and housing production at all affordability levels in transportation-efficient places, with a focus on housing for lower-income residents.

Clean Electricity Grid

Much of the state's success to date in reducing GHGs is due to decarbonization of the electricity sector as a result of the RPS, SB 100 implementation, and the Cap-and-Trade Program. Moving forward, a clean, affordable, and reliable electricity grid will serve as a backbone to support deep decarbonization across California's economy. Under this Scoping Plan, the role of electricity in powering the economy will grow in almost every sector.

In 2021, 70 percent of California electricity demand was served by in-state power plants totaling about 82 GW, with the rest coming from out-of-state imports.[343] Additionally, approximately 8 GW of customer solar photovoltaic capacity has been installed to date to help with in-state demand.[344] Figure 4-3 shows the breakdown of in-state and imported sources of electricity.

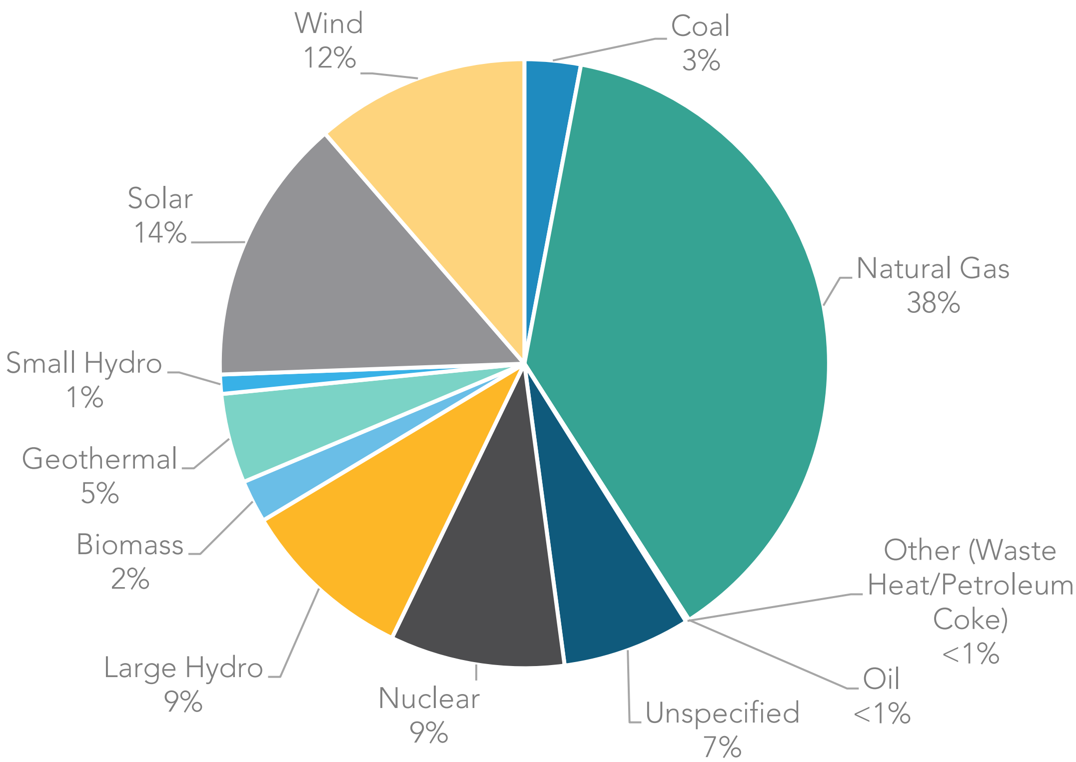
[343] CEC. 2021. Electric Generation Capacity and Energy. Data available at: https://www.energy.ca.gov/data-reports/energy-almanac/california-electricity-data/electric-generation-capacity-and-energy and CEC. 2021. Total System Electric Generation. Data available at: https://www.energy.ca.gov/data-reports/energy-almanac/california-electricity-data/2021-total-system-electric-generation. Capacity values are nameplate capacity from sources 1 MW and larger.

[344] CEC. 2021. *SB 100 Joint Agency Report Summary: Achieving 100% Clean Electricity in California, An Initial Assessment.* 10. https://www.energy.ca.gov/publications/2021/2021-sb-100-joint-agency-report-achieving-100-percent-clean-electricity.

Figure 4-3: 2021 total system electric generation (based on GWh)[345]



Note: Imports contributing to total system generation are comprised of 58% zero-carbon energy and 42% non-renewable and unspecified energy. Percentages do not add to exactly 100 due to rounding.

In 2021, about 48 percent of electricity generation serving California came from non-renewable and unspecified[346] resources, while 52 percent came from renewable and zero-carbon resources. The state's Strategic Reliability Reserve, established in AB 205 to provide additional reliability insurance during extreme events, may make three of the fossil gas-fired OTC plants planned for retirement available to support the grid on a limited basis after 2023. The state also adopted legislation to facilitate extension of the Diablo Canyon Nuclear Power Plant for five years beyond its 2025 planned closure.[347] At the

[345] *Total system generation* is the sum of all utility-scale, in-state generation, plus net electricity imports. CEC. 2021 Total System Electricity Generation. https://www.energy.ca.gov/data-reports/energy-almanac/california-electricity-data/2021-total-system-electric-generation.

[346] *Unspecified power* refers to electricity that is not traceable to a specific generating facility, such as electricity traded through open market transactions. It typically consists of a mix of resources and may include renewables.

[347] In accordance with SB 846 (Dodd, Chapter 239, Statutes of 2022).

same time, the state continues to rapidly expand deployment of clean energy generation and storage resources and plan for increased electrification.[348] This is critical to reducing GHG emissions and addressing the long-term impacts of climate change.

Climate change is causing unprecedented stress on California's energy system—driving high demand and constraining supply. Heat, drought, and wildfires can both reduce electricity supply from reductions in hydropower generation and impacts on generation and transmission performance, and increase demand, especially in the evening hours when solar generation is declining.

California has experienced three straight years of energy reliability challenges, including a multi-day extreme heat event across the western United States with temperatures up to 20 degrees above normal in California, resulting in rotating outages in August 2020. In 2021, heat waves in June prompted a Grid Warning and the onset of emergency conditions, and the Bootleg Fire caused the loss of one transmission line, reducing import capability by 3,000 megawatts into the California Independent System Operator (CAISO) balancing authority area. And from August 31–September 9, 2022, a 10-day extreme heat event resulted in an unprecedented, sustained period of high peak loads in the CAISO system, averaging 47,000 MW and maxing at an all-time record of over 52,000 MW on September 6. The Western region also hit its record peak load on September 6, at 167.5 GW.

Reliable electricity service was maintained throughout the 10-day September 2022 heat wave in spite of the record breaking load levels. Factors that contributed to this outcome include the installation of over 3,500 MW of lithium-ion battery storage since summer 2020, enhanced coordination and communication within and outside of California, engagement with customer groups and other stakeholders, state actions to reduce load during critical times, and the additional capacity provided through the Strategic Reliability Reserve and other new state programs authorized in the 2022 Budget to provide load reduction and support the grid in extreme events. CEC, CPUC, CAISO, and the California Department of Water Resources will continue to build out strategies to enhance reliability in light of the increasing and compounding impacts of climate change on the electricity system.

[348] In June 2021, the CPUC adopted D.21-06-035 directing procurement of 11,500 MW of new capacity between 2023 and 2026 to ensure systemwide electric reliability as Diablo Canyon and several OTC facilities retire. It requires that, out of the 11,500 MW, 2,500 MW must be from zero-emission resources. Additionally, 2,000 MW must be long lead-time resources, with at least 1,000 MW of long-duration storage and 1,000 MW of firm capacity with zero on-site emissions or that qualifies under the RPS eligibility requirements.

While the electricity sector is using less fossil fuel due to increasing amounts of renewables,[349] existing fossil gas generation will continue to play a critical role in grid reliability until other clean, dispatchable alternatives can be deployed at scale. The integration of greater amounts of variable renewable generation resources[350] is changing power system planning and operations, and system operators need resources with flexible attributes to balance shifting supply and demand.

High levels of solar generation can lead to instances of oversupply during the middle of the day, when the sun is brightest.[351] In the evening hours, as the sun is setting, solar generation declines to zero and customers with solar generation shift back to the electric grid. In hot weather, customer demand remains high well into the summer evening period to power air conditioning, which can lead to reliability challenges.[352]

Figure 4-4 shows the energy sources used throughout one summer day in July. Renewable energy is consistent during the middle of the day, but it cannot meet all of the evening demand in the gray area. As illustrated in the figure, fossil gas generation is currently a resource that is typically ramped up to meet this evening demand as solar production begins to drop and electrical loads increase To help address this challenge, resource installations that pair solar with batteries, as well as a greater amount of battery build-out, are coming online currently and over the next five years. Nevertheless, the state's electricity grid is expected to be stressed further in the coming years by heat waves, drought, wildfires, and the growing intermittent power supply from renewables. California must accelerate deployment of diverse clean energy resources to maintain reliability and affordability in the face of climate change.

---

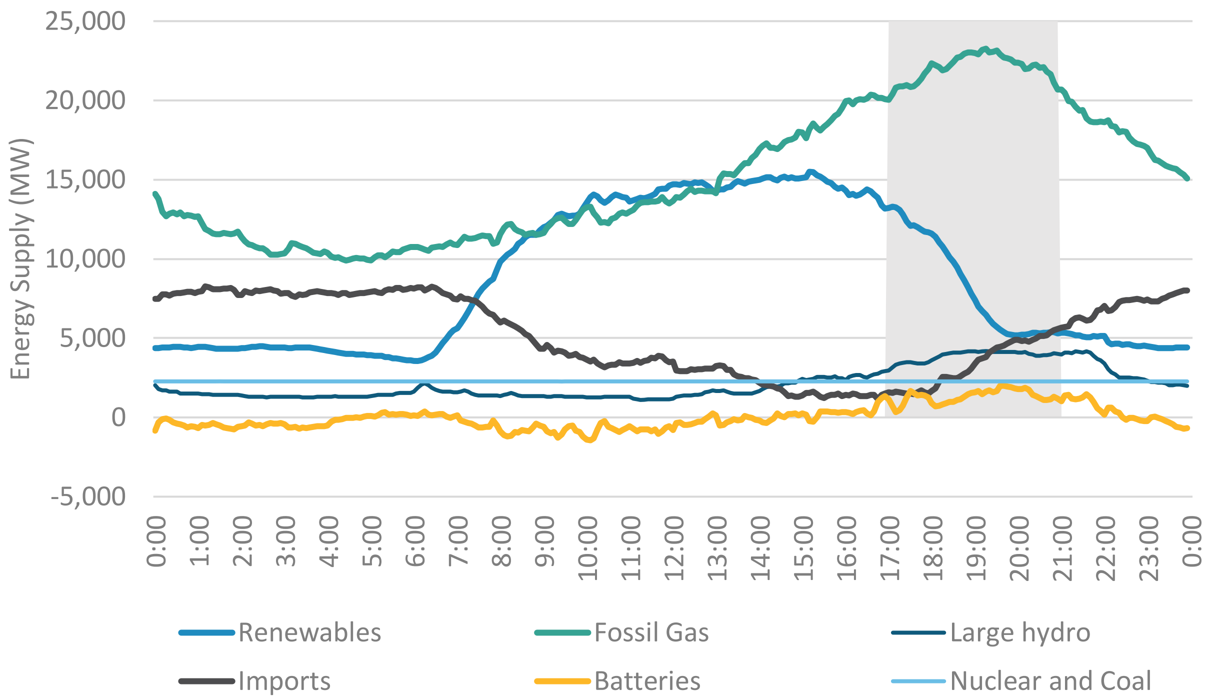
[349] CARB. 2022. *California Greenhouse Gas Emissions for 2000 to 2020.* https://ww2.arb.ca.gov/sites/default/files/classic/cc/inventory/2000-2020_ghg_inventory_trends.pdf.

[350] A *variable renewable generation resource* is a renewable source of electricity that is non-dispatchable due to its fluctuating nature and only produces electricity when weather conditions are right, such as when the sun is shining or the wind is blowing. Renewable resources that can be controlled and are dispatchable include geothermal, biomass, and dam-based hydroelectric power.

[351] *Brightness* is used colloquially here; solar energy depends on insolation (e.g., sun-hours), which is the measurement of cumulative solar energy that reaches an area over a period of time.

[352] CAISO, CPUC, and CEC. 2021. *Final Root Cause Analysis: Mid-August 2020 Extreme Heat Wave.* http://www.caiso.com/Documents/Final-Root-Cause-Analysis-Mid-August-2020-Extreme-Heat-Wave.pdf.

Figure 4-4: Electricity supply trend by resource for a California summer day, July 2022



Sector Transition

Decarbonizing the electricity sector is a crucial pillar of this Scoping Plan. It depends on both using energy more efficiently and replacing fossil-fueled generation with renewable and zero carbon resources, including solar, wind, energy storage,[353] geothermal, biomass, and hydroelectric power. The RPS Program[354] and the Cap-and-Trade Program continue to incentivize dispatch of renewables over fossil generation to serve state demand. SB 100 increased RPS stringency to require 60 percent renewables by 2030 and for California to provide 100 percent of its retail sales[355] of electricity from renewable and zero-carbon resources by 2045. Furthermore, SB 1020 has added interim targets to

---

[353] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, NF1, NF2. finalejacrecs.pdf (arb.ca.gov).

[354] The CEC estimates that 36 percent of California's 2019 retail electricity sales was served by RPS-eligible renewable resources (see CPUC. 2021. CPUC Perspectives on Electric Sector Decarbonization. https://ww2.arb.ca.gov/sites/default/files/2021-11/CPUC-sp22-electricity-ws-11-02-21.pdf).

[355] SB 100 speaks only to retail sales and state agency procurement of electricity. The *2021 SB 100 Joint Agency Report* interprets this to mean that other loads—wholesale or non-retail sales and losses from storage and transmission and distribution lines—are not subject to the law.

SB 100's policy framework to require renewable and zero-carbon resources to supply 90 percent of all retail electricity sales by 2035 and 95 percent of all electricity retail sales by 2040; the governor has asked the CEC to establish a planning goal of at least 20 GW of offshore wind by 2045; and the governor directed that state agencies plan for an energy transition that avoids the need for new fossil gas capacity to meet California's long-term energy goals.[356] In addition to grid-level resources, state efforts have supported rapid growth of the distributed solar industry through key actions like the California Solar Initiative (SB 1, Murray, Chapter 132, Statues of 2006).[357] Steps to commercialize microgrids powered by clean resources[358] are also being examined as part of SB 1339 (Stern, Chapter 566, Statutes of 2018).[359]

California also continues to advance its appliance and building energy efficiency standards to reduce growth in electricity consumption and meet the SB 350 goal to double statewide energy efficiency savings in electricity and fossil gas end uses[360] by 2030. In 2018, the CEC adopted a building energy efficiency code requiring most new homes to have solar photovoltaic systems[361] (or be powered by a solar array nearby) starting January 1, 2020. In 2019, California reached the milestone of 1 million solar rooftop installations.

Increased transportation and building electrification and continued policy commitment to behind-the-meter solar and storage will continue to drive growth of microgrids and other distributed energy resources (DER).[362] The CPUC's High-DER proceeding is examining how to prepare the electric grid for a high DER future by determining how to integrate

[362] Distributed energy resources include rooftop solar and other distributed renewable generation resources, energy storage, electric vehicles, time variant and dynamic electric rates, flexible load management, demand response, and energy efficiency technologies.

millions of DERs within the distribution grid to maximize societal and ratepayer benefits from DERs while ensuring grid reliability and affordable rates.[363]

SB 350 also aims to connect long-term planning for electricity needs with the state's climate targets. This is primarily accomplished through CARB's establishment of 2030 GHG emissions targets for the electricity sector in general and for each electricity provider, which inform the CPUC and publicly owned utilities' integrated resource planning. A GHG planning target range of 30 to 53 $MMTCO_2e$—informed by the 2017 Scoping Plan—was originally developed and adopted by CARB in 2018. In its 2021 IRP planning cycle, the CPUC adopted a 38 MMT GHG target for the electricity sector in 2030, which drops to 35 MMT in 2032.[364]

The Scoping Plan Scenario incorporates SB 350's energy efficiency doubling goal, aligns with the CPUC's IRP 2030 GHG target and latest GHG emissions benchmarks through 2035,[365] the governor's 20 GW offshore wind and no new gas generation[366] goals, and SB 100's 2030 RPS and 2045 zero-carbon retail sales targets to reduce dependence on fossil fuels in the electricity sector by transitioning substantial energy demand to renewable and zero-carbon resources.[367] As described in Chapter 2, CCS is applied in limited sectors, including on 16.7 MMT of CO_2 from existing fossil gas electricity generation in 2045, to ensure the state achieves the 85 percent reduction in anthropogenic emissions required by AB 1279. Continued transition to renewable and

---

[363] The High-DER proceeding is one of four "anchor" proceedings in the CPUC's DER Action Plan 2.0 and is within the Action Plan's infrastructure track. Information on the High-DER proceeding is available at: https://www.cpuc.ca.gov/industries-and-topics/electrical-energy/infrastructure/distribution-planning. The Action Plan can be accessed at: https://www.cpuc.ca.gov/about-cpuc/divisions/energy-division/der-action-plan.

[364] The February 10, 2022, Decision 22-02-004 by the CPUC adopts the 2021 Preferred System Plan, completing the 2019–21 IRP cycle. https://docs.cpuc.ca.gov/PublishedDocs/Published/G000/M451/K412/451412947.PDF. The Decision requires load serving entities to submit plans in the next IRP cycle detailing how they will meet their proportionate share of a 30 MMT electric sector target, as well as a 38 MMT GHG target.

[365] June 15, 2022, Administrative Law Judge's Ruling for 2022 integrated resource plan filings specifies the need for GHG targets to plan for in 2035 to continue progress toward the 2045 goal. The ruling proposes a straight-line projection from the GHG planning target for 2030. Corresponding to the adopted Preferred System Plan in D.22-02-004, 38 MMT in 2030 leads to a target of 30 MMT in 2035. https://docs.cpuc.ca.gov/PublishedDocs/Efile/G000/M485/K625/485625915.PDF.

[366] The governor's July 22, 2022, letter specifies no new gas generation but does not place any constraints on existing gas resources. Therefore, for purposes of RESOLVE electricity sector modeling, existing gas capacity is an available resource that is able to be reduced over time based on announced retirements or if selected for retirement by the model.

[367] CARB. 2021. PATHWAYS Scenario Modeling: 2022 Scoping Plan Update – Attachment B: Generation Technologies to be included in Modeling. https://ww2.arb.ca.gov/sites/default/files/2021-12/Revised_2022SP_ScenarioAssumptions_15Dec.pdf.

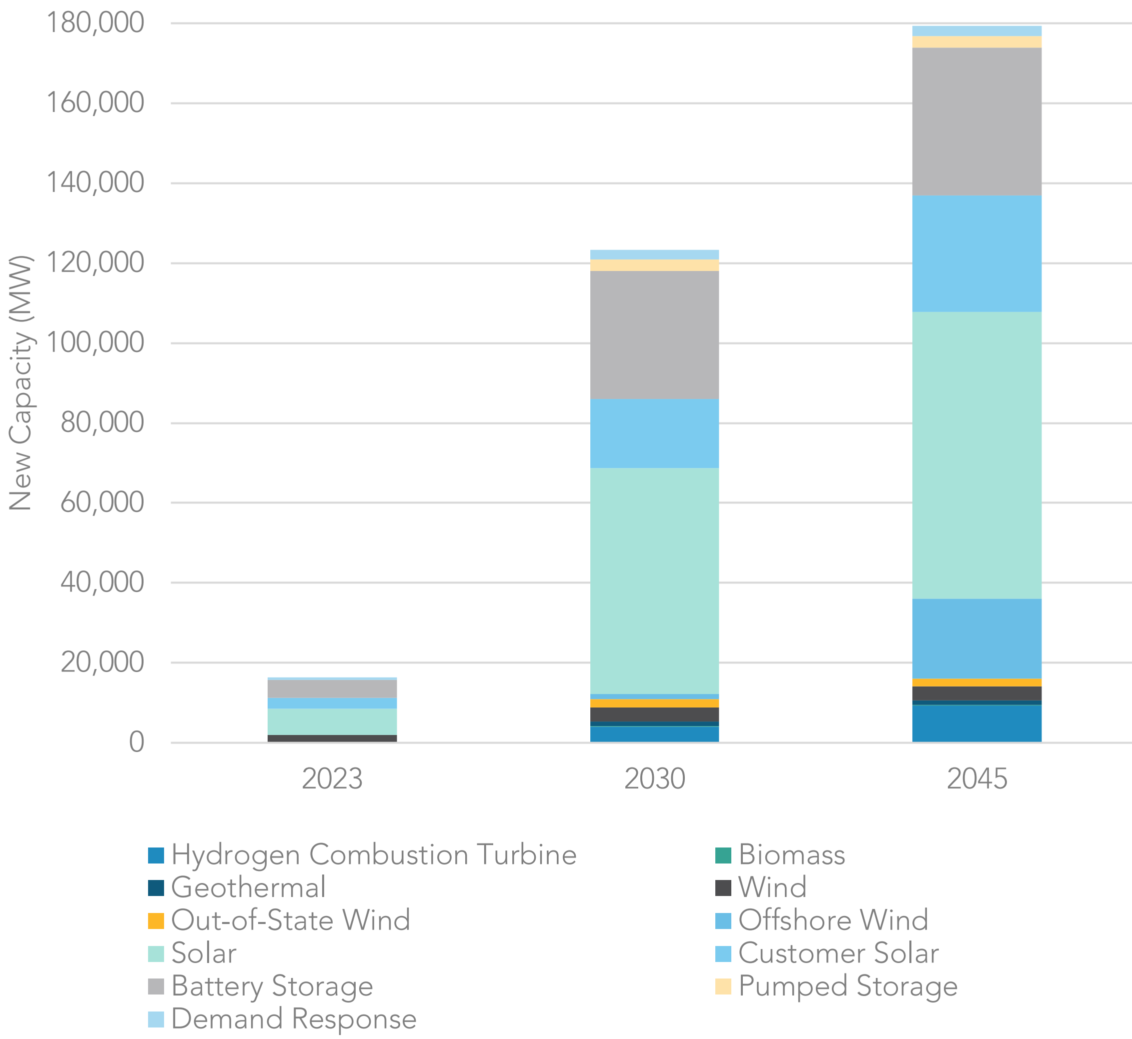
zero-carbon electricity resources will enable electricity to become a zero-carbon substitute for fossil fuels across the economy.

Figure 4-5 shows the modeled resource capacity to meet the SB 100 retail sales target.[368] Energy efficiency moderates some of the need for additional electricity generation. However, that is quickly surpassed by growing electricity demand of 26 percent by 2030 and 76 percent by 2045 compared to today (2022) from increased population and electrification of other sectors, as shown in Figure 4-6. The estimated resource build needed to meet this level of demand amounts to approximately 72 GW of utility solar[369] and 37 GW of battery storage by 2045. Annual build rates (over the 2022–2035 period) for the Scoping Plan Scenario will need to increase by about 60 percent and over 700 percent for utility solar and battery storage, respectively, compared to historic maximum rates.[370] To reach the 2045 target, the state will need to quadruple its current level of wind and solar capacity. This does not include capacity associated with hydrogen production nor mechanical CDR, which was modeled off-grid; assuming hydrogen production via electrolysis, this would roughly be equivalent to an additional 10 GW[371] of solar generation needed in 2045, and an additional 64 GW of solar generation for direct air capture in 2045. The scale of solar and battery build rates needed could be reduced through the commercialization of new zero-carbon technologies.

---

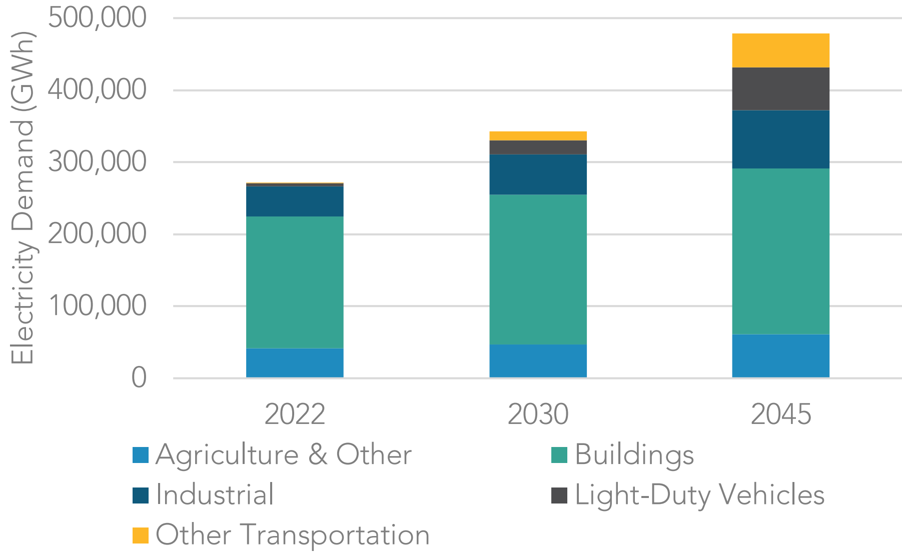
[368] SB 846 requires that load-serving entities exclude energy, capacity, or any attribute from the Diablo Canyon power plant in their resource plans. The Scoping Plan Scenario excludes energy, capacity, or any attribute from the Diablo Canyon power plant after the prior planned retirement date of 2025.
[369] The amount of additional customer solar included in the Scoping Plan Scenario is 29,208 MW by 2045.
[370] E3. 2022. CARB Scoping Plan: AB32 Source Emissions Final Modeling Results. PowerPoint. *https://ww2.arb.ca.gov/sites/default/files/2022-11/SP22-MODELING-RESULTS-E3-PPT.pdf*. Build rates are from EIA data historical builds in the 2011–2021 time frame.
[371] The estimate does not include hydrogen production assumed to be produced with bioenergy with carbon capture and storage (BECCS) and steam methane reforming (SMR).

Figure 4-5: Projected new electricity resources needed by 2045 in the Scoping Plan Scenario[372]



[372] See *https://ww2.arb.ca.gov/sites/default/files/2022-11/2022-sp-PATHWAYS-data-E3.xlsx* for the capacity build-out by resource type.

Figure 4-6: Electric loads in 2022, 2030 and 2045 for the Scoping Plan Scenario[373]



This transformation will drive investments in a large fleet of generation and storage resources but will also require significant transmission to accommodate these new capacity additions. Transmission needs include high-voltage lines to access out-of-state resources and major in-state generation pockets. In consideration of typical 8- to 10-year lead times for many projects, the CAISO published its first 20-Year Transmission Outlook to inform transmission planning focused on meeting the needs identified through the 2021 SB 100 Joint Agency Report process. The outlook calls for significant transmission development to access offshore wind and out-of-state wind and reinforce the existing CAISO footprint at an estimated cost of $30.5 billion.[374]

Presently, fossil gas power plants provide about 75 percent of the flexible capacity for grid reliability as more renewable power enters the system. Moving forward, other resources such as storage and demand-side management are essential to maintain reliability with high concentrations of renewables. Hydrogen produced from renewable resources and renewable feedstocks can serve a dual role as a low-carbon fuel for existing combustion turbines or fuel cells, and as energy storage for later use. Reliability

---

[373] *Other Transportation* includes all non-light-duty vehicles and reflects electrification of modes like passenger and freight rail, aviation, and ocean-going vessels.

also can be supported through increased coordination and markets in the interconnected western power grid; this is already helping to better integrate renewables.[375]

Strategies for Achieving Success

- Use long-term planning processes (Integrated Energy Policy Report, IRP, CAISO Transmission Planning Process, AB 32 Climate Change Scoping Plan) to support grid reliability and expansion of renewable and zero-carbon resource and infrastructure deployment.
- Complete systemwide and local reliability assessments across CAISO and other balancing authority areas, using realistic assumptions for land use, build rates, statewide and distribution system level constraints, and energy needs. Such assessments should be completed before state agencies update their electricity sector GHG targets.
- Prioritize actions to mitigate impacts to electricity reliability and affordability and provide sufficient flexibility in the state's decarbonization roadmap for adjustments as may be needed.
- Facilitate long lead-time resource development through the IRP and the SB 100 interagency process and through technology development and demonstration funding[376] that includes resources such as long-duration energy storage and hydrogen production.
- Continue coordination between energy agencies and energy proceedings to maximize opportunities for demand response.
- Continue to explore the benefits of regional markets to enhance decarbonization, reliability, and affordability.
- Address resource build-out challenges, including permitting, interconnection, and transmission network upgrades.
- Explore new financing mechanisms and rate designs to address affordability.[377]
- Per SB 350, double statewide energy efficiency savings in electricity and fossil gas end uses by 2030, through a combination of energy efficiency and fuel substitution actions.[378]
- Per SB 100 and SB 1020, achieve 90 percent, 95 percent, and 100 percent

renewable and zero-carbon retail sales by 2035, 2040, and 2045, respectively.

- Evaluate and propose, as needed, changes to strengthen the Cap-and-Trade Program.
- Target programs and incentives to support and improve access to renewable and zero-carbon energy projects (e.g., rooftop solar, community owned or controlled solar or wind, battery storage, and microgrids) for communities most at need, including frontline, low-income, rural, and indigenous communities.[379]
- Prioritize public investments in zero-carbon energy projects to first benefit the most overly burdened communities affected by pollution, climate impacts, and poverty.[380]

Sustainable Manufacturing and Buildings

Fossil gas is the primary gaseous fossil fuel used to produce heat at industrial facilities, as well as in residential and commercial buildings. In buildings, space and water heating, cooking, and clothes drying all rely on gaseous fuels today. Industrial processes that require heat for conventional boilers and other processes also rely on gaseous fuels. Refineries rely on fossil gas and other gaseous fossil fuels, like liquefied petroleum gas and refinery fuel gas, and fossil gas is also used to generate electricity, as discussed earlier.

Gaseous fossil fuel use can be displaced by four primary alternatives: zero-carbon electricity, solar thermal heat, hydrogen, and biogas/biomethane. Displacing gaseous fossil fuel use can yield indoor air quality benefits, protect public health and property from unexpected fossil gas leaks, and reduce short-lived climate pollutants, which are many times more potent in affecting climate change than CO_2. The Scoping Plan Scenario reduces dependence on fossil gas in the industrial and building sectors by transitioning substantial energy demand to alternative fuels. Reducing fossil gas combustion also will help toward achieving our air quality and equity goals by reducing pollution in neighboring areas and communities. In addition, reduced dependence on gasoline and diesel in the transportation sector diminishes the need for gaseous fossil fuels to support oil and gas production and petroleum refining operations as those are phased down relative to the demand.

Sector Transition

Industry

California's industrial sector contributes significantly to the state's economy, with a total output from manufacturing in 2019 of $324 billion (10.4 percent of the state total)[381] and employment of 1,222,000 manufacturing jobs (7.6 percent of the total state workforce).[382] California industry includes a diverse range of facilities, including cement plants, refineries, glass manufacturers, oil and gas producers, paper manufacturers, mining operations, metal processors, and food processors. Combustion of fossil gas, other gaseous fossil fuels, and solid fossil fuels provide energy to meet three broad industry needs: electricity, steam, and process heat. Non-combustion emissions result from fugitive emissions and from the chemical transformations inherent to some manufacturing processes. About 20 percent of the GHG emissions from the industrial sector are non-combustion emissions.

Decarbonizing industrial facilities depends upon displacing fossil fuel use with a mix of electrification, solar thermal heat, biomethane, low- or zero-carbon hydrogen, and other low-carbon fuels to provide energy for heat and reduce combustion emissions. Emissions also can be reduced by implementing energy efficiency measures and using substitute raw materials that can reduce energy demand and some process emissions. Some remaining combustion emissions and some non-combustion CO_2 emissions can be captured and sequestered. The strategy employed will depend on the industrial subsector and the specific processes utilized in production. The left side of Figure 4-7 illustrates the fuels used to meet industrial manufacturing energy demand in 2020. Industrial manufacturing energy demand needs to transition to the fuel mix shown for 2035 and 2045. The right side of Figure 4-7 illustrates the fuel mix needed to meet the energy demand of oil and gas extraction and petroleum refining operations for the same years. Energy demand in this portion of the industrial sector declines along with decreased demand for gasoline and diesel in the transportation sector. In both figures there is a continuing demand for fossil gas due to lack of non-combustion technologically feasible or cost-effective alternatives for certain industrial sectors. Policies that support decarbonization strategies like electrification, use of renewable energy, and transition to alternative fuels are needed.

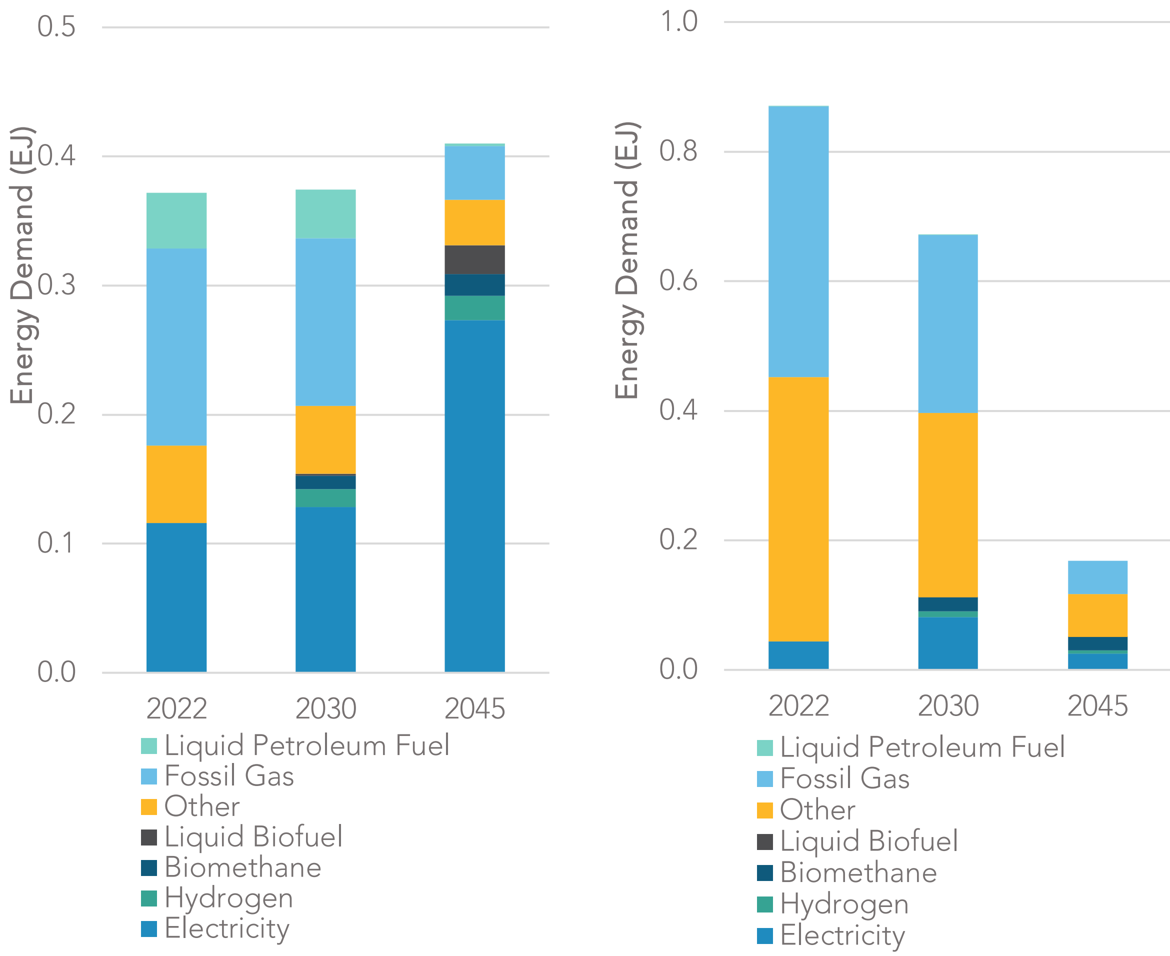
[381] National Association of Manufacturers (NAM). 2021 California Manufacturing Facts. https://www.nam.org/state-manufacturing-data/2021-california-manufacturing-facts/.
[382] NAM. 2021 California Manufacturing Facts. https://www.nam.org/state-manufacturing-data/2021-california-manufacturing-facts/.

Figure 4-7: Final energy demand in industrial manufacturing (left) and in oil and gas extraction and petroleum refining (right) in 2022, 2030, and 2045 in the Scoping Plan Scenario[383]



Electrification and solar thermal heat are best-suited to industrial processes that have relatively low heat requirements, such as food processors, paper mills, and industries that use low-pressure steam in their processes. Approaches could include replacing fossil gas boilers with electric boilers, process heaters with industrial electric heat pumps, steel forging furnaces with induction heaters, and implementing other sector-specific process electrification. Under current rate structures for industrial electricity and fossil gas in

[383] *Other* fuel in the industrial manufacturing sector is primarily coke and coal for cement production. *Other* fuel in the petroleum refining sector is primarily fossil gas associated with refining petroleum products.

California, most projects to electrify a fossil gas-powered industrial process will face operating cost barriers and potential reliability concerns. Microgrids powered by renewable resources and with battery storage are emerging as a key enabler of electrification and decarbonization at industrial facilities.

There are fewer commercially available and economically viable electrification options to replace industrial processes that require higher-temperature heat. For these processes, onsite combustion may continue to be needed, and decarbonization will require fuel substitution to hydrogen,[384] biomethane, or other low-carbon fuels. Fuel substitution and continued combustion will require monitoring and mitigation of any potential air quality impacts, especially in low-income and communities of color which already face disproportionate air pollution burdens. Industries in California with high heat needs include steel forging, glass manufacturing, and industries with calcination processes, such as manufacturing lime and cement.

Onsite emissions from cement manufacturing derive from two main sources: (1) fuel combustion to heat the kiln to a very high temperature and (2) process CO_2 emissions from the chemical transformation of limestone. Over 60 percent of emissions from the sector are process emissions unrelated to fuel use, and most emissions related to fuel use are from coal and petroleum coke combustion. Process emissions from cement manufacturing are significant and will continue even if the sector were to operate using only zero-carbon fuels; thus carbon capture and use/sequestration will be a likely component of any strategy to fully decarbonize cement manufacturing. There are additional opportunities to reduce GHG emissions from cement manufacturing via the combination of fuel-switching to low-carbon fuels (e.g., biomethane, municipal solid waste, biochar), increased blending of non-clinker materials, and efficiency improvements. High technological and economic barriers exist to electrifying kiln process heat at cement plants, as clinker production requires temperatures in excess of 1,500°C. There are potential decarbonization opportunities throughout the value chain of cement use, including in cement manufacturing, concrete mixing, and construction practices.[385] SB 596 (Becker, Chapter 246, Statutes of 2021), which was signed by Governor Newsom in September 2021, requires CARB to develop a comprehensive strategy for cement use in California to achieve a GHG intensity 40 percent below 2019 levels by 2035, and net-zero emissions by 2045.

385 California Nevada Cement Association. Achieving Carbon Neutrality in the California Cement Industry. https://cncement.org/attaining-carbon-neutrality.

Oil and gas extraction and refining make up over half of California's industrial GHG emissions. Reduced demand for transportation fossil fuels corresponds to reduced supply of fossil gas and other gaseous fossil fuels for refineries to produce these fuels. Some refining operations will continue to operate to produce fossil fuel for the remaining transportation energy demands, along with renewable diesel and sustainable aviation fuel, as discussed in the Transportation Sustainability section of this chapter.

Across industrial subsectors and processes, California facilities also could realize significant reductions in GHG emissions and energy-related costs by implementing advanced energy efficiency projects and tools.[386] While enhanced operation and maintenance practices are typical at industrial facilities, additional strategic energy management practices offer greater efficiency gains by focusing on setting goals, tracking progress, and reporting results.

Strategies for Achieving Success

- Maximize air quality benefits using the best available control technologies for stationary sources in communities most in need, including frontline, low-income, disadvantaged, rural, and tribal communities.[387]
- Prioritize alternative fuel transitions first in communities most in need, including frontline, low-income, disadvantaged, rural, and tribal communities.[388]
- Invest in research and development and pilot projects to identify options to reduce materials and process emissions along with energy emissions in California's industrial manufacturing facilities, leveraging programs like the CEC's Electric Program Investment Charge (EPIC).[389]
- Evaluate and propose, as needed, changes to strengthen the Cap-and-Trade Program.
- Support electrification with changes to industrial rate structures.
- Develop infrastructure for CCS and hydrogen production to reduce GHG emissions where cost-effective and technologically feasible non-combustion alternatives are not available.
- Implement SB 905.

- Establish markets for low-carbon products and recycled materials using Buy Clean California Act and other mechanisms relying on robust data
- Develop a net-zero cement strategy to meet SB 596 targets for the GHG intensity of cement use in California.
- Continue to leverage energy-efficiency programs, including the U.S. DOE's ENERGY STAR program,[390] U.S. DOE's Superior Energy Performance program,[391] and ISO 50001.[392]
- Evaluate and continue to offer incentives to install energy efficiency and renewable energy technologies through programs such as CPUC decisions as part of rulemaking R.19-09-009[393] and the CEC's Food Production Investment Program (FPIP) and EPIC programs.[394]
- Leverage low-carbon hydrogen programs, including the Bipartisan Infrastructure Law, for regional hydrogen hubs, hydrogen electrolysis, and hydrogen manufacturing and recycling.
- Evaluate the role of hydrogen in meeting GHG emission reductions, including policy recommendations regarding the use of hydrogen in California as required by SB 1075.
- Address cost barriers to promote low-carbon fuels for hard-to-electrify industrial applications.

Buildings

Buildings have cross-sector interactions that influence our public health and well-being and affect land use and transportation patterns, energy use, water use, and indoor and outdoor environments.[395] There are about 14 million existing homes and over 7.5 billion square feet of existing commercial buildings[396] in California. Fossil gas supplies about half of the energy consumed by end uses in these buildings. In addition to GHG emissions, fossil gas usage in buildings also produces CO_2, NOx, $PM_{2.5}$, and

formaldehyde.[397] Each year, about 120,000 new homes[398] and more than 100 million-square feet[399] of commercial buildings are newly constructed across California. These new buildings will represent between a third to half of the total building stock by mid-century.

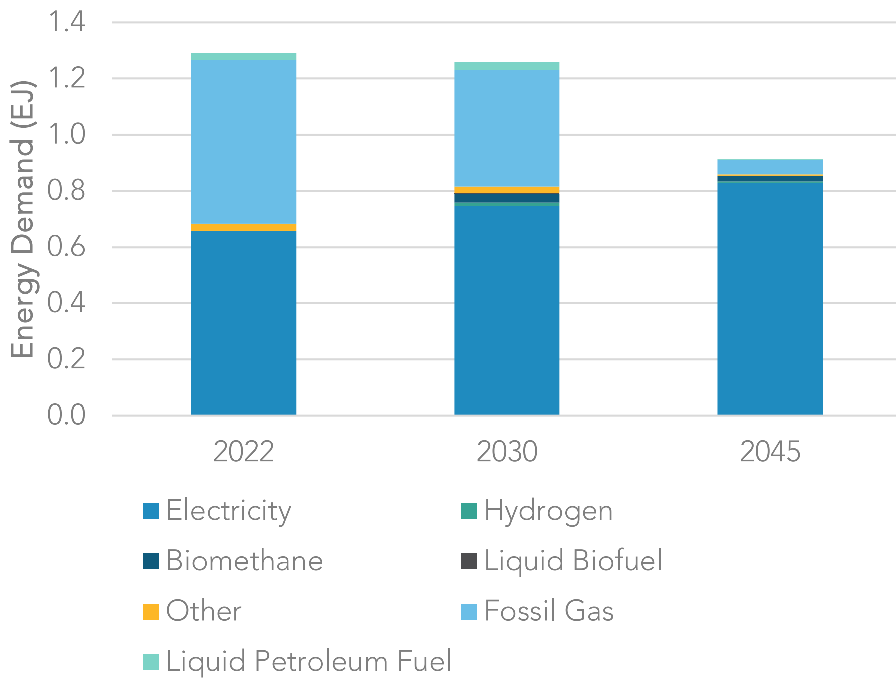
Achieving carbon neutrality must include transitioning away from fossil gas in residential and commercial buildings, and will rely primarily on advancing energy efficiency while replacing gas appliances with non-combustion alternatives. This transition must include the goal of trimming back the existing gas infrastructure so pockets of gas-fueled residential and commercial buildings do not require ongoing maintenance of the entire limb for gas delivery. Blending low-carbon fuels such as hydrogen and biomethane into the pipeline further displaces fossil gas. Pipeline safety and reliability must be evaluated to accommodate low-carbon fuels. Figure 4-8 illustrates the energy Californians use in buildings at present compared with the Scoping Plan Scenario, which introduces alternatives to fossil gas. In that scenario almost 90 percent of energy demand is electrified by 2045, and the remaining energy demand is met with combustion of hydrogen, biomethane, and fossil gas.

[397] Zhu, Yifang, et al. 2020. *Effects of Residential Gas Appliances on Indoor and Outdoor Air Quality and Public Health in California.* UCLA Fielding School of Public Health Department of Environmental Health Sciences.

[398] Construction Industry Research Board. 2018. Annual Building Permit Summary. http://www.cirbreport.org.

[399] Delforge, Pierre. August 11, 2021. California Forging Ahead on Zero Emission Buildings. Blog. NRDC. https://www.nrdc.org/experts/pierre-delforge/california-forging-ahead-zero-emission-buildings.

Figure 4-8: Final energy demand in buildings in 2022, 2030, and 2045 in the Scoping Plan Scenario[400]



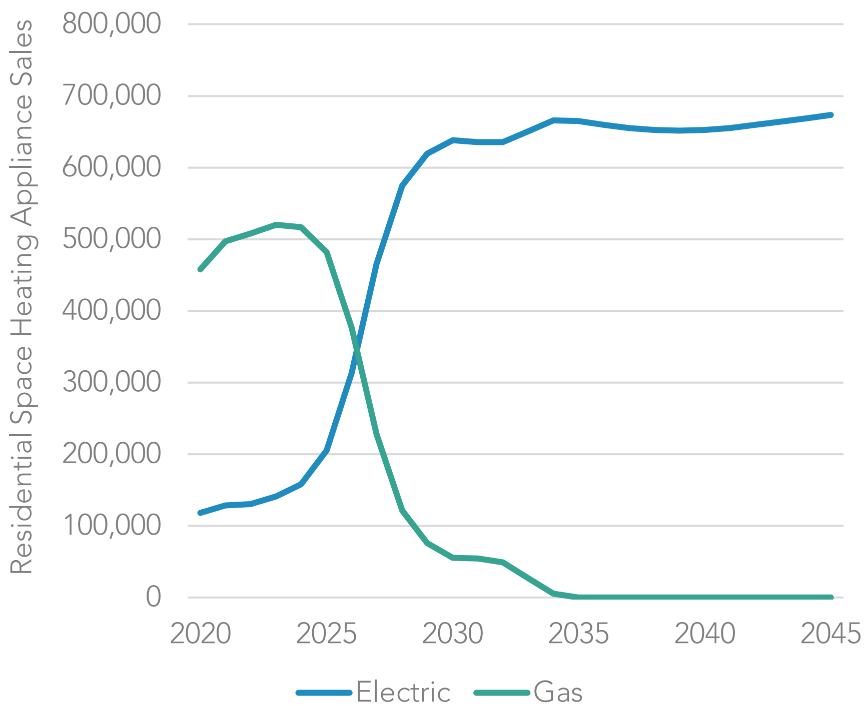
This transition is achieved when all new buildings constructed include non-combustion appliances, and appliances in existing buildings are replaced at the end of their useful life with non-combustion alternatives. Currently, electric alternatives, combined with the decarbonizing of California's grid, are the most effective alternatives, and the Scoping Plan Scenario modeled these alternatives. The Scoping Plan Scenario assumes three million all-electric and electric-ready homes by 2030 and seven million by 2035. Figure 4-9 illustrates the pace at which electric space heating appliance sales increase and gas space heating appliance sales decrease in residences in the Scoping Plan Scenario, such that by 2035 100 percent of residential home appliance sales are electric. By 2030 over six million electric heat pumps are installed statewide. The residential electric space heating appliance sales increases rapidly in the near term as new all-electric buildings are constructed and as existing buildings are renovated to utilize electric appliances. A similar transition is envisioned for other home appliances. Commercial buildings also will undergo a transition away from gas appliances to electric appliances, achieving 80 percent sales of all-electric appliances by 2035 and 100 percent by 2045. Appendix F (Building Decarbonization) describes a holistic policy approach to rapidly grow the

---

[400] *Other* fuel in the buildings sector is primarily liquid petroleum gas and waste heat.

number of zero emission appliances and buildings, to surmount the market barriers, and to prioritize an equitable transition for vulnerable communities.

Figure 4-9: Residential space heating appliance sales in the Scoping Plan Scenario



Strategies for Achieving Success

- Prioritize California's most vulnerable residents with the majority of funds in the new $922 million Equitable Building Decarbonization program, created through the 2022–2023 state budget. This would include residents in frontline, low-income, disadvantaged, rural, and tribal communities. This program is dedicated to a statewide direct-install building retrofit program for low-income households to replace fossil fuel appliances with electric appliances, energy-efficient lighting, and building insulation and sealing while also coordinating reductions in gas infrastructure in specific geographic areas.
- Achieve three million all-electric and electric-ready homes by 2030 and seven million by 2035 with six million heat pumps installed statewide by 2030.
- Expand incentive programs to support the holistic retrofit of existing buildings, especially for vulnerable communities.
- Ensure that incentive programs prioritize energy affordability and tenant protections, promote affordable and low-income household retrofits that improve habitability and reduce expenses, protect and empower small landlords and homeowners, address overlooked consumer groups, and pair decarbonization

with other critically needed renovation efforts to ensure that buildings support human health and are climate- and weather-resistant.[401]

- End fossil gas infrastructure expansion for newly constructed buildings.[402]
- Evaluate and propose, as needed, changes to strengthen the Cap-and-Trade Program.
- Strengthen California's building standards to support zero-emission new construction.
- Develop building performance standards for existing buildings.
- Adopt a zero-emission standard for new space and water heaters sold in California beginning in 2030, as specified in the 2022 State Strategy for the State Implementation Plan.
- Expand use of low-GWP refrigerants within buildings.
- Support electrification with changes to utility rate structures and by promoting load management programs.
- Increase funding for incentive programs and expand financing assistance programs focused on existing buildings and appliance replacements.
- Expand consumer education efforts to raise awareness and stimulate the adoption of decarbonized buildings and appliances, especially in vulnerable communities.
- Implement biomethane procurement targets for investor-owned utilities as specified in SB 1440 (Hueso, Chapter 739, Statutes of 2018) to reduce GHG emissions in remaining pipeline gas and reduce methane emissions from organic waste.

Carbon Dioxide Removal and Capture

Climate Change 2022: Mitigation of Climate Change,[403] a report by the IPCC released in early 2022, states "The deployment of CDR to counterbalance hard-to-abate residual emissions is unavoidable if net zero CO_2 or GHG emissions are to be achieved. The scale and timing of deployment will depend on the trajectories of gross emission reductions in different sectors. Upscaling the deployment of CDR depends on developing effective approaches to address feasibility and sustainability constraints especially at large scales." In line with that report, this Scoping Plan considers CDR as a complement to technologically feasible and cost-effective GHG emissions mitigation, and the size of its role will depend on the degree of success in reducing GHG emissions at the source across the economy. [404] The modeling shows that emissions from the AB 32 GHG Inventory sources will continue to persist even if all fossil related combustion emissions are phased out. These residual emissions must be compensated for to achieve carbon neutrality. Options for CDR include both sequestration in natural and working lands and mechanical approaches like direct air capture. Chapter 2 provides estimates on how much CO_2 removal is possible by our natural and working lands and how much must be removed by mechanical CDR.

CCS, which is carbon capture from anthropogenic point sources, is described in Chapter 2 and involves capturing carbon from a smokestack of an emitting facility. Direct air capture, on the other hand, captures carbon directly from the atmosphere. Direct air capture technologies, unlike CCS, are not associated with any particular point source.

For this section, *carbon management* refers to the capture, movement, and sequestration of CO_2 through mechanical solutions for both capture at point sources and direct removal from the atmosphere through direct air capture.[405] Enabling policies and regulations across each of these steps are necessary for individual projects, and on a broader scale, for delivering reductions in support of the state's carbon neutrality and long-term carbon-negative goals. Figure 4-10 provides a graphic of the typical carbon management infrastructure.

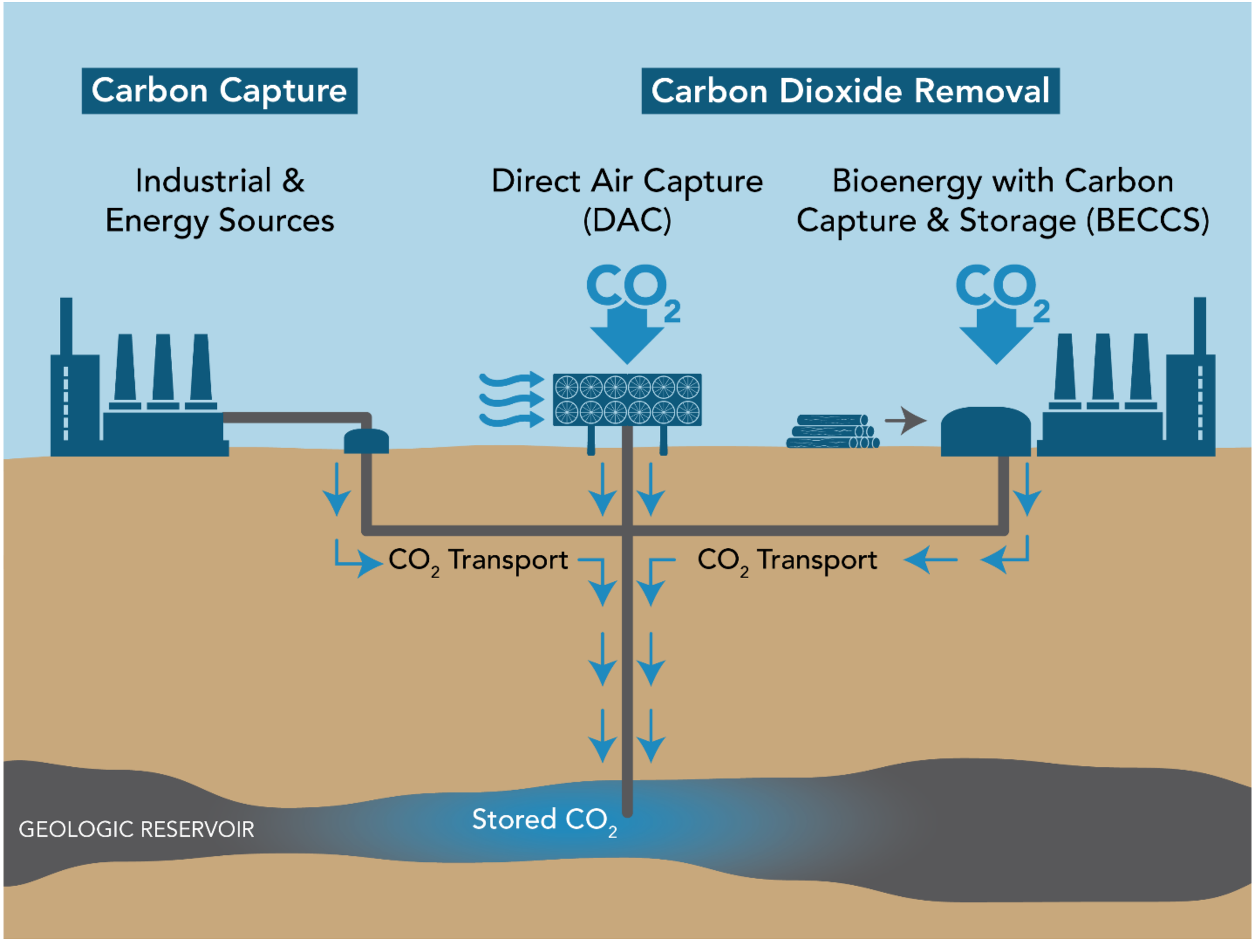
[405] CDR through natural and working lands is discussed in Chapter 2 and later in this chapter.

Figure 4-10: Carbon management infrastructure



Carbon dioxide removal directly from the atmosphere itself refers to a suite of carbon negative technologies that can be used to draw down ongoing and historical carbon emissions already in the atmosphere. Some CO_2 removal technologies leverage the abilities of both natural photosynthesis and mechanical removal by using biomass wastes as inputs to make low- or zero-carbon energy or fuels, all while capturing and storing produced CO_2.

Captured CO_2 from point sources or from the atmosphere is permanently stored in specialized geologic formations, typically half a mile or more underground. A recent Stanford University study estimated the state's commercial storage potential is nearly 70,000 million metric tons of CO_2, even when excluding oil and gas reservoirs.[406] California is well-positioned because few other places on the West Coast are suitable for

[406] Stanford Center for Carbon Storage. Opportunities and Challenges for CCS in California. https://sccs.stanford.edu/california-projects/opportunities-and-challenges-for-CCS-in-California.

geologic storage at scale. To inform discussion around CO_2 removal, CARB held two full-day workshops exploring the types of options for carbon capture and geologic storage and utilization in products.[407,408,409]

The modeling results provided in Chapter 2 demonstrate the targeted need for CCS on large facilities such as refineries and cement. The CCS numbers do not include the potential additional applications for producing hydrogen with biomethane, other manufacturing, electricity, or other bioenergy. If CCS is not deployed, those emissions would be released directly into the atmosphere and instead need to be addressed through CDR to achieve carbon neutrality. Although a study finds California has 76 existing electricity and industrial facilities that are suitable candidates for CCS retrofit,[410] this Scoping Plan proposes a targeted role for this technology such that it would only be used to address sectors where non-combustion options are not technologically feasible or cost-effective at this time, to the extent needed to achieve the 85 percent reduction in anthropogenic emissions as called for in AB 1279. In future updates to the Scoping Plan, there may be additional options for technologically feasible or cost-effective technologies that may be deployed, which would further reduce the need for CCS and CDR except in situations to address historical GHG emissions.

Recognizing the need for carbon capture and utilization sequestration and removal, the Legislature passed, and the governor signed, SB 905. It includes several key requirements in the development of the state's Carbon Capture Removal, Utilization, and Storage Program. The following is a summary of the work to be completed to establish and administer this program. Many of these steps will address the need to evaluate the safety and efficacy of actions to support carbon removal, sequestration, and transfer via pipelines. Note that not all of these actions are under CARB's authority.

- Review technology to evaluate efficacy, safety, viability of CCUS/CDR methodologies.
- Develop monitoring and reporting requirements and schedules.
- Develop a unified permit application.
- Develop financial responsibility requirements.
- Develop a centralized public database for project status.

- Consult with CNRA on pore space requirements as CNRA develops a framework for pore space governing agreements.
- Establish a Geologic Carbon Sequestration Group to identify suitable injection well locations, subsurface monitoring, and potential hazards that may require suspension of injection.

SB 905 also has requirements for project developers such as to develop monitoring plans and to avoid any adverse health and environmental impacts at the carbon capture location—or mitigation of unavoidable impacts as required under existing requirements. For the site of injection, there are requirements for site stability, monitoring, and reporting plans. SB 905 also bans CCS with enhanced oil recovery in California and prohibits the transfer of CO_2 via pipeline until the U.S. Department of Transportation's Pipelines and Hazardous Materials Safety Administration (PHMSA) completes its current rulemaking to update existing CO_2 pipeline safety requirements.

An often-cited example of pipeline concerns involves a CO_2 pipeline in Mississippi. On February 22, 2020, a CO_2 pipeline operated by Denbury Gulf Coast Pipelines LLC (Denbury) ruptured in proximity to the community of Satartia, Mississippi. The rupture followed heavy rains that resulted in a landslide, creating excessive axial strain on a pipeline weld (DOT 2022). The combination of weather and topography resulted in a slower dissipation of the gas. The pipeline was also carrying hydrogen sulfide, a flammable and toxic gas. The pipeline failed on a steep embankment, which had recently subsided. Heavy rains are believed to have led to a landslide, which created axial strain on the pipeline and resulted in a full circumferential girth weld failure. The PHMSA investigation also revealed several contributing factors to the accident, including but not limited to: Denbury not addressing the risks of geohazards in its plans and procedures, underestimating the potential affected areas that could be impacted by a release in its CO_2 dispersion model, and not notifying local responders to advise them of a potential failure.

As the Satartia example highlights, appropriate pipeline safety and environmental standards in California are critical to minimize any risks from CO_2 transport in the future. As such, SB 905 also tasks CNRA, in consultation with the Public Utilities Commission, to, no later than February 1, 2023, provide a proposal to the Legislature to establish a state framework and standards for the design, operation, siting, and maintenance of intrastate pipelines carrying CO_2 fluids of varying composition and phase to minimize the risk posed to public and environmental health and safety. The recommended framework shall be designed to minimize risk to public health and environmental health and safety, to the extent feasible. Because SB 905 prohibits the transfer of CO_2 via pipeline until the PHMSA completes its current rulemaking to update existing CO_2 pipeline safety requirements, CCS or CDR projects that would require a pipeline to transfer CO_2 are not feasible at this time within California.

Ultimately, and in accordance with SB 905, the merits of each CCS or CDR project must be evaluated on a case-by-case basis.[411] Deployment of CCS and CDR could support skilled jobs and workforces, including those in traditional fossil energy communities. Other co-benefits could include criteria air pollutant reductions and water production. It will be important to design projects that do not exacerbate community health impacts, include early and ongoing community engagement, and are in compliance with local, state, and federal public health and environmental protection laws. It also should be noted that, as these types of projects are an emerging area of governance, additional coordination and discussion will be needed among the various levels of authorities involved. SB 905 has already initiated this process by assigning specific agencies with tasks related to their expertise and authority.

Chapter 2 includes a more detailed discussion about the proposed role of CO_2 removal in this Scoping Plan.

Sector Transition

State,[412] national,[413,414] and global decarbonization analyses[415] indicate a significant role for carbon management infrastructure, yet relatively few projects are operational. Around the world, about two dozen large CCS projects are capturing tens of millions of metric tons of CO_2 each year, with about a dozen operating in the United States.[416] The vast majority of capacity is at industrial facilities, such as ethanol and fertilizer plants, that would otherwise vent nearly pure CO_2 into the atmosphere as a by-product of normal, non-combustion processes. Future research, development, and demonstration projects must refine and commercialize capture systems for more complex applications, especially

415 IPCC. Mitigation Pathways Compatible with 1.5°C in the Context of Sustainable Development. Chapter 2. https://www.ipcc.ch/sr15/chapter/chapter-2/. All analyzed pathways limiting warming to 1.5°C with no or limited overshoot use CDR to some extent to neutralize emissions from sources for which no mitigation measures have been identified and, in most cases, also to achieve net negative emissions to return global warming to 1.5°C following a peak (high confidence). The longer the delay in reducing CO_2 emissions toward zero, the larger the likelihood of exceeding 1.5°C, and the heavier the implied reliance on net negative emissions after mid-century to return warming to 1.5°C (high confidence).

416 Congressional Research Service. 2021. Carbon Capture and Sequestration (CCS) in the United States. R44902. https://crsreports.congress.gov/product/pdf/R/R44902?msclkid=e45e0012c25911ec8085ca575cb61e82.

for those with limited decarbonization options. It has only been in the last few years that attention has seriously turned to mechanical CDR. As new information and modeling on climate change have been made available, the science has become clearer that avoiding the most catastrophic impacts of climate change requires both reducing emissions and deploying mechanical CDR.

California is paving a path forward on a science-based carbon management infrastructure policy that can serve as an example for other jurisdictions. The LCFS, which reduces the carbon intensity of transportation fuels, includes a protocol for select carbon management projects to become certified and generate LCFS credits.[417] CCS is not a new concept or technology. Twenty years of CCS testing show it is a safe and reliable tool.[418] As mentioned in Chapter 2, while no new CCS projects have been implemented or generated any credits under the CARB CCS protocol, CCS projects have been implemented elsewhere since the 1970s. Moreover, there has been a U.S. Department of Energy CCS research program underway for more than two decades. These all form a foundation of information for future efforts. Certified projects must successfully demonstrate adherence to rigorous pre-construction, operational, and site closure standards designed to strengthen environmental performance, as described in CARB's CCS Protocol. The protocol is designed to layer on top of existing federal carbon sequestration regulations designed to protect the environment. The protocol would need to be reevaluated if CCS were to be more broadly applied across sectors beyond transportation fuel production.

Direct air capture and carbon mineralization have high potential capacity for removing carbon, but direct air capture is currently limited by high cost. Carbon mineralization may also have high potential for removing carbon from the atmosphere, but understanding of the technology is still limited.[419] Direct air capture could also be deployed at higher rates to remove legacy GHG emissions from the atmosphere. Chapter 2 contains additional information on the current status of CCS and mechanical CDR projects globally, as well as federal support of such technologies.

Strategies for Achieving Success

- Implement SB 905.

---

[417] CARB. 2018. Carbon Capture and Sequestration Protocol under the Low Carbon Fuel Standard. August 13. https://ww2.arb.ca.gov/sites/default/files/2020-03/CCS_Protocol_Under_LCFS_8-13-18_ada.pdf.

[418] National Energy Technology Laboratory. Permanence and Safety of CCS. https://netl.doe.gov/coal/carbon-storage/faqs/permanence-safety.

[419] Aines, Roger. No date. Options for Removing CO_2 from California's Air. Lawrence Livermore National Laboratory. https://ww2.arb.ca.gov/sites/default/files/2021-08/llnl_presentation_sp_engineeredcarbonremoval_august2021.pdf.

- Convene a multi-agency Carbon Capture and Sequestration Group comprised of federal, state, and local agencies to engage with environmental justice advocates, tribes, academics, researchers, and community representatives to identify the current status, concerns, and outstanding questions concerning CCS, and develop a process to engage with communities to understand specific concerns and consider guardrails to ensure safe and effective deployment of CCS.[420]
- Iteratively update the CARB CCS Protocol with the best available science and implementation experience.
- Incorporate CCS into other sectors and programs beyond transportation where cost-effective and technologically feasible options are not currently available and to achieve the 85 percent reduction in anthropogenic sources below 1990 levels as called for in AB 1279.
- Evaluate and propose, as appropriate, financing mechanisms and incentives to address market barriers for CCS and CDR.
- Evaluate and propose, as appropriate, the role for CCS in cement decarbonization (SB 596) and as part of hydrogen production pathways (SB 1075).
- Support carbon management infrastructure projects through core CEC research, development, and demonstration (RD&D) programs.
- Continue to explore carbon capture applications for producing or leveraging zero-carbon power for reliability needs as part of SB 100.
- Consider carbon capture infrastructure when developing hydrogen roadmaps and strategy, especially for non-electrolysis hydrogen production.
- Evaluate and streamline permitting barriers to project implementation while protecting public health and the environment.
- Explore options for how local air quality benefits can be achieved when CCS is deployed.
- Explore opportunities for CCS and CDR developers to leverage existing infrastructure, including subsurface infrastructure.
- Explore permitting options to allow for scaling the number of sources at carbon sequestration hubs.

Short-Lived Climate Pollutants (Non-Combustion Gases)

Short-lived climate pollutants (SLCPs) include black carbon (soot), methane (CH_4), and fluorinated gases (F-gases, including hydrofluorocarbons [HFCs]). They are powerful climate forcers and harmful air pollutants that have an outsized impact on climate change

[420] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, F4.9. finalejacrecs.pdf (arb.ca.gov).

in the near term, compared to longer-lived GHGs, such as CO_2. According to the IPCC's *Climate Change 2021: The Physical Science Basis,* in the near-term (i.e., 10- to 20-year time scale) the warming influence of all SLCPs combined will be at least as large as that of CO_2.[421] The United Nations Environment Programme's Global Methane Assessment[422] advises that achieving the least-cost pathways to limit warming to 1.5°C requires global methane emission reductions of 40–45 percent by 2030 alongside substantial simultaneous reductions of all climate forcers, including CO_2 and SLCPs. Action to reduce these powerful emissions sources today will provide immediate benefits—both to human health locally and to reduce warming globally—as the effects of our policies to transition to low carbon energy systems and achieve carbon neutrality further unfold.

In 2017, the Board approved the comprehensive Short-Lived Climate Pollutant Reduction Strategy (Strategy).[423] This strategy explained how the state would meet the following SB 1383-established targets:

- 40 percent reduction in total methane emissions[424] (including a separate 40 percent reduction in dairy and livestock emissions)
- 40 percent reduction in hydrofluorocarbon gas emissions
- 50 percent reduction in anthropogenic black carbon emissions
- 50 percent reduction of organic waste disposal from 2014 levels by 2020, and 75 percent by 2025, including recovery of at least 20 percent of edible food for human consumption

The state is expected to achieve roughly half of the SB 1383 targeted emissions reductions by 2030 through strategies currently in place (See Figure 4-11). As directed by the Legislature under SB 1383, state agencies focused on voluntary, incentive-based mechanisms to reduce SLCP emissions in the early years of implementation to overcome technical and market barriers. Under this "carrot-then-stick" strategy, incentives are replaced with requirements as the solutions become increasingly feasible and cost-effective. To meet legislated targets, more aggressive action is needed.

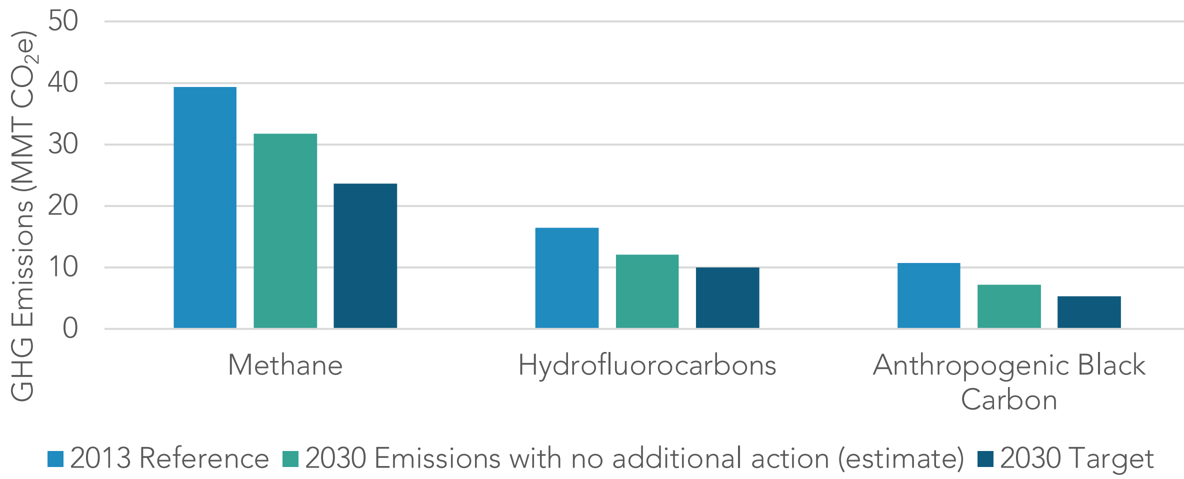
[423] CARB. 2017. Short-Lived Climate Pollution Reduction Strategy. https://ww2.arb.ca.gov/sites/default/files/2020-07/final_SLCP_strategy.pdf.
[424] All SB 1383 emissions reductions are mandated to be realized by 2030 and are relative to 2013 levels.

Figure 4-11: Expected progress toward SB 1383 targeted emissions reductions by 2030 through strategies currently in place



While the state's overall GHG emissions have declined by 9 percent over the past decade, SLCP emissions reductions have not kept pace with broader progress toward decarbonization. After growing steadily in the preceding decade, methane emissions have remained relatively flat since 2013.

HFCs are the fastest growing source of GHG emissions, primarily driven by their use to replace ozone-depleting substances and an increased demand for cooling and refrigeration.[425] Since 2005, statewide HFC emissions have more than doubled. While the rate of increase has slowed in recent years due to the state's measures, HFC emissions are still on the rise in California, and have grown by over 50 percent since 2010.[426] Globally, as temperatures rise, adoption of cooling technologies (and refrigerants) is increasing rapidly. If no measures are taken, it is estimated that HFCs will account for 9 to 19 percent of the total global GHG emissions by 2050.[427]

Methane

Human sources of methane emissions are estimated to be responsible for up to 25 percent of current warming.[428] Fortunately, methane's short atmospheric lifetime of ~12 years[429] means that emissions reductions will rapidly reduce concentrations in the atmosphere, slowing the pace of temperature rise in this decade. Further, a substantial portion of the targeted reductions can be achieved at low cost and will provide significant human health benefits. For example, the UN's *Global Methane Assessment* (2021)[430] found that over half of the available targeted measures have mitigation costs below \$21/MTCO_2e, and that each million metric tons of methane reduced would prevent 1,430 premature deaths annually due to ozone pollution caused by methane.

Following the Twenty Sixth Conference of Parties (COP26) (the United Nations Convention on Climate Change in 2021), over 110 nations have signed onto the Global Methane Pledge (Pledge)[431] to limit methane emissions by 30 percent relative to 2020 levels. The Pledge covers countries that emit nearly half of all methane and make up 70 percent of global GDP. The UN's Global Methane Assessment[432] shows that human-caused methane emissions can be reduced by up to 45 percent this decade, which would avoid nearly 0.3°C of global warming by 2045.

As shown in Figure 4-12, the three largest sources of California's methane emissions are the dairy and livestock industry, landfills, and oil and gas systems.

---

428 IPCC. 2021. *Climate Change 2021:The Physical Science Basis.* https://www.ipcc.ch/report/ar6/wg1/.

429 In contrast, the lifetime of CO_2 is hundreds of years. The IPCC Third Assessment Report concluded that no single lifetime can be defined for CO_2 because of the different rates of uptake by different removal processes. According to IPCC Fourth Assessment Report, the majority of an increase in CO_2 will be removed from the atmosphere within decades to a few centuries, while the remaining 20 percent may stay in the atmosphere for many thousands of years.

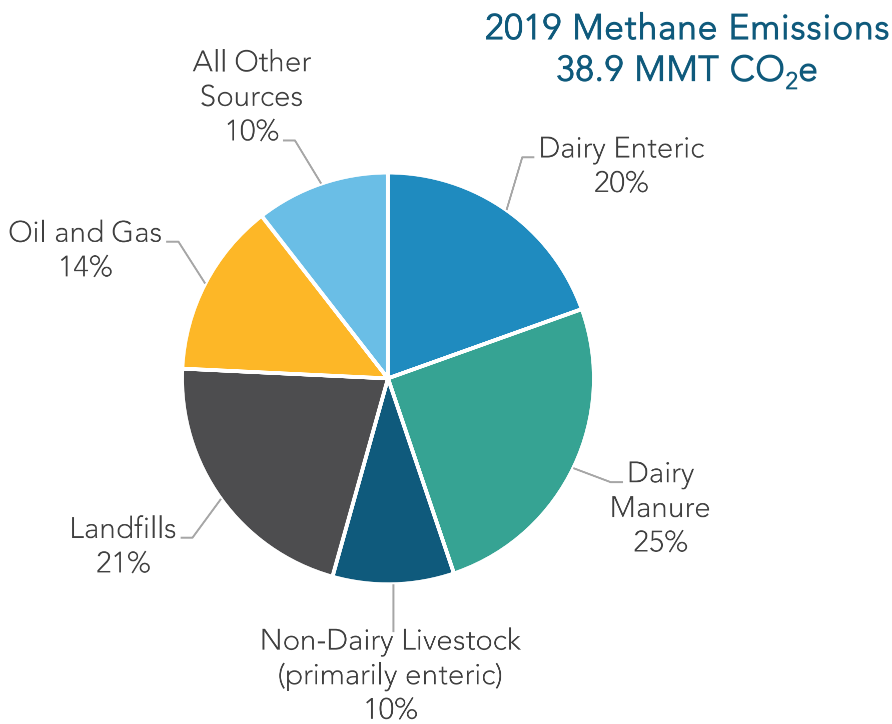
Figure 4-12: Sources of California methane emissions (2019)



Emissions from dairy and livestock operations come from two main sources: (1) enteric fermentation and (2) manure management operations, especially at dairies that employ open anaerobic lagoons that allow methane to escape into the atmosphere. Landfills, the second largest source of methane emissions, produce methane from the decomposition of organic waste. Although approximately 95 percent of all the waste that has been disposed of in the state has been deposited in a landfill that is equipped with a gas collection and control system, as required by California's Landfill Methane Regulation,[433] a portion of the methane still escapes into the atmosphere. Fugitive methane emissions can be intermittent and highly variable, both seasonally and spatially, particularly at landfills. Research has shown that landfills are complex systems and a wide range of conditions (e.g., atmospheric, operational, biological, chemical, and physical) may contribute to variability in rates of organic waste degradation, methane generation, and capture efficiency, so reducing the amount of organics deposited in landfills is critical to reducing overall landfill methane emissions. And despite the variability in individual landfill emissions, landfill gas collection and control systems remain the most effective strategy

[433] CARB. Landfill Methane Regulation. https://ww2.arb.ca.gov/our-work/programs/landfill-methane-regulation.

for reducing methane emissions from waste once it is placed in a landfill. Non-combustion methane emissions from the oil and gas sector are the third largest source of methane emissions in California. Almost three-quarters of the methane emissions from this sector come from leaks and venting from fossil gas transmission and distribution pipelines and equipment.

Hydrofluorocarbons

HFCs are synthetic GHGs that are powerful climate forcers. They are used mainly as refrigerants or heat transfer fluids in refrigeration, space conditioning, and heat pump equipment. Refrigerants are ubiquitous and are used everywhere from supermarkets, convenience stores, cold storage warehouses and wineries, to vending machines and residential and motor vehicle air-conditioners. Additionally, HFCs are also used as foam-blowing agents, solvents, aerosol-propellants, and fire suppressants. While HFCs remain in the atmosphere for a much shorter time than CO_2, the relative global warming potential (GWP) values of HFCs can be hundreds to thousands of times greater than CO_2. The mix of HFCs currently in use in California, weighted by usage (tonnage), have an average 100-year GWP of 1,700.[434] The average atmospheric lifetime of the mix of HFCs in use is 15 years.[435] Given the short average lifetimes, rapid reductions in HFC emissions can translate into near-term reductions in climate change effects.

As the global temperatures increase, the demand for cooling and refrigerants will continue to grow, as will the use of electric heat pumps to replace conventional fossil gas heating options. Unless addressed, continued use of high-GWP HFCs will perpetuate a feedback loop, where the cooling agents themselves cause additional warming.

In 2016, representatives from 197 nations signed the Kigali Amendment, which amended the existing Montreal Protocol (to reduce ozone-depleting substance production and consumption) to include a global phasedown in the production and consumption of HFCs beginning in 2019.[436] As of September 2022, 137 nations have either accepted, approved, or ratified the Kigali Amendment. On September 21, 2022, the U.S. Senate approved ratification of the Kigali Amendment, and it is expected that the United States

---

[435] Zhongming, Z., et al. 2011. *HFCs: A Critical Link in Protecting Climate and the Ozone Layer: A UNEP Synthesis Report.*

[436] United Nations Treaty Collection. Chapter XXVII, Amendment to the Montreal Protocol on Substances that Deplete the Ozone Layer. https://treaties.un.org/Pages/ViewDetails.aspx?src=IND&mtdsg_no=XXVII-2-f&chapter=27&clang=_en.

will soon join the 137 nations that have already ratified.[437] In the United States, Congress enacted the federal *American Innovation and Manufacturing (AIM) Act* in December 2020.[438] The AIM Act authorizes the U.S. EPA to address HFCs in several ways, including a national HFC phasedown that nearly mirrors the schedule of the global phasedown under the Kigali amendment.[439]

Nearly 90 percent of HFC emissions in California come from their use as refrigerants in the commercial, industrial, residential, and transportation sectors. The timescales over which the HFC emissions occur vary, depending on the type of application. Thus, strategies to reduce HFC emissions must be tailored by equipment type. CARB has several measures in place to tackle HFC emissions from the various sources shown in Figure 4-13 below. This includes the Refrigerant Management Program[440] that tracks and manages emissions from large commercial, industrial, and cold storage refrigeration facilities in the state. CARB has adopted regulations to reduce HFC emissions from consumer product aerosol propellants, semiconductor manufacturing, and small cans of automotive refrigerant.[441]

In 2018, California adopted HFC prohibitions via regulation and legislation for several sectors, including stationary refrigeration and foam end uses to backstop the partially vacated federal Significant New Alternatives Policy (SNAP) program.[442] Most recently, in 2020, CARB adopted additional measures that place GWP limits on refrigerants used in refrigeration and air conditioning equipment, which are the largest sources of HFC emissions, and are commonly used in residential, commercial, and industrial buildings. Additionally, CARB adopted a unique pilot program requiring the use of reclaimed refrigerant: the Refrigerant Recovery, Reclaim, and Reuse (R4) Program. The newly adopted HFC rules for the refrigeration and air conditioning sectors are the first of their kind in the nation.

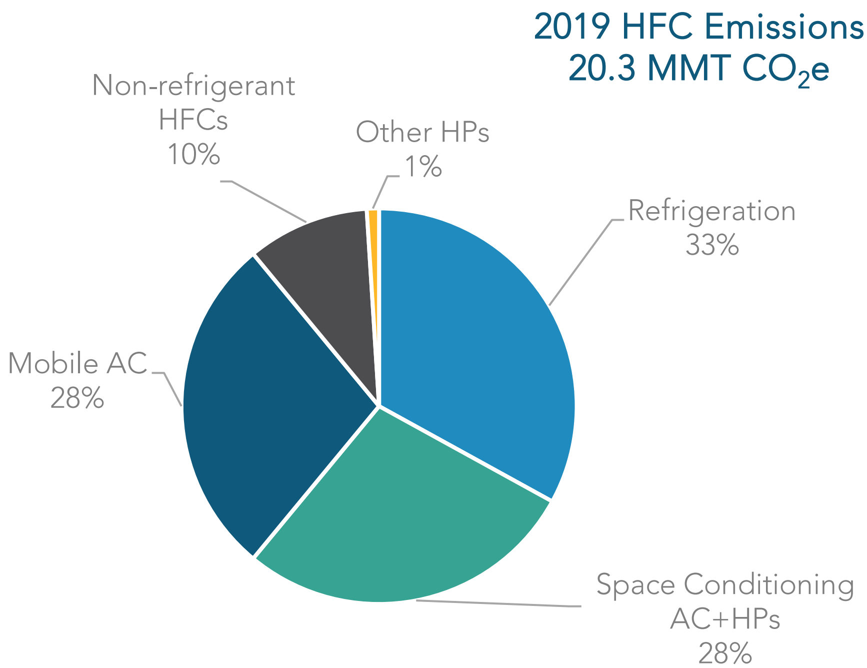
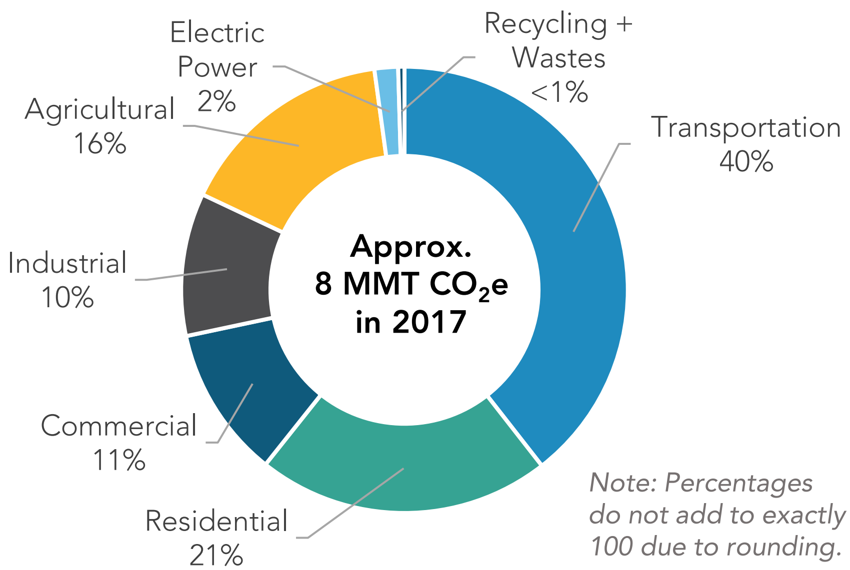
Figure 4-13: Sources of hydrofluorocarbon (HFC) emissions (2019)



Anthropogenic Black Carbon

Black carbon is not included in AB 32 or the state's AB 32 GHG inventory that tracks progress toward the state's climate targets; however, it has been identified as a powerful climate forcer and is included California's Short-Lived Climate Pollutant Reduction Strategy. The majority of anthropogenic black carbon emissions come from transportation, specifically heavy-duty vehicles, and they have decreased since 2013 due to engine certification standards and in-use rules for on-road and off-road fleets, along with clean fuel requirements and incentives, including California Climate Investments and LCFS credits. Additionally, fuel combustion for residential, commercial, and industrial applications contribute significantly to overall black carbon emissions. Approximately 95 percent of residential black carbon emissions are due to wood combustion; these emissions are being reduced through programs like the Woodsmoke Reduction Program established by SB 563 (Lara, Chapter 671, Statutes of 2017). Alternatives to agricultural burning and policies that phase out agricultural burning will also result in agricultural black carbon emissions reductions. In 2021 CARB provided a preliminary estimate of 2017 black carbon emissions (Figure 4-14).[443] This estimate will be finalized as part of a future update to the Short-Lived Climate Pollutant Inventory.

Figure 4-14: Sources of anthropogenic black carbon (preliminary 2017 estimates; AR5 100-yr GWP 900)



Sector Transition

California has long recognized the importance of mitigating non-combustion SLCPs and took several early action measures as part of a comprehensive, ongoing program to reduce in-state GHG emissions under AB 32. The early action measures included CARB's Landfill Methane Regulation,[444] Refrigerant Management Program,[445] and Oil and Gas Methane Regulation.[446]

Methane

The methane abatement strategies currently in place are projected to achieve half of the methane emissions needed to meet the overall methane reduction target of SB 1383 (40 percent reduction by 2030). The reduction target translates to a limit of less than 24 $MMTCO_2e$ in 2030 (Figure 4-15). It is anticipated that, since some sectors have fewer

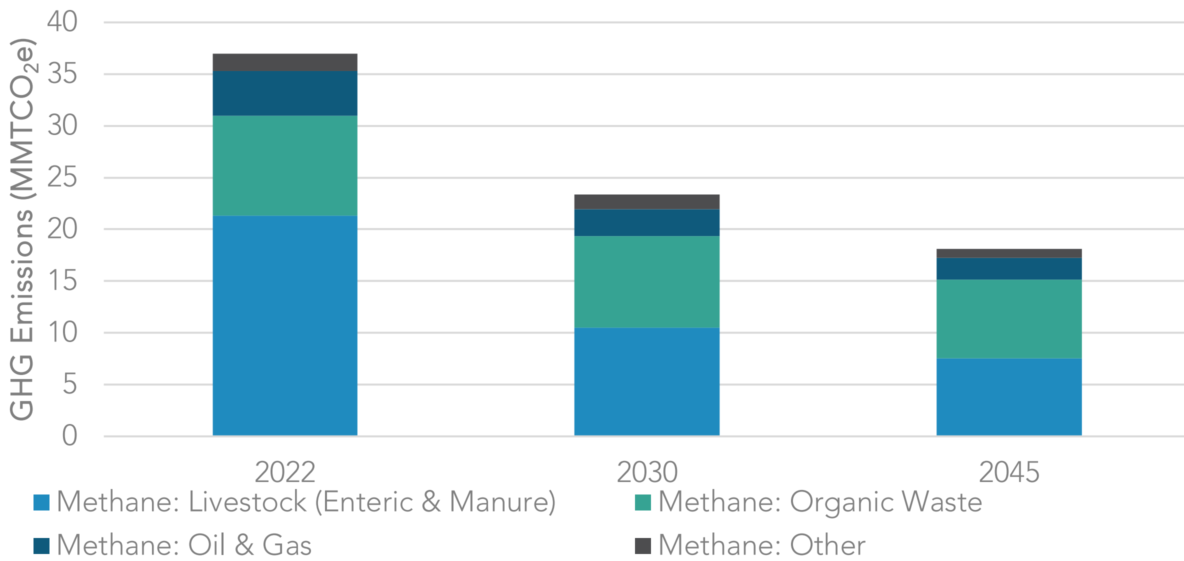
strategies that can be implemented to reduce methane in the near-term, other sectors will need to go beyond the 40 percent reduction to meet the target.

Figure 4-15: Methane emissions in 2022, 2030, and 2045 in the Scoping Plan Scenario[447]



Dairy and Livestock Methane

California is the largest dairy-producing state, home to one in five U.S. dairy cows. To date, methane emissions reductions from the dairy and livestock sector have mainly been driven by a decreasing animal population and the growing adoption of manure management strategies, including anaerobic digesters and conversion to dry manure systems and pasture systems. CARB recently completed a detailed analysis of the emission reductions expected by 2030 and the estimated additional investment needed to reach the dairy and livestock sector methane reduction target. [448]

Assuming no adoption of additional manure management and enteric mitigations strategies beyond the projects that have committed funding, and a continued annual animal population decrease of 0.5 percent per year through 2030, further reductions of approximately 4.4 $MMTCO_2e$ will be needed to achieve the 2030 methane emissions reduction target for the sector set by SB 1383. If the remaining reductions are met through

---

[447] The *Organic Waste* category includes methane from landfills, wastewater treatment, and compost facilities.

[448] CARB. 2021. Analysis of Progress toward Achieving the 2030 Dairy and Livestock Sector Methane Emissions Target. June. https://ww2.arb.ca.gov/sites/default/files/2021-06/draft-2030-dairy-livestock-ch4-analysis.pdf.

a mix of dairy projects in which half are dairy digesters and half are alternative manure management projects, then it is estimated that at least 420 additional projects will be necessary. Additional emissions reductions beyond this level will likely be necessary to ensure that the overall state methane emissions reduction targets are met.

Despite the considerable methane emissions mitigation potential of enteric strategies like feed additives, little progress has been made, as few products with proven mitigation potential have become commercially available, and unlike manure management strategies, there is a lack of financial incentives for their adoption.

Market conditions favoring farm consolidation and improved production efficiencies have driven reductions in the California and U.S. dairy population over the past decade. [449] These efficiency gains have allowed California to maintain production levels despite the decreasing population. If demand for dairy and beef products remains steady or increases, continued improvements in production efficiency and adoption of effective manure management and enteric mitigation strategies will be important to support dairy and livestock methane emission reductions.

Strategies for Achieving Success

- Install state of the art anaerobic digesters that maximize air and water quality protection, maximize biomethane capture, and direct biomethane to sectors that are hard to decarbonize or as a feedstock for energy.
- Increase alternative manure management projects, including but not limited to conversion to "solid," "dry," or "scrape" manure management; installation of a compost-bedded pack barn; an increase in the time animals spend on pasture; and implementation of solid-liquid separation technology into flush manure management systems.
- Implement enteric fermentation strategies that are cost-effective, scientifically proven, safe for animal and human health, and acceptable to consumers, and that do not impact animal productivity. Provide financial incentives for these strategies as needed.
- Accelerate demand for dairy and livestock product substitutes such as plant-based or cell-cultured dairy and livestock products to achieve reductions in animal populations.
- In consideration of pace of deployment of methane mitigation strategies and the scale of complimentary incentives, consider regulation development to ensure that the 2030 target is achieved, assuming the conditions outlined in SB 1383 are met.

[449] MacDonald, James M., Jonathan Law, and Roberto Mosheim. 2020. *Consolidation in U.S. Dairy Farming.* ERR-274. July. https://www.ers.usda.gov/webdocs/publications/98901/err-274.pdf.

Landfill Methane

Achieving the 75 percent organic waste disposal reduction target[450] of SB 1383, and maintaining that level of disposal in subsequent years, would bring annual landfill emissions in 2030 to just below the 2013 baseline. Annual methane emissions will be higher through 2030 than originally anticipated by the SLCP Strategy because the state did not achieve the anticipated reductions in organic waste disposal of 50 percent below 2014 levels by 2020. SB 1383 prohibited the organic disposal regulations from taking effect until 2022,[451] and, as a result, emissions have continued to increase.

Due to the multidecadal time frame required to break down landfilled organic material, the emissions reductions from diverting organic material in one year are realized over the course of several decades. For example, one year of waste diversion in 2030 is expected to avoid 8 $MMTCO_2e$ of landfill emissions, cumulatively, over the lifetime of that waste's decomposition.[452] Near-term diversion efforts are critical to avoid locking in future landfill methane emissions.

CalRecycle's 2020 report, *Analysis of the Progress Toward the SB 1383 Waste Reduction Goals,*[453] estimated that 8 million short tons of composting and anerobic digestion capacity will be needed to manage organic wastes, above the existing and new capacity expected to be available by 2025. The 2019 report, *Co-Digestion Capacity in California,*[454] from the State Water Resources Control Board estimated that at least 2.4 million tons of digester capacity is available at urban wastewater treatment plants if sufficient incentives or funding for collection, receiving, and processing operations are provided to enable utilization of this capacity. The CPUC approved a decision in February 2022 implementing the biomethane procurement program, which will require investor-owned utilities by 2025 to procure 17.6 billion cubic feet (BCF) of biomethane produced from organic wastes to support the landfill disposal reduction and SLCP target and reduce fossil gas reliance for

---

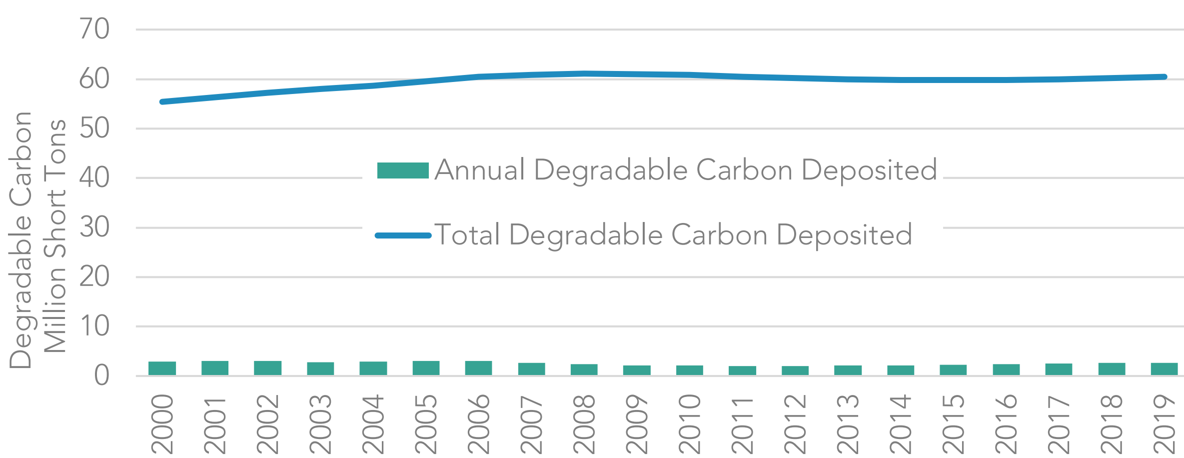
[450] The target is from 2014 levels by 2025.
Public Resources Code, § 42652.5. CalRecycle approved the SLCP: Organic Waste Reductions regulations (*https://calrecycle.ca.gov/organics/slcp/*) in 2020 and began implementing them in January 2022. These regulations are designed to achieve the 2025 disposal reduction and edible food recovery targets.
[452] The life cycle emissions reduction is based on anticipated diversion of 27 million short tons of organic waste from CalRecycle (2020) Analysis of the Progress Toward the SB 1383 Organic Waste Reduction Goals (*https://www2.calrecycle.ca.gov/Publications/Details/1693*). Under CalRecycle's SLCP regulations, an alternative to landfill disposal must achieve a life cycle GHG reduction of 0.3 $MTCO_2e$ per short ton of waste diverted.
[453] CalRecycle. 2020. *Analysis of the Progress Toward the SB 1383 Waste Reduction Goals.* *https://www2.calrecycle.ca.gov/Publications/Details/1693*.
[454] State Water Resources Control Board. 2019. *Co-Digestion Capacity in California.* *https://www.waterboards.ca.gov/water_issues/programs/climate/docs/co_digestion/final_co_digestion_capacity_in_california_report_only.pdf*.

residential and commercial customers.[455] Additionally, the organic waste stream includes more than one million tons of edible food that could be recovered before it enters the waste stream through food rescue programs that combat hunger in communities throughout California.

While reducing organic waste disposal is the most effective means of achieving reductions in waste sector methane, strategies to reduce emissions from waste already in place in landfills also will play a role in achieving near-term reductions. As Figure 4-16 shows, the total degradable carbon (a measure of the amount of waste with potential to generate methane) that is accumulated from waste deposited in previous years is over 20 times greater than the amount added each year. This illustrates that even if we were able to entirely phase out landfilling of organic waste today, the existing waste in place at landfills would continue to generate methane for decades into the future.

Through a combination of improvements in operational practices, use of lower permeability covers, advanced landfill gas collection systems, and increased monitoring to detect and repair leaks, it is estimated that a direct emission reduction of 10 percent is achievable across the state's landfills by 2030. Technologies to utilize landfill gas efficiently can contribute further emission reductions in the energy sector.

Figure 4-16: Degradable carbon deposited in landfills



Strategies for Achieving Success

- Maximize existing infrastructure and expand it to reduce landfill disposal, with strategies including composting, anaerobic digestion, co-digestion at wastewater treatment plants, and other non-combustion conversion technologies.

---

[455] CPUC. 2022. Decision 22-02-025.

- Expand markets for products made from organic waste, including through recognition of the co-benefits of compost, biochar, and other products.[456]
- Recover edible food to combat food insecurity.
- Invest in the infrastructure needed to support growth in organic recycling capacity.
- Utilize existing digesters at wastewater treatment facilities to rapidly expand food waste digestion capacity.
- Direct biomethane captured from landfills and organic waste digesters to sectors that are hard to decarbonize.
- Implement improved technologies and best management practices at composting and digestion operations.
- Reduce emissions from landfills through improvements in operational practices, lower permeability covers, advanced collection systems, and technologies to utilize landfill gas.
- Leverage advances in remote sensing capabilities to quickly pinpoint large methane sources and mitigate leaks, improve understanding of the factors that lead to better capture efficiency, and explore new technologies and practices that can reliably improve methane control at landfills.

Upstream Oil and Gas Methane Reduction

For oil and gas production, processing, and storage, California is currently on track to achieve a 41 percent reduction in methane emissions by 2025 relative to 2013. The additional reductions needed to meet the 2030 target may be achieved by implementing additional regulatory requirements to further reduce intentional venting of fossil gas from equipment. If necessary, additional reductions from transmission and distribution facilities may be achieved by requiring the utilities to increase inspection and repair activities or further reduce emissions from pipeline blowdowns by implementing methods such as using portable compressors, using plugs to isolate sections of pipelines, flaring vented gas, routing gas to fuel gas systems, and installing static seals on compressor rods. Advances in methane detection technologies (e.g., satellites equipped to detect large methane sources) may also help to identify and mitigate methane emissions quickly across the oil and gas sector.

As California transitions away from fossil fuels, in-state oil and gas production will likely decline. This could result in an increase over time in the number of long-term idle and orphan wells (idle wells lacking a financially solvent, responsible owner) in the state. While California has regulations aimed at helping ensure operators manage their idle wells,

---

[456] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, F4.4. finalejacrecs.pdf (arb.ca.gov).

there could likely be an increase in California's orphan well population. Plugging all orphan wells, of which there are currently over 5,000, could take decades due to the limited resources California has for orphan well plugging. The benefits from plugging wells include methane emission reductions and job creation; employment gains from well plugging and site remediation activities could help temporarily offset job losses from the oil and gas industry. The California Council on Science and Technology's 2018 report on orphan wells, *Orphan Wells in California: An Initial Assessment of the State's Potential Liabilities to Plug and Decommission Orphan Oil and Gas Wells,*[457] found that the potential cost to the state of plugging current orphan wells could be approximately $500 million, and the cost of plugging all active and idle wells could total over $9.1 billion. As oil and gas production in California declines due to reduced demand for fossil fuels, additional funding will likely be needed to cover the costs of plugging wells that have no viable operator.

Strategies for Achieving Success

- Mitigate emissions from leaks by regular leak detection and repair (LDAR) surveys at all facilities.
- Replace high emitting equipment with zero emission alternatives wherever feasible.[458]
- Have CARB and CalGEM lead a Task Force to identify and address methane leaks from oil infrastructure near communities.
- Pursuant to SB 1137, develop leak detection and repair plans for facilities in health protection zones, implement emission detection system standards, and provide public access to emissions data.
- Minimize emissions from equipment that must vent fossil gas by design (e.g., fossil gas powered compressors).
- Install vapor collection systems on high emitting equipment.
- Phase out venting and routine flaring of associated gas (gas produced as a by-product during oil production).
- Continuous ambient monitoring at fossil gas underground storage facilities to quickly detect large methane sources.
- Reduce pipeline and compressor blowdown emissions.

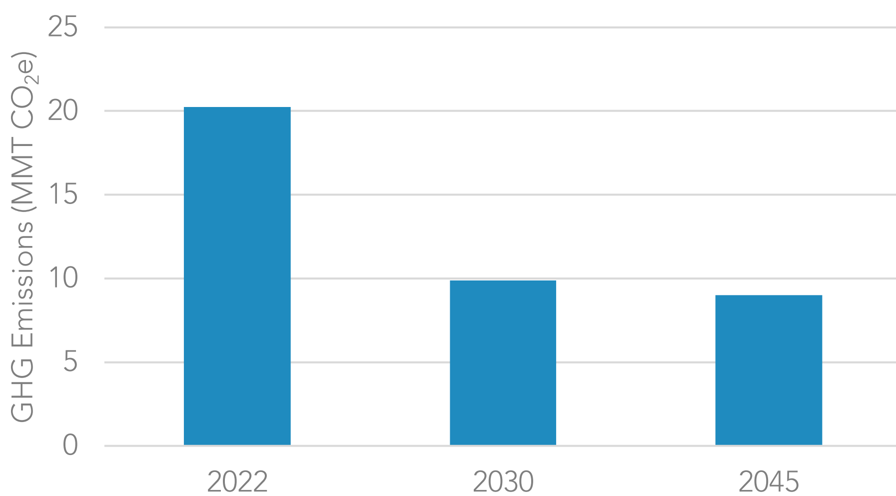
[458] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, P5. finalejacrecs.pdf (arb.ca.gov).

- Leverage advances in remote sensing capabilities to quickly pinpoint large methane sources and mitigate leaks.[459]

Hydrofluorocarbons

In California, all the HFC measures currently in place will help achieve more than 70 percent of the reductions needed to achieve the 2030 HFC goal and provide very significant emissions reductions by 2045 and beyond. However, new targeted measures will be needed to maintain the pace of reductions, as demand for technologies that currently predominantly use high-GWP refrigerants is anticipated to grow. Despite decarbonization efforts, high-GWP HFCs are expected to be among the last remaining persistent GHG emission sources, as shown in Figure 4-17.[460]

Figure 4-17: Hydrofluorocarbon emissions in 2022, 2030, and 2045 in the Scoping Plan Scenario



HFC emissions from new and existing sources should be addressed in tandem with building decarbonization efforts to maximize reductions.[461] As buildings are electrified in an effort to decarbonize them, the use of heat pumps for space conditioning, water heaters, and clothes dryers is expected to increase significantly. Heat pumps, while using

---

[459] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, CC17. finalejacrecs.pdf (arb.ca.gov).

[460] Energy and Environmental Economics, Inc. 2020. *Achieving Carbon Neutrality.* https://ww2.arb.ca.gov/sites/default/files/2020-10/e3_cn_final_report_oct2020_0.pdf.

[461] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, NF26. finalejacrecs.pdf (arb.ca.gov).

electricity, not fossil gas, currently rely predominantly on high-GWP refrigerants. Very low- or no-GWP technologies and solutions are either available or emerging for various heat pump technologies, and likely to develop further as international efforts to mitigate HFCs continue. However, most of these technologies are still nascent in the United States. In addition, some of the alternatives cannot be used until California building codes are updated, which is currently expected at the earliest in mid-2024 for some technologies based on the recently adopted provisions in AB 209[462] requiring the California Building Standards Commission to adopt the latest safety standards for refrigerant containing equipment into California's building codes. The current updates to the building codes will allow the use of many refrigerants with lower GWPs than HFCs currently in use. However, additional building code updates are needed to expand the choices of ultra-low-GWP alternatives, and that will need to happen in the next few years. The adoption of low-GWP refrigerants must occur in parallel with building decarbonization efforts; without such efforts, the vast GHG benefits of the latter will be partially offset, and the proportion of HFC emissions from buildings will continue to grow.

Leaks from existing air conditioning and refrigeration equipment are a major source of statewide and global HFC emissions. Once installed, refrigeration and air conditioning equipment can stay in place for decades, while leaking refrigerants into the atmosphere. This makes it very important that new installed equipment use refrigerants with a GWP as low as possible. The refrigerants inside existing equipment are sometimes collectively referred to as the *installed base* or *banks* of potential HFC emissions. If released spontaneously, the existing HFC banks would equal 60 percent of all annual statewide GHG emissions in California, as illustrated in Figure 4-18.[463]

The sales prohibitions on newly produced refrigerants set forth in SB 1206 (2022) and the national/international HFC phasedown will help in reducing HFC emissions from existing equipment by restricting the supply of and increasing the value of existing high-GWP HFCs, thus enabling a circular economy. In the 2022–2023 state budget, CARB received $45 million in incentive funding for climate-friendly refrigerant technologies; this funding will be critical in shifting the market toward the best available refrigerant technologies in various sectors.

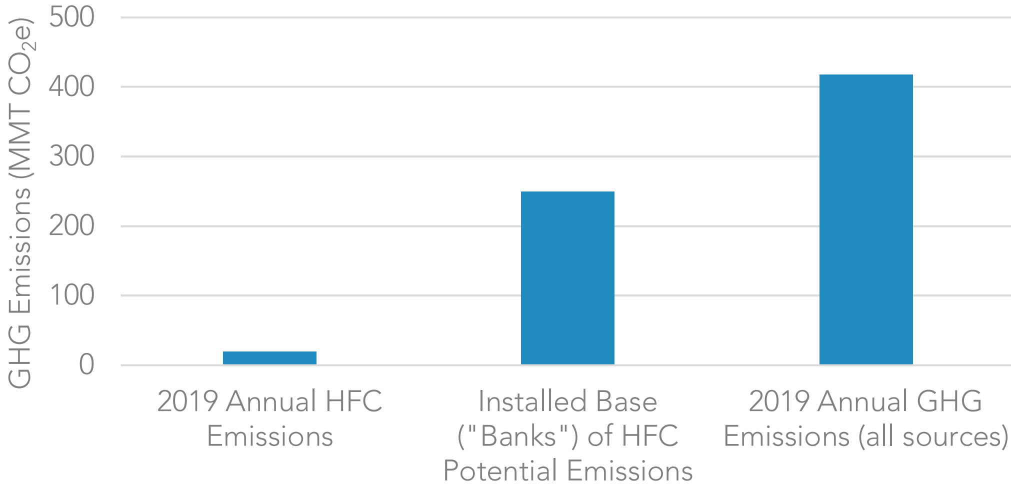
Figure 4-18: Potential emissions from refrigerants in existing equipment



Strategies for Achieving Success

- Expand the use of very low- or no-GWP technologies in all HFC end-use sectors, including emerging sectors, like heat pumps for applications other than space conditioning, to maximize the benefits of building decarbonization.[464]
- Convert large HFC emitters such as existing refrigeration systems to the lowest practical GWP technologies.[465]
- Prioritize small-scale and independent grocers serving priority populations in addressing existing "banks" of high-GWP refrigerants.[466]
- Improve recovery, reclamation, and reuse of refrigerants by limiting sales of new or virgin high-GWP refrigerants and requiring the use of reclaimed refrigerants where appropriate.[467]
- Assist low-income and disadvantaged communities in obtaining low-GWP space conditioning units to protect vulnerable communities from heat stress and wildfire smoke.[468]

[468] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, NF28, JT5, and JT6. *finalejacrecs.pdf (arb.ca.gov)*.

- Accelerate technology transitions in California and the U.S. overall by collaborating with international partners committed to taking action on HFCs under the Kigali Amendment to the Montreal Protocol; this includes addressing barriers to adoption of very low- or no-GWP refrigerant technologies such as high upfront costs, shortage of trained technicians, and lag in updating safety standards and building codes.

Anthropogenic Black Carbon

Significant progress has been made since 2013 to reduce anthropogenic black carbon emissions, primarily from decreased combustion of distillate fuels in the agricultural sector, as well as improvements to provide cleaner, on-road combustion technologies. Under current strategies, anthropogenic black carbon from transportation is expected to be reduced by over 60 percent in 2030. Continued reductions in combustion emissions across all sectors from both the state's climate and air quality programs will also help reduce anthropogenic black carbon emissions going forward.

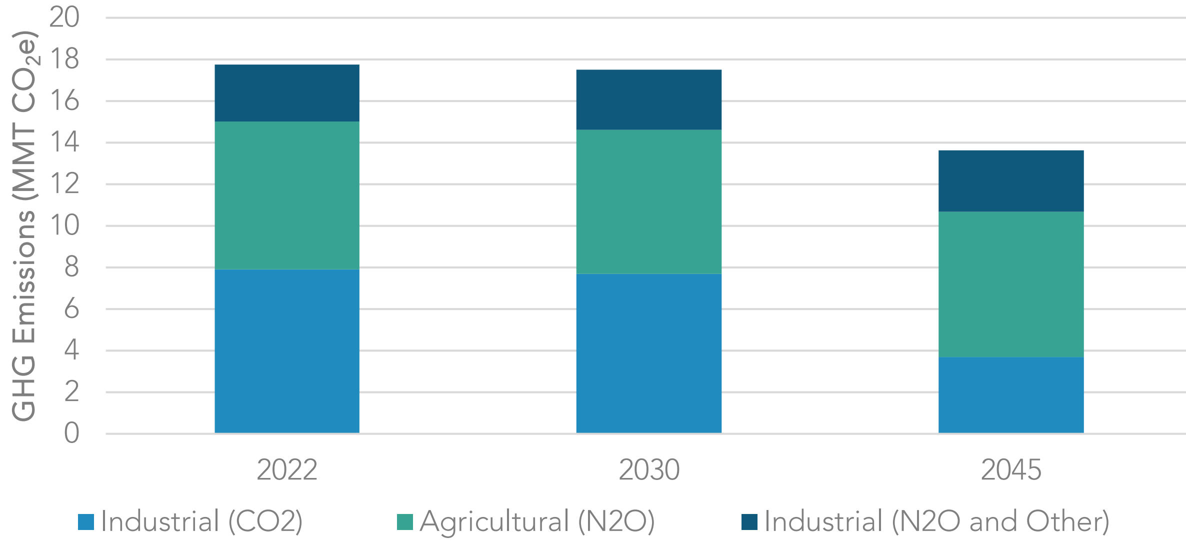
Strategies for Achieving Success

- Reduce fuel combustion commensurate with state's climate and air quality programs, particularly from reductions in transportation emissions and agricultural equipment emissions.[469]
- Invest in residential woodsmoke reduction.

In addition to SLCP emissions, some remaining non-combustion emissions are anticipated to persist in the coming decades, as shown in Figure 4-19. These include CO_2 from industrial processes such as cement manufacturing, oil and gas extraction, and geothermal electric power; N_2O from wastewater treatment, fertilizers, and livestock manure applied to agricultural soils; and other industrial, non-HFC GHG emissions.

[469] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, F1A and Appendix A (Table Summary of Direct Emission Reduction Strategies). "Emissions reductions from energy consumed by California's agricultural sector, including post-harvest processing, use of tractors and other farm equipment, and water import and irrigation." *finalejacrecs.pdf (arb.ca.gov)*.

Figure 4-19: Remaining non-combustion emissions in 2022, 2030, and 2045 in the Scoping Plan Scenario



Natural and Working Lands

California's natural and working lands (NWL) cover approximately 90 percent of the state's 105 million acres,[470] and include forests, grasslands, shrublands and chaparral, croplands, wetlands, sparsely vegetated lands, and the green spaces in urban and built environments. These lands include California Native American tribes' ancestral and cultural lands, parks and green spaces in our cities and communities, and the waters and the iconic landscapes we know and love. The diverse landscapes and biodiversity found throughout California's NWL provide a multitude of benefits to the people of California, including clean water, clean air, biodiversity, food, economic prosperity, recreational opportunities, continuation of traditional tribal ways of life, mental health benefits, and many others.

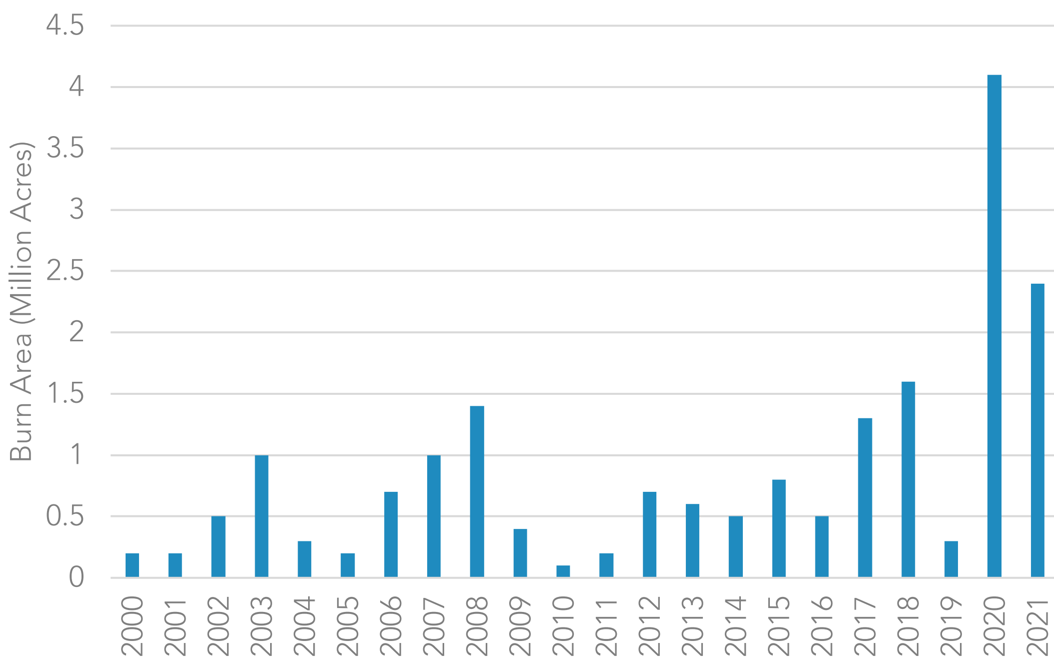
Our lands are a critical sector in California's fight to achieve carbon neutrality and build resilience to the impacts of climate change. Healthy land can sequester and store atmospheric CO_2. Healthy lands also can reduce emissions of powerful SLCPs, limit the release of future GHG emissions, protect people and nature from the impacts of climate change, and build our resilience to future climate risks. Creation of healthy lands through

[470] CNRA. 2022. Natural and Working Lands Climate Smart Strategy. https://resources.ca.gov/-/media/CNRA-Website/Files/Initiatives/Expanding-Nature-Based-Solutions/CNRA-Report-2022---Final_Accessible_Compressed.pdf.

multi-benefit and mitigation measures can also support tribal and local traditional lifeways. Unhealthy lands have the opposite effect—they release more GHGs than they store and are more vulnerable to future climate change impacts.

Climate change impacts have become more apparent in recent years and are having significant effects on communities throughout the state. One of these impacts is the much more frequent occurrence of unusually large, high-severity wildfires, which are being driven by climate change and by a recent history of fire-exclusion and land management practices that have resulted in forests with high levels of biomass. These recent large and high-severity wildfires have resulted in a significant amount of burned acreage and emissions in California (Figure 4-20).[471]

Figure 4-20: Acreage of burned wildland vegetation area



These wildfires deviate from the lower-severity fires that previously occurred at frequent intervals, around which California's forests evolved. As climate change accelerates, these large, uncharacteristic wildfires are likely to become more common and impact more of our landscapes. Climate change is also expected to have other significant effects on our lands, including more extreme droughts, floods, extreme heat, and the spread of invasive aquatic and terrestrial species, pests, diseases, and parasites. These impacts can lead

[471] CARB. 2022. Wildfire Emission Estimates for 2021. https://ww2.arb.ca.gov/sites/default/files/classic/cc/inventory/Wildfire%20Emission%20Estimates%202000-2021.pdf.

to negative feedback loops on human and ecological health; for example, increasing the spread of invasive species can lead to increases in pesticide use, if not managed through regulation or mitigation, which can pose risks to human health and the environment.

California's approach to climate action in the NWL sector is not solely focused on maximizing carbon stocks but instead on supporting carbon management that holistically fosters ecosystem health, resilience, provision of overall climate function, and other co-benefits.

Natural systems operate on a longer timescale than the energy and industrial sectors, and benefits from climate action on our lands can take decades to accrue. Scaling climate smart land management in California requires taking action now and playing the "long game" by establishing and maintaining consistent, patient approaches and programs.

Landscapes

For the first time, this Scoping Plan includes modeling for the NWL sector. The focus of the initial modeling is limited to seven land types that align with the those in the NWL Climate Smart Strategy.[472] Work will continue to incorporate more landscapes and management practices into the modeling over time. The initial landscapes included in the modeling for this Scoping Plan are:

- Forests
- Shrublands and Chapparal
- Grasslands
- Croplands
- Wetlands
- Developed Lands
- Sparsely Vegetated Lands

Each of these land types are a key component to the state's approach to increasing climate action in the NWL sector, as called for in Executive Order N-82-20 and AB 1757.[473] The Executive Order directs CARB to update the target for this sector in support of carbon neutrality by 2045 as part of this Scoping Plan, and to take into consideration the NWL Climate Smart Strategy. AB 1757 calls for the development of an

---

472 CNRA. 2022. *Natural and Working Lands Climate Smart Strategy. Appendix B.* *https://resources.ca.gov/-/media/CNRA-Website/Files/Initiatives/Expanding-Nature-Based-Solutions/Appendix-B_04132022_ada.pdf*.

473 AB 1757 California Global Warming Solutions Act of 2006: Climate Goal: Natural and Working Lands. *https://leginfo.legislature.ca.gov/faces/billTextClient.xhtml?bill_id=202120220AB1757*.

ambitious range of targets for the NWL sector to be integrated into the Scoping Plan and other state policies. It directs CARB and CNRA to work closely together to update the NWL Climate Smart Strategy, and establish an expert advisory committee to inform and advise on NWL modeling, targets, and implementation strategies.[474] Additionally, in 2021, the governor signed SB 27[475] (Skinner, Chapter 237, Statutes of 2021) into law. It directed CARB to establish CO_2 removal targets for 2030 and beyond and take into consideration the NWL Climate Smart Strategy. The governor's Executive Order, AB 1757, and SB 27 go beyond previous direction from the Legislature and past administrations. These directives emphasize the importance of quantifying land-based carbon both statewide,[476] and in programs and policies,[477] setting targets[478] for NWL to support the state's climate objectives, and advancing land management actions[479] that support the health and resiliency of these lands.

Blue carbon (also known as carbon captured and held in coastal vegetation and soils, such as seagrasses, seaweeds, and wetlands)—is also important to consider as we look at long-term climate goals. While this landscape is not currently covered by IPCC inventory guidelines or included in California's NWL Inventory, the United States was the first nation to include blue carbon in its national GHG emissions inventory. California's Ocean Protection Council and San Francisco Estuary Institute are partnering to create a new coastal wetlands, beaches, and watersheds inventory. CARB staff will utilize information from this effort and assess other available data to evaluate how this landscape may be integrated into our efforts in the future as more data become available.[480]

Trends of Carbon on Landscapes

CARB currently tracks the carbon stock changes though the Inventory of Ecosystem Carbon in California's Lands[481] (NWL Inventory), which is summarized in Chapter 1. The NWL Inventory is a key tool for tracking changes in carbon stocks across the state, and it will serve as the inventory of record for this sector, tracking sector-wide progress toward the target. The NWL Inventory provides a retrospective snapshot of the status of California's lands, and captures the gains or losses of carbon stocks that occur over time. In addition to tracking carbon stock changes, the NWL Inventory is an important tool for understanding the impacts of our efforts to increase climate action in this sector (such as those identified in this Scoping Plan and the NWL Climate Smart Strategy) on NWL carbon stocks. The inventory is also used as the foundation for Scoping Plan scenario modeling and target setting.

CARB's inventory shows that carbon stocks decreased in NWL lands from 2001 to 2011, releasing more carbon than they were storing, and then increased slightly from 2012 to 2014.[482] These trends highlight the interannual and interdecadal variability of lands and their ability to be both a source and a sink of carbon, and the importance of looking at NWL data and trends over multiyear and multidecadal time periods, as opposed to looking only at annual changes. This movement is part of the Earth's carbon cycle, where carbon transfers between the land, ocean, and atmosphere. As part of the carbon cycle, over decades or centuries, fire and plant respiration and decomposition move carbon from the land to the atmosphere, while plant growth and other processes move carbon from the atmosphere to the land. Emissions from fossil-fuel combustion are contributing to putting this cycle out of balance.

Additionally, some historic land management practices that have resulted in the loss of carbon from the soil are also contributing to the atmospheric rise of CO_2 while simultaneously exacerbating the imbalance of the water cycle, which is influenced by and linked to the carbon cycle. These emissions are also contributing to a feedback loop for California's lands: as CO_2 emissions accumulate in the atmosphere—and California experiences more warming, extreme heat events, and droughts—the risk and intensity of carbon losses also increases, which in turn transfers more carbon from the land to the atmosphere. And because forests and shrublands comprise approximately 85 percent of the carbon stocks in California, management strategies and disturbances in forest and

---

[482] These trends are consistent estimates in the most recent AB 1504 reporting period.

shrubland carbon play an important role in determining whether California's lands are providing either net carbon sequestration or net emissions on an annual basis.

The gains and losses of carbon on our lands will fluctuate in the future; what is important is to restore carbon in places where it has been lost and reduce large carbon losses on our NWL through active, attentive, and adaptive management. For additional details on the nexus between NWL and GHGs, see pages 5–6 of the NWL Climate Smart Strategy.

Goals and Accelerating Nature-Based Solutions

The state's climate mitigation targets are traditionally identified by individual years, (i.e., tons of GHG emissions in 2020 or 2030). However, because NWL processes fluctuate year to year and because it can sometimes take decades for climate action to fully impact carbon in NWL, it is important to consider the statewide, long-term trends of carbon stock change when identifying how this sector contributes to California's pathway to achieving carbon neutrality. Tracking carbon stock change over a multi-decadal period is the best way to assess the full direct impact climate action has on carbon storage. Such an approach filters out fluctuations from year-to-year weather variations and multi-year natural climate cycles, such as El Niño patterns.

Current data sources and methods allow us to track only certain carbon stocks that exist on NWL. For target tracking to be successful, each carbon pool must be inventoried using a methodology that can detect changes due to management and climate change. Certain carbon pools lack the scientific data and methodologies necessary for target-setting and tracking. For example, soils in forests, shrublands, and grasslands are not included in the Scoping Plan carbon stock target because, currently, there is no way to track statewide soil carbon through time in a way that would capture the effects of increased climate action and climate change.

When considering how NWL contribute to the state's goal of carbon neutrality, all lands' carbon stock gains and losses must be considered, and the Scoping Plan target is set in these terms. It is not sufficient to aggregate climate benefits only within areas where projects, management, or climate action occur. Much of the state does not receive active or quantifiable management, but these areas still contribute to the state's overall carbon stock change and GHG emissions. To incorporate the entire carbon balance toward true carbon neutrality, the Scoping Plan target is set in terms of carbon stock change across the entire state. This incorporates all lands that both receive and do not receive active management, and includes the end result of all sequestration, emissions, and other changes to carbon on the landscape.

However, carbon stock change is not equivalent to emissions. Currently, the data and emission quantification science is not sufficient to enable inventories to comprehensively track all NWL emissions in a way that would enable us to set an NWL target in terms of statewide emissions and sequestration. There is a great need, across the entire NWL sector statewide, for more empirical data, science, and tools to track all carbon stocks across each carbon pool, and to begin to track emission and sequestration rates. As California implements AB 1757, there is an opportunity to update the data, science, and tools to enable this level of tracking and target setting in the future.

As outlined in Chapter 2, California is projected to lose carbon stocks over the coming decades, but this Scoping Plan analysis also shows that increasing the pace and scale of climate smart land management in California will reduce the carbon stock losses and GHG emissions from the NWL sector. In response to EO N-82-20 and AB 1757, the proposed target for NWL is shown in Table 4-1.

Table 4-1: Scoping Plan modeled target for NWL, based on increasing action on NWL

	Total Carbon Stock % Change from 2014
2045	-4

Achieving this target will require significant expansion of the pace and scale of climate action on California's NWL, including the following:

- Increasing climate smart forest, shrubland, and grassland management to at least 2.3 million acres a year—an approximate 10x increase in management from current levels.
- Increasing climate smart agricultural practices by at least 78,000 acres adopted a year, annually conserving at least 8,000 acres a year of croplands, and increasing organic agriculture to comprise at least 20 percent of cultivated acres in California by 2045—an approximate 7.5x increase in healthy soils practices from previous levels and a 2x increase in total acres of organic agriculture.
- Increasing annual investment in urban trees in developed lands by at least 200 percent above historic levels and establishing defensible space on all parcels by 2045.
- Restoring at least 60,000 acres, or approximately 15 percent of all Sacramento–San Joaquin River Delta (Delta) wetlands, by 2045.
- Cutting land conversion of deserts and sparsely vegetated landscapes by at least 50 percent annually from current levels, starting in 2025.

If the carbon stock target above is met, and the management actions above are implemented, the modeling for NWL indicates that California's lands will be a net source of emissions, producing approximately 7 $MMTCO_2e$ of average annual emissions.

Additional climate smart management practices and additional landscapes, such as those included in the Climate Smart Strategy and discussed below in Additional Management Strategies, have the potential to increase carbon stocks and reduce GHG emissions from NWL beyond the levels modeled for this Scoping Plan.

The purpose of the NWL target and the above estimated outcomes is to provide a numerical guide that can support the state's efforts to accelerate both near-term and long-term climate action on California's lands, prioritizing durable solutions that deliver multiple outcomes. Taking these actions over the coming decades will reduce the potential carbon losses from NWL, reduce GHG emissions from some landscape types (such as croplands and Delta wetlands), and support sequestration of GHGs from NWL between 2025 and 2045. These actions will also deliver significant benefits to Californians beyond advancing our climate goals, such as reducing wildfire emissions and their associated health impacts, increasing habitat for biodiversity, reducing urban heat island effects, reducing harmful pesticide exposure, expanding economic opportunities, and others. Additional information on several economic and health outcomes from the Scoping Plan Scenario is included in Chapters 2 and 3.

Statewide planning and target setting for the NWL sector will only create meaningful change if followed by effective on-the-ground implementation. State government cannot accomplish this implementation alone. Effective large scale climate action is dependent on partnerships among tribal, federal, state, regional, and local partners, and across governmental, private, nonprofit, and commercial sectors. The NWL sector of the Scoping Plan sets a carbon target with climate action recommendations that can be used to achieve the quantified carbon, health, and economic outcomes. Implementation of these actions must be led by local or regional partnerships that plan and execute projects appropriate to the specific conditions. The technical expertise and local knowledge of land managers and stewards in all sectors must be elevated to ensure relevant, efficient, and effective climate action.

Implementation of climate action should contribute to state targets, maximize local benefits, and alleviate environmental injustices and other social inequities. On-the-ground action is largely executed and managed by local and regional actors, but state government agencies must support communities across the state in implementing nature-based climate solutions that address statewide objectives, such as the Scoping Plan carbon target. This includes providing resources and developing frameworks, while greatly increasing capacity and technical assistance to assist and empower local partners. Examples of how this can be done are the Regional Forest and Fire Capacity Program within the forestry sector, the UC Cooperative Extension in the agricultural and forestry sectors—as well as the work of the state's 10 regional Conservancies. These programs provide strong examples to emulate as they facilitate statewide coordination, and information and resource transfer from the state to the regional and local levels. The Regional Forest and Fire Capacity Program provides funding for local and regional groups to build their organizational capacity to plan and implement wildfire and forest management projects that are informed by their own local expertise. The UC Cooperative Extension is an example of how the state provides technical assistance to local landowners and community organizations, helping them apply the latest science-based management strategies to their lands. California's regional Conservancies play a pivotal role in implementing regional conservation, restoration, and land management efforts through activities such as grant funding, science generation, and planning assistance.

The state also has identified the need to incorporate and elevate traditional indigenous knowledge into climate action on the regional and local scales. Accomplishing this requires close partnerships with tribes for mutual knowledge and resource sharing, while protecting culturally sensitive knowledge and resources. As Tribes are sovereign nations with specialized cultural knowledge and experience in managing lands, climate action on these lands that contribute to the State of California's climate targets can only be accomplished with the full participation and under the leadership of the Tribes that govern those lands.

Strategies for Achieving Success: Crosscutting Items for all NWL

- Implement AB 1757 and SB 27.
- Implement the Climate Smart Strategy.
- Accelerate the pace and scale of climate smart action, consistent with the management levels identified above, as part of a collective effort between federal, state, private, nonprofit, and individual land managers.
- Prioritize and practice equity, including through meaningful community engagement and prioritizing implementation of nature-based solutions that benefit the communities most vulnerable to climate change.[483]
- Advance multi-benefit, collaborative, landscape-level approaches that engage communities and landowners, and incorporate adaptive managements.
- Consult and partner with California Native American tribes to increase co-management and tribal management authority; restore, protect, and enhance natural cultural resources, traditional foods, and cultural landscapes; respect tribal sovereignty; and support tribes' implementation of tribal expertise and Traditional Ecological Knowledge and cultural easements.[484]

[483] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N8. *finalejacrecs.pdf (arb.ca.gov)*.

[484] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N1, N6, N16, N17, N18. *finalejacrecs.pdf (arb.ca.gov)*.

- Leverage existing innovative financial and market mechanisms, and explore new ones, between the public, private, and philanthropic sectors to secure funding of climate smart land management.
- In partnership with communities, tribes, and the private sector, expand and develop new infrastructure for manufacturing and processing of climate smart agricultural and biomass products.
- Leverage and support technical assistance providers: such as the UC Cooperative Extension and California's 98 Resource Conservation Districts, that have track records of providing technical assistance to local landowners and implementing agriculture, forestry, natural resource management, and restoration projects across the state.
- Establish and expand mechanisms that ensure NWL are protected from land conversion and parcelization (e.g., conservation easements or Williamson Act), in line with the strategies outlined in CNRA's Pathways to 30x30 California.[485,486] Pair land conservation projects with management plans that increase carbon sequestration, where feasible.
- Increase opportunities for private and philanthropic investments in nature-based climate solutions, utilizing existing voluntary and compliance carbon markets, existing state and local programs, and the California Carbon Sequestration and Climate Resiliency Project Registry established pursuant to SB 27.
- Expand monitoring and tracking of management actions and outcomes consistent with the tracking and monitoring recommendations of the Climate Smart Strategy.

Forests, Shrublands, and Chaparral

At roughly 29 million acres, forests cover 27 percent of California. Shrublands and chaparral cover 31 percent of the state; roughly 33 million acres. Both types are distinct, with their own ecological dynamics and management strategies, and are modeled within a single model that is calibrated to treat them uniquely.

Together, forests, shrublands, and chaparral support a high biodiversity of plants and animals, in addition to high levels of carbon stocks. They provide important air and water quality benefits to all Californians, as well as recreational opportunities and, for forests, harvested wood products for the state. These landscapes are fire-adapted, and historical tribal management of these lands has fostered ecosystem health and resilience. Over the past century, these lands have been impacted severely by fire exclusion, including

---

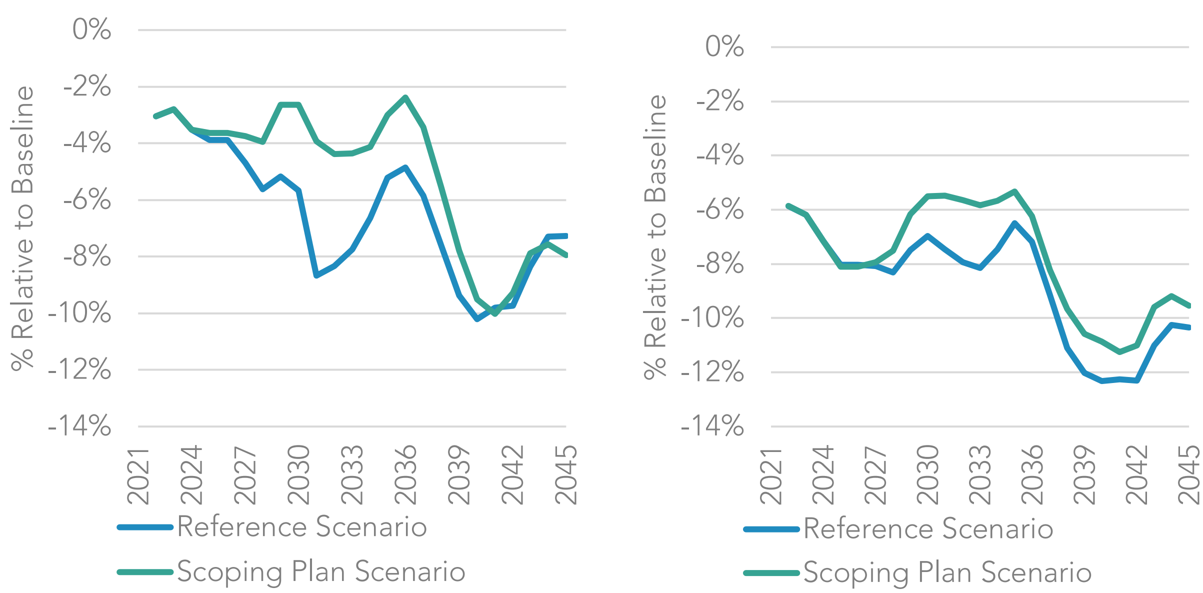
[485] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N5, N26, N27. *finalejacrecs.pdf (arb.ca.gov)*.

[486] CNRA. 2022. *Pathways to 30x30 California*. https://www.californianature.ca.gov/pages/30x30.

exclusion of indigenous people's management and past management practices, which has resulted in less resilient ecosystems and communities and more destructive wildfires today. This, along with drought induced stress and mortality, has changed these landscapes from a carbon sink to a carbon source. Climate smart management can help make forests more resilient to climate change and less prone to catastrophic wildfire. Climate-smart management in shrublands and chaparral face additional challenges and uncertainty, but can still provide protection for threatened communities and natural resources. This management, if conducted on a regular basis to maintain forest health, can help reduce emissions from forests, shrublands, and chaparral, and help strengthen and maintain the co-benefits that Californians experience from them.

Under all management levels, forests and shrublands are expected to lose carbon over the next two decades due to climate change and wildfire (Figure 4-21).

Figure 4-21: Forest (left) and shrubland (right) carbon stocks by 2045[487,488]



While this decrease in carbon stocks may be inevitable, forest management under the Scoping Plan Scenario can help direct where and how carbon loss occurs. By proactively managing forests and shrublands, the loss of carbon from wildfire can be lessened as the risk of high severity fire is decreased, with the removed biomass going toward a more

[487] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N13. *finalejacrecs.pdf (arb.ca.gov)*.
[488] This analysis is the aggregation of all forests and shrublands from all ownerships across the entire state of California.

useful purpose such as harvested wood products, bioenergy, and engineered carbon removal. Managing for a diverse and resilient forest landscape also can help forests recover more quickly so that when climate change and wildfire impacts occur, forests will be less affected and can continue to thrive and sequester carbon. Additional details on the climate benefit potential of forests and shrublands/chapparal can be found in Section 2 of the NWL Climate Smart Strategy.

Strategies for Achieving Success

- Accelerate the pace and scale of climate smart forest management to at least 2.3 million acres annually by 2025, in line with the climate smart management strategies identified in this Scoping Plan, the NWL Climate Smart Strategy, and the Wildfire and Forest Resilience Action Plan.[489]
- Establish and expand mechanisms that ensure forests, shrublands, and grasslands are protected from land conversion and that support ongoing, rather than one-time, management actions.
- In collaboration with state and local agencies, accelerate the deployment of long-term carbon storage from waste woody biomass residues resulting from climate smart management, including storage in durable wood products, underground reservoirs, soil amendments, and other mediums.
- Expand infrastructure to facilitate processing of biomass resulting from climate smart management.
- Expand permit streamlining in collaboration with state and local agencies to accelerate implementation of climate smart forest management while protecting natural resources.

Grasslands

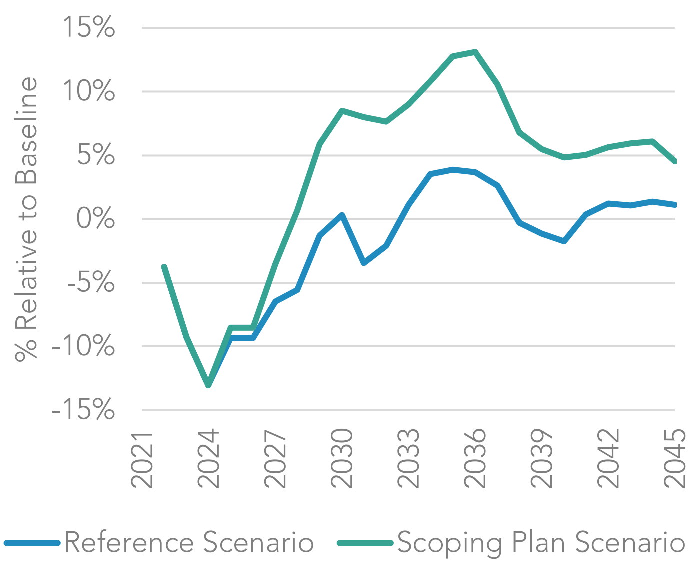
Grasslands cover 9 percent of California, roughly 10 million acres, and are found throughout the state in various landscapes, with concentrations in the foothills surrounding the Sacramento and San Joaquin Valleys. In addition to carbon storage (primarily in the soil), grasslands provide open space, wild habitat, grazing land, and important water filtration and recharge benefits. The protection of grasslands provides an opportunity to reduce sprawl and complement VMT reduction strategies. As grasslands are susceptible to invasive species, climate smart strategies can increase grassland

[489] Forest Management Task Force. 2021. *California's Wildfire and Forest Resilience Action Plan: Recommendations of the Governor's Forest Management Task Force.* https://www.fire.ca.gov/media/ps4p2vck/californiawildfireandforestresilienceactionplan.pdf.

resilience to climate change by improving species diversity and maintaining or increasing soil carbon stocks.

Modeling results show that increased fuels treatments and avoided land conversion can increase carbon stocks on grasslands by 2045, but sequestration rates fluctuate annually. Grasslands are capable of high carbon sequestration rates but are susceptible to carbon losses from wildfire and land conversion. Soil carbon is the major carbon pool on these lands, and continued future improvement of the monitoring and modeling of soil carbon is needed. Similar to forests and shrubland/chaparral, modeling alternatives that include fuels treatments resulted in greater carbon stocks compared to no management, and had lower wildfire emissions. Unlike forests and shrubland/chaparral, which have a general declining carbon stocks trend, the modeling results (Figure 4-22) show grasslands can maintain or increase carbon stocks with active management. Details on the climate benefit potential of grasslands can be found in Section 2 of the NWL Climate Smart Strategy.

Figure 4-22: Grassland carbon stocks by 2045



Strategies for Achieving Success

- Establish and expand mechanisms that ensure grasslands are protected from land conversion/parcelization and that support ongoing, rather than one-time, management actions that improve carbon sequestration.
- Deploy grassland management strategies, like prescribed grazing, compost application, and other regenerative practices, to support soil carbon sequestration, biodiversity, and other ecological improvements.

- Increase adoption of compost production on farms and application of compost in appropriate grassland settings for improved vegetation and carbon storage, and to deliver waste diversion goals through nature-based solutions.

Croplands

Croplands cover 9 percent of the state, roughly 9.5 million acres. This land is some of the most productive agricultural land in the world, and enables California to be a global leader in agriculture. Aside from developed lands, croplands are the most intensively managed landscapes in the state, and are closely tied to society through the food they produce and the constant, direct contact that people have with croplands through the course of management. In addition to food security, croplands provide considerable carbon storage in the soil and, in perennial croplands, in aboveground biomass. Climate smart practices can improve public health; for example, by reducing synthetic fertilizer and pesticide use. They also help to maintain or increase the climate resilience of cropland productivity through improved soil conditions and increased pollinator habitat.

There is also significant potential to transform this sector to increase soil carbon storage, reduce GHG emissions (Figure 4-23), and reduce pesticide exposure and health impacts. Moving to an agricultural system that improves soil health and water holding capacity reduces over-application of nitrogen, reduces the use of pesticides and fumigants, and increases biodiversity and pollinator habitat, supporting California's pathway to carbon neutrality while simultaneously improving the lives of those who live and work in the agricultural community. Croplands are intricately tied to people, communities, and their health, and through climate smart practices and cropland conservation, these lands have the potential to contribute more to society than just food.[490] The implementation of climate smart agricultural practices and diversified organic agriculture can help California achieve social and environmental benefits, like improving water use efficiency, increasing pollinator habitat, and reducing synthetic fertilizer and pesticide use.[491] Additional details on the climate benefit potential of croplands can be found in Section 2 of the NWL Climate Smart Strategy.

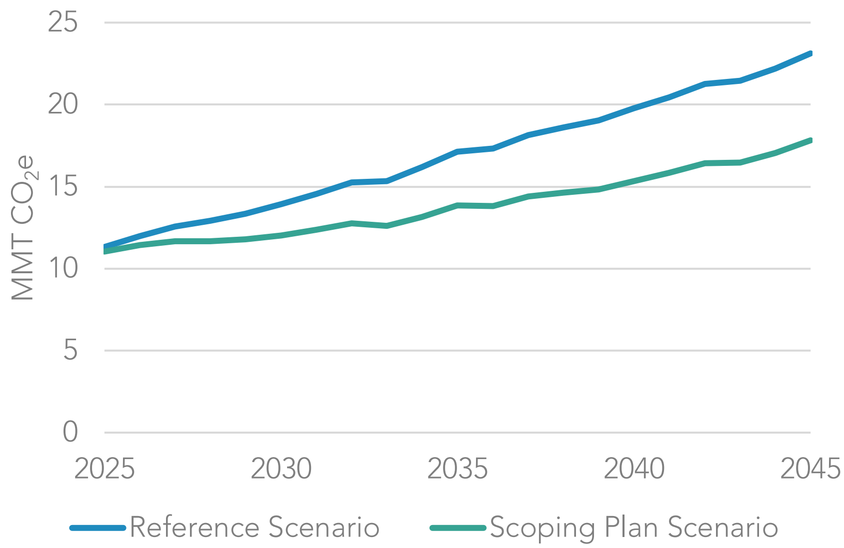
[491] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N11. finalejacrecs.pdf (arb.ca.gov).

Figure 4-23: Cumulative CO_2e emissions from annual croplands in 2045[492]



CARB recognizes the complex nature of croplands, cross-sector relationships, and the need to build on this analysis to further our understanding of cropland dynamics. Many more aspects of cropland management need to be explored for potential climate benefits, such as water and nutrient use management, pest control methods, crop rotations, and other management practices. The impacts of climate change on water availability, annual/perennial crop growth, and future carbon sequestration trends are uncertain, and recent policies such as the Sustainable Groundwater Management Act may also influence cropland management in unforeseen ways. Nonetheless, it is clear that greater climate smart practice implementation can prepare California for the future and yield tangible benefits for the state.

Strategies for Achieving Success

- Accelerate the pace and scale of healthy soils practices to 80,000 acres annually by 2025, conserve at least 8,000 acres of annual crops annually, and increase organic agriculture to 20 percent of all cultivated acres by 2045.

---

[492] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N11. *finalejacrecs.pdf (arb.ca.gov)*.

- Utilize the recommendations included in CDFA's Farmer and Rancher-Led Climate Change Solutions[493] report to accelerate deployment of healthy soils practices, organic farming, and climate smart agriculture practices.
- Establish or expand financial mechanisms that support ongoing deployment of healthy soils practices and organic agriculture.[494]
- Support strategies that achieve co-benefits of safer, more sustainable pest management practices and the health and preservation of ecosystems, such as implementing the California Department of Pesticide Regulation's (DPR's) Sustainable Pest Management Work Group recommendations.[495]
- Conduct research on the intersection of pesticides, soil health, GHGs, and pest resiliency via a multi-agency effort with DPR, CDFA, and CARB.[496]
- Conduct outreach and education to develop and facilitate the increased adoption of safer, more sustainable pest management practices and tools; reduce the use of harmful pesticides; promote healthy soils; improve water and air quality; and reduce public health impacts.
- In collaboration with state and local agencies, accelerate the deployment of alternatives to agricultural burning that increase long-term carbon storage from waste agricultural biomass, including storage in durable wood products, underground reservoirs, soil amendments, and other mediums.
- Work across state agencies to reduce regulatory and permitting barriers around some healthy soils practices (e.g., composting), where appropriate.
- Utilize innovative agriculture energy use and carbon monitoring and planning tools to reduce on-farm GHG emissions from energy and fertilizer application or to increase carbon storage, as well as to promote on-farm energy production opportunities.

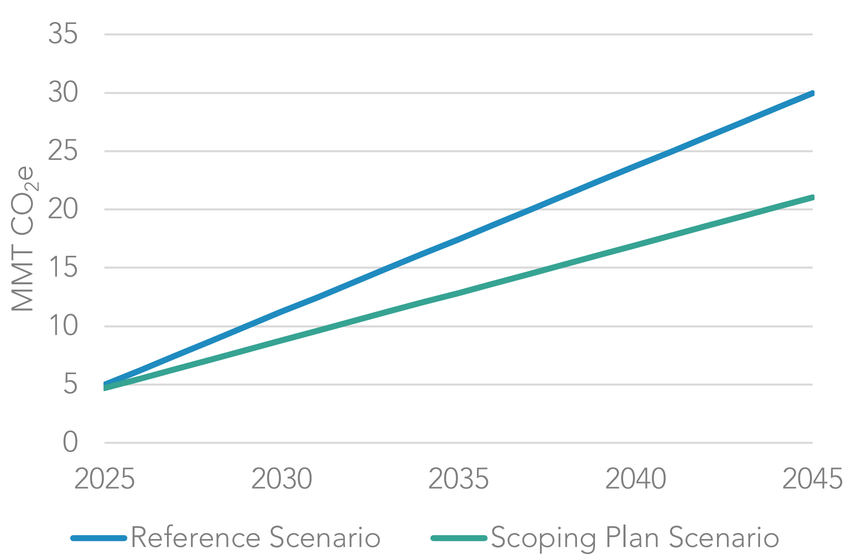
[496] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N11. finalejacrecs.pdf (arb.ca.gov).

Wetlands

Wetlands cover 2 percent of the state (roughly 1.7 million acres) and include inland and coastal wetlands, such as vernal pools, peatlands, mountain meadows, salt marshes, and mudflats. These lands are essential to California's communities as they serve as hotspots for biodiversity, contain considerable carbon in the soil, are critical to the state's water supply, and protect upland areas from flooding due to sea level rise and storms. Wetlands have been severely degraded through reclamation, diking, draining, and dredging practices in the past, resulting in the emissions of the carbon stored in the soils and the loss of ecosystem benefits. Climate smart strategies to restore and protect all the types of wetlands can reduce emissions while simultaneously improving the climate resilience of surrounding areas and improving the water quality and yield for the state. Restored wetlands also can reduce pressure on California's aging water infrastructure. These benefits beyond emissions reductions will help in the future, as climate change is predicted to negatively affect water supply.

Avoided conversion and restoration of Delta wetlands reduces CO_2 and methane emissions from wetlands, with GHG reductions scaling with implementation rates (Figure 4-24). Expansion of conservation and restoration efforts will generate benefits such as the conservation of biodiversity, improved water quality and supply, and reduced flood risk. Additional details on the climate benefit potential of wetlands can be found in Section 2 of the NWL Climate Smart Strategy.

Figure 4-24: Cumulative CO_2e emissions from Delta wetlands by 2045



Strategies for Achieving Success

- Restore 60,000 acres of Delta wetlands annually by 2045 to reduce methane emissions from wetlands and reverse the resulting subsidence.

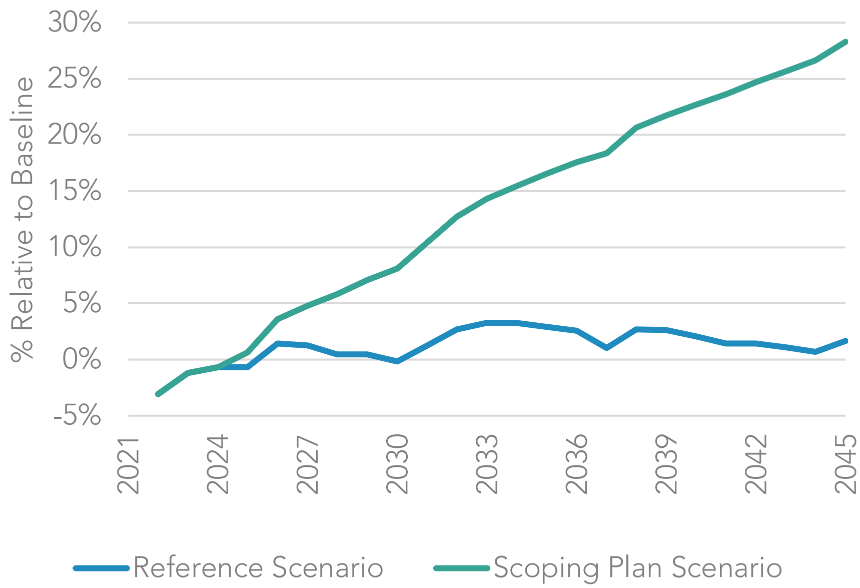
- Identify and prioritize wetland restoration efforts around climate vulnerable communities.
- Leverage other funding and institutions to support wetland restoration projects, including land trusts, local funding (e.g., San Francisco Measure AA), federal funding, and private and philanthropic funding to support wetlands restoration projects.
- Work across state agencies to reduce regulatory and permitting barriers around wetland restoration projects, where appropriate.

Developed Lands

Developed lands cover 6 percent of the state (roughly 6.8 million acres) and include urban, suburban, and rural areas, as well as transportation and supporting infrastructure throughout California. This area encapsulates the land on which the vast majority of Californians reside and call home. The vegetation within cities and communities, and along infrastructure, are all part of developed lands. This vegetation provides numerous benefits to surrounding areas, including carbon storage, air and water filtration, reduced urban heat island effect, and access to nature, aesthetics, and mental health, among others. These areas are susceptible to climate change as well, and climate smart strategies to protect and expand the urban forests, landscaping, green spaces, parks, and associated vegetation can increase their climate resilience and the benefits Californians derive from them. These strategies also have a significant opportunity to benefit disadvantaged communities, who may not have equitable access to these practices or the benefits they provide. Additional details on the climate and equity benefit potential of developed lands can be found in Section 2 and the Introduction of the NWL Climate Smart Strategy.

Urban forests have a significant potential to sequester carbon (Figure 4-25). They are vastly different from wildland forests, as they require investments to maintain and irrigate. This results in the need for a significant increase in investment to increase urban forest carbon. As urban forests become denser and management difficulty increases, the carbon stock returns on investment diminish, making it expensive to maximize carbon in urban forests. Water availability and irrigation efficiency are also an important consideration for increasing urban forest cover. As water becomes scarcer, the prioritization of irrigating trees over lawns or gardens may be required to achieve increases in urban forest carbon.

Figure 4-25: Carbon stocks in urban forests by 2045



Within wildland-urban interface (WUI) areas, defensible space can protect urban and rural communities from wildfire. Analysis results show that 48 percent of parcels are currently fully compliant with defensible space requirements. This highlights how much work needs to be done to protect communities and homes. Defensible space results in a decrease in carbon stocks, as expected when reducing fuels for wildfire.

Strategies for Achieving Success

- Increase urban forestry investment annually by 200 percent, relative to business as usual.
- Increase public awareness of urban forest benefits and, where appropriate, prioritizing irrigation of trees over lawns.
- Provide technical assistance and resources to disadvantaged communities to implement community urban greening projects to provide equitable access to the benefits of urban greening projects.[497]
- Work with state and local agencies to expand technical assistance for and enforcement of the defensible space requirements of PRC 4291 to reduce wildfire risk to homes and structures.

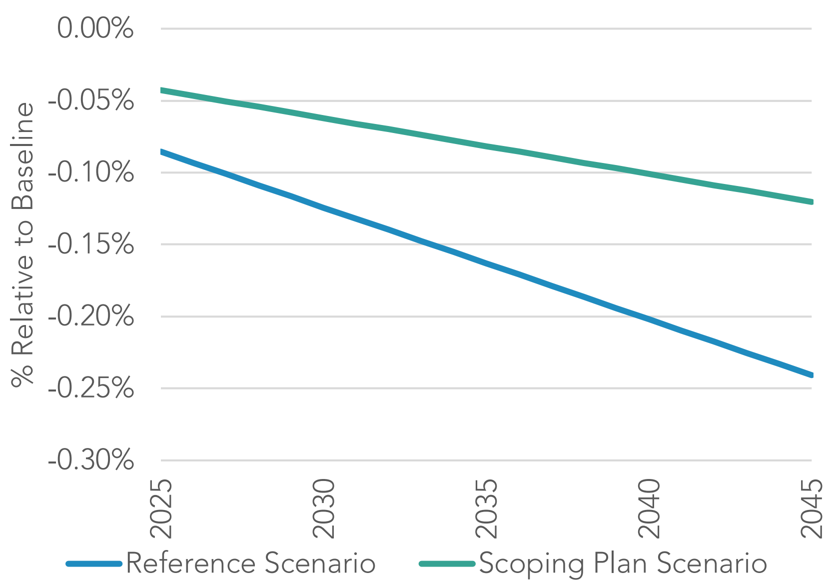
[497] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N8. *finalejacrecs.pdf (arb.ca.gov)*.

Sparsely Vegetated Lands

Sparsely vegetated lands cover 10 percent of the state, roughly 10.2 million acres, primarily in the east and southern parts of California. These lands include deserts, beaches, dunes, bare rock, and areas covered in ice and snow (e.g., higher mountain elevations). The limited carbon storage of these lands varies from bare rock and mineral soil to more vegetated areas, though severe climate limits the amount of biomass. Nonetheless, sparsely vegetated lands are important for open space and provide rare and unique habitats for endemic species and a diversity of wildlife. These lands present important recreational opportunities for Californians and serve as important protective buffers in coastal and low-lying areas. Land use change threatens these lands, and conservation efforts are important for protecting these unique areas of California.[498]

Avoided conversion of sparsely vegetated lands reduces the organic carbon lost from the soil, which is the major carbon pool in this land type (Figure 4-26). In identifying the outcomes for sparsely vegetated lands, CARB modeled avoided land conversion to another land use.

Figure 4-26: Carbon stocks in sparsely vegetated lands by 2045



Strategies for Achieving Success

- Establish and expand mechanisms that ensure sparsely vegetated lands are

[498] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N26. finalejacrecs.pdf (arb.ca.gov).

protected from land conversion, prioritizing those areas most vulnerable to climate change and loss.

Additional Management Strategies

Additional nature-based climate solutions beyond those management strategies modeled for this Scoping Plan are available for implementation, but either cannot currently be modeled and/or affect carbon and the landscape in ways that cannot currently be tracked. Nevertheless, it is important to take action even where these technical gaps exist. Some of these actions, such as cultural burning and indigenous farming practices, have been used on large scales for decades or even centuries, while others are relatively new concepts. The state nevertheless recommends implementing the additional solutions listed here to achieve potential additional climate benefits, as well as other co-benefits. These additional solutions were drawn from the NWL Climate Smart Strategy and stakeholder, tribal government, and interagency feedback.[499]

Considerations

Although these practices are recommended, because of the lack of in-depth modeling and analysis available, several considerations must be addressed when implementing them. These considerations also apply to the management strategies included in the Scoping Plan Scenario.

- Future climate change impacts are uncertain: The negative impact that climate change can have on the ability of these practices to maintain expected climate benefits is uncertain and may significantly change in the future. Climate change is expected to further diminish the already constricting growing conditions in California, with increasing droughts, more extreme weather events, and expanding disturbances from fire, insects, and disease. It is estimated that suitable habitat for many native plant and animal species could shift, creating novel ecosystems without historical precedent. Close monitoring of all practices, including no management, across our NWL will be critical to understand if and how future climate change affects outcomes and how to adapt management to meet the needs of the system under climate change.[500]

---

[499] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N24. *finalejacrecs.pdf (arb.ca.gov)*.
[500] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N15. *finalejacrecs.pdf (arb.ca.gov)*.

- Local conditions: Not every practice is applicable, feasible, or even desirable in every location across California. Implementation of these practices should account for local conditions and needs that may affect the appropriateness of that practice.
- Long-term carbon storage: The ability to sequester additional carbon into NWL is only beneficial to the climate if that carbon stays out of the atmosphere. Many of the additional practices listed here may require continual incentives or interventions to ensure permanence of carbon storage in the soil and biomass. For example, in croplands, it is difficult to estimate how much of the carbon stored by no-tillage can be released by a single subsequent tillage, but a return to conventional tillage would usually be expected to erase most gains.[501,502]
- Scaling actions: There are uncertainties on how these practices may impact both the environment and communities when significantly expanded. For this reason, it is best to take a cautious and measured approach to ramping up actions to a larger scale.
- Infrastructure and operational needs: Scaling up the implementation of some of these practices demands transformational change in the supporting infrastructure and operational frameworks. For example, increasing forest management to the degree included in the Scoping Plan Scenario will require significant changes to wood-processing infrastructure, workforce capacity, permitting processes, technical assistance, and other operational constraints. The increased application of compost to croplands, and potentially to rangelands, will require a significant increase in organic waste and dairy manure collection to increase compost supply, in line with SB 1383. This will also require additional compost production facilities as well as compost/organic waste transportation and application methods.
- Co-benefits: Many co-benefits from these practices exist beyond the climate benefits. These co-benefits include improved public and worker health; improved microbial, insect, and wildlife habitat; enhanced biodiversity; greater labor demand in the nature-based economy; and improved climate resilience.
- Labor and Economics: Many of these practices require additional labor, and an evaluation of how many more jobs are needed to carry out many of these practices

[501] Muñoz-Romero, V., R. J. Lopez-Bellido, P. Fernandez-Garcia, R. Redondo, S. Murillo, and L. Lopez-Bellido. 2017. "Effects of tillage, crop rotation and N application rate on labile and recalcitrant soil carbon in a Mediterranean Vertisol." *Soil Tillage Res.* 169, 118–123.
[502] Mitchell, J. P., A. Shrestha, W. R. Horwath, R. J. Southard, N. Madden, J. Veenstra, and D. S. Munk. 2015. "Tillage and cover cropping affect crop yields and soil carbon in the San Joaquin Valley." *California. Agron. J.* 107, 588–596.

is currently unknown. There will also be the need to explore the costs and economic benefits of implementing these additional practices.

- Retreatments: All of these practices have limits on how long they can enhance carbon sequestration. Many of these practices need to be periodically repeated, followed by complementary practices, or maintained through time. This increases costs and requires diligence and long-term stewardship.

Additional NWL Actions and Strategies

Below is a set of additional actions that should be taken on California's natural and working lands. Again, these practices were not modeled for this Scoping Plan, and all of the considerations listed above should be taken into account before implementing the following actions.

- Conservation of all NWL types (in line with the NWL Climate Smart Strategy and CNRA's Pathways to 30x30 California) is critical to ensuring continued carbon sequestration and provision of co-benefits from these lands for all Californians.[503]
- Reforestation following disturbance, using appropriate species, is an impactful practice that can help prevent conversion away from forestland and establish new trees to sequester carbon. The number of acres that may need reforestation following high severity wildfires is estimated to continue to increase into the future.
- Restoration of shrublands, chaparral, riparian zones, and oak woodlands across California includes a variety of practices to alter their structure and return endemic species to the areas. These unique habitats provide multiple co-benefits to the state, such as clean water, reduced wildfire risk, and biodiverse habitats for flora and fauna.
- Conservation and restoration of wetlands, beyond the Delta wetlands included in the NWL modeling, can protect these unique habitats and the climate benefits they provide. These wetland types can include but are not limited to coastal wetlands, mountain meadows, vernal pool complexes, alkali sinks and meadows, and floodplains.
- Conservation and restoration of seagrasses and seaweeds provide a number of benefits, including carbon storage and sequestration, habitat provision for many culturally and commercially important species of fishes and invertebrates, shoreline protection, and tourism opportunities.[504]

[503] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N26, N27. *finalejacrecs.pdf (arb.ca.gov)*.

[504] AB 32 EJ Advisory Committee. 2022 Scoping Plan Recommendations, N2. *finalejacrecs.pdf (arb.ca.gov)*.

- Prescribed herbivory utilizes various livestock to consume vegetation to reduce fuel loads across an area. This fuel management practice can be used in forests, grasslands, and shrublands as an effective alternative to herbicide use, and should be considered wherever local conditions allow.
- Urban and community greening efforts such as green schoolyards, urban farms, rain gardens, community gardens, community composting, and many more provide numerous health benefits to communities.
- Additional Healthy Soils Program practices on annual croplands such as conservation cover and crop rotation, biomass planting for borders, wind barriers, riparian areas, and improved nutrient management can improve soil health, water retention, and increase carbon stocks.
- Healthy Soils Program practices on perennial croplands and rangelands, such as compost application and alley cropping/cover cropping to improve soil health, water retention, erosion control, and biomass growth.[505]
- Stacking of these Healthy Soils Program practices, where appropriate, in perennial and annual systems, can synergistically improve soil health and provide multiple benefits.
- Mulching adds high carbon materials to croplands or fallowed lands to reduce competing vegetation and retain moisture. This practice can support other benefits such as reduced water use and reduced synthetic pesticide and fertilizer use, as well as provide a use for suitable forest and agricultural waste biomass.
- Reductions in the use of synthetic fertilizers in cropland management, generally supported by the implementation of new management tools or technologies, can lead to reductions in GHG emissions from the production and application of fertilizers. This benefit is in addition to the co-benefits of reduced chemical runoff into waterways and reduced exposure of human populations to their harmful effects.

[505] Various types of organic amendments are being researched for application to particular landscape types. For example, compost application to rangelands is a relatively new practice that has been shown to improve soil health and increase carbon sequestration in the short term, though the science on the long-term impacts of this practice is still developing and the supply of available compost may be limiting.

Chapter 5: Challenge Accepted

This chapter provides an overview of the next steps and partnerships that will be needed to successfully implement this Scoping Plan. The path forward is not dependent on one agency, one state, or even one country. It will take action on a global level to address the threat climate change poses. But, the work begins at home.[506] The state can lead by engaging Californians and demonstrating how action at the state, regional, and local levels of government, as well as action at community and individual levels, can contribute to addressing the challenge before us. We must build partnerships with academic institutions, private industry, and others to support and accelerate the transition to carbon neutrality. Ultimately, the success of this Scoping Plan will be measured by our ability to implement the actions modeled in the Scoping Plan Scenario at all levels of government and society. This will depend on a mix of legislative action, regulatory program development, incentives, institutional support, workforce and business development, education and outreach, community engagement, and research and development and deployment. Optimizing this mix will help to ensure that clean energy and other climate mitigation strategies are clear, winning alternatives in the marketplace and in communities—to promote equity, drive innovation, and encourage consumer adoption. Bold institutional action will catalyze continued research and push private investment to create jobs and bring innovative ideas to reality.

State-level Action

Achieving the targets described in this Scoping Plan will require continued commitment to and successful implementation of existing policies and programs and identification of new policy tools and technical solutions to go further, faster. California's Legislature and state agencies will continue to collaborate to achieve the state's climate, clean air, equity, and broader economic and environmental protection goals. It will be necessary to maintain and strengthen this collaborative effort, and to draw upon the assistance of the federal government, regional and local governments, tribes, communities, academic institutions, and the private sector to achieve the state's near-term and longer-term emission reduction goals and a more equitable future for all Californians.

[506] This "polycentric" approach to climate challenges, engaging many levels of government, was articulated in leading papers by Nobel laureate Elinor Ostrom. See, for example, Ostrom, E. 2014. "A Polycentric Approach to Coping with Climate Change." *Annals of Economics and Finance* 15-1, 97–134.

Regulations and Programmatic Development

Meeting the AB 32 2020 GHG emissions reduction target several years earlier than mandated demonstrated that developing mitigation strategies through a public process, where all stakeholders have a voice, leads to effective actions that address climate change and yields a series of additional economic and environmental co-benefits to the state. Following adoption of this Scoping Plan, state agencies will continue to update and implement new and existing programs to align with the outcomes in the plan. Community, tribal, and stakeholder engagement will be a critical part of this work. Several state agencies, including CARB, the CEC, the California State Transportation Agency (CalSTA), the CPUC, and others will need to be part of various subsequent rulemaking processes. Each of these agencies' leadership and technical staff will engage with the public through public meetings, written and oral comment, and other methods of engagement. This work will be informed by evaluations of the health, air quality, environmental, equity, and economic benefits and impacts of regulations, including an assessment of the societal cost of carbon, as required under AB 197.

Incentive Programs

As described in Chapter 1, incentive programs are one of the most important tools the state has in advancing our low carbon future, especially for climate vulnerable communities. The programs ensure clean technology and energy are accessible and are critical to closing ongoing opportunity gaps. These programs also leverage private-sector investment and build sustainable, growing markets for clean and efficient technologies, and they are particularly necessary to support GHG emission reduction strategies for priority sectors, sources, and technologies. Clean technologies are often already the best and lowest cost option over their lifetimes but incentive funding is critical to ensure that they are broadly available, especially in climate vulnerable communities. Incentives also build on California's long track record of driving innovative technology developments, and creating new industries, with targeted investment. The Inflation Reduction Act also provides a new source of funding and tax incentives that must be leveraged to help achieve the state's climate goals.

Many state funding programs are designed to achieve multiple objectives simultaneously: reduce emissions from GHGs, criteria pollutants, and toxic air contaminants; manage natural and working lands for carbon sequestration; and address health and opportunity gaps in disadvantaged communities. California's incentive programs focused on jump-starting the transition to a zero emission transportation future are a good example of this "stacked" approach. The state is investing billions of dollars through programs such as the On-Road Heavy-Duty Voucher Incentive Program and Clean Cars 4 All in order to replace the light- and heavy-duty vehicles most responsible for the state's GHG emissions and poor air quality, all while bolstering the nascent ZEV market. Further strategies aid in developing new technologies, in ramping up access for all, and in shifting to cleaner modes of transport; for instance, by supporting investments in walkable, bikeable communities and transit, as well as in vehicles. This funding strategy is, of course, paired with the regulatory approach described above.

Local Action

Local action by cities can support and amplify efforts to reduce GHGs. For example, the City of Oakland requires all new construction to be all-electric and is currently working on electrifying existing buildings.[507] In addition, starting in 2023, the City of Sacramento will require all new buildings under three stories to be all-electric, and it extends the mandate to all new construction by 2026 with some limited exemptions. The City of Sacramento also requires levels of EV charging infrastructure in new construction starting in 2023, higher than the minimum state requirements, and provides parking incentives for zero-emission carsharing and EV charging.[508] Local governments asserting this type of leadership are critical partners in supporting state-level measures to contain the growth of GHG emissions associated with the transportation system and the built environment.

California must accommodate population and economic growth in a far more sustainable and equitable manner than in the past. Good climate policy can and should create affordable and pleasant places to live, with effective transport and clean air for all—a future in which local governments and communities are central partners. Local governments have the primary authority to plan, zone, approve, and permit how and where land is developed to accommodate population growth, economic growth, and the changing needs of their jurisdictions. They also make critical decisions on how and when to deploy transportation infrastructure, and can choose to support transit, walking, bicycling, and neighborhoods that do not force people into cars. Local governments also have the option to adopt building ordinances that exceed statewide building code requirements, and play a critical role in facilitating the rollout of ZEV infrastructure. As a result, local government decisions play a critical role in supporting state-level measures to contain the growth of GHG emissions associated with the transportation system and the built environment—the two largest GHG emissions sectors over which local governments have authority.

Local governments are also frequently the source of innovative and practical climate solutions that can be replicated in other areas. Their efforts to reduce GHG emissions within their jurisdictions are vital to achieving the state's near-term air quality and long-term climate goals. Local governments must continue to take action that affirmatively

---

[507] City of Oakland. Building Electrification. *https://www.oaklandca.gov/projects/building-electrification*.

builds the projects and expend the funds needed to further the state's collective path toward equitable emissions reductions. As such, aligning local jurisdiction action with state-level priorities to tackle climate change and the outcomes called for in this Scoping Plan is critical to achieving the statutory targets for 2030 and 2045. Local governments can implement climate strategies that can effectively engage residents by addressing local conditions and issues that also deliver local economic benefits.

Local Climate Action Planning and Permitting

California encourages local jurisdictions to take ambitious, coordinated climate action at the community scale; action that is consistent with and supportive of the state's climate goals.[509] As discussed in more detail in Appendix D (Local Actions), local jurisdictions can do much to enable statewide priorities, such as taking local action to help the state develop the housing, transport systems, and other tools we all need. Indeed, state tools—such as the Cap-and-Trade Program or zero-emission vehicle programs—do not substitute for these local efforts. Multiple legal tools are open to local jurisdictions to support this approach, including development of a climate action plan (CAP), sustainability plan, or inclusion of a plan for reduction of GHG emissions and climate actions within a jurisdiction's general plan. Any of these can help to align zoning, permitting, and other local tools with climate action.

Once adopted, the GHG emissions reductions plans detailed in CAPs can provide local governments with a valuable tool for coordinated climate planning in their community. When a local CAP complies with CEQA requirements, individual projects that comply with the CAP are allowed to streamline the project-specific GHG analysis.[510,511] Effectively, local governments that adopt a CEQA-compliant CAP enable project developers to use this streamlined approach. This saves time and resources and provides more consistent expectations for how GHG reduction measures are applied across projects in the jurisdiction. While the state encourages local governments to follow this approach, we acknowledge not all jurisdictions have the resources to develop a CAP that meets the CEQA requirements.

In addition to being required for a local CAP to comply with CEQA, local GHG reduction targets have long been recommended as part of the process of developing a climate

---

[509] This plan provides more detailed guidance and tools to local governments in Appendix D (Local Actions).

[510] Cal. Code of Regs., tit. 14, § 15183.5.

[511] California Governor's Office of Planning and Research. n.d. "General Plan Guidelines - Chapter 8 Climate Change."

action plan.[512] One challenge local jurisdictions have faced is how to evaluate and adopt quantitative, locally appropriate goals that align with statewide goals. An effective response to this challenge is to focus on goals that can help implement overall state priorities—enabling the key transformations California needs.

There are many ways that local governments can make key contributions to this transformation, depending on the characteristics of their jurisdiction and community. For example, some jurisdictions will inherently have more land capacity to remove and store carbon, whether through natural and working lands or by other means. Other jurisdictions will be host to GHG-emitting facilities that serve necessary functions and will take time to transition to clean technology (e.g., municipal wastewater treatment plants, landfills, and energy generation and transmission facilities). It is important to recognize that we will need to build new energy production and distribution infrastructure, and repurpose existing ones, for clean technology and energy before we are able to phase down existing fossil sources. There also will be a need to handle the significant amount of biomass resulting from sustainable forest management for catastrophic wildfire prevention, agricultural waste, and landfill diversion.

Regional efforts can support change too: energy and transportation systems that serve Californians do not stop at jurisdictional boundaries, and some local decisions can have ramifications for other communities. For instance, Metropolitan Planning Organizations (MPOs) can help to integrate local efforts by planning consistent with the Scoping Plan and Climate Action Plan for Transportation Infrastructure, including by removing polluting roadway capacity expansions from project pipelines and instead focusing on climate-friendly solutions. These varied capabilities and needs should be taken into account in setting targets for local climate plans. For instance, although net zero targets can often be valuable and achievable, and mitigation is important, targets should be considered in the larger context of these goals. This all means any GHG targets on a local scale should take into consideration the actions and outcomes included in this Scoping Plan. Jurisdictions considering "net zero" targets should carefully consider the implications such targets may have on emissions in neighboring communities and the ability of the state to meet our collective targets.

Jurisdictions without formal CAPs also have important opportunities within this context. These jurisdictions can still take actions that effectively translate key state plans, goals, and targets, including those articulated in this Scoping Plan for local action. For instance, state ZEV targets can advance local efforts to promote broad and equitable access to charging and fueling. Similarly, local jurisdictions can enable reduced dependence on

---

[512] Climate Smart Communities. 2014. Climate Action Planning Guide. https://cdrpc.org/wp-content/uploads/2015/05/CAP-Guide_MAR-2014_FINAL.pdf.

single-occupancy vehicles by supporting dense infill housing and transit, among other actions. Such actions can be reflected in particular project plans, in general plans, or through other local policies. Regional partnerships among these jurisdictions can also help tap resources and provide for more effective overall action.

Unlocking CEQA Mitigation for Local Success

The California Environmental Quality Act also provides important tools for lead agencies to support the achievement of the state's GHG and VMT reduction goals. Although many climate-friendly local government actions already fall into categories that may not require a full CEQA analysis, thanks to streamlining or other tools, and although certain product types (such as affordable infill housing) are generally clearly consistent with state climate goals, CEQA analyses may still sometimes be required. CEQA can be a powerful and useful tool to engage the public, identify additional opportunities to support climate efforts, and localize change. It is important that lead agencies look for ways to use CEQA to support these core purposes, ensuring that these processes do not become sources of delay but instead unlock more opportunities. The uncertainty analysis in Chapter 2 evaluates how project implementation delays can lead to missed state climate targets and continued dependence on fossil energy. Mitigation measures applied in the communities affected by projects subject to CEQA have the added benefit of improving health, social, and economic resiliency as climate impacts worsen.

Appendix D (Local Actions) explores the role of local government action and CEQA in detail. As discussed there, an important CEQA-related tool is mitigation—which can be used to further drive local action consistent with state climate goals. When a lead agency determines that a proposed project would result in potentially significant GHG impacts due to its GHG emissions or a conflict with state climate goals, the lead agency must impose feasible mitigation measures to minimize the impact. Appendix D (Local Actions) provides suggestions for prioritizing the various types of mitigation, starting with on-site GHG-reducing design features[513] and mitigation measures, such as methods to reduce VMT and support building decarbonization, access to shared mobility services or transit, and EV charging. After exhausting all the on-site GHG mitigation measures, CARB recommends prioritizing local, off-site GHG mitigation measures, including both direct investment and voluntary GHG reduction or sequestration projects, in the neighborhoods impacted by the project. This could include, for example, development of a neighborhood green space, investment in street trees, or expansion of transit services. Implementing GHG mitigation measures in the project's vicinity would allow the project proponent and the lead agency to work directly with the affected community to identify and prioritize the

[513] Cal. Code of Regs., tit. 14, § 15126.4(c)(2) and (3).

mitigation measures that meet their needs while minimizing multiple environmental and societal impacts.

Once all potential on-site and local off-site GHG mitigation measures have been incorporated to the extent feasible, Appendix D (Local Actions) provides further suggestions for prioritizing other mitigation types, including non-local off-site mitigation, and voluntary offsets issued by a recognized and reputable voluntary carbon registry (as listed on CARB's website[514]) may be appropriate. Additional in-state mitigation also may be available in the upcoming SB 27[515] (Skinner, Chapter 237, Statues of 2021) registry, which will serve as a database of projects in the state that drive climate action on natural and working lands. Lead agencies should use substantial evidence to demonstrate that the project proponent explored and prioritized investments in feasible, local mitigation prior to moving mitigation to a geography located farther away from the project.

Communities and Environmental Justice

As noted in Board Resolution 20-33,[516] it is incumbent on CARB to function as an agent of responsible social change, especially when it is clear that environmental injustices continue to persist for low-income communities, tribes, and communities of color.

State law defines *environmental justice* as the fair treatment of all people of all races, cultures, and incomes with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations, and policies.[517] Government Alliance for Race and Equity (GARE)[518] defines *racial equity* as when race can no longer be used to predict life outcomes and outcomes for all groups are improved.

For this Scoping Plan to be successful, it must address environmental justice and advance racial equity. Implementation of the plan needs to address the needs of those communities that are disproportionately burdened by climate impacts and continue to face significant health and opportunity gaps. Now, we need to ensure our actions allow these communities to not only have a seat at the table, but also inform and shape the policies

to ensure their communities thrive. With this Scoping Plan, the state also adds a new tool to identify which communities will be the least resilient in the face of selected climate impacts and will see disproportionate economic impacts as a result. As described in Chapter 3, the CVM will enable the state to target programs and policies to build resiliency in the specific regions that will feel climate impacts more acutely due to existing health and opportunity disparities leading to disproportionate economic impacts. This tool will be critical in the state's efforts to address climate impacts while accounting for environmental injustices and racial inequities. CARB will incorporate the CVM into its work as it moves forward and will share this new tool with other agencies to align our efforts. The goal is to keep expanding the CVM to incorporate additional climate impacts to better identify disproportionate economic impacts as community level data becomes available.

AB 617 is another important tool for both Air Districts and CARB to bring resources to communities that have long been disproportionately burdened by poor air quality. While AB 617 does not require local agencies to participate in the Community Air Protection Program, several AB 617 communities are finding ways to bring local land use agencies to the table to respond to community priorities. We look forward to more opportunities to foster relationships with local authorities and continued collaboration between state and air district programs.

In alignment with AB 32, and to ensure environmental justice and racial equity were integrated into this Scoping Plan, CARB reconvened the AB 32 Environmental Justice Advisory Committee (EJ Advisory Committee) to advise CARB on the development of this Scoping Plan. Since reconvening in May 2021, the EJ Advisory Committee has engaged in the following activities:

- In October 2021, the EJ Advisory Committee sent a letter to the governor requesting a timeline extension for the Scoping Plan process. In response to the EJ Advisory Committee's letter, CARB modified this Scoping Plan process[519] and committed to an active engagement with the EJ Advisory Committee following the approval of this Scoping Plan. The EJ Advisory Committee also presented to the CARB Board[520] at its October 2021 Board meeting, reiterating its request for a timeline extension, as well as sharing additional concerns about process.

- In December 2021, the EJ Advisory Committee shared its responses to Scenario Input Questions,[521] as well as a narrative document outlining their concerns[522] around the process, the need for evaluation, and the need for a tribal representative. In response to the EJ Advisory Committee Scenario Input Questions, CARB incorporated the EJ Advisory Committee responses into the Scenario Assumptions document,[523] and modeled results from PATHWAYS.[524] In response to the EJ Advisory Committee's concerns, CARB worked diligently to appoint a tribal representative[525] in February 2022, and to outline additional opportunities for the EJ Advisory Committee to engage in the Scoping Plan process.[526]
- In March 2022, the EJ Advisory Committee presented at the joint EJ Advisory Committee / CARB Board meeting[527] and walked through their preliminary draft recommendations to inform this Scoping Plan. In April, the EJ Advisory Committee shared its revised preliminary draft recommendations[528] to inform this Scoping Plan.
- In September 2022, the EJ Advisory Committee presented at the joint EJ Advisory Committee / CARB Board meeting[529] and engaged in discussion about priority items as they relate to incorporating environmental justice into the Scoping Plan. By the end of September, the EJ Advisory Committee shared its final

[528] AB 32 EJ Advisory Committee. Draft Recommendations. https://ww2.arb.ca.gov/sites/default/files/barcu/board/books/2022/031022/ejacrecsrevised.pdf.

[529] EJ Advisory Committee. 2022. EJAC Presentation. September 1. https://ww2.arb.ca.gov/sites/default/files/barcu/board/books/2022/090122/ejacpres.pdf

recommendations[530] to inform this Scoping Plan. To the extent possible, CARB has incorporated and cited these recommendations through this Scoping Plan.

In addition to the activities listed above, Central Valley EJ Advisory Committee members hosted a successful community engagement workshop[531] in San Joaquin Valley in February 2022 with over 100 attendees. Members of EJ Advisory Committee hosted a statewide community engagement workshop[532] in June 2022 with more than 165 attendees. Throughout the EJ Advisory Committee's process, members of the Committee continued to work with their communities to ground truth their recommendations to inform the development of the Scoping Plan. The EJ Advisory Committee worked hard to ensure the voices of those communities most burdened by climate impacts were reflected in the plan. The EJ Advisory Committee will continue to play an ongoing role in the implementation of this Scoping Plan to ensure environmental justice and racial equity are prioritized in our effort to address the climate challenge before us.

To the extent possible, the EJ Advisory Committee's recommendations were integrated throughout the plan. This plan directly cites instances where there is alignment between the plan and the EJ Advisory Committee recommendations. This approach seeks to ensure there is more transparency and identify consensus that exists, as well as relevant ways equity and environmental justice are addressed in this plan and in the planning for future related implementation activities. CARB is dedicated to its efforts to ensure this plan does not leave communities behind.

As this Scoping Plan moves into the implementation phase, there will be a need to better understand how to address EJ Advisory Committee recommendations on the following topics:

- Actions under the jurisdiction of other agencies: there are certain EJ Advisory Committee recommendations that are outside of CARB's jurisdiction. As the EJ Advisory Committee continues to convene, it would be helpful to understand the

[530] EJ Advisory Committee. 2022. EJAC 2022 Scoping Plan Recommendations. September 30. https://ww2.arb.ca.gov/sites/default/files/barcu/board/books/2022/090122/finalejacrecs.pdf

[531] San Joaquin Valley Climate Justice & the Scoping Plan. 2022. https://ww2.arb.ca.gov/sites/default/files/2022-07/SJV%20Climate%20Justice%20%26%20the%20Scoping%20Plan%20Workshop%20Report%20out%20%26%20Recommendations_5.2022.pdf

[532] EJAC. 2022. *EJAC/Community Engagement Synthesis Report '22.* https://ww2.arb.ca.gov/sites/default/files/2022-07/EJAC-CommunityEngagement-SynthesisReport-2022-English%26Spanish.pdf.

role that CARB can play as it relates to the EJ Advisory Committee's recommendations for actions outside CARB's jurisdiction and coordinates with sister agencies.

- Actions that require legislative direction: there are certain EJ Advisory Committee recommendations that would require legislative action. As the EJ Advisory Committee continues to convene, it will be helpful to understand how CARB can work with the EJ Advisory Committee to share these recommendations with the appropriate members of the Legislature.
- Actions directly tied to implementation activities: This Scoping Plan is not an implementation document; it is a plan to chart a course to continue to reduce GHG emissions and achieve carbon neutrality. Once the Scoping Plan is approved, there will be follow-up action at CARB, as well as at other agencies. In these follow-up efforts, there will be a role for ongoing EJ Advisory Committee engagement.
- Actions to implement recent legislation, such as SB 905.

CARB proposes to continue to work with the EJ Advisory Committee to better understand how to move forward on EJ Advisory Committee recommendations that fall into the topics listed above and any other recommendations that were not included in this plan. It is also important to note that there are numerous recommendations where CARB shares the goals of the EJ Advisory Committee and can assist in implementation steps. Examples include the following:

- CARB shares the goal of prioritizing non-fossil energy generation and supports non-fossil projects and opportunities to locate behind-the-meter clean resources in communities of concern in programs such as the Solar on Multifamily Affordable Housing program.
- CARB will engage with agencies and academic institutions to further workforce development.
- Many other recommendations related to financial support for various energy projects, such as microgrids, are within the purview of the CPUC or local publicly owned utilities. Similarly, utility scale projects are within the jurisdiction of other agencies. However, CARB supports strategies identified in the recommendations such as offshore wind to reduce the reliance on fossil fuel generation.
- CARB is supportive of rooftop solar, although it is not within CARB's jurisdiction to determine how incentives for those projects are structured.
- CARB is supportive of strong energy decarbonization goals, recognizing that increased reliance on electrification in transportation and other sectors will create significant demand for electricity, and therefore ensuring reliability of a decarbonized grid is a critical need for the state.
- In the transportation sector, CARB is supportive of the EJ Advisory Committee's recommendations to maintain aggressive zero emission vehicle goals consistent

with its statutory mandate to ensure regulations are technologically feasible and in alignment with Governor Newsom's ZEV Executive Order (EO N-79-20). CARB looks forward to continued engagement on rulemakings that will implement these goals.

- As noted elsewhere in this plan, CARB is supportive of the Caltrans California Transportation Plan 2050 and the California Climate Action Plan for Transportation Infrastructure.
- CARB is supportive of additional public support for transit. CARB is supportive of locating EV charging in low-income communities and communities of color.
- CARB is supportive of prioritizing funding incentives for transit and heavy- and medium-duty vehicles, although CARB does believe there is an important role for incentives that support adoption of light-duty vehicles for the time being. CARB will also be opening a rulemaking on the Low Carbon Fuel Standard to ensure it continues to support clean fuels that will displace petroleum fuels and will consider the EJ Advisory Committee recommendations on this program.
- In the industrial sector, in addition to the strategies discussed more fully in this Scoping Plan, CARB continues to work with the Legislature, local agencies, and air districts to support, implement, and enforce effective reductions in emissions of GHGs and air pollutants in stationary sources. The air districts have the authority to directly issue permits addressing a facility's criteria pollutant and toxics emissions levels. These levels are set after careful permit review, under district regulation and statute. However, AB 617 directs and authorizes CARB to take several actions to improve data reporting from facilities, air quality monitoring, and pollution reduction planning for communities affected by a high cumulative exposure burden. CARB will continue to implement AB 617 and look for ways to strengthen the Community Air Protection Program.
- Considerations around the phaseout of oil and gas extraction and refining, and the role of carbon capture are discussed more thoroughly in Chapter 2.

As CARB continues to engage with the EJ Advisory Committee—in addition to the EJ Advisory recommendations that have been integrated throughout this plan—below are the following commitments that CARB is making to ensure that environmental justice is integrated in this plan and its implementation:

- Building decarbonization is a pillar of this Scoping Plan and CARB commits to working closely with state and local agencies to implement the EJ Advisory Committee recommendations that call for prioritization for residents in low-income communities and communities of color in this transition.
- CARB commits to sharing the EJ Advisory Committee's recommendations with the CEC, CPUC, and other agencies administering funds to support building

decarbonization, and to work closely with those agencies as they engage in public processes to further building decarbonization.

- CARB has committed to review the Cap-and-Trade program and determine what potential legislative or regulatory amendments could be necessary to ensure the program continues to deliver GHG reductions needed to achieve the statutory climate goals. In that process, CARB will consider the recommendations of the EJ Advisory Committee[533] and Independent Emissions Market Advisory Committee,[534] as well as others.

Critically, the EJ Advisory Committee makes numerous recommendations centered around tracking progress of the various strategies in this Scoping Plan. Currently, progress is tracked and reported in numerous ways, including the annual GHG inventory and reports to the Legislature. Part of the ongoing work of implementation, however, will include consideration of ways to provide more data and information to the public, such as rates of deployment of clean energy and technology as described in Chapter 1. CARB will also continue to collaborate with CDPH and OEHHA on health metrics to track cumulative benefits of air pollution and climate programs, especially in low-income communities and communities of color.

As noted earlier in this document, the EJ Advisory Committee will continue to play a vital role in the Scoping Plan and its implementation to ensure environmental justice and racial equity are prioritized in our effort to address the climate challenge before us. This includes ongoing EJ Advisory Committee engagement to advise CARB on the development of the Scoping Plan and any other pertinent matters in implementing AB 32. The ongoing EJ Advisory Committee will help to ensure integration of environmental justice in implementation efforts as it relates to AB 32, and also help CARB as we work toward a future where race is no longer a predictor for life outcomes.

Academic Institutions and the Private Sector

Academic institutions produce and present the latest science on both the impacts of, and actions to reduce, climate change damages. They are also leading the way by

[533] California Legislative Information. Bill Text – AB 32. Air pollution: greenhouse gases: California Global Warming Solutions Act of 2006. (AB 32, Nuñez, Chapter 488, Statutes of 2006). https://leginfo.legislature.ca.gov/faces/billNavClient.xhtml?bill_id=200520060AB32.

[534] California Legislative Information. Bill Text – AB 398. California Global Warming Solutions Act of 2006: market-based compliance mechanisms: fire prevention fees: sales and use tax manufacturing exemption. (AB 398). https://leginfo.legislature.ca.gov/faces/billNavClient.xhtml?bill_id=201720180AB398.

establishing their own climate goals and GHG emissions reductions targets.[535, 536, 537] They are incubators for innovation and knowledge in clean energy and technology and play an important role in adding to the wealth of robust information to inform policies and programs. Academic institutions have the ability to fill knowledge gaps and push us toward new frontiers. As we move forward, we will continue to see these institutions as partners and resources that can help CARB look for ways to accelerate and introduce actions to reduce GHG emissions and remove and store carbon.

As such, it will be important to maintain and enhance relationships with academic institutions, including community colleges. Community colleges are more likely to have a large proportion of first generation students or students that come from low-income communities or communities of color. The perspective of this diverse student body will be critical to inform discussions on climate change damages and mitigation efforts. This student body is also a future workforce, and courses to teach the skills for a sustainable economy are a chance to close historical opportunity gaps. Importantly, many of the students at community colleges are local residents and community members. This engagement provides another way to invest in communities across our state. The Foundation for California Community Colleges is already leading the way through innovate programs such as their Good Jobs Challenge - California Resilient Careers in Forestry.[538] These types of programs could be replicated across other sectors. CARB will evaluate how to leverage the requirements in AB 680 on workforce development in the California Climate Investments programs with the work at the Foundation for California Community Colleges.

As noted in Chapter 1, public and private partnerships will be important as we move forward in the great energy transition. But the private sector is also important in the context of research and development and deployment. Many of these companies have the resources and expertise to build and produce the clean technology and energy we will need. It was through the efforts of several private companies (Bell, Exxon, Telecom

Australia) that the photovoltaic solar panels in use today were developed.[539] Similarly, it was companies such as General Electric and Texas Instruments that contributed to the development of hydrogen fuel cells.[540] This Scoping Plan includes the known and emerging clean technologies and fuels available today. The private sector spirit of invention, improvement, and innovation must continue to deliver new tools in the fight against climate change.

Individuals

This Scoping Plan not only projects ambitious availability of clean technology and energy, but also includes aggressive assumptions about consumer adoption of ZEVs, heat pumps, and other energy efficiency practices, among others. When it comes to climate change mitigation, the sum of the parts matters. Only when we add up the impacts of the choices we make do we understand the true impact on GHG emissions. Today, many Californians have opportunities to choose between driving a car, taking a bus, biking, or walking. Many can choose to install a heat pump or buy an electric cooktop. Together, we can increase these opportunities and pick the future we want. We can start or transform businesses that create clean jobs, innovate new technologies, or introduce new systems. We can engage with fellow workers to support durable paths for labor in a clean economy. And we can choose to engage with our community, tribes, and our governments to advocate for change, call out challenges, and propose solutions. Our choices will help determine California's climate future. Down one path is a future of climate impacts that will continue to worsen and further increase disparities across communities. Down the other is a future that avoids the worst impacts of climate change, improves air quality—especially for the most burdened communities—and fosters new economic and job opportunities to support a sustainable economy.

Importantly, we must acknowledge that historical decisions have resulted in health and opportunity gaps for residents in low-income communities and communities of color. Not everyone has the resources or access to make these choices—to buy a ZEV, install a heat pump, or use public transit to get to work. It is here that government can help. Government, at multiple levels, can fund programs and structure policies to provide consumers with more choice and to support them in adopting cleaner technology options. Whether through affordable energy rates or assistance in purchasing zero emission vehicles and appliances, we can use the transition to a carbon neutral economy as an opportunity to close some of these persisting opportunity gaps. By acting now, we can

LEG 2024-0023

Re: Sacramento Municipal Utility District's Comments on the Proposed Amendments to the Low Carbon Fuel Standard

The Sacramento Municipal Utility District (SMUD) appreciates the opportunity to provide comments on the California Air Resources Board's (CARB or Board) proposed amendments to the Low Carbon Fuel Standard (LCFS), issued on December 19, 2023 (Proposed Amendments). Transportation electrification is a key component in achieving the goals of SMUD's 2030 Zero Carbon Plan and the state's carbon neutrality goals, and the LCFS serves as a critical policy tool to complement and support SMUD and others in the effort to eliminate emissions from the transportation sector.

While SMUD is overall supportive of the Proposed Amendments, SMUD files these comments to recommend several areas where additional clarification or revision is needed. SMUD's comments on the Proposed Amendments cover the following:

291.1 1. The Proposed Amendments represent a significant improvement and address many needed revisions to the LCFS regulations.

291.2 2. CARB should clarify that the equity holdback requirements for local publicly owned utilities (POUs) will remain at 50% of total holdback credit proceeds.

3. The Proposed Amendments introduce several new and amended equity
291.3 holdback project categories that, with minor clarifications, will allow investment in needed programs and projects.

4. CARB should clarify the intent for removing the equity holdback project
291.4 category for multilingual marketing, education, and outreach (ME&O). SMUD supports retaining a more focused version of this category that would enable targeted outreach to underserved communities.

5. While some verification of transaction data and calculations may be necessary,
291.5 CARB should remove the site visit requirement for all covered electrical chargers or, if retained, clarify the Less Intensive Verification option.

Beyond these comments, SMUD also supports comments submitted by
291.6 the California Municipal Utilities Association (CMUA) and the California Electric Transportation Coalition (CalETC), both filed on February 20.

1. The Proposed Amendments represent a significant improvement and address many needed revisions to the LCFS regulations.

291.1 cont. SMUD commends CARB staff for their collaborative approach to updating the LCFS
regulation and believes that the Proposed Amendments represent a significant
291.7 improvement and clarification of the LCFS. Increasing the stringency of the program
to 18.75% in 2025 and to 30% by 2030, at minimum, is a necessary step to support
a healthy market for LCFS credits. Likewise, the implementation of the auto-
291.8 acceleration mechanism will help to ensure technology advancements that lower the
carbon intensity of fuels do not result in an oversupply of LCFS credits. These
necessary market improvements will help drive investments in electric mobility
options, charging infrastructure and programs necessary to reach the state's
decarbonization goals. SMUD supports CARB's efforts and supports consideration
of further increases in stringency.

291.9 SMUD strongly supports the Proposed Amendments continuing the allocation of
base credits to electric distribution utilities (EDUs) to develop and administer projects
and programs that advance transportation electrification (TE). POUs are well
positioned to design and implement programs that meet the needs of the
communities they serve. SMUD also appreciates CARB's efforts to clarify and
291.10 expand examples of holdback and equity holdback project categories, even where
we recommend further clarification below.

291.11 SMUD further appreciates CARB's recognition that there is a growing need to
support the market and infrastructure for medium- and heavy-duty (MHD) electric
vehicles (EVs); refocusing the California Clean Fuel Rewards (CCFR) program is an
appropriate change. Additionally, right-sizing EDU contributions to the CCFR
291.12 program will both ensure that the statewide program is appropriately scaled to the
smaller MHD market, as well as enable EDUs to devote more funding toward
holdback programs focused on transportation electrification.

291.2 cont. **2. CARB should clarify that the equity holdback requirements for local POUs will remain at 50% of total holdback credit proceeds.**

CARB should revise the Proposed Amendments to clarify that the equity holdback requirement for POUs remains at 50% of total holdback credit proceeds. The text of the Proposed Amendments changes the equity holdback credit requirements for all electric distribution utilities and does not distinguish between investor-owned utilities (IOUs) or POUs.[1] However, CARB's supporting documents indicate that these changes were necessary in order to align CARB's equity contribution requirements with similar requirements from the California Public Utilities Commission (CPUC);

[1] 94583(c)(1)(A)5.a. (all references to regulatory sections are to the Proposed Amendments, unless otherwise noted).

291.2 cont. such requirements apply only to IOUs.[2] Further, Appendix E specifically notes that the "holdback equity requirement for Publicly Owned Utilities would remain at 50%."[3] Since this revision was merely intended to align CARB and CPUC requirements, the regulatory language in Section 94583 should be updated to reflect this intent.

In addition, for many POUs like SMUD, LCFS is the primary source of funding for transportation electrification programs. There remains a significant need for investment in transportation electrification programs and infrastructure in communities across our region. When coupled with the increase in holdback credits, maintaining the 50% spending requirement will allow SMUD to accelerate its investments in projects benefiting equity communities while continuing to offer our critically needed portfolio of transportation electrification programs.

Furthermore, POUs should a have somewhat greater flexibility in how to spend holdback credit proceeds. First, POUs are not-for-profit entities that are ultimately responsible to their communities. This structure requires POUs to prioritize community needs and often means that POUs are best positioned to develop programs and direct investments to the areas of greatest need. Additionally, POUs come in different sizes but are generally much smaller than IOUs. As a result, there is significant variation between POUs regarding the demographics, income levels, and unique challenges facing their local community. If POUs had to devote a substantially higher percentage of their holdback proceeds to a limited set of projects, this would impair POUs' ability to put proceeds toward their best use in each POU service area. SMUD appreciates that CARB staff recognized this need and requests that CARB update the regulatory text consistent with this understanding. SMUD supports CalETC's proposed revisions to Section 95483(c)(1)(A)5.a.

291.3 cont.

3. **The Proposed Amendments introduce several new and amended equity holdback project categories that, with minor clarifications, will allow investment in needed programs and projects.**

The Proposed Amendments provide a revised list of qualified equity holdback projects, which overall demonstrates a substantial improvement. Several new and important categories were included and will allow EDU investment in high-impact programs. However, there are project categories that require some clarification and revision in order to enable utilization. These categories include: investments in electric and clean mobility solutions, re-skilling and workforce development, investments in grid-side distribution infrastructure for MHD EV charging, and the explicit inclusion of panel upgrades for low-income residential customers.

[2] See *Staff Report: Initial Statement of Reasons* (December 19, 2023) at 36, 67 (hereinafter "Staff Report"); *Appendix E: Purpose and Rationale of Proposed Amendments for the Low Carbon Fuel Standard Requirements* at 14, 15 (hereinafter "Appendix E").
[3] Appendix E at 15.

291.3 cont. *A. There are two categories addressing electric mobility that may be clarified by substituting with a single encompassing category.*

The Proposed Amendments include an existing equity project category focused on electric mobility solutions, and introduce a new, similar category focused on public transit and other clean mobility solutions:

> iii. Investment in electric mobility solutions, such as EV sharing and ride hailing programs.
>
> …
>
> v. Promoting use and additional incentives for use of public transit and other clean mobility solutions, via charging equipment or infrastructure for the following categories:
>
> > I. EV sharing and ride hailing programs,
> >
> > II. Electrification of public transit and school buses, including battery swap programs, and
> >
> > III. Use or ownership of neighborhood electric vehicles, eBikes, eScooters, eMotorcycles, and other micromobility solutions.[4]

These are important categories to include in the equity holdback project list and SMUD appreciates their inclusion in the Proposed Amendments. SMUD's work with local community-based organizations (CBOs), local agencies, and residents has revealed that there is substantial need for a variety of electric mobility solutions within many equity communities.

SMUD coordinated with three other local agencies[5] in the development of the Sacramento Area Zero Emission Vehicle (ZEV) Deployment Strategy (Strategy).[6] The Strategy is a regional approach to improving air quality, reducing greenhouse gas emissions, and promoting efficient mobility. Equity is a key component of each of the four program areas, which include electrifying the public transit fleet, eMobility hubs, MHD charging plazas, and training a clean energy workforce. Each of the Strategy's program areas have a clear nexus with project categories included on CARB's proposed equity holdback project list.

---

[4] 94583(c)(1)(A)5.a.

[5] Coordinating entities included Sacramento Regional Transit, the Sacramento Metropolitan Air Quality Management District, and the Sacramento Council of Governments.

[6] The Sacramento Area ZEV Deployment Strategy is accessible at: https://www.sacog.org/planning/transportation/transit-strategies/zero-emissions-vehicle-planning.

291.3 cont. Particularly relevant for this equity project category, the Strategy is planning for 600 transit buses with zero emission fuels and five strategically located charging facilities throughout the region. Additionally, the Strategy identifies the need for 27 eMobility hubs within Sacramento County and an additional 25 hubs throughout the region. These eMobility hubs will provide shared electric cars, battery storage, and microgrid capabilities. A necessary part of this effort is SMUD's Sustainable Communities program that leads engagement efforts in coordination with CBOs and residents to understand priorities for under resourced communities regarding electric mobility access and associated charging.

SMUD commends CARB's inclusion of the new eMobility project category, but requests clarification about how the existing and proposed categories should be understood. First, both categories include "EV sharing and ride hailing programs." This introduces confusion regarding whether these categories overlap or are aimed at different programs and projects. Second, Section 94583(c)(1)(A)5.a.v. could be read to limit investments to only charging equipment or infrastructure for subcategories I. through III. SMUD opposes this apparent limit, if intended, because it is unnecessarily restrictive. Investments in public transit and eMobility solutions involve many expenses, particularly in under resourced communities, beyond just charging and infrastructure. For example, eMobility hubs include the development and identification of suitable locations, community outreach, coordination with other local agencies and CBOs, designing tools to make the hubs useful to residents, staffing and technical assistance for users of the hubs, and often incentives towards the purchase of mobility solutions. Conversely, if it was not intended as a limit, it is unclear how to reconcile the language limiting spending to charging and infrastructure with language in the subcategories referring to ownership of micromobility solutions (e.g., "use or ownership of neighborhood electric vehicles…"). Since these current categories lead to confusion over scope and application, SMUD supports CalETC's proposed revision, which both combines and simplifies these project categories.

CalETC's proposed amendment is as follows:

~~iii. Investment in electric mobility solutions, such as EV sharing and ride hailing programs.~~

v. Investing in, or promoting the ~~Promoting~~ use of, ~~and additional incentives foruse of~~ public transit and other clean mobility solutions~~, via~~ ~~charging equipment or infrastructure for the following categories~~ such as:

I. EV sharing and ride hailing programs,

II. Electrification of public transit and school buses, including battery swapprograms, and

III. Use or ownership of neighborhood electric vehicles, 291.3 cont. eBikes, eScooters, eMotorcycles, and other micromobility solutions.

IV. Charging equipment or infrastructure for any of the above.

291.13 *B. The addition of a re-skilling and workforce development equity holdback category is a significant improvement, with minor clarifications needed.*

Section 94583(c)(1)(A)5.a.vi. provides the following:

vi. Re-skilling and workforce development for transportation electrification and electric vehicle infrastructure applications, developed in coordination with the California Workforce Development Board or local workforce development agencies.[7]

SMUD appreciates the inclusion of this proposed subsection, which promises more streamlined investment of equity holdback proceeds in re-skilling and workforce development programs. Under the existing regulations, SMUD received Executive Officer approval for a workforce development program, but the process took over a year. The inclusion of this category will remove this additional administrative hurdle and help to promote development of these programs.

CARB should broaden the scope of entities that EDUs are permitted to coordinate with in order to make these investments. The ZEV Deployment Strategy specifically acknowledges the need to partner with other key entities, including educational institutions, trade organizations, CBOs, and others.[8] Additionally, SMUD's EO approved program was developed in coordination with local CBOs but was not developed in coordination with state or local workforce development agencies. SMUD understands that this project is consistent with the intent of this new proposed equity project category.

SMUD continues developing plans and strategies for TE workforce development focused on its local community. SMUD is uniquely positioned to address these workforce needs given its coordination on the ZEV Deployment Strategy, ongoing experience with workforce development, and knowledge of EV charging needs and infrastructure within its service area. Requiring EDUs to specifically coordinate with state or local workforce development agencies, which may or may not be familiar with TE needs, is largely unnecessary and may slow development of these programs.

SMUD supports CalETC's proposal that provides more flexibility for coordinating entities:

---

[7] 94583(c)(1)(A)5.a.vi.
[8] See ZEV Deployment Strategy at footnote 6.

291.13 cont. vi. Re-skilling and workforce development for transportation electrification and electric vehicle infrastructure applications, developed in coordination with the California Workforce Development Board, ~~or~~ local workforce development agencies, a community-based organization, a California Community College, or a workforce strategy adopted by the Board of a POU.

291.14 *C. SMUD supports the inclusion of MHD EV charging infrastructure investments, and requests that CARB clarify that these investments are not geographically restricted.*

SMUD appreciates the inclusion of the MHD EV charging infrastructure category in the equity holdback project list.[9] Inclusion of this category will enable investment in this needed and costly infrastructure and is complementary to the shift of the statewide CFR program to incentivize MHD EV purchases. In 2022, SMUD conducted a study on the impact of MHD charging on SMUD's distribution system. Based on this study and ongoing analysis, SMUD estimates that, through 2041, SMUD would need to invest between hundreds of millions to over a billion dollars in grid upgrades, depending on the role of managed charging, in order to support growth in light, medium, and heavy-duty EVs in our region. LCFS funding can play a critical role in readying the grid for widespread MHD vehicle charging while mitigating the impacts of these investments on ratepayers.

CARB should clarify that MHD EV charging infrastructure benefits equity communities regardless of the location of these projects. Many equity projects implicitly contain a locational requirement in that they must primarily benefit or serve equity communities.[10] Such a restriction for MHD EV infrastructure would significantly limit the number of locations where these investments could be made, and investments may be needed in areas that do not overlap with equity communities. Instead, CARB should clarify that MHD EV infrastructure investments will primarily benefit and serve equity communities regardless of location or proximity to such communities, since equity communities often bear a disproportionate share of pollution associated with major transportation corridors. Since MHD EV infrastructure projects will help to reduce emissions within these corridors, the location of these projects within or near equity communities should not be required.

291.15 *D. SMUD supports the explicit inclusion of residential panel and service upgrades in the equity holdback project list.*

Proposed Section 94583(c)(1)(A)5.a.iv. permits rebates and incentives for low-income individuals to obtain an EV and for installing EV charging infrastructure

[9] 94583(c)(1)(A)5.a.vii.
[10] See 94583(c)(1)(A)5.a.

291.15 cont. in residences. SMUD appreciates the retention of this equity holdback project category, but requests that CARB specifically list panel and service upgrades as permitted expenses. While this category allows “installing EV charging infrastructure in residences”, it could be read narrowly to only permit installation of EV chargers or more broadly to permit upgrades for all needed electrical improvements to enable EV charging. Specifically including panel and service upgrades in this category will provide more confidence that these types of investments are consistent with CARB’s intent.

291.4 cont. **4. CARB should clarify the intent for removing the equity holdback project category for multilingual marketing, education, and outreach. SMUD supports retaining a more focused version of this category that would enable targeted outreach to underserved communities.**

SMUD is concerned by the elimination of the multilingual ME&O equity project category. The Proposed Amendments fully eliminate the multilingual ME&O category, but no justification was provided in the Staff Report. Appendix E does address the multilingual ME&O category but merely states that “[s]taff is also proposing the removal of holdback credit proceeds for Marketing, Education, & Outreach for electric vehicles.”[11]

First, CARB should clarify the statement in Appendix E. While the change in the proposed regulatory text appears limited to eliminating the multilingual ME&O category, Appendix E could be read to prevent investments in ME&O from non-equity holdback credit proceeds as well as project-specific ME&O for equity holdback projects. CARB should clarify that both non-equity holdback ME&O spending and project-specific ME&O associated with equity projects are still permitted.

Further, equity-focused education and outreach projects provide substantial value that should be recognized in the equity project list. SMUD regularly conducts direct community outreach events specifically targeted at underserved communities. These events are different from general marketing or broad-based advertising campaigns and allow customers to directly ask questions, experience EV operation, and understand EV benefits. SMUD has also used equity funding to support needs assessments, conducted in partnership with CBOs, and other pre-project work, like community listening sessions and neighborhood canvasing in under-resourced communities.[12] This targeted work must be done to facilitate programs and projects that fit the needs of specific communities because needs vary throughout SMUD’s service area. Eliminating such pre-project work risks less informed and under-utilized equity projects.

[11] Appendix E at 15.
[12] See e.g., ZEV Deployment Strategy at footnote 6.

291.4 cont. SMUD encourages CARB to clarify that EDUs are still permitted to spend equity proceeds on project-specific ME&O expenses and utilize non-equity holdback credit proceeds on ME&O more generally. Additionally, SMUD urges CARB to reconsider full elimination of the multilingual ME&O category and revise this category to preserve direct customer outreach and education to identify and tailor programs to successfully meet community needs.

SMUD supports CalETC's proposed revision to the multilingual ME&O category:

v. Multilingual ~~marketing, education, and outreach~~ community education events located within communities listed in 95483(c)(1)(A) designed to increase awareness and adoption of EVs and clean mobility options, and outreach in coordination with community-based organizations, including but not limited to neighborhood canvassing, community listening sessions, and needs assessments, focused in communities listed in 95483(c)(1)(A) to inform the development of projects and programs tailored to community needs. ~~including information about: the environmental, economic, and health benefits of EV transportation; basic maintenance and charging of EVs; electric rates designed to encourage EV use; and local, state, and federal incentives available for purchase of EVs.~~ Education and outreach do not include general marketing or advertising campaigns.

291.5 cont. **5. While some verification of transaction data and calculations may be necessary, CARB should remove the site visit requirement for all covered electrical chargers or, if retained, clarify the Less Intensive Verification option.**

Section 95500(c)(1)(E)1. introduces a new verification requirement applicable to metered residential and non-residential EV charging but exempting nonmetered residential EV charging.[13] SMUD agrees with CARB staff[14] that the growth in the number of LCFS credits generated by EV charging justifies additional assurance that data and calculations reported to CARB are accurate. However, electricity transactions are substantially different from other fuel pathway types, and due to this difference, CARB should consider a different level and scope of verification for these transactions.

As currently drafted, the Proposed Amendments would require site visits to all covered electric charger facilities, only excluding non-metered residential EV

[13] See 95500(c)(1)(E)1. (specifically exempting EV charging under 95491(d)(3)(A), which includes "Non-Metered Residential EV Charging"; 95491(d)(3)(B) covers metered residential charging, and subsection (C) covers non-residential EV charging).
[14] Appendix E at 117-118 (explaining that the data assurance needs have increased due to the growth and projected growth of transportation electrification).

291.5 cont. charging but still including all metered residential and non-residential EV charging.[15] While there may be benefit in performing desktop reviews of electricity transaction data and calculations, CARB should not require verification bodies to perform site visits for EV charging sites. First, site visits would likely only verify the existence of the equipment, which is already accomplished when chargers are submitted to CARB for fuel supply equipment (FSE) registrations. These site visits would at best only confirm the accuracy of the charging equipment and would not provide data regarding charger reliability, inventory, or utilization, which are beyond the current scope of the LCFS program. Since EV charging equipment is standardized and charging data can be collected without a site visit, it is unclear what benefit would be provided from conducting these site visits. Second, these sites vary in size, some include few chargers per site, and many are dispersed throughout broad service areas. The impracticality of annually visiting each covered charger facility throughout the state may be exacerbated if there is an insufficient number of third-party verifiers to conduct site visits. This potentially constrained supply of verifiers and the numerous (and growing) number of chargers is likely to lead to substantial costs. Additionally, accessing covered sites may be particularly difficult since the Proposed Amendments require site visits for any metered residential EV charging and many non-residential charging sites are located on private property.[16] Third, this increased cost may hinder the ability of utilities and others receiving EV charging credits to scale EV charging deployment and solutions. Recognizing the pace and scale of the need for EV charging, CARB should acknowledge that increased costs may disincentivize deployment. SMUD encourages CARB to remove site visit requirements for electricity transactions listed in Section 95500(c)(1)(E)1. since this requirement will not provide meaningful improvement for data accuracy for the LCFS program, may have several practical implementation challenges, and may substantially increase costs that will hinder deployment.

If CARB chooses not to remove the site visit requirements, CARB should clarify the "Less Intensive Verification" requirements.[17] The Proposed Amendments state that fuel reporting entities "only reporting electricity transactions" identified in 95500(c)(1)(E) are eligible for the Less Intensive Verification.[18] Section 95500(c)(1)(E)1. specifically exempts nonmetered residential EV charging from the definition. This would seemingly make all EDUs receiving credits associated with nonmetered residential EV charging (i.e., base credits) ineligible for Less Intensive Verification, since these entities would be reporting electricity transactions not covered by that section. Additionally, as written, fuel reporting entities receiving credits from sources other than EV charging, despite these other sources also being separately subject to verification, would be ineligible for Less Intensive Verification

[15] See 95501 (stating that "services must meet the following requirements"), 95501(b) (stating "[v]erification services must include, but are not limited to, the following:"), 95501(b)(3) (requiring site visits).
[16] See footnote 13 (explaining that only non-metered residential EV charging is exempted under 95500(c)(1)(E)1.).
[17] 95501(h).
[18] *Id.*

291.5 cont. for the portion of their data associated with verification of their electricity transactions. For example, a fuel reporting entity reporting hydrogen fuel cell vehicle fueling[19] that also reported covered electricity transactions would seemingly be completely ineligible for Less Intensive Verification, despite these hydrogen transactions requiring separate verification. Instead, CARB should clarify that fuel reporting entities are eligible for the Less Intensive Verification for any verification required by 95500(c)(1)(E) and this verification option is only available for electricity-based transactions, but reporting other transaction types does not revoke eligibility.

Finally, if CARB chooses not to remove site visit requirements entirely, CARB should consider providing clearer guidelines on when site visits may be required for electricity transactions. Currently, the Proposed Amendments give the verification body the discretion to conduct site visits where "deemed necessary" to achieve reasonable assurance.[20] Vesting this discretion with the verification body may create an incentive to conduct site visits where unnecessary or call into question the fairness and objectivity of verification results, given the Less Intensive Verification section does not provide any meaningful review or standards for making this determination.

6. Conclusion

Thank you for the opportunity to provide feedback on the Proposed Amendments. SMUD looks forward to working with CARB and stakeholders to develop proposed regulatory changes that strengthen the LCFS regulation and promote widespread transportation electrification.

Honorable Chair Liane Randolph and Honorable Board Members
Low Carbon Fuel Standard Program
California Air Resources Board
1001 I St., Sacramento, CA 95814

Sent via email to LCFSworkshop@arb.ca.gov

Re: Proposed Low Carbon Fuel Standard Amendments

Chair Randolph and Members of the Board:

EVgo appreciates the opportunity to comment on the California Air Resources Board's (CARB) amendments to the Low Carbon Fuel Standard (LCFS) proposed in the agency's Initial Statement of Reasons (ISOR). Headquartered in Los Angeles, EVgo is one of the nation's largest public fast charging providers for electric vehicles (EVs) with a mission to expedite the mass adoption of EVs by creating a convenient, reliable, and affordable EV charging network that delivers fast charging to all drivers.

The LCFS is one of California's most effective decarbonization tools. It supports critical investments in EV charging infrastructure needed to meet Advanced Clean Cars (ACC) II and other CARB zero-emission vehicle (ZEV) regulations. Unlike other California policies that incentivize EV charger deployment through one-time capex support, the LCFS provides critical ongoing support for EV charger operations, including maintenance, in a manner that enhances the EV charging experience for all drivers.

It is imperative that CARB strengthen the LCFS in this rulemaking to further accelerate ZEV adoption and drive investment in clean fuels. EVgo appreciates the measures CARB has proposed to raise the ambition of the program and recommends CARB take additional action to ensure that the LCFS continues to bolster the deployment of EV charging across the state, as summarized below:

292.1
1. EVgo supports the increased stringency of the annual carbon intensity (CI) targets and the introduction of the auto-acceleration mechanism (AAM) to deliver more greenhouse gas (GHG) emissions reductions in line with state climate goals.

292.2
2. CARB can reduce the risk of excess credits and support greater GHG emissions reductions through an increase in the stringency of the 2025 CI step down by at least seven percentage points.

292.3 3. CARB can support greater GHG emissions reductions by allowing the AAM to be triggered in 2026 with an effective date in 2027.

292.4 4. CARB can strengthen the light-duty fast charging infrastructure (FCI) credit provisions to support the deployment of public fast charging infrastructure necessary to meet state climate and equity goals.

292.5 5. CARB should consider overlapping existing California Department of Food and Agriculture (CDFA) Division of Measurement Standards (DMS) weights & measures regulations before the adoption of new verification requirements for electric fuels in the LCFS.

292.1 cont. **1. EVgo supports the increased stringency of the annual CI targets and the introduction of the AAM to deliver more GHG emissions reductions in line with state climate goals.**

EVgo directionally supports the more ambitious near-term annual CI targets proposed in the ISOR, including the revised 30% CI target in 2030. As CARB plainly stated in its November 2022 Workshop preceding this rulemaking, the LCFS is overperforming.[1] Increasing the stringency of near-term CI targets is one important step CARB can take to improve the health of the program and account for the current pace of low carbon fuel adoption.

Additionally, EVgo supports the adoption of the AAM to reduce the risk that the LCFS will continue to overperform in future years. The AAM will ensure that the program continues to send a clear investment signal to low carbon fuel providers and ensure that the LCFS accommodates unforeseen advances in the decarbonization of California's transportation fuel pool. Furthermore, the AAM can set a helpful precedent for other jurisdictions seeking to adopt and implement successful clean fuel standards that support climate, air quality, and economic development goals.

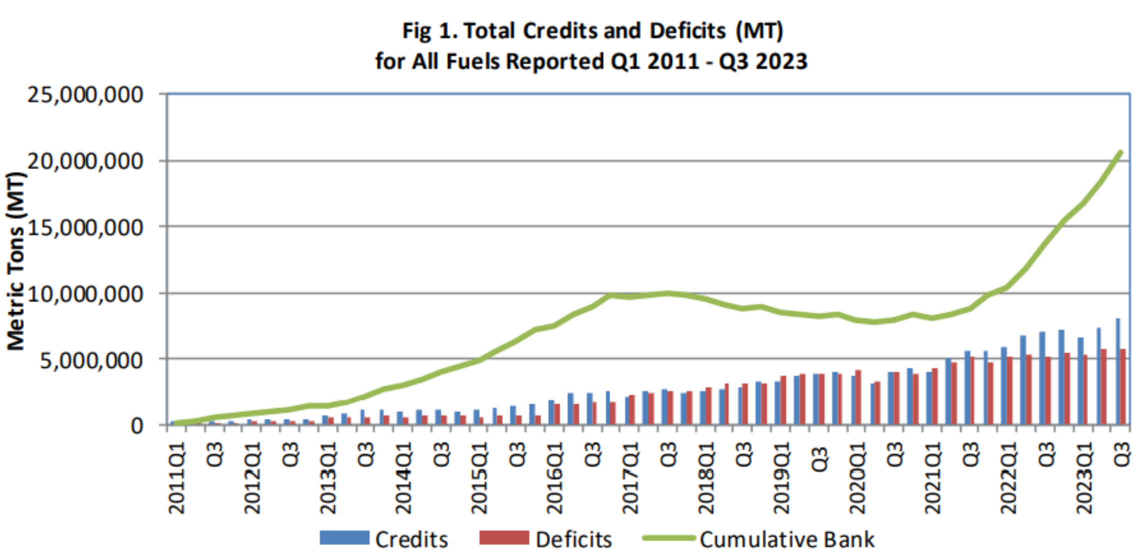
292.2 cont. **2. CARB can reduce the risk of excess credits and support greater GHG emissions reductions through an increase in the stringency of the 2025 CI step down by at least seven percentage points.**

While EVgo directionally supports the 2025 CI step down as a critical measure to stabilize the LCFS credit market, EVgo asserts that CARB can feasibly support a more ambitious step down of at least seven percentage points – leading to a 2025 CI target of at least 20.75% below base year CI target.[2]

[1] https://ww2.arb.ca.gov/sites/default/files/2022-11/LCFSPresentation.pdf
[2] Sheehy and Yan, *Analyzing Future Low Carbon Fuel Targets in California*, released February 2024, available at: https://static1.squarespace.com/static/5b57ab49f407b4a7ffa44ffa/t/65cd3c74d1a72f445cdc7a7e/1707949173143/ICFReport2024.pdf

The ISOR clearly demonstrates that production of low carbon fuels has far exceeded CARB's estimates in 2018 when the current annual CI targets were established.[3] CARB's most recent quarterly data summary for Q3 2023 illustrates that the LCFS credit bank exceeded 20 million credits for the first time – growing unabated as decarbonization of California's transportation fuel pool outpaces the ambition of the program.[4] Increasing the stringency of near-term CI targets is vital for correcting program overperformance and providing greater stability to the credit bank.

Moreover, CARB has revised the baseline CI value for ultra low sulfur diesel (ULSD) upward from 100.45 gCO2e/MJ to 105.76 gCO2e/MJ in Appendix A-1 of the Proposed Regulation Order (PRO).[5] This adjustment would partially offset the benefit of CARB's proposed five percent CI step down in 2025 by lowering the stringency of the program and increasing the risk that the credit bank continues to grow – primarily from credits generated by renewable diesel. If CARB proposes to make this adjustment to the baseline ULSD CI value, raising the ambition of the 2025 CI step-down by at least seven percentage points will help avoid the risk of sustained overperformance and better align with California's climate policy objectives.



[3] ISOR at 22-23.

[5] https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2024/lcfs2024/lcfs_appa1.pdf

292.3 cont. **3. CARB can support greater GHG emissions reductions by allowing the AAM to be triggered in 2026 with an effective date in 2027.**

EVgo asserts that CARB can further support the ambition of California's decarbonization goals by allowing the AAM to be triggered in 2026 with a potential earliest effective date in 2027 as opposed to the currently proposed 2027 trigger year and effective date in 2028. CARB has taken care to develop a transparent, easily understandable mechanism to address one of the central challenges of the LCFS today and into the foreseeable future: "market overperformance."[6] It is not apparent why CARB would purposefully delay the implementation of this conditional market mechanism at a time when the LCFS credit bank continues to reach unprecedented levels and when the transportation sector remains the largest contributor to California GHG and criteria pollutant emissions. Allowing the AAM to trigger earlier will support more ambitious, achievable, and near-term emissions reductions and send a clear market signal to invest further in clean fuels.

292.4 cont. **4. CARB can strengthen the light-duty FCI credit provisions to support the deployment of public fast charging infrastructure necessary to meet state climate and equity goals.**

While EVgo appreciates several of the amendments made to strengthen the light-duty FCI provisions in the LCFS, including the minimum 150 kW charger capacity requirement and a revised FCI cap formula, EVgo respectfully encourages CARB to modify the proposed FCI provisions to ensure they are aligned with the trajectory of California's EV goals. As noted by Earthjustice[7], the Natural Resources Defense Council[8], CalETC and the Electric Vehicle Charging Association[9], and CARB itself[10], it is imperative that the LCFS support California's climate policy goals by supporting the adoption zero-emission vehicles wherever feasible. The light-duty passenger vehicle market is one sector that is primed for rapid growth in coming years driven by ACC II requirements, and EVgo provides the following recommendations to ensure FCI continues to play a complementary role in EV market development:

292.6 a. *Preserve the existing pool of light-duty FCI credits at 2.5% of prior quarter deficits starting in 2026 instead of reducing the available pool of credits to 0.5% of prior quarter deficits.* Updated modeling from California Energy Commission's (CEC) AB 2127 state EV

charger demand assessment plainly demonstrates that substantial near-term deployment of direct current fast charging (DCFC) infrastructure is needed to support 2030 charging needs established by ACC II.[11] The benefits of FCI are not limited disadvantaged, low-income, or rural communities: given that California needs over 37,000 fast chargers across the state by 2030 to meet ACC II goals, EV charging developers seek to deploy charging ahead of demand and may rely on short-term FCI credits when charger utilization at a site is initially low.

FCI credits are also critically important for supporting ongoing operating costs for fast chargers that enhance reliability and customers' charging experience. With charging experience issues gaining traction as a state[12] and national[13] priority necessary for bolstering consumer confidence in EV adoption, now is not the time to pull back on this critical source of funding for ongoing O&M costs.[14] Regrettably, reducing the size of the available FCI credit pool may ultimately deter investment in DCFC infrastructure where expected charger utilization may not be sufficiently robust – including low-income, disadvantaged, and rural communities.

292.7 b. *Adopt the U.S. Treasury Department (TD) and Internal Revenue Service (IRS) definition of "non-urban census tracts" to establish LD-FCI eligibility for public DCFC sites in rural California communities in lieu of the current 10-mile threshold definition proposed by Staff.* In January 2024, TD and IRS released guidance on charging station location requirements to be eligible for the 30C alternative fuel vehicle refueling property credit, which was amended in the Inflation Reduction Act to encourage greater EV charging infrastructure deployment in rural and low-income communities.[15] Maps were also released to clearly illustrate which rural areas would be eligible for the 30C tax credit resulting from this guidance through 2030.[16] While California has clear definitions for disadvantaged and low-income communities that can readily be used to determine FCI eligibility, CARB Staff's proposal to define rural eligibility as 10 miles from the nearest public DCFC[17] is arbitrary and challenging to implement because charging developers are

constantly adding new chargers across the state. To improve clarity, provide stability, align with federal policy guidance, and encourage greater investment in public DCFC outside of California's major metro areas, EVgo recommends that CARB replace the proposed rural eligibility criteria with TD and IRS's definition of non-urban census tracts.

292.8 c. *Expand the size of eligible FCI sites beyond four chargers and 1,000 kW nameplate capacity to align with guidance from the National Electric Vehicle Infrastructure (NEVI) program minimum standards, California state agency activities, EV market trends, and an enhanced customer experience.* CARB Staff proposed limiting FCI eligibility to up to four chargers per site and a nameplate capacity of no greater than 1,000 kW to provide FCI to more charging stations across the state.[18] EVgo appreciates the intent of these policy provisions but asserts that limiting eligible FCI per site to four chargers and 1,000 kW is misaligned with federal, state, and market guidance. CARB references NEVI program minimum standards when justifying its proposal to increase minimum charger nameplate capacity eligibility to 150 kW[19], and the NEVI guidance also plainly specifies that four ports and 150 kW charging is the *minimum* required for NEVI-eligible stations – not the maximum. CEC and Caltrans have incorporated this guidance into their first round NEVI solicitation, which encourages applicants to build charging stations well in excess of the four-port minimum on key corridors such as I-5 and I-15.[20]

Finally, larger sites are critical to an enhanced customer experience and will be increasingly so as EV penetration continues. The growth in EV sales necessitates larger sites with faster, more convenient charging; smaller sites are more likely to lead to queuing, or customers needing to wait in line – contrary to state goals for an enhanced customer experience. It is not uncommon for new public DCFC sites to include more six or more DCFC stalls, exceeding a cumulative 1,000 kW nameplate capacity as part of network providers' ongoing efforts to elevate the customer experience. It is vital that CARB consider EV drivers' charging experience when establishing FCI guidelines and EVgo recommends that CARB remove the FCI charger limit per site and preserve the existing 2,500 kW cap on FCI-eligible DCFC sites.[21]

292.5 cont. **5. CARB should consider overlapping CDFA DMS weights & measures regulations before the adoption of new verification requirements for electric fuels in the LCFS.**

CARB has proposed to require third-party verification for reporting of electricity from EV charging, including non-residential charging. EVgo supports timely, accurate reporting of fuel

292.5 cont. transactions to maintain the integrity of the LCFS. However, CARB's proposed regulations appear to duplicate existing CDFA DMS regulations[22] that require EV chargers to meet stringent accuracy tolerances and require county weights & measures offices to regularly test EV charging equipment.

Specifically, DMS adopted regulations in January 2020 that require commercially available EV chargers to meet stringent accuracy standards – as well as other consumer protection requirements – which conform to the National Institute of Standards and Technology Handbook 44 technical standards for charging equipment.[23] These requirements, which include a +/- 5% maintenance tolerance for DC electricity as vehicle fuel, are aligned with CARB's proposed §95491.2(a)(1)(B) which would require all meters to achieve accuracy levels of +/- 5%.[24] Furthermore, many county weights & measures officials are beginning to enforce compliance with these regulations by testing EV chargers in the field; if a charger is not performing within the accuracy tolerances prescribed by DMS regulation, counties can require a charger to enter maintenance until the charger's accuracy tolerance is corrected.[25] Finally, EV charging providers already support continued implementation and enforcement of weights & measures regulations by paying annual device registration fees to counties where the devices are in operation.[26] In sum, EVgo respectfully encourages CARB to consider these existing CDFA regulations before establishing new, overlapping verification requirements for EV chargers in the LCFS.

Conclusion

EVgo commends CARB's ZEV leadership and its continued refinement of the LCFS in confronting California's most pressing transportation decarbonization challenges. The LCFS is one of California's signature climate policies, and CARB is well-positioned to strengthen the ambition of the program while ensuring that it remains aligned with the agency's core ZEV regulations and CEC's charging infrastructure goals. EVgo looks forward to continued engagement on these topics and further development of a robust, convenient, and reliable EV charging network that benefits all Californians.

Rajinder Sahota
Deputy Executive Officer
California Air Resources Board
1001 I Street
Sacramento, CA 95814

Re: Low Carbon Fuel Standard Updates

Dear Deputy Executive Officer Sahota,

On behalf of the Bay Area Council and our partners, we respectful request the California Air Resources Board (CARB) consider specif actions in the Low Carbon Fuel Standard (LCFS) update to advance the production of Sustainable Aviation Fuels (SAF) in furtherance of California's 2045 climate goals. Specifically, we ask that CAR cap carbon intensity ratings for new Sustainable Aviation Fuel (SAF) production facilities; provide equal access expansion of boo and claim accounting to SAF; leverage LCFS provisions to realize additional SAF air quality benefits beyond GhG emissions; and tha CARB reconsider its proposal to regulate fossil jet fuel for intrastate flights.

The CARB 2022 Scoping Plan establishes the goal of using SAF to meet 80 percent of all aviation fuel demand by 2045, up from less than one percent today. Meeting this ambitious goal will require unprecedented investments in new infrastructure and the processin of many thousands of tons of feedstock. SAF refineries are large infrastructure projects requiring substantial financing, and the inclusion of CARB's renewable fuel refinery CI performance thresholds in commercial contracts is an increasingly important tool for making these projects pencil. Models used for the generation of price support mechanisms such as the Low Carbon Fue Standard (LCFS) credit and the Blenders Tax Credit (BTC) rely on as a key metric for credit valuation and generation. However, und current rules, CARB may change the official CI for SAF projects a any time, undermining the value of the BTC and the LCFS credit th underpins project feasibility. This uncertainty acts as a disincentive to investors and is an obstacle to achieving the state's SAF production goals and broader emissions targets.

To address this challenge, CARB should consider opening a 10-year window during which time SAF refinery projects would be allowed tc keep, for a period of 20 years, the CI determination made by CARB using the GREET methodology at the time of the project's Final Investment Decision (FID). To ensure the baseline CI determined at FID is continuously met, producers should agree to re-testing on a regular bi-annual cadence. By better aligning CI incentives with asset lifespans, CARB would provide the predictability necessary for securing the large-scale financing needed to jump-start this important new industry.

We commend CARB's current policy supporting book and claim accounting for low-CI electricity and RNG inputs for low-CI hydrogen production, as well as their initiative to expand access through power purchase agreements (PPAs). Nevertheless, we advocat for equal access expansion to Sustainable Aviation Fuel (SAF). Bot low-CI hydrogen and SAF play pivotal roles in displacing hard-to-electrify

sectors like aviation, as outlined in the 2022 CARB Scoping Plan. However, existing LCFS rules tend to disadvantage SAF in compariso to hydrogen due to limited access to emissions reductions from process energy, such as low-CI electricity and RNG. This incongruity undermines state objectives for SAF uptake and aviatic decarbonization, necessitating CARB's intervention to ensure equitable treatment between these future fuels.

Furthermore, we underscore the critical importance of encouraging the long-term adoption of SAF by leveraging LCFS provisions to realize additional air quality and climate benefits. Notably, whil light and medium/heavy-duty transportation are expected to electrify within decades, aviation's transition to decarbonizatior will be more prolonged, with SAF anticipated as the primary lever CARB must recognize and account for the substantial positive externalities associated with SAF substitution for fossil jet fuel and devise mechanisms within the LCFS to drive SAF adoption. Additionally, considerations such as the air quality benefits of SAF, particularly in reducing fine particulate matter, must be addressed. Equally significant are the environmental justice concerns raised by communities living near airports, urging CARB's support for SAF as a means to mitigate the disproportionate health impacts of fossil jet fuel combustion. It is only through actual SAF adoption that these air quality benefits might be realized. Given these multifaceted benefits unique to SAF, we urge CARB to prioritize its utilization and explore innovative measures, such a credit multipliers or CO2 equivalent metrics, to appropriately incentivize its adoption and address its distinctive contributions to climate mitigation.

In addition, The Bay Area Council also expresses serious concern with a new proposal by the California Air Resources Board (CARB) t regulate "fossil jet fuel used for intrastate flights" as an obligated fuel under the LCFS Program. We do not believe this proposed change would result in increased SAF production, availability, or use in California, but it would lead to higher je fuel prices. The primary barrier to increased SAF production and availability in California remains the higher cost of SAF for producers and buyers relative to conventional jet fuel and renewable diesel. The CARB proposal would not address this fundamental challenge or otherwise meaningfully increase SAF suppl or use. Instead, the Bay Area Council suggests CARB consider alternative incentive structures that can help close the price gap between SAF and Conventional Jet-A, alongside SAF-specific economi development programs and investments via GoBiz as previously encouraged by SB1383 and the SAF Coalition.

Additionally, the intra-state flight proposal seeks to regulate je fuel and reduce emissions from aviation, both of which are pre-empted under federal law - a fact that CARB recognized when it exempted jet fuel in 2018. Aviation has unique demands for reliability and consistency with approved fuel specifications for the safe operation and maintenance of aircraft. Accordingly, while the EPA is the primary federal regulator for on-highway, non-road, and marine fuels, under 42 U.S.C. § 7545, the FAA has authority to establish standards for composition and chemical or physical properties of jet fuel or to eliminate aircraft emissions (49 U.S.C. § 44714). The FAA retains federal jurisdiction over suc fuels even if used for intrastate flights. These statutory authorities establish clear and broad federal authority for regulating jet fuel and aircraft engine emissions that pre-empts California from regulating fossil jet fuel under the LCFS program We ask that CARB reconsider this aspect of the proposed regulatior and maintain the exemption for jet fuel from regulation under the

LCFS program.

The Bay Area Council represents 350 of the Bay Area's largest employers across all sectors of the economy. For many of these companies, air travel represents the vast majority of Scope 3 emissions. Unlike other sectors, aviation has no realistic net-zer alternative over the next 20 years, making state efforts to scale SAF all the more important. By better aligning current incentives with asset life cycles, California can become a world leader in SA production and come that much closer to achieving its broader climate goals. We stand ready to offer any assistance necessary to transform these goals into a tangible reality.

Thank you for your leadership, and for considering our views.

Sincerely,

Adrian Covert

Re: Low Carbon Fuel Standard Updates

Dear Deputy Executive Officer Sahota,

On behalf of the Bay Area Council and our partners, we respectfully request the California Air Resources Board (CARB) consider specific actions in the Low Carbon Fuel Standard (LCFS) update to advance the production of Sustainable Aviation Fuels (SAF) in furtherance of California's 2045 climate goals. Specifically, we ask that CARB cap carbon intensity ratings for new Sustainable Aviation Fuel (SAF) production facilities; provide equal access expansion of book and claim accounting to SAF; leverage LCFS provisions to realize additional SAF air quality benefits beyond GhG emissions; and that CARB reconsider its proposal to regulate fossil jet fuel for intrastate flights.

The CARB 2022 Scoping Plan establishes the goal of using SAF to meet 80 percent of all aviation fuel demand by 2045, up from less than one percent today. Meeting this ambitious goal will require unprecedented investments in new infrastructure and the processing of many thousands of tons of feedstock. SAF refineries are large infrastructure projects requiring substantial financing, and the inclusion of CARB's renewable fuel refinery CI performance thresholds in commercial contracts is an increasingly important tool for making these projects pencil. Models used for the generation of price support mechanisms such as the Low Carbon Fuel Standard (LCFS) credit and the Blenders Tax Credit (BTC) rely on CI as a key metric for credit valuation and generation. However, under current rules, CARB may change the official CI for SAF projects at any time, undermining the value of the BTC and the LCFS credit that underpins project feasibility. This uncertainty acts as a disincentive to investors and is an obstacle to achieving the state’s SAF production goals and broader emissions targets.

To address this challenge, CARB should consider opening a 10-year window during which time SAF
293.1 refinery projects would be allowed to keep, for a period of 20 years, the CI determination made by CARB using the GREET methodology at the time of the project's Final Investment Decision (FID). To ensure the baseline CI determined at FID is continuously met, producers should agree to re-testing on a regular bi-annual cadence. By better aligning CI incentives with asset lifespans, CARB would provide the predictability necessary for securing the large-scale financing needed to jump-start this important new industry.

We commend CARB's current policy supporting book and claim accounting for low-CI electricity and RNG inputs for low-CI hydrogen production, as well as their initiative to expand access through power purchase agreements (PPAs). Nevertheless, we advocate for equal access expansion to Sustainable Aviation Fuel (SAF). Both low-CI hydrogen and SAF play pivotal roles in displacing hard-to-electrify

sectors like aviation, as outlined in the 2022 CARB Scoping Plan. However, existing LCFS rules tend to
293.2 disadvantage SAF in comparison to hydrogen due to limited access to emissions reductions from process
energy, such as low-CI electricity and RNG. This incongruity undermines state objectives for SAF uptake
and aviation decarbonization, necessitating CARB's intervention to ensure equitable treatment between
these future fuels.

Furthermore, we underscore the critical importance of encouraging the long-term adoption of SAF by
leveraging LCFS provisions to realize additional air quality and climate benefits. Notably, while light and
medium/heavy-duty transportation are expected to electrify within decades, aviation's transition to
decarbonization will be more prolonged, with SAF anticipated as the primary lever. CARB must
recognize and account for the substantial positive externalities associated with SAF substitution for fossil
jet fuel and devise mechanisms within the LCFS to drive SAF adoption. Additionally, considerations such
as the air quality benefits of SAF, particularly in reducing fine particulate matter, must be addressed.
Equally significant are the environmental justice concerns raised by communities living near airports,
urging CARB's support for SAF as a means to mitigate the disproportionate health impacts of fossil jet
fuel combustion. It is only through actual SAF adoption that these air quality benefits might be realized.
Given these multifaceted benefits unique to SAF, we urge CARB to prioritize its utilization and explore
293.3 innovative measures, such as credit multipliers or CO2 equivalent metrics, to appropriately incentivize its
adoption and address its distinctive contributions to climate mitigation.

In addition, The Bay Area Council also expresses serious concern with a new proposal by the California
Air Resources Board (CARB) to regulate "fossil jet fuel used for intrastate flights" as an obligated fuel
293.4 under the LCFS Program. We do not believe this proposed change would result in increased SAF
production, availability, or use in California, but it would lead to higher jet fuel prices. The primary
barrier to increased SAF production and availability in California remains the higher cost of SAF for
producers and buyers relative to conventional jet fuel and renewable diesel. The CARB proposal would
not address this fundamental challenge or otherwise meaningfully increase SAF supply or use. Instead,
the Bay Area Council suggests CARB consider alternative incentive structures that can help close the
293.3 price gap between SAF and Conventional Jet-A, alongside SAF-specific economic development programs
and investments via GoBiz as previously encouraged by SB1383 and the SAF Coalition.

Additionally, the intra-state flight proposal seeks to regulate jet fuel and reduce emissions from aviation,
both of which are pre-empted under federal law - a fact that CARB recognized when it exempted jet fuel
in 2018. Aviation has unique demands for reliability and consistency with approved fuel specifications for
the safe operation and maintenance of aircraft. Accordingly, while the EPA is the primary federal
regulator for on-highway, non-road, and marine fuels, under 42 U.S.C. § 7545, the FAA has the authority
to establish standards for composition and chemical or physical properties of jet fuel or to eliminate
aircraft emissions (49 U.S.C. § 44714). The FAA retains federal jurisdiction over such fuels even if used
for intrastate flights. These statutory authorities establish clear and broad federal authority for regulating
jet fuel and aircraft engine emissions that pre-empts California from regulating fossil jet fuel under the
293.4 LCFS program. We ask that CARB reconsider this aspect of the proposed regulation and maintain the
exemption for jet fuel from regulation under the LCFS program.

The Bay Area Council represents 350 of the Bay Area's largest employers across all sectors of the economy. For many of these companies, air travel represents the vast majority of Scope 3 emissions. Unlike other sectors, aviation has no realistic net-zero alternative over the next 20 years, making state efforts to scale SAF all the more important. By better aligning current incentives with asset life cycles, California can become a world leader in SAF production and come that much closer to achieving its broader climate goals. We stand ready to offer any assistance necessary to transform these goals into a tangible reality.

Thank you for your leadership, and for considering our views.

Sincerely,

RE: Proposed 2024 Low Carbon Fuel Standard Amendments

Dear California Air Resources Board,

Thank you for the opportunity to provide input regarding the 2024 California Low Carbon Fuel Standard (LCFS) Amendments. RMI is a global non-profit organization that focuses on deep decarbonization of the world's most polluting sectors, leading sustainability programs across four geographies: the U.S., India, China, and the Global South. RMI has a 40-year history of advancing low and zero-carbon transportation solutions and transforming global power systems to support modern, low-carbon economies.

These comments will address the proposed rules on page 149 of Appendix A-1, in section 95488.8(i)(1) that focus on the applicability of book-and-claim accounting for low-carbon intensity (CI) electricity for hydrogen production. As the proposed rules stand, hydrogen that is used as a feedstock in the production of e-fuels would not be eligible to use book-and-claim accounting to certify its CI score under California's LCFS. This will limit such projects to relying on on-site, "behind the meter" clean electricity to certify their CI score; as grid electricity used to make hydrogen without the option of a well-regulated book-and-claim option will not result in clean hydrogen. E-fuels, including sustainable aviation fuel, maritime fuels such as methanol or ammonia, and renewable diesel, are made using low-emission hydrogen and biogenic or atmospheric CO_2 sourced from carbon dioxide removal facilities.

294.1 Limiting the end uses for hydrogen that is produced using grid-connected electrolysis would limit the amount of hydrogen produced in California, impede effective decarbonization of heavy transportation, and undermine the state's decarbonization goals as stated in the 2022 Scoping Plan.

We urge CARB to continue to allow book-and-claim accounting of low-CI electricity in the production of hydrogen feedstock for low-carbon transportation fuels. Below we have outlined why the current proposed rulemaking would be counter to the stated goals of the LCFS and the 2022 Scoping Plan.

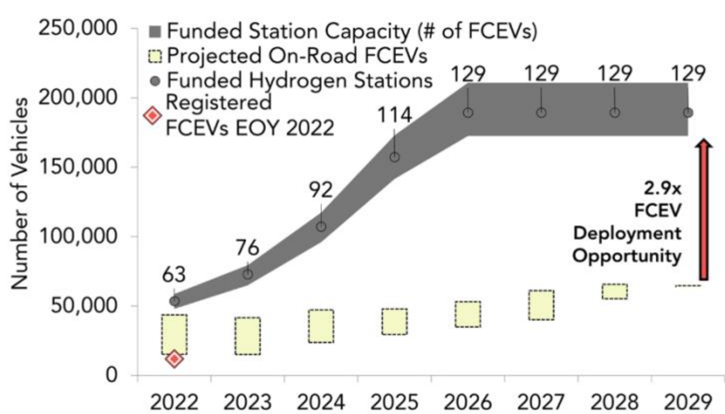
294.1 cont. **1. Hydrogen has the greatest decarbonization potential in sectors that are difficult or uneconomic to electrify. For transportation, this often means being used as a feedstock in e-fuels.**

Hydrogen can be used to directly power fuel cell electric vehicles (FCEVs) but RMI analysis shows that direct electrification of light duty vehicles results in 0.41 kg CO_2e/kWh *more* reduction than using zero emissions hydrogen. As such, hydrogen should be directed to transportation end uses that cannot be electrified, like aviation, maritime fuel, and even diesel replacement in some long-haul trucking routes. For these applications, hydrogen will be most commonly used to produce e-fuels rather than as a direct fuel in a FCEV.

In many cases, hydrogen's highest and best use for decarbonization is as a feedstock into these fuels, rather than as a direct fuel itself. E-fuels should therefore benefit from book-and-claim accounting option in the same way that hydrogen as a direct fuel does.

2. Light-duty FCEVs are not a large enough offtake market for the planned amount of electrolytic hydrogen production in California.

FIGURE 22: COMPARISON OF PROJECTED VEHICLE DEPLOYMENT AND NETWORK RATED CAPACITY



Source: California Air Resources Board, Annual Evaluation of Fuel Cell Electric Vehicle Deployment

In addition to not being the most effective end use for hydrogen as a decarbonization tool, FCEVs alone will not generate enough demand to offtake hydrogen produced in California. According to CARB's 2023 Annual Evaluation of Fuel Cell Electric Vehicle Deployment, just under 13,000 FCEVs are currently on the roads (making up 1.1% of all zero emission cars in California). In the same report, CARB estimated that "the projected hydrogen fueling network capacity growth is expected to stay well ahead of demand through the end of the decade. By 2029, the statewide hydrogen fueling network will have rated capacity at full availability sufficient for nearly three times the number of expected FCEVs on the road." In

294.1 cont. an analysis that used the network capacity at recent levels of availability (as opposed to rated capacity) station capacity would still be at least double the projected demand.

It is clear that light-duty FCEVs will not constitute a large enough offtake sector to support electrolytic hydrogen plans in California. Allowing electrolytic hydrogen used as a feedstock to use book-and-claim electricity would afford hydrogen producers flexibility in finding offtakers while still benefiting from LCFS and decarbonizing priority offtake sectors.

3. **The proposed addition of intrastate jet fuel to the LCFS will require access to hydrogen as a feedstock for sustainable aviation fuel.**

In the Proposed 2024 LCFS Amendments, CARB suggests eliminating the exemption for intrastate fossil jet fuel. We applaud this expansion of the program and suggested it as a lesson for other LCFS states to learn from in a recent policy memo. However, adding restrictions to electrolytic hydrogen as a feedstock in the same rulemaking is counterproductive to this action.

While most sustainable aviation fuel (SAF) that is currently on the California market is made from lipids and biofeedstocks, it is unlikely that this pathway will be able to scale to meet the sector's low carbon fuel needs. SAF made from biofeedstocks faces steep competition for those feedstocks (e.g. corn and soy) from other biofuels, biogenic carbon removal, bioenergy, and other end uses. Additionally, the scaling of these crop-based fuels comes with its own problems, including inefficient land use, increased food prices, and the undermining of the sustainability of the eventual fuel. In part due to these problems, SAF made from biofeedstocks is only expected to reach a global high of 8.9 billion gallons by mid-century, contributing to slightly less than 10% of the global aviation fuels market at that time. It is increasingly clear that biogenic SAF will not be able to scale to the level needed to meet decarbonization goal.

At the same time, the technology required for battery electric or hydrogen fuel cell-powered aircraft is still more than a decade away. Current battery densities for flight are less than 200 Wh/kg — acceptable for short haul flights but inefficient for longer hauls. Long haul electrification would require densities in excess of 350 Wh/kg, which may not be available until 2040. Hydrogen fuel cell technologies face similar challenges.

This leaves hydrogen-derived SAF as the best option for aviation decarbonization right now. Hydrogen-derived SAF is an emerging fuel, but the technology is well-understood and will be scalable as feedstock supply chains mature. It is imperative that SAF producers can access low-CI hydrogen--specifically electrolytic hydrogen that does not depend on biofeedstocks--to create the fuel necessary to participate in LCFS.

294.1 cont. **4. This rule will reduce IRA dollars flowing into the state.**

The Inflation Reduction Act (IRA) offers multiple credits that will support the production of hydrogen and hydrogen-derived fuels; by limiting the eligible offtakers for grid-connected electrolytic hydrogen, this proposed rule will likely reduce the amount of hydrogen produced and therefore the amount of federal funding that California companies can unlock through the 45V tax credit and other federal funding opportunities. 45V is a tech-neutral credit which evaluates all production pathways with the same set of emissions standards, including grid-connected and behind the meter electrolytic hydrogen, and non-electrolytic hydrogen that meets CI requirements. Furthermore, there has been intense debate and research into how grid connected electrolytic hydrogen may certify its CI score to qualify for 45V. We believe that CARB should align its book-and-claim system (for all hydrogen, regardless of its end use) to the federal standards. In this way it can reduce regulatory strain on California companies and draw tax credits to the state.

By limiting the production of hydrogen-based SAF, this rule will also reduce the amount of 40B/45Z credits for the production of SAF that California companies may pursue. All together, this could severely limit the growing hydrogen and SAF industries as well as industries up and down their supply chains.

We urge the Air Resources Board to reconsider this small but consequential element of the proposed 2024 amendments to the Low Carbon Fuel Standard. To accomplish its decarbonization goals and to successfully support the growing hydrogen industry, the LCFS must allow book-and-claim accounting of low-CI electricity supplied for hydrogen production through electrolysis for use in production of a transportation fuel.

Sincerely,

Kyle Clark-Sutton
Manager, US Program

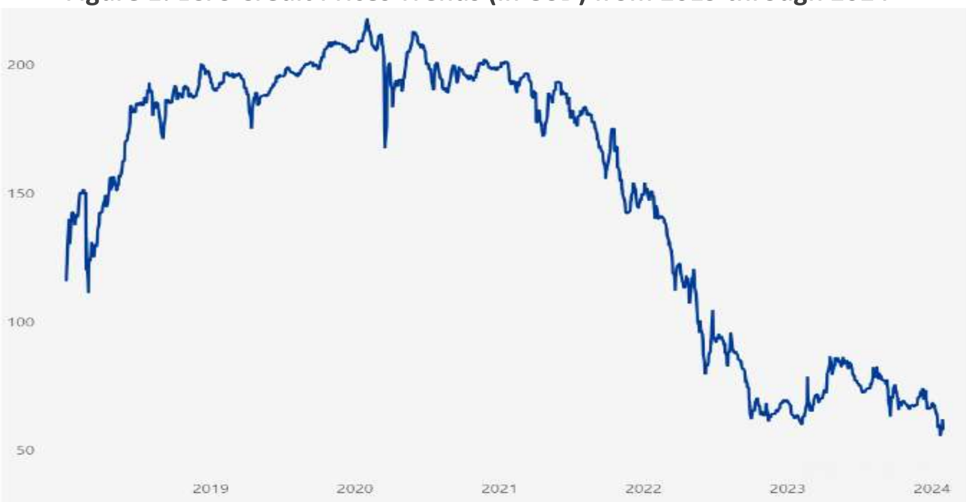
Re: Neste Comments on Proposed Low Carbon Fuel Standard (LCFS) Regulation Published on December 19, 2023

Dear Ms. Sahota:

Neste appreciates the opportunity to provide these comments to the California Air Resources Board (CARB) regarding the proposed LCFS regulation published on December 19, 2023. Neste is the world's largest producer of renewable diesel (RD) and sustainable aviation fuel (SAF), over 90% of which are produced from waste and residues. During the past ten years, Neste's transformation journey has taken it from a local oil refiner to a global leader in renewable and circular solutions. Neste's goal is to achieve carbon neutral production by 2035 and supply California with products that will enable the state to be carbon neutral by 2045. We are in the business of combating climate change by producing effective climate solutions, and our vision is to create a healthier planet for our children.

295.1 Neste believes that finalizing this rulemaking quickly is the highest priority. The LCFS credit market continues to be unstable due to the record amount of renewable energy generating significantly more credits than are required to offset deficits created by the currently outdated CI targets. As shown below in Figure 1, the LCFS credit prices continue to go down because the CI reduction goals are not strict enough, and delays in this rulemaking have made the problem worse. The market had expected CARB to complete this rulemaking to be complete in late 2023, but it only officially started in January 2024. Thus, the instability of the credit market continues to get worse as shown in Figure 1 and it will take that much longer to recover. This continued uncertainty about credit prices makes it difficult for the industry to make its investment decisions and thus essential emissions reductions are on pause. Other LCFS programs, such as Oregon's Clean Fuels Program, have essential program upgrades on pause as well because most believed California's LCFS rulemaking would be complete by now. We urge CARB to prioritize this rulemaking and ensure it is completed by **2nd quarter 2024**.

Figure 1: LCFS Credit Prices Trends (in USD) from 2019 through 2024



February 20, 2024

Neste recommends the following as part of the LCFS rulemaking:

295.1 reference
- Ensure the regulatory updates go into effect in 2024 to avoid further unrealized emissions reductions due to overperformance of the credit market;

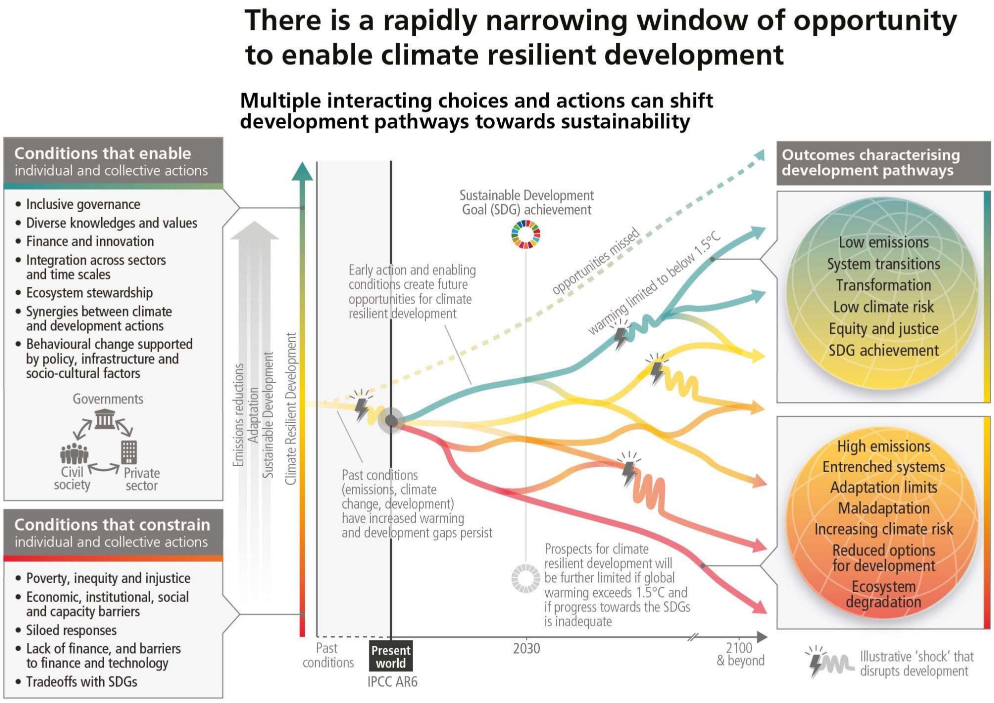
295.2
- Apply an immediate CI step-down of **12%** (and not the proposed 5%) in 2025 to adequately address the large credit bank and to account for the adjustment to the fossil diesel baseline that effectively cancels out the proposed 5% step down for diesel;

295.3
- Start applying the CI Automatic Acceleration Mechanism (AAM) proposed by CARB in 2026 (using 2025 data) and not wait until 2027 to address overperformance in the LCFS credit market should it persist;

295.4
- Avoid an arbitrary cap on feedstocks used to produce renewable diesel and SAF. Such a cap will have the unintended consequences of extending dependence on fossil fuels, exacerbating air quality challenges, and compromising the ability to decarbonize the aviation and maritime sectors.

It is very important that CARB pursue the most aggressive carbon intensity (CI) reduction goals. The IPCC has stated in 2023 that, "There is a rapidly closing window of opportunity to secure a liveable and sustainable future for all (very high confidence);" and, "The choices and actions implemented in this decade will have impacts now and for thousands of years (high confidence)" as shown in Figure 2 below[1]. The time for action is **now**, and the future of our planet is counting on CARB's leadership to address climate change. Modeling work being conducted by the Low Carbon Fuels Coalition (LCFC) shows that CARB can be
295.1 referenced aggressive without jeopardizing the stability of the LCFS. As such, we recommend that CARB pursue aggressive action on this rulemaking, as any hesitance will only favor fossil fuels and delay emission reductions.

Figure 2: IPCC Data on Rapidly Narrowing Window to Address Climate Change



Neste is proud of being an early supplier of renewable diesel in California. We started selling renewable diesel in the state in 2012 when many questioned the viability of the LCFS program, and are glad to see that over **6.5 billion** (with a "b") gallons of fossil diesel have been displaced with renewable diesel over the life of the LCFS program. That is more than twice the diesel California consumes in one year. This equates to

[1] https://www.ipcc.ch/report/ar6/syr/downloads/report/IPCC_AR6_SYR_SPM.pdf , pg 25

about 45 million metric tons of GHG emissions reduced by renewable diesel, the equivalent of what 15 or so large refineries emit in one year. This was all possible due to the leadership CARB showed when it enacted the LCFS program, and Neste encourages CARB to demonstrate that same leadership today to continue setting ambitious carbon reduction goals.

Neste congratulates CARB for creating effective policies and market signals that have resulted in the California diesel market becoming **61%** renewable as of 3rd quarter 2023. What is more impressive is that consumers saw a drop in diesel prices during more recent increases in renewable diesel consumption, showing that phasing out fossil fuels can actually protect the consumer. As noted by CARB staff in the LCFS Rulemaking Standardized Regulatory Impact Assessment (SRIA)[2] and Initial Statement of Reasons (ISOR)[3] stronger action in the LCFS rulemaking can speed up the phaseout of fossil fuels and result in billions of dollars worth of health benefits to Californians.

With this rulemaking, CARB has an opportunity to implement Governor Newsom's July 2022 directive[4] to speed the transition away from petroleum and CARB can do so by maximizing the stringency of the LCFS regulation. Hesitation to be ambitious at this point will only delay critical progress toward meeting the state's carbon emission goals. Neste urges CARB to make every effort to maximize the carbon reductions that will occur under this LCFS rulemaking. Our planet and our children are counting on your leadership.

Below is a summary of some key benefits of the California LCFS to the California consumer as well as detailed discussion of policy recommendations for the Proposed LCFS Regulation. Neste also supports the comments from the Low Carbon Fuels Coalition and ICF on this rulemaking. We appreciate your consideration.

Overview of the Benefits of the California LCFS Program

The LCFS Continues to Drive Use of Renewable Energy While Protecting California Consumers

Per the US Department of Energy Alternative Fuels Data Center,[5] renewable diesel is now competitive in price with conventional diesel in California. This is largely due to the incentives and stable renewable fuels market created by the California LCFS program, and Neste agrees with CARB that, "LCFS credit prices have not shown any historical correlation with retail gasoline prices" (See page 83 of the ISOR). In other words, there is no data showing that the LCFS is directly contributing to price spikes at the fuel pumps and studies have shown there is no such correlation[6]. In fact, CARB estimates that consumers will see an annual savings of **$20 billion** in lower transportation costs in 2045 when compared to 2021 costs, and all from using alternative fuels (See page 82 of the ISOR).

The price of petroleum crude, however, continues to be the main driver for spikes in the diesel and gasoline markets, and California consumers will continue to be impacted by these spikes as long as California continues to depend on fossil fuels. As shown below in Figures 3 and 4, diesel and gasoline prices (orange lines) follow the price of crude (black lines) and consumers saw price spikes when crude prices peaked. On the other hand, there are no obvious diesel or gasoline price increases (orange lines) due to increases in renewable fuels blending or LCFS credit prices (area/pillars in gold). The LCFS program provides the certainty needed to establish thriving renewable fuels markets, while protecting consumers at the pump.

---

February 20, 2024

Figure 3: Price Trends of US Crude, Diesel and RD Share of CA Diesel

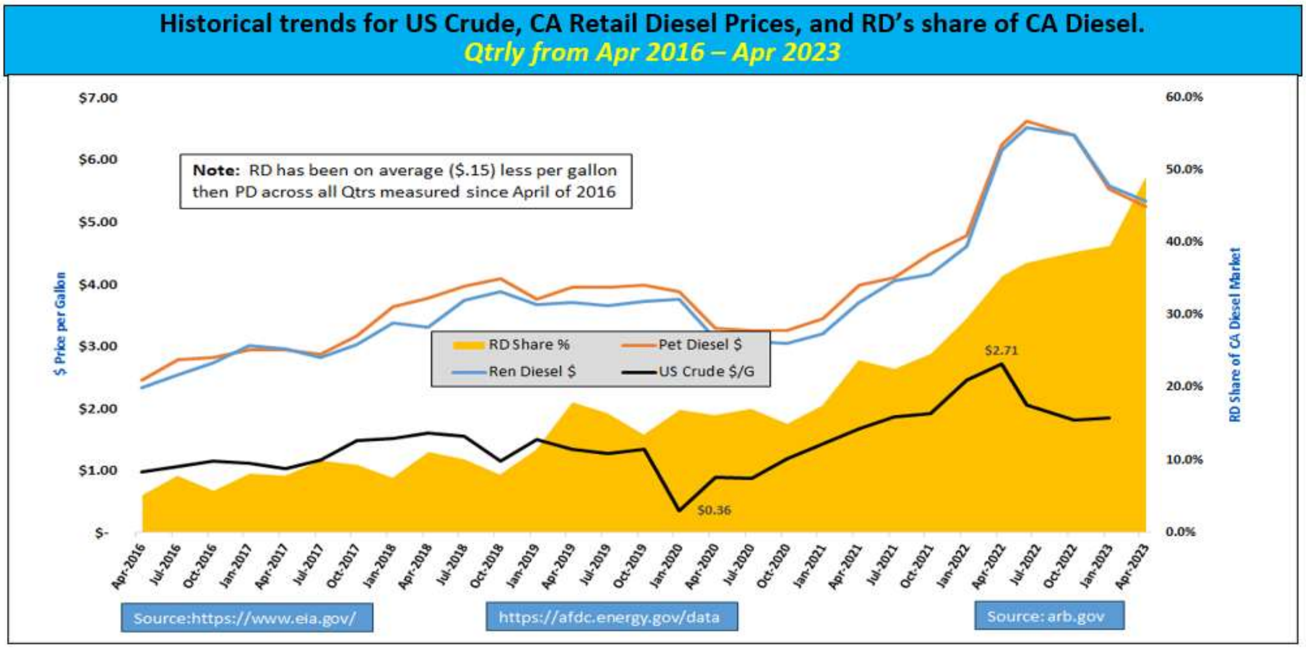

Figure 4: Price Trends of US Crude, Gasoline, Ethanol and California LCFS Credits

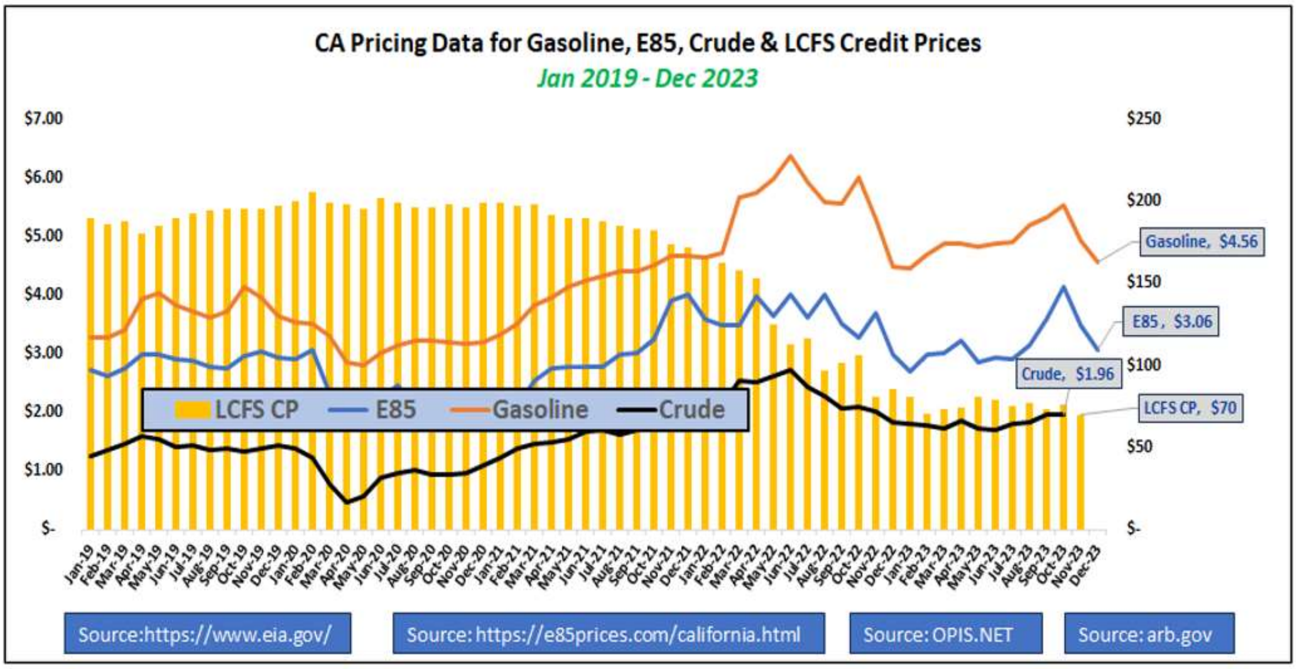
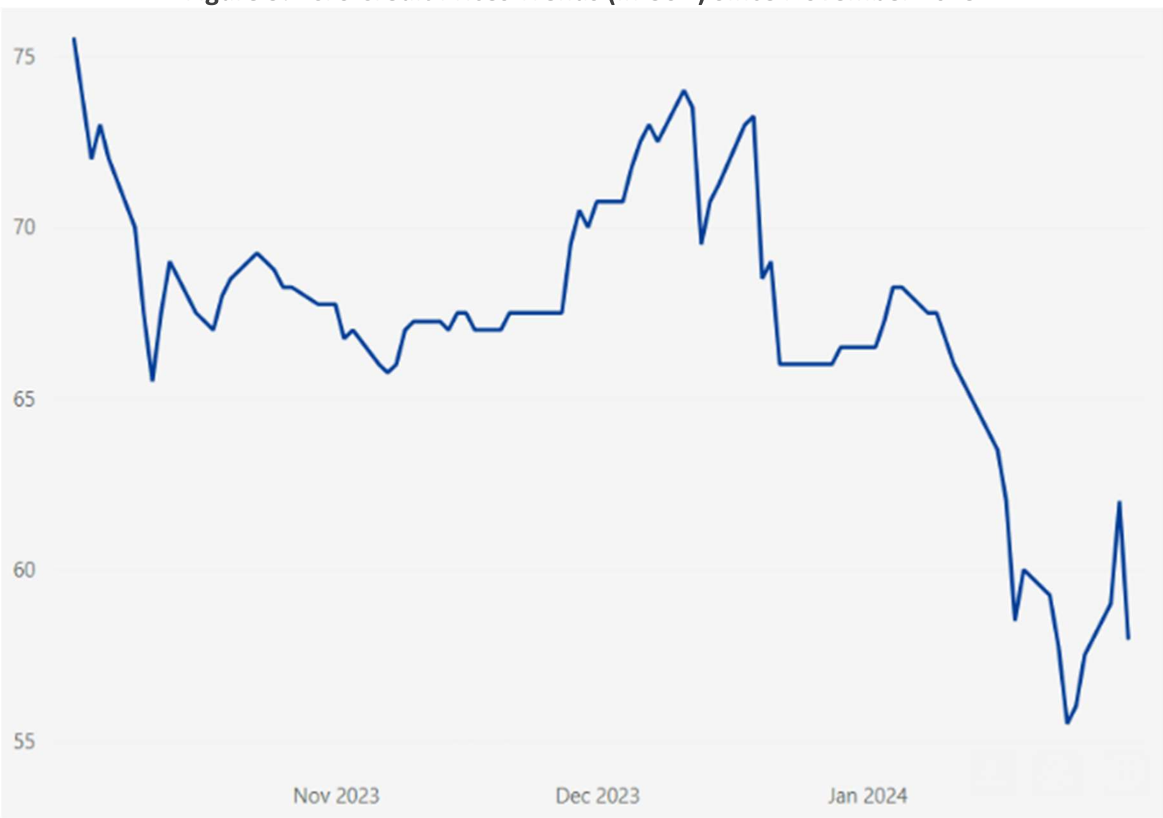


The LCFS Continues to Drive Economic Growth in California

One of the major successes of the California LCFS program is the billions of dollars invested in the state to meet the renewable fuels demand created by the LCFS program. Per Bloomberg, renewable energy is the fastest growing business in the state, and has greatly contributed to the GDP growth in California[7]. It in fact helped California surpass Germany as the 4th largest economy in the world. The LCFS is not only advancing the state's climate goals, it is generating economic growth, job creation and tax revenue growth that is helping drive the California economy. As seen in Figure 5 below, LCFS credit prices continue to tumble since the proposed LCFS regulation was published in December 2023, signaling that the market likely believes that CARB can be more aggressive in this rulemaking. This further makes the case for CARB to take aggressive action by updating the LCFS incentives for renewable fuels so that California remains the center of renewable fuels investments in the nation.

Figure 5: LCFS Credit Prices Trends (in USD) Since November 2023



Per the 2022 Scoping Plan, the "LCFS is a key driver of market development for renewable diesel and its coproducts. While the federal renewable fuel standard (RFS) and blenders tax credit also benefit producers, an analysis of their respective contributions to market development, and interviews with industry representatives and independent experts, point to LCFS as a more important factor in market development, at least in recent years" (see page 38 of the 2022 Scoping Plan)[8]. The ISOR for this rulemaking similarly states on page 7 that, "Private investments, policy signals such as a more stringent LCFS, and federal incentives will all need to be leveraged to realize the outcomes in the 2022 Scoping Plan Update". On Page 53 the ISOR states "Cumulatively, from 2024 through 2046, the proposed amendments are estimated to increase total revenue for credit generating businesses as compared to the baseline scenario by **$149**

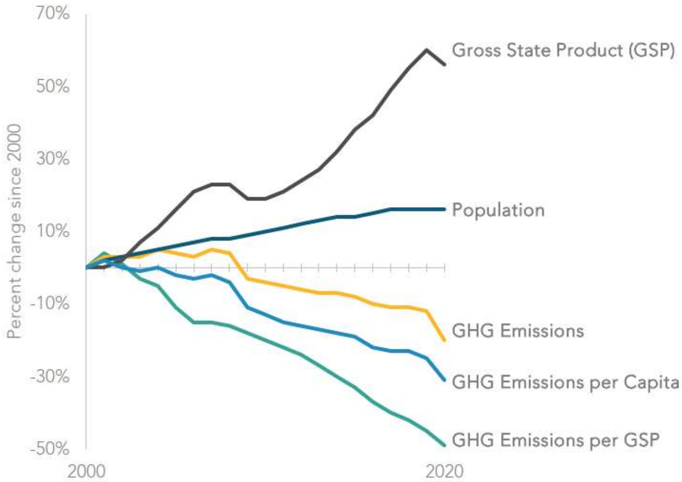
[7] https://www.bloomberg.com/opinion/articles/2022-10-24/california-poised-to-overtake-germany-as-world-s-no-4-economy

[8] https://ww2.arb.ca.gov/sites/default/files/2023-04/2022-sp.pdf

billion, of which approximately $128 billion is estimated to accrue to California businesses." In other words, the LCFS rulemaking is expected to drive significant value to California business.

Figure 1-1 in the 2022 Scoping Plan shows that California has been able to reduce its carbon footprint while having strong GDP growth (see below). This is largely due to the success of the LCFS program. In fact, per the US Bureau of Economic Activity (BEA), California has had stronger GDP growth than neighboring states with no LCFS programs.[9]

Figure 1-1: California total and per capita GHG emissions[25]



The California LCFS Program Has Delivered Significant GHG and Criteria Emissions Reductions:

CARB should clearly state its commitment to the LCFS program given the significant GHG emissions reductions it has delivered thus far. It has been highly successful in driving emissions reductions in the transportation sector thus far. Below is an overview of some of the successes of the LCFS program through 3rd quarter 2023[10].

- ***145.8 million tons of CO_2***, the equivalent of removing carbon emissions from 14% of gasoline vehicles in the US in 2022[11]
- Displaced the equivalent of ***29.4 billion gallons*** of conventional gasoline, diesel and jet fuels since its inception in 2011. This is the equivalent of 21% of total annual US gasoline consumption as of 2022[12].
- Renewable diesel capacity has grown substantially and far exceeds what was previously modeled in 2018 when the current CI benchmarks were established (page 22 of the ISOR)

In addition to delivering GHG emissions reductions, the LCFS has also been instrumental in driving reductions in criteria pollutants from vehicles across the state, including in disadvantaged communities that are disproportionately impacted by air emissions from the transportation sector. As part of this LCFS rulemaking, CARB estimated that the LCFS would reduce annual emissions as shown below in Table 1, and that toxic air contaminant (TAC) emissions would similarly go down.

[9] https://www.bea.gov/data/gdp/gdp-state
[10] https://ww2.arb.ca.gov/resources/documents/low-carbon-fuel-standard-reporting-tool-quarterly-summaries
[11]https://www.eia.gov/tools/faqs/faq.php?id=307&t=10#:~:text=EIA%20estimates%20that%20in%202022,1%2C488%20MMmt%20of%20CO2
[12] https://www.eia.gov/tools/faqs/faq.php?id=23&t=10

Table 1: Emissions Reductions Expected from this LCFS Rulemaking from 2024 through 2046[13]

Pollutant	Reduction
GHGs	558 million MT
PM2.5	4,281 tons
NOx	25,586 tons

Per page 8 of the ISOR for this rulemaking, "The LCFS also supports other existing State GHG reduction efforts; notably, the Short-Lived Climate Pollutant (SLCP) Reduction Strategy, Advanced Clean Cars II (ACC II) regulations, Advanced Clean Fleets (ACF) regulation, Clean Truck Partnership, Advanced Clean Trucks (ACT) regulation, 2020 Mobile Source Strategy, Sustainable Freight Action Plan (SFAP), Commercial Harbor Craft (CHC) regulation, In-Use Locomotive regulation, Innovative Clean Transit (ICT) regulation, and Renewable Portfolio Standard (RPS)." In other words, all of these regulations depend on the LCFS regulation to drive further emissions reductions in each of these emissions sources, thus making the LCFS the cornerstone of emissions reductions in the state of California.

Renewable Diesel Has Delivered Significant Emissions Reductions:

Renewable diesel is now the single ***largest carbon reducer*** over the life of the LCFS program, and has resulted in **31%** of the GHG reductions achieved by the LCFS program[14]. Combined with newer heavy duty diesel engine technologies delivering near-zero NOx and PM emissions, studies have shown that increased use of renewable diesel and biodiesel can achieve three times the GHG reductions possible in the next 10 years versus accelerated electrification[15]. If liquid renewable fuels were further incentivized by the LCFS, California would see dramatic decreases in GHG, criteria and toxic pollutant emissions more quickly because liquid renewable fuels are widely available TODAY.

In addition to generating lower GHG emissions, renewable diesel burns much cleaner than conventional diesel. This leads to improvements in the air quality of regions with high diesel truck traffic, which tends to impact disadvantaged communities. Below are some examples of renewable diesel's co-benefits documented by CARB. In other words, renewable diesel use has resulted in significant NOx and PM reductions across the state, including in disadvantaged communities, and by far the largest reductions among all fuels in the LCFS program. This further highlights the need for CARB to continue making the LCFS a top priority and to prioritize currently available technologies such as renewable diesel so that local communities can benefit from reduced emissions immediately.

- As part of the Alternative Diesel Fuels (ADF) Regulation, CARB determined that renewable diesel reduced **NOx by 10%** relative to conventional diesel[16]
    - CARB also found that PM, benzene, ethyl benzene, and toluene emissions from renewable diesel were significantly lower than from conventional diesel combustion.
- As part of the Commercial Harbor Craft Regulation, CARB determined that renewable diesel reduced **NOx by 11.8%** and **PM by 26.6%** when compared to conventional diesel[17]

[13] https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2024/lcfs2024/isor.pdf (pages 56 and 58)
[14] https://ww2.arb.ca.gov/sites/default/files/2023-01/quarterlysummary_013123.xlsx
[15] https://dieselforum.org/news-posts/posts/10-years-of-opportunity-cutting-emissions-from-medium-and-heavy-duty-vehicles-in-the-northeast
[16] https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2015/adf2015/adf15isor.pdf
[17] https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2021/chc2021/appe.pdf

  - CARB noted that the cleaner combustion of renewable diesel is driven by the superior cetane rating (consistently above 70) which leads to maintenance benefits for truck owners
- Renewable diesel does not contain sulfur, eliminating all SOx emissions

Table 2 below summarizes the significant GHG and criteria emissions reductions achieved when switching from conventional diesel to renewable diesel.

Table 2: Renewable Diesel Emissions Reductions When Compared to Conventional Diesel

Pollutant	% Reduction
GHGs	80%
PM	26.6%
NOx	10-11.8%
SOx	100%

Considering that California diesel trucks now run on 54% renewable diesel as of 3rd quarter 2023[18], a large percentage of the emissions reductions shown in Table 2 are being realized today. Additional emissions reductions are possible if CARB further prioritizes the use of renewable diesel by going beyond the 30% CI reduction as noted in the ISOR. Local communities are benefiting TODAY from significant emissions reductions due to the cleaner burning fuels incentivized by the LCFS program, and CARB should work towards maximizing these emissions reductions generated by renewable fuels.

Renewable Diesel Driving Economic, Climate and Air Quality Benefits Locally TODAY

As noted above, RD has delivered significant economic and environmental benefits across the state. It is also important to note that Neste's focus on circular solutions - where waste and residue can be collected, processed and repurposed for energy – works on a community level. Through our acquisition of Mahoney Mahoney Environmental®, Neste has helped foodservice establishments turn used cooking oil (UCO) and other waste products into useful products like renewable fuels. Mahoney manages the entire recycling process — from equipment set-up to collection and processing. Mahoney shares the benefit of the UCO and passes that added value onto restaurant operators.

Mahoney is a licensed EPA recycler, and all facilities recycle nearly 100% of the materials processed. Mahoney's goal is to be the premier back-of-the-house service provider to foodservice operators — from national and regional chains to independent restaurants to airports – throughout the United States.

Mahoney services about 80,000 foodservice facilities nationwide, and about 13,400 in California. In California, Mahoney collects about 66,980,000 pounds of UCO and recycles it. The environmental impact from recycling the UCO collected in California is equivalent to:

- 73,452 Tons of Waste Diverted from a Landfills and/or waterways
- 11,300,328 Trees Planted
- 12,830 Cars Made Zero Emission

Mahoney is proud to employ over **100 employees** in California and that makes an economic impact with job creation across the state. Mahoney also does business with hundreds of restaurants, including small

[18] https://ww2.arb.ca.gov/resources/documents/low-carbon-fuel-standard-reporting-tool-quarterly-summaries

and minority owned businesses. The goal is to make kitchens and the environment safer for future generations.

As part of our circular approach to fueling, Neste has partnered with the City of Oakland to collect used cooking oil locally and convert it into renewable diesel for use in the city's fleet. By making waste more valuable and supporting jobs that collect and treat it, this concept helps the local economy in the city while the cleaner-burning Neste MY Renewable Diesel improves the lives of its residents by reducing local emissions from the city's fleet.

By simply switching to Neste MY Renewable Diesel, the city of Oakland's fleet has been able to reduce the following emissions when compared to fossil diesel:

- GHG emissions by 74 percent
- Fine particulates by 33 percent
- Carbon monoxide emissions by 24 percent
- Nitrogen oxide emissions by 9 percent

This concept creates a win-win-win for the city, its businesses and its residents. It helps the local economy in and around Oakland, improves air quality in the city, and, of course, ensures that used cooking oil does not end up as waste. Neste hopes that CARB continues to incentivize these circular solutions that are having real impacts in local communities TODAY.

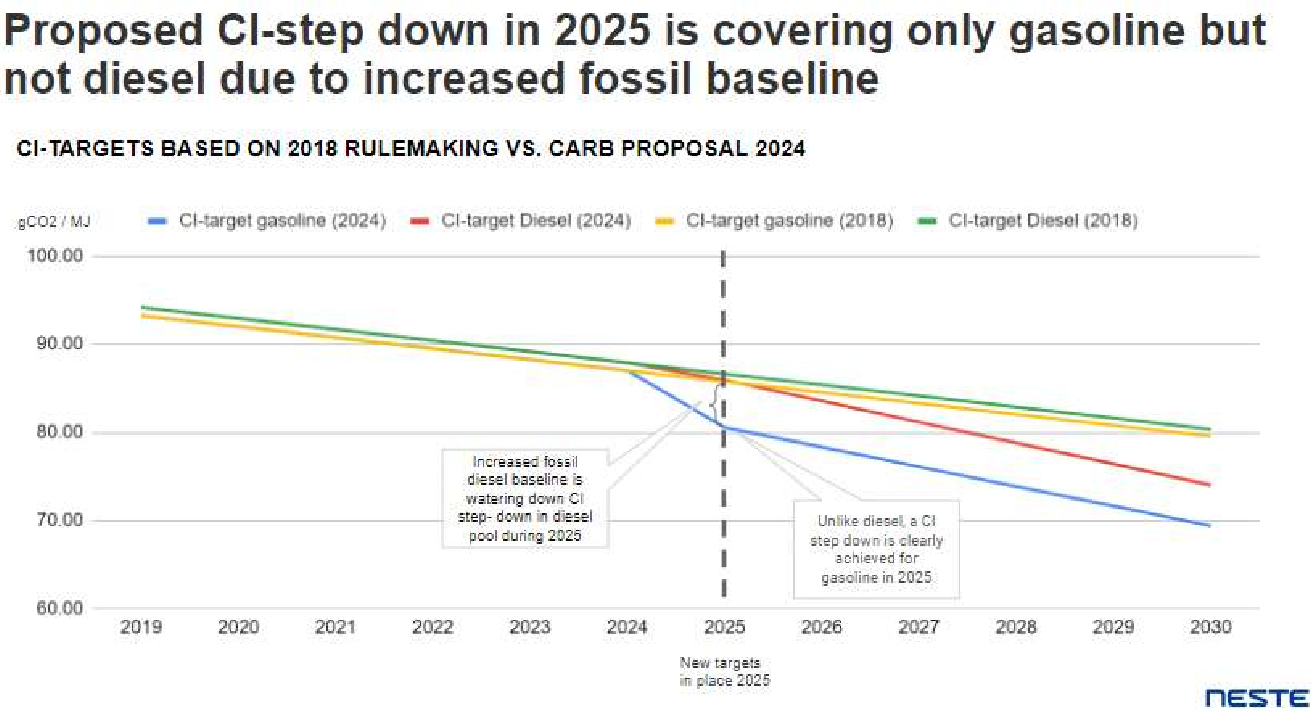
Overview of the Comments on the Proposed LCFS Regulation

Step Down CI Reduction Is Needed Immediately to Stabilize the LCFS Carbon Market:

295.2 reference

Neste sees an immediate step down in the CI as integral to quickly addressing the overperformance of the LCFS program and the depressed credit prices. This could also provide visibility to the industry that could bolster investments in future alternative energy projects. Overperformance is a lost opportunity for GHG reductions, and the longer the market overperforms, the longer California passes up significant reductions in GHGs and harmful air pollutant emissions. Neste supports a CI step down in the range of 12% for 2025 as modeled by ICF in the "ISOR Case", versus the 5% proposed by CARB. ICF found that a CI reduction of 25% in 2025 is needed to "ensure that the credit bank reverses and that the bank is drawn down to a level that is in line with a credit bank of only two quarters' worth of deficits". As part of this rulemaking, CARB also updated the fossil diesel baseline from 100.45 gCO_2/MJ to 105.76 gCO_2/MJ, a 5% CI increase that essentially canceled out the 5% CI step down that CARB proposed for diesel. Neste plotted the CI reduction targets proposed by CARB in Tables 1 and 2 of the Proposed LCFS Regulation in Figure 6 below, showing that the CI step down is nonexistent for diesel. To truly balance the LCFS credit market, **a 12% CI step down must be made in 2025**. This step down is needed before the AAM can be effectively implemented, otherwise the AAM could be triggered excessively and overperformance will persist.

Figure 6: Fossil Diesel Baseline Increase Effect on CARB Diesel Annual CI Reduction Targets



Automatic Acceleration Mechanism (AAM) Should Start in 2026 (using 2025 data):

In the current environment, where the credit price is at 2015 lows and the credit bank is at a record 20.6 million credits[19], it is important that adjustments to the CI reduction targets are made through a
295.3 predictable process and send credible, long-term signals to the market. Neste therefore appreciates that
reference CARB is proposing an AAM that will move up the CI standard by one year (and subsequent years) when triggered, resulting in a predictable impact on the longer-term fuel market.

Given the significant credit bank and the expected record growth in renewable energy consumption in California, Neste recommends that the AAM first be activated in **2026** (using 2025 data) and not wait until 2027. It is essential that CARB have this mechanism in place should overperformance persist, and to balance out the credit market more quickly so that renewable fuel producers can feel more confident investing in new production.

Neste also supports ICF's recommendation that the AAM triggers be reevaluated to ensure a smoother reduction of the credit bank. By lowering the "Credit Bank to Average Quarterly Deficit Ratio" AAM trigger from 3 to 2.5, CARB can provide an even more predictable credit market.

Feedstock Sustainability Certifications Are More Effective at Phasing Out Fossil Fuels

A Cap on Lipid Feedstocks Only Favors Fossil Fuels

295.4 reference

Neste supports the sustainability requirements proposed by CARB in this rulemaking, and is strongly opposed to any caps on feedstocks used to produce liquid renewable fuels. Calls for caps on feedstocks as a means to balance the LCFS credit market are in reality calls to pause emissions reductions, and fossil fuels would be further used over renewable energy. Neste agrees with CARB that more aggressive emissions reductions will more quickly balance out the credit market and not pauses on emissions reductions. Arbitrary caps will likely lead to increases in GHG and criteria pollutant emissions, and will undermine California's ability to address difficult to decarbonize sectors such as the aviation and maritime sectors. Neste agrees with CARB that a cap on feedstocks will have the following negative impacts on California's most vulnerable residents:

- Increased dependence on fossil fuels (pg 102 of SRIA)
- Exacerbates existing air quality challenges due to higher NOx and PM (pg 102 of SRIA and pgs 118 and 124 of the ISOR)
- Will lead to worst health outcome among all scenarios modeled by CARB (pg 124 of ISOR)

Neste agrees with CARB that, "The inclusion of land use change emissions in LCFS life cycle methodologies result in stronger incentives for waste-and-residue-based feedstocks, which are not associated with land use change impacts, relative to crops. As a result, the majority of biomass-based diesel in the LCFS has historically come from waste feedstocks like used cooking oil, animal fat and inedible distiller's corn oil" as stated on page 35 of the ISOR. Waste and residues continue to be the dominant feedstock used to produce California's liquid renewable energy, and create a true circular solution while eliminating a major environmental hazard. In fact, per the World Economic Forum "Clean Skies for Tomorrow" report prepared by McKinsey and Co[20], waste and residue volume worldwide is estimated to be 40 MT/yr (see Figure 11 on page 27) a figure that is 10 times larger than what CARB estimates in its modeling. As noted on page 116 of the ISOR, a cap on lipid feedstocks will "result in higher volumes of fossil diesel being used than any of the other scenarios evaluated" and resulting in "credit prices immediately reaching the maximum credit price in 2025 and remaining at the maximum levels for every year analyzed." A cap only favors fossil fuels and undermines CARB's goal to be carbon neutral by 2045, and therefore should be rejected.

There is simply no data supporting the need for a cap on crop-based feedstocks. The Advanced Biofuels Association (ABFA) conducted a study that concluded, "To 2030, feedstock supplies available for use in the U.S. are more than enough to meet our forecast demand—after accounting for food[21]." In fact, data is showing that meat prices are dropping due to the production of renewable energy because more animal feed is being produced[22]. As part of the July 7th LCFS Workshop, CARB received compelling data showing that the Indirect Land Use Change (ILUC) factors are helping prevent deforestation and other land use issues. The ILUC factors also reduce credit generation from diesel produced from these feedstocks, something proponents of a cap are seeking. Neste therefore strongly opposes a cap, and strongly recommends that vegetable oils derived from newer crops and farming technologies should be accounted for in the LCFS. There is no data showing that crop-based feedstocks are affecting food prices, availability and overall land use.

[20] https://www3.weforum.org/docs/WEF_Clean_Skies_Tomorrow_SAF_Analytics_2020.pdf

[21] http://advancebioprod.wpengine.com/wp-content/uploads/2021/12/LMC-Lipid-Feedstocks-Outlook-SUMMARY-SLIDES-Nov-2021.pdf

[22] https://www.bloomberg.com/news/articles/2024-01-28/why-us-chicken-pork-prices-will-fall-when-soy-based-renewable-diesel-ramps-up

Highlight of Comments submitted to CARB as part of July 7th, 2022 LCFS Workshop:

- Technology advancements have resulted in significant increases in production yields per acre and thus crop production is increasing while land use remains stable
  - A cap could actually eliminate investments in newer farming practices that could lead to even lower CI fuels
- Liquid biofuels have achieved about 75% of the GHG reductions since the inception of the LCFS program
- Liquid biofuels burn much cleaner and lead to immediate air quality benefits, especially to communities of color that are disproportionately affected by the air pollution of the transportation sector

A cap will likely also deter what could be one of the greatest environmentally positive changes to date in farming methodology. CARB has a great opportunity to acknowledge through incentives that not all farming is the same. Methodologies utilizing low to zero till, reduced fertilizer, cover cropping, and other climate smart agriculture (CSA) practices could change farming practices for the better to the point that it reshapes an industry to make the planet a healthier place for our children. Renewable fuel companies are also making major investments on future low-CI technologies such as green hydrogen, algae and Power to X. Renewable fuel producers often use existing feedstocks to produce newer generation biofuels, and concurrently phase out older generation feedstocks. This means announcements for new renewable energy are often tied to repurposing of existing feedstocks. By prematurely restricting the production of liquid renewable fuels today, CARB will delay essential GHG reductions, improvements in air quality in disadvantaged communities, and the production of next generation renewable fuels.

Recommendations for the Sustainability Requirements for Crop-Based and Forest-Based Feedstocks

Neste agrees that requiring additional sustainability requirements are more appropriate at addressing concerns with the growth of crop-based and forest-based feedstocks than arbitrary caps on feedstocks. Currently, all of Neste's feedstocks are subject to sustainability due diligence and we ensure sustainability of most of our renewable fuel production chain through certifications like ISCC EU, ISCC Plus, RedCERT2 and national verification schemes[23]. All of our Neste operated refineries also hold ISCC certificates. In the United States, our renewable fuel sustainability is approved by the Environmental Protection Agency (EPA). Neste also supports the comments submitted by the LCFS Coalition on CSA and the need to recognize CSA in the LCFS, and we look forward to working with CARB staff to establish detailed guidance on the sustainability requirements so that industry is clear on how they will apply.

Neste believes it is essential that approved certification systems be posted and available to the public within 3 months of submission of a complete application. The logistics of a certification will be very complex, and maximum amounts of time will be required to ensure feedstocks are certified by January 2028. Lastly, we recommend that CARB provide a 3 year grace period for certification systems that are revoked or suspended, to ensure that there is sufficient time to get certified under a new system.

Climate Smart Ag Recommendations

Instead of pursuing a cap on crop-based feedstocks that could hamper investment on CSA, CARB should instead incentivize these new technologies by recognizing that CSA can result in fuels with lower CI values.
295.5 Climate change is already happening, and CARB should start working on creating these science based ILUC factors and CA-GREET model that account for the lower emissions from CSA such as regenerative cultivation methods and cover crops to drive the development of the low CI fuels of tomorrow.

[23] https://www.neste.com/sustainability/supply-chain/raw-material-sourcing

Intrastate Jet Fuel Exemption:

295.6 In analyzing CARB's proposal to eliminate the exemption for intrastate jet fuel, in combination with other measures already discussed in these comments, it is likely to help bring stability to the credit market and help correct the current imbalance. Neste believes that the proposal will also drive continued growth in SAF demand and production, as well as potentially for other renewable fuels. We see such proposals as important to continue driving investments in the production of SAF, and enhancing its viability as an alternative to fossil jet fuel to provide significant GHG and air pollution reduction benefits. We agree with CARB that SAF is the only viable way to decarbonize emissions on a large scale from the hard-to-carbonize aviation sector. The current proposal allows for multiple options for obligated parties to comply. These options can be in addition to, in combination with, or even instead of using SAF.

Neste recognizes that the aviation sector has concerns with the proposal. Since this is the first proposal of its kind, we encourage CARB and all stakeholders to continue working to identify enhancements, additional options for implementation, or alternative approaches to advance the publicly stated emissions reductions goals of the aviation sector.

Low-CI Hydrogen Recommendations:

295.7 Neste appreciates CARB's proposing to create greater incentives for the production and use of low-CI hydrogen, especially as noted in Section 95488.8 (i)(3) "Book-and-Claim Accounting for Pipeline-Injected low-CI Hydrogen Used in FCV and Alternative Fuel Production." Neste recommends that all renewable facilities that use low-CI hydrogen be allowed to generate CI benefits from using low-CI hydrogen and not just facilities connected to a California hydrogen pipeline. Globally, Neste is investing millions in the development of low-CI hydrogen to produce even lower CI versions of drop-in fuels like renewable diesel and SAF.[24] We hope to eventually expand the use of low-CI hydrogen at all our facilities and have the option to bring those lower CI fuels to California. The California hydrogen pipeline requirement creates unnecessary barriers and should be deleted.

In Section 95488.8 (i)(3), Neste also recommends the elimination of the December 22, 2022 facility startup date for facilities to be eligible for the low-CI hydrogen CI benefits. As the lone renewable fuel company with a production footprint on 3 continents, allowing low-CI hydrogen from any of our facilities could help increase supply of lower CI fuels to California.

General Recommendations:

Neste also has the following general comments that apply to more administrative requirements in the LCFS regulation:

295.8
1. **Transition to CA-GREET 4.0:** Given that the LCFS rulemaking is delayed, a 2024 start date for using CA-GREET 4.0 will not be feasible. The start date for using it should be 2025 or later, and for credit transactions it should be required in 2027 or later to give all stakeholders enough time to apply for new CARB fuel pathways. This should be reflected throughout the Proposed Regulation as it appears that a 2024 startup date was assumed.

295.9
2. **Temporary Fuel Pathways:** Per Section 95488.9(b), the Temporary Pathways are increasing by an average of 5 gCO2e/MJ for all fuels. Neste could not confirm the exact reason for this, and recommends that CARB provide the data and calculations associated with these significant CI increases.

[24] https://www.neste.com/news/neste-moves-forward-in-its-renewable-hydrogen-project-in-porvoo-finland

295.10 3. **Incentives to Be Below Certified CI:** In Section 95488.10, lists that CARB is willing to issue credits for those pathway holders with a verified CI that is below the certified CI. To further incentivize CI reductions, CARB should also have a multiplier when below the certified CI just as imposed when the verified CI is above the certified CI. This will incentivize investments in emissions reductions more quickly.

295.11 4. **Low-CI Hydrogen:** CARB is introducing the concept of Low-CI hydrogen throughout the Proposed Regulation. We recommend clarification on how this is different from Renewable Hydrogen. If different, Neste requests a definition for Low-CI Hydrogen be added into the Proposed Regulation.

295.12 5. **Clarify Section 95488.8(i)(1):** Low-CI/renewable hydrogen can be used to produce liquid renewable fuels such as renewable diesel. Can CARB please clarify that 95488.8(i)(1) also applies to low-CI electricity used to produce hydrogen that is then used to produce liquid renewable fuels. It is Neste's understanding that this is CARB's intention, but Section 95488.8(i)(1) should be modified to state "or Used to Produce Hydrogen as a transportation fuel or for alternative fuel production."

295.13 6. **The Tier 1 Calculator for HEFA:** The "Pathway Summary '' tab has automatic column and row hiding that is difficult to manage and Neste requests that it be removed.

295.14 7. **Ocean Going Vessels (OGVs):** Facing increasing CI reduction targets proposed by the International Maritime Organization (IMO), shipping companies are looking to renewable fuels as a way to reduce their emissions. CARB should consider including fuel used in those ocean going vessels within the LCFS to support and accelerate the decarbonization of large container ships, tankers, and other OGVs.

295.15 8. **Severability:** Given the significant number of updates that will occur as part of this rulemaking, Neste recommends that CARB make the following updates to the Severability language in Section 95497.

§ 95497. Severability.

Each provision of this subarticle shall be deemed severable, and in the event that any provision, or part thereof, in this subarticle is held to be invalid~~,~~ or temporarily unenforceable, the remainder of this subarticle shall continue in effect.

Neste looks forward to continued participation in the LCFS rulemaking, and leading in the fight against climate change.

Please feel free to contact me if you want additional information or have questions regarding our submission.

We appreciate your consideration.

ELECTRIC VEHICLE CHARGING ASSOCIATION

February 20, 2024

California Air Resources Board
1001 I Street
Sacramento, CA 95814

Re: SUPPORT Proposed Amendments to the Low Carbon Fuel Standard Regulation

EVCA is a not-for-profit trade organization of 22 leading EV charging industry member companies and two zero-emission autonomous fleet operators. The association was established in 2015 to comprehensively represent the entire EV charging value chain and provide a collective industry voice for decision-makers in California.

The Low Carbon Fuel Standard (LCFS) has been instrumental in supporting California's transition to low-carbon fuels, and we applaud the effort by the California Air Resources Board (CARB) to make modifications to the regulation to adapt to the changing needs of the market. While EVCA is broadly supportive of the proposed modifications to LCFS and has separately submitted joint comments on various elements of the Proposed Regulation, this letter focuses on the issue of LCFS credits claimable by multi-family properties.

SUPPORT: LCFS credits for non-residential chargers at multi-family properties.

EVCA supports the amendment proposal to expand eligibility for LCFS credits to non-residential charging stations at multi-family residences. The ability to
296.1 claim credits will encourage multi-family properties to deploy chargers and create new financing opportunities that reduce the cost of charger deployment for property owners. This proposal presents a powerful new tool to offer the convenience of home charging for residents of multi-family housing and address the gap in charger access for these residents compared to Californians living in single-family homes.

RECOMMENDATION: Allow multi-family residences with dedicated parking arrangements to claim LCFS credits.

While EVCA is supportive of the proposal to expand eligibility for multi-family residences to claim LCFS credits, we find the proposal stops short because it is not inclusive of chargers serving dedicated parking spaces. Restricting credits based on parking arrangements would be challenging to track and implement. Further, multi-family residences with dedicated parking arrangements face the same underlying barriers to charger deployment as properties with unassigned parking. Expanding LCFS credit eligibility to all non-residential station owners will alleviate the following challenges across the segment:

- **Station ownership.** Charging equipment serving dedicated spaces is often purchased, installed, and maintained by the property owner or by a 3rd party owner-operator charging network, as a service for residents. Though chargers serving dedicated spaces may serve a single household, the responsibilities and costs of managing and maintaining these chargers ultimately falls to the property owner or 3rd party owner-operator charging network. When the station owner and the station user are not the same entity, LCFS credits should be allowed to be claimed by the station owner-operator, to defray the costs of such an investment in the multi-family context.
- **Shared infrastructure.** Residents of multi-family housing struggle to install their own dedicated chargers due to the shared nature of electrical infrastructure. It is often infeasible for a single dedicated space in a separated parking area to install a charger without significant construction and electrical work, which may include adding new electrical service, conduit, trenching, and upgrading a panel. Shared electric infrastructure, even when it serves dedicated charging spaces, raises costs beyond what a single resident may be willing to pay. This circumstance creates a need for a single entity - the property owner or 3rd party owner-operator charging network- to make the investment to own and operate stations on behalf of residents, justifying broader eligibility for LCFS.
- **Split decision-making authority.** Regardless of the parking arrangement, the shared nature of electric service upgrades for multifamily residences splits decision-making responsibilities across many stakeholders. Eligibility for LCFS would encourage investment in

stations on behalf of residents to circumvent these challenges; decision-making is simplified if costs are reduced and a single entity is willing to make an investment on behalf of the group.

EVCA believes CARB's intention is to empower more multi-family residences to invest in charger access for use by residents. To better support the goal, EVCA respectfully urges CARB to amend the Proposed Regulation to allow all non-residential chargers at multi-family residences to directly claim credits from the LCFS program, regardless of parking arrangement.

We appreciate the opportunity to submit comments on this matter. Thank you for your consideration.

Sincerely,

Reed Addis
Governmental Affairs
Electric Vehicle Charging Association

COMMENTS ON LCSF PROPOSED DRAFTS FROM DECEMBER 19, 2023 – February 20, 2024

To Whom it might concern,

297.1 I appreciate the auto acceleration to increase the CI stringency and support no Board approval for consecutive auto acceleration events unless they are further strengthened.

297.2 Electrification needs to be the focus. Regarding equity measures in impacted communities, the credits should first be directed to providing clean electric public buses and school buses, along with the necessary charging infrastructure. Impacted communities should have a say in where the equity dollars are spent.

297.3 There has been an explosion of logistic facilities (warehouses) especially in communities that already are impacted by pollution and often currently don't meet the Clean Air Standards. Please encourage our State legislators to pass moratoriums on these centers until some priority system is established for who gets the funding, i.e., trucks at ports.

297.4 There has been an explosion of increasing sizes of dairies into industry size numbers and negative community health impacts. We must move away more quickly from combustion period. There should be a cap on the number and location of dairies in relationship to where people live. There needs to be better measurement of leakage and methods moved away from a wet to a dry process for manure.

297.5 I'd like to have access to the amount of methane leaking from landfills in our communities. We have a closed landfill in our county that still leaks and receives violations and fines.

297.5a Just as we need to move away from corporate one-crop farming, we need to move away from consolidation of dairy cows just to make it more economical to purchase expensive bio-digestors to capture methane, which it looks like will be with us for a long time. First this report stated that biomethane will be used for injection into our natural gas pipeline system. Let's call it what it is – FOSSIL GAS. Then you want to use the FOSSIL GAS for hydrogen. With 80% of credits going to a combustion source in one way or the other, there is harm to health regardless of the name.

From past experience I've known real estate developers who buy land for a development and hold it for 20 years and then say the project can build using the old regulations. Look at CAL GEM. Petroleum/Energy companies take out permits on extraction projects and sit with the permits. Any time there is an announcement of no more permits as of (pick a date), the numbers of permits skyrockets.

297.6 This "Phase Out" of methane crediting needs a major rollback on the proposed deadlines and extensions. After all, ethanol was first introduced as an additive in automobiles in 1910, and it's still with us. The credits have lasted for years.

297.7 It's a good idea to discontinue the credits for forklifts and move those funds to something else that needs electrification.

297.8 I support verification requirements for electricity credits that all participants generating credits from EV go through annual independent verifications.

297.9 As originally proposed hydrogen still needs more pilot programs and strict safety requirements from federal and State laws. Hydrogen should be focused only on hard to decarb industries. The only hydrogen used should be "green" electrolytic, not blue, or some other way to reuse fossil fuels.

In the original LCFS bill the leg analysis states, “Create air monitoring and mitigation plan. Avoid any
297.10 significant impact on residents in communities affected by high-cumulative exposure burden.” This
applies to biodigesters. Refining biofuels, and hydrogen projects, et al.

Remember to calculate the use of energy needed to create the outcomes. Pipes leak whether above the ground, underground, or under water.

While I appreciate the stated no palm oil use for biofuels, guardrails and caps need to be put in place. I
297.11 have a cousin living in Iowa and I hear about the pushback from farmer’s pressured by imminent domain
to be bought out because of these credits for biofuels.

We need healthy soil and incentives in the Federal Farm Bill to protect smaller farmer and encourage
farmers to stay in business to feed America. Food prices have increased faster than incomes and many
297.12 people are only feeding their families with Food Banks, school meals, and SNAP programs.

There needs to be more awareness around the harm of viruses from birds and animals too closely habituated and fed grains.

297.13 I appreciate that CARB works with Natural Resources and Transportations and hope there is a holistic approach also with Water, since so many of these energy producing facilities negatively impact our water supplies.

297.14 I support the elimination exemption for Intrastate FF jet fuel.

I don’t support allowing hydrogen production facilities directly to the refineries to implement eligible
297.15 GHG reduction projects as it is written in the draft LCFS. We know that hydrogen is a secondary source
of energy. Most hydrogen today is by steam reforming natural gas (Methane, fossil gas). There are already enough dangers at our local refineries. I think there needs to be more specificity in the draft proposal. There has been excessive flaring at Chevron in Richmond since they installed the new hydrogen plant in 2012.

I have attended the last 4 CARB workshops on LCFS. I have listened to the public, EJAC. Presenters, and members of CARB Board and staff. I think the allocation of the different pieces used to meet the Statewide goals needs to be looked at. At the August 25 meeting I heard 380 more digesters were
297.16 needed to meet the LCFS goals. The current dairy digester method shouldn’t be increased when the
amount we already have is causing such harm in our communities.

297.17 We should honestly be looking to promote consuming less beef and dairy products. If not, we need to move incentives to smaller farms with natural land and diverse products. Less close habitation reduces viruses that wipe out large numbers of animals, similar to the chickens that had to be killed in large numbers recently. It reduces trucking products long distances.

Great strides are being made in insulating electrical wires with lighter material that do not weigh down
297.18 power lines and contribute to more fires, and allow more electrical transmissions on the same existing
lines and infrastructure. Just because LCFS as it was created 15 years ago does not mean it has to last until 2045. Let’s look at a clean air economy through holistic eyes. Who benefits and who is harmed from each of these programs.

Jan Warren at 3202 Primrose Lane, Walnut Creek, CA 94598 – 925.818.6530

Subject	Comment regarding DAC emissions matching requirements

Comment

```
This comment focuses on the requirements for low-carbon heat and
power for CO2 removal using direct air capture and storage (DACS)

It includes discussions around reporting options, technical and
commercial readiness of some kinds or low-carbon energy, and the
need to consider methodologies for emissions avoided and removed.

These recommendations may provide precedent and guidance for other
low-carbon pathways involving significant electric and heat inputs
such as green hydrogen and e-fuels.

Carbon Direct

17 State Street
New York, NY 10004

February 20, 2024

To the California Air Resources Board and associated staff:

We support the CARB's direction to further progress direct air capture (DAC) as a technology option to abate the greenhouse gas emissions of California fuels under the Low Carbon Fuel Standard (LCFS). This flexibility as a compliance option may reduce compliance costs, stimulate innovation and investment in climate technology, and position California as a global leader in reaching economy-wide, net-zero emissions targets. We welcome the opportunity to add our perspective to CARB's ongoing development related to DAC.

298.1

Direct air capture with storage (DACS) is a critical carbon removal technology for a net-zero world. This is recognized and substantiated in a large number of studies and deep decarbonization roadmaps, such as the IPCC's Sixth Assessment Report, the recent Lawrence Livermore National Laboratory's "Roads to Removal" report, and the European Union's communication of their 2040 climate target as well as their proposed path to climate neutrality by 2050.

Because DAC is in its early stages of operational and scale-up development, it is essential for the technology to mature and be available at the anticipated scale for later, deeper decarbonization. *Learning, knowledge sharing, data collection, and reporting are the immediate necessary steps before sound commercial and environmental regulation can be made*. Real data from operational pilots and facilities are essential. This is, in part, a key outcome of the US Department of Energy's Direct Air Capture Hub program, which includes pilot and small demonstration projects in California. In this context, CARB's decisions may prove precedent-setting not only for DAC in the US, but for other critical reduction and removal technologies and associated regulatory policies around the globe.

Carbon Direct agrees with most scholars and experts in the field: to provide material removal of CO_2 from the air and oceans, DAC facilities must operate on a net basis,

17 State Street
New York, NY 10004

with high removal efficiencies, and with deduction of input energy emissions in their full product value chain. These must be substantiated by the use of low-carbon-intensity energy (heat and power) on a life-cycle basis. One proposed approach is “book and claim” power matching. This is where the annually averaged power used by DAC plants is matched with additional, location-based, renewable power. We are involved in ongoing discussions on the carbon credentials and impacts of these approaches, on both the power- and carbon-systems levels.

We would like to offer an addition or alternative to power matching as a way to substantiate carbon matching and integrity. Specifically, we hold that the current wish for “24/7” hourly matched power is not, at this time, technically nor commercially available at the quantity or quality needed for DAC matching loads. Additionally, quarterly power matching can be severely constrained or unavailable with the seasonal and episodic limits of variable renewable power (i.e., wind and solar, with or without batteries).

- To achieve true atmospheric neutrality, overall carbon neutrality of heat and power supply is a critical quality specification for DAC projects. However, time-matching of low-carbon generation and power demand (e.g. hourly power matching) is not the only way to demonstrate this and in some cases it may not be sufficient. Another approach is true carbon reduction accounting or "emissionality." This is the quantified, avoided emissions from the electricity generated by the low-carbon power supply minus the induced emissions from the electricity consumed by the facility, based on the respective hourly marginal emissions. This methodology can be applied regardless of the source of low-carbon electricity (nuclear, renewable, biopower, geothermal).
- The use of emissionality reporting[1] may provide the necessary confidence to market participants surrounding the carbon matching of electricity supply. Carbon matching of electricity could be used for DAC and other power-intensive projects, like green hydrogen production. This would provide time-shifted carbon matching which may be separate from hourly power matching.[2] Time-shifted matching can be location-based, with a wider or more narrow temporal and geographic definition. True carbon neutrality can be met with annual power averaging if the carbon avoided matches the carbon

[1] See the Resurety white paper, WattTime insight brief, and the report on UtilityDive for more information on emissonality.
[2] Though emissionality does not directly contribute to the development of firm, dispatchable, low-carbon power, it can catalyse their development as they can be included as “hourly” low-carbon power supplies, and with increasing renewables the amount of avoided emissions will decrease.

induced, and this is substantiated and quantified. Quarterly power matching would not improve emissions integrity further.

- *DAC facility operators could provide emissionality reporting to CARB through a transparent mechanism* (e.g., an annual book and claim methodology). Because emissionality is a maturing methodology, it would not be appropriate to include annual carbon matching as a requirement for DAC facilities until emissionality techniques are mature and this information is widely available. The lack of access to reliable, marginal emissions information for specific DAC plant technologies and low-carbon power generator locations remains a concern, and mandatory annual reporting would help.

Carbon Direct fully supports the development of firm, dispatchable, low-carbon power and power storage on the pathway toward a genuine 24/7, year-round, low-carbon power supply at capacity. Emissionality can be a "bridge" approach to catalyzing development and, as grids decarbonize further, may deliver more avoided emissions.

Thank you for the opportunity to provide feedback and your consideration.

Carbon Direct Inc. (Carbon Direct), helps organizations go from climate goal to climate action. Carbon Direct is a science-first organization that combines technology with deep expertise in climate science, data, and policy. We deliver actionable climate strategies and high-quality carbon dioxide removal (CDR) to decarbonize the global economy.

Carbon Direct has built a reputation as a trusted arbiter of high-quality strategy for carbon reduction, removal, and utilization throughout value chains, working with leading organizations. Our team of over 40 scientists includes thought leaders who actively contribute to the science of climate mitigation with novel assessment methodologies, providing public resources to facilitate action. Carbon Direct has applied its expertise to the completion of:

- Over 600 engineered, hybrid, and nature-based carbon credit project assessments, deep diligences for multi-year off-take agreements, and project co-design engagements;
- Over 150 unique emerging technology diligence reviews; and
- Deep technical diligence and de-risking engagements in improved forest management, reforestation, BECCS, and DAC, with commercial strategy support in collaboration with carbon credit developers to ensure that their products are best-in-class.

Re: Airlines for America® Input on the 2024 Proposed Low Carbon Fuel Standard Amendments

Dear Chair Randolph:

I. Introduction

Airlines for America® (A4A), the principal trade and service organization of the U.S. airline industry,[1] appreciates the opportunity to provide comments to the California Air Resources Board (CARB) on the Proposed Low Carbon Fuel Standard (LCFS) Amendments.[2]

The U.S. airline industry is committed to reducing its climate impact and achieving net zero carbon emissions by 2050. Transitioning to Sustainable Aviation Fuels (SAF), also referred to as Alternative Jet Fuel (AJF) by CARB, is core to this commitment, and we have pledged to work with governments and other stakeholders to make three billion gallons of SAF available in the United States by 2030. Achieving these goals requires new and additional policy incentives, streamlined permitting processes, and close collaboration among airlines, the fuels industry, manufacturers, environmental organizations and governments, among others.

With respect to SAF, California has established itself as an early leader in attracting investment, production, and use of SAF through the existing Low Carbon Fuels Standard (LCFS) Program, which provides an opt-in credit for SAF that helps reduce the price difference between SAF and conventional jet fuel. We look forward to working with CARB on measures that will rapidly expand availability and deployment of SAF in California.

Aviation accounts for 2.6% of the U.S. greenhouse gas emissions but 5% of U.S. Gross Domestic Product (GDP) and 4.1% of California's GDP, thus having an outsized economic impact relative to its share of emissions. There are more than 380,000 employees of U.S.

---

[1] A4A's members are: Alaska Airlines, Inc.; American Airlines Group Inc.; Atlas Air, Inc.; Delta Air Lines, Inc.; Federal Express Corporation; Hawaiian Airlines, Inc.; JetBlue Airways Corp.; Southwest Airlines Co.; United Airlines Holdings, Inc.; and United Parcel Service Co. Air Canada, Inc. is an associate member.

[2] These comments supplement and incorporate A4A's comments on the LCFS submitted on January 7, 2022, August 8, 2022, and March 15, 2023, as well as the comments previously submitted during the 2018 LCFS referenced in footnote 10 *infra*.

commercial aviation firms based in California, with an overall economic impact of $194 billion[3]. Aviation is critical to driving California's economy and its rank as the fifth largest economy in the world, enabling $114 billion in annual trade flows and underpinning many of the rest of California's biggest economic drivers such as agriculture, tourism, manufacturing, banking, technology and small business. Ensuring a healthy and vibrant aviation industry is essential to California's future, and leveraging CARB's early leadership on SAF can enable California leadership in the emerging SAF production industry, creating new jobs and economic development opportunities.

299.1 With this context, we express our serious concern with the proposal by CARB to regulate jet fuel used for flights within California as an obligated fuel under the LCFS Program. This proposal to obligate jet fuel would be unlikely to result in increased SAF production, availability, or use in California, but would lead to higher jet fuel prices and slow down rather than accelerate efforts to increase SAF production and use in California. The primary impediment to increased SAF production and availability in California and elsewhere remains the higher cost of SAF for producers and buyers relative to conventional jet fuel and renewable diesel. In addition, the long permitting processes for constructing SAF production facilities is a major impediment to growing overall production capacity in California, a necessary step to achieve California's goals. 299.2 The CARB proposal would not address these fundamental challenges or otherwise meaningfully increase SAF supply or use. And because the proposal will not meaningfully increase SAF supply, the local air quality benefits attributed to increased SAF use as a result of eliminating the intrastate jet fuel exemption are overstated.

299.3 In addition to not being an effective policy tool to increase SAF production, the CARB proposal to regulate jet fuel is pre-empted by federal law, a fact that CARB recognized when it exempted jet fuel from the LCFS in 2018.[4] It is critically important that uniform federal rules apply to aviation and aviation fuels, under the Supremacy Clause of the U.S. Constitution. The CARB proposal seeks to regulate jet fuel and reduce emissions from aviation through such regulation, both of which are pre-empted under federal law, as described in further detail below. In light of the clear and broad federal authority for regulating jet fuel and aircraft engine emissions, California is pre-empted from regulating jet fuel under the LCFS.

299.4 We urge CARB to reconsider and withdraw the proposal to remove the exemption for jet fuel for intrastate flights and instead preserve the existing opt-in approach for SAF and partner with the aviation sector and stakeholders across the emerging SAF ecosystem on new policies and approaches to address the underlying challenges which could rapidly increase the availability and use of SAF in California. We encourage further dialog on this point to find a mutually acceptable path forward.

---

[4] CARB stated that "[s]ubjecting aircraft fuels to annual carbon intensity standards would raise federal preemption issues" available at https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2018/lcfs18/isor.pdf?_ga=2.259407882.120243749 0.1641231788-253234234.1573227006

II. Discussion

1. The proposal to remove the exemption for conventional jet fuel is unlikely to lead to increased SAF production, availability, or use

299.1 reference

The proposal to remove the exemption for conventional jet fuel for flights within California is unlikely to result in increased SAF production, availability, or use in California, but is likely lead to higher jet fuel prices. Given the higher cost of SAF compared to other regulated fuels, such as renewable diesel, producers and importers are most likely to buy credits generated from other fuels, rather than produce SAF to address the deficits generated by conventional fuels used on flights within California. Fuel producers will continue to prioritize renewable diesel production instead of SAF. As a result, the removal of the exemption for conventional jet fuel is unlikely to materially change the SAF production relative to the status quo. In fact, the deficits created by intrastate jet fuel likely will be retired primarily by renewable diesel and other road transport related credits. Obligating jet fuel will lead to the increased price of jet fuel, diverting resources that might have gone for SAF purchase and use towards renewable diesel production instead.

The relationship between deficit generation and credit generation is unchanged by the CARB proposal. Under the structure of the LCFS program, deficits are created for fuel producers from specific conventional fuels delivered into California as identified and defined by the program. These deficits form a common pool that can be retired with credits from any type of eligible fuel. But there is no requirement for a relationship between the type of fuel that created the deficit and the type of credit that retires that deficit. To illustrate this situation, one must only look at which fuels generate deficits in the current program, and which alternative fuels receive the credit benefits. In the current program, CARBOB (gasoline) generates 85% of the deficits, but gasoline alternatives (i.e. ethanol and EV related credits) receive only 40% of the credits. Diesel, on the other hand, generates only 14% of the deficits, but receives 44% of the credits.

Share of LCFS Program deficits and credits by fuel type for 2022 calendar year[5]

	CARBOB (Gasoline)	Diesel	Jet
Share of Total Deficits by Source	85%	14%	0%
Share of Credits by Fuel Alternative	40% (24% Electric, 16% ethanol)	44% (36% Renewable Diesel, 8% Biodiesel)	<1% (Alternative Jet Fuel)

Very few (<1%) AJF credits are generated because of the relatively higher cost of AJF compared to renewable diesel, not because of the absence of conventional jet fuel deficits. The relative cost of the fuels that can generate credits will be unchanged by the CARB proposal and therefore the relative supply and demand for renewable diesel and AJF credits is also unlikely to change. The LCFS proposal is likely to undermine the critical need to rapidly scale up

[5] A4A analysis of LCFS Program Quarterly Data Spreadsheet, available at https://ww2.arb.ca.gov/sites/default/files/2023-10/quarterlysummary_Q22023.xlsx

production and use of SAF in order to meet ambitious government and aviation sector climate goals, including California's own ambitions for aviation within the state.

Also, regarding implementation, the proposal identifies producers as the First Fuel Reporting Entity for jet fuel but does not provide any information for how Reporting Entities would determine the volume of jet fuel used for flights within California. Data on jet fuel usage for flights within California is not currently collected or readily available and reporting entities would not be able to accurately measure and report on jet fuel used for intrastate flights across all types of operators – commercial, business, and general aviation. CARB's proposal is therefore completely unworkable and cannot be complied with in its current form.

2. The air quality benefits attributed to the intrastate jet fuel obligation are inaccurate and overstated.

299.2 referenced

A4A and its members concur with CARB's assessment that SAF has the potential to provide local air quality (LAQ) benefits (compared to conventional jet fuel) near airports. Significant academic and industry research has been conducted, including full scale static engine tests and flight tests have demonstrated lower Sulphur Oxides (SOx) and Particulate Matter (PM) emissions from SAF compared to conventional fossil jet fuel. However, we disagree with CARB's analysis and presentation of future LAQ levels that implies reductions in jet fuel related LAQ emissions resulting from the proposed intrastate jet fuel obligation. In addition, we recommend CARB review its model for jet fuel LAQ emissions as it does not appear to reflect the current scientific consensus. This analysis is so fundamental to CARB's proposal that it deserves an accurate and more robust study of the available facts.

As described in earlier sections of this document, the proposal to remove the jet fuel exemption is unlikely to stimulate additional SAF production, with producers most likely using credits generated by other fuels to satisfy the jet fuel obligation. Further, whatever increases in SAF production occur over the forecast time period will be the result of all economic levers: federal incentives[6], LCFS incentives, LCFS deficit generation, and operator contributions. Attributing all SAF increase to only LCFS deficit generation is a misattribution of benefit of the proposed obligation. Therefore, claims of PM and NOx reduction from SAF use as a result of the intrastate jet fuel proposal are greatly overstated. LAQ emissions reduction will only occur when and where SAF is actually used in significant quantities.

In addition, we note that CARB's analysis of the benefits of LAQ emissions resulting from the use of SAF is based on a single series of tests conducted by NASA in 2009 and reported on in 2011[7]. CARB's interpretation of the results from this test identified that "Alternative jet fuel emits 87.4% the NOx and 55% the PM2.5 that fossil jet fuel emits." Additional research has been conducted since 2009 and the scientific consensus differs significantly from what CARB has modeled. The Airport Cooperative Research Program analyzed the body of research available in 2018 and concluded that SAF minimally reduces or has no effect on NOx. The body of research and summary analysis does verify that potential reductions in SOx and PM emissions are significant, similar to CARB's assumptions, and generally proportional to the SAF blend

[6] See ISOR p. 55, IRA tax credits are included in baseline scenario
[7] See ISOR Appendix C-1, Sec VI, p. B-6

percentage as combusted in the engine.[8] We recommend CARB review its Methodology for Estimating Changes in Criteria Pollutant Emissions from Use of Alternative Jet Fuel for AJF emissions and update to current scientific consensus.

3. The proposal to remove the exemption for jet fuel used on flights within California is pre-empted by Federal Law.

CARB's Previous Recognition of Federal Preemption

299.3 reference

Conventional Jet Fuel (CJF), which is defined in section 95481(a)(33) of the LCFS regulation, is currently exempt from the LCFS Program through section 95482(c)(2). When CARB proposed and then finalized this exemption as part of the 2018 LCFS rulemaking, CARB stated, correctly, that "[s]ubjecting aircraft fuels to annual carbon intensity standards would raise federal preemption issues."[9] CARB then pointed out that it "has the authority to amend the LCFS regulations to create incentives to promote the use of low carbon fuels in aircraft by allowing credit for such fuels. Importantly, by promoting the voluntary production and use of alternative jet fuel, CARB would not be regulating aircraft fuels, but rather would simply be creating opportunities for airlines to better support California's GHG objectives."[10] A4A fully supported CARB's continuation of the non-deficit generating status of CJF (which was originally set forth in section 95480.1(d)(1) of the LCFS regulation before being moved to section 95482(d)(4)) and its inclusion of AJF as a credit-generating fuel under the LCFS Program on a voluntary, opt-in basis.[11]

The exemption in section 95482(c)(2) is expansive and encompasses all CJF, whether used in intrastate flights or any other flights taking off from California airports. Nothing has changed since the 2018 LCFS rulemaking, meaning California, like every other state in the country, continues to be federally preempted from regulating jet fuel irrespective of a flight's destination. Put another way, CARB remains subject to federal law that clearly preempts any authority other than the Federal Aviation Administration (FAA) from regulating aviation fuel, and CARB is compelled to maintain the scope of 95482(c)(2) to include CJF used for intrastate flights.

Preemption Under the Clean Air Act and the Federal Aviation Act

Federal law has for many decades made clear that the FAA has exclusive jurisdiction over jet fuel and that states are expressly preempted from adopting and enforcing fuel standards for aircraft:

[11] We incorporate by reference the comments we filed during the 2018 LCFS rulemaking, "Comments on the 2018 Amendments to the Low Carbon Fuel Standard" (April 23, 2018), and "Airlines for America's Comments on Proposed Modifications to the Proposed Revisions to the Low Carbon Fuel Standard (LCFS) Regulation" (July 5, 2018).

> The Administrator of the [FAA] shall prescribe-
>
> (1) standards for the composition or chemical or physical properties of an aircraft fuel or fuel additive to control or eliminate aircraft emissions the Administrator of the Environmental Protection Agency decides under section 231 of the Clean Air Act (42 U.S.C. 7571) endanger the public health or welfare; and
>
> (2) regulations providing for carrying out and enforcing those standards.[12]

Congress added this provision to the Federal Aviation Act of 1958 in conjunction with its adoption of Sections 231-234 of the Clean Air Amendments of 1970. Taken together, those complementary legislative enactments manifested an express Congressional intent that federal regulation alone was govern the regulation of aircraft emissions.[13]

That express intent with respect to the aircraft fuel and emissions must be read in the broader context of federal preemption of the field of aircraft regulation that has been legislated by Congress and embraced by the courts. As the Supreme Court has held, it is well-settled that the Federal Aviation Act of 1958 creates a "uniform and exclusive system of federal regulation" of aircraft that preempts state and local regulation.[14] This recognizes the critical importance of ensuring aircraft operations are not subject to a patchwork of state and local laws. It also recognizes the critical importance that maintaining the integrity of aviation fuel has to maintaining the safety of aircraft operations. Quite simply, Congress recognized the need to ensure the FAA had sole and exclusive authority to regulate aviation fuels.

As a corollary of the federal government's express and exclusive authority with respect to the regulation of aviation fuel, Section 233 of the Clean Air Act explicitly preempts states and their political subdivisions from "adopt[ing] or attempt[ing] to enforce any standard respecting emissions from any aircraft or engine thereof unless such standard is identical to a standard" established under section 231,[15] which requires that the FAA be consulted on any aircraft *engine* emission standards proposed by the U.S. Environmental Protection Agency (EPA).[16]

---

[12] *See* 49 U.S.C. § 44714 ("Aviation fuel standards").

[13] *See* Conf. Rep. No. 1783, 91st Cong. 2nd Session (1970) ("The states were preempted from adopting or enforcing any emissions control standard with respect to aircraft or aircraft engines to which federal standards would apply").

[14] *See Burbank v. Lockheed Air Terminal, Inc.*, 411 U.S. 624, 639 (1973); see also *American Airlines v. Department of Transp.*, 202 F.3d 788, 801 (5th Cir. 2000) (aviation regulation is an area where "[f]ederal control is intensive and exclusive") (quoting *Northwest Airlines, Inc. v. Minnesota*, 322 U.S. 292, 303 (1944)).

[15] *See* 42 U.S.C. § 7573; 40 C.F.R. § 87.3(d).

[16] 40 C.F.R. § 87.3(a) (EPA emission standards "apply to engines on all aircraft that are required to be certificated by FAA"). Aircraft and engine certification is the exclusive domain of the FAA. Thus, any state

EPA, for its part, has openly acknowledged that FAA has exclusive authority over aviation fuel. In a 2012 response to a rulemaking petition requesting that EPA address the lead content of fuel used in piston-engine general aviation aircraft, EPA explained as follows:

> EPA has no direct authority on setting . . . aviation fuel specifications by regulation. Rather, FAA has authority to prescribe standards for the composition or chemical or physical properties of aircraft fuels to control or eliminate aircraft emissions. 49 U.S.C. § 44714. However, under current practice, these specifications are not set directly by government regulation. Rather, FAA indirectly regulates aircraft fuel by specifying that fuel meeting specifications identified by the aircraft engine manufacturer as part [of] the engine type certificate . . . must be used by the operator as a condition of operating the aircraft under its type certificate. Thus, while EPA has an interest in environmentally compatible fuels, our direct role here is limited to setting an engine emission standard under [Clean Air Act] section 231 that can be met, within appropriate leadtime, with the development and application of requisite technology, giving appropriate consideration to the cost of compliance and to safety and noise factors.[17]

In accordance with the legislative directives of CAA Section 231 (requiring the EPA Administrator to issue regulations for aircraft engine emissions) and Section 232(a) (granting

---

regulation that interferes with EPA's emissions standards for aircraft engines also interferes with FAA's authority.

[17] *See* EPA, *Memorandum in Response to Petition Regarding Lead Emissions from General Aviation Aircraft Piston-Engines*, at 16 (July 18, 2012) (footnote omitted) (emphasis added), available at https://www.epa.gov/sites/default/files/2016-09/documents/ltr-response-av-ld-petition.pdf; *see also* 75 Fed. Reg. 22440, 22441 (Apr. 28, 2010) ("Under the [Clean Air Act], if, in the Administrator's judgment, lead emissions from the use of leaded avgas cause or contribute to air pollution which may reasonably be anticipated to endanger public health or welfare, then EPA would be required under our statutory authority to prescribe standards to control the emissions of lead from piston-engine aircraft. In promulgating such standards, the EPA would be required to consult with the [FAA], and could not change standards if doing so would significantly increase noise and adversely affect safety. FAA would then be required, after consultation with EPA, to prescribe regulations to [e]nsure compliance with any standards to control the emissions of lead from piston-engine aircraft. ***Under 49 U.S.C. 44714, FAA would also be required to prescribe standards for the composition or chemical or physical properties of piston-engine fuel or fuel additives to control or eliminate aircraft lead emissions***.) (emphasis added); *id.* at 22445-46 ("**fuels used exclusively in aircraft engines are to be regulated by the FAA**") (emphasis added); National Academies of Sciences, Engineering, and Medicine, *State and Federal Regulations That May Affect Initiatives to Reduce Airports' GHG Emissions*, at 15 (2012) (footnote omitted) ("EPA's authority to establish [aircraft emission standards] under the [Clean Air Act] does not extend to the regulation of jet fuel. Rather, FAA has exclusive authority to prescribe 'standards for the composition or chemical or physical properties of an aircraft fuel or fuel additive to control or eliminate aircraft emissions' for pollutants EPA has found endanger the public health and welfare"), available at https://www.nap.edu/cart/download.cgi?record_id=22671.

the Secretary of Transportation authority to enforce standards issued under Section 7571) both EPA and FAA have issued regulations exercising their exclusive authorities in this space.[18] There is no language in those regulations suggesting an exemption that would allow California or any other state to regulate fuel content, nor has any court decision recognized the same.

For aviation fuel, 14 CFR § 34.3 sets forth the uniform "General Requirements" for that fuel. As explained above, that regulation contemplates FAA setting standards in consultation with EPA as the federal agency with expertise in this area. States, however, are not involved, reflecting the legislative intent for uniform federal regulation. Further, the LCFS is not identical to any fuel standard that has been adopted by EPA and FAA under the auspices of Sections 231 and 233 of the CAA and the Federal Aviation Act. Extending its reach to aviation fuel is therefore not excused from preemption.

<u>The Federal Aviation Act Preempts State Regulation of Aircraft Operations</u>

Extending the reach of the LCFS to jet fuel would impose a regulatory mandate of aircraft operations. California is both expressly precluded from regulating aircraft fuels, and the Federal Aviation Act more broadly preempts the field of aviation regulation so as to preclude applying the LCFS to aircraft operations. *See City of Burbank*, 411 U.S. at 634 (explaining that the *pervasive* nature of federal regulation evidences Congress' preemptive intent). Congress recognized that the airline industry is a uniquely complex, interconnected system in which even the slightest disruption can have ripple effects that disrupt the functioning of the National Airspace System and interstate commerce.

Indeed, with respect to operational mandates there is no "minor" encroachment in the aviation industry—any state interference with airlines' operations has the potential to cause chaos at a national or international level. *Northwest Airlines v. State of Minnesota*, 322 U.S. 292, 303 (1944) ("Planes do not wander about in the sky like vagrant clouds. They move only by federal permission, subject to federal inspection, in the hands of federally certified personnel and under an intricate system of federal commands. The moment a ship taxies onto a runway it is caught up in an elaborate and detailed system of controls. It takes off only by instruction from the control tower, it travels on prescribed beams, it may be diverted from its intended landing, and it obeys signals and orders. Its privileges, rights, and protection, so far as transit is concerned, it owes to the Federal Government alone and not to any state government").

This concern prompted Congress to vest FAA with sole, exclusive authority to regulate airline *operations*. As the court explained in *Arapahoe County Public Airport Authority v. Federal Aviation Administration*, 242 F.3d 1213, 1221 (10th Cir. 2001), it is "difficult to visualize a more comprehensive scheme of combined regulation, subsidization, and operational participation than that which Congress has provided in the field of aviation") (citations omitted). ("Congress' clear intent to occupy the field with respect to the airline industry "tilts the balance toward the application of supremacy principles to protect against state courts trumping the federal interests and concerns") *Id.*; *see also English v. General Electric Co.*, 496 U.S. 72, 79 (1990) ("in the absence of explicit statutory language, state law is pre-empted where it regulates conduct in a field that Congress intended the Federal Government to occupy exclusively").

---

[18] See notes 14 and 15, supra. FAA has issued regulations under 49 U.S.C. § 44714, set forth at 14 CFR Part 34.

Extending the LCFS to Aviation Fuels Would be Preempted by the Airline Deregulation Act

California's proposal would interfere with airlines' prices, routes, and services, and is therefore preempted under the Airline Deregulation Act (ADA). Under the ADA, states are expressly forbidden from interfering with airlines' prices, routes, and services. The ADA provides that "[a] State, political subdivision of a State, or political authority of at least 2 States may not enact or enforce a law, regulation, or other provision having the force and effect of law related to a price, route, or service of an air carrier." 49 U.S.C. § 41713(b).

This is an expansive prohibition and federal courts have consistently struck down laws that even minimally encroach on the aviation industry. *Rowe v. New Hampshire Motor Transport Association*, 552 U.S. 364 (2008). Congress' goal in passing the ADA was to avoid inefficient regulation of the airline industry and to allow market demands to drive airlines' competitive decisions. *Federal Express Corp. v. California Public Utilities Commission*, 936 F.2d 1075, 1075, 1079 (9th Cir. 1991) (explaining that Congress preempted state regulation of the airline industry to create a "sound regulatory environment" and to "facilitate adaptation of the air transportation system to the present and future needs of the domestic and foreign commerce of the United States). By including these specific statutory preemption provisions, Congress sought to ensure the ADA purposes and avoid the effect of a balkanized system of local laws and a patchwork of regulatory regimes at odds with a national objective of deregulating air commerce. *Ventress v. Japan Airlines*, 747 F.3d 716 (9th Cir. 2014).

California's proposed LCFS expansion would cause disruptions that would impermissibly interfere with airlines' operations, including but not limited to:

- Forcing airlines to alter their methods of tracking fuel supply sources and uses.
- Forcing airlines to potentially alter the amount of fuel carried by planes involved in intrastate trips.
- Forcing airlines to restructure their supply chain based on California's regulatory CI metric, rather than based on the demands of the marketplace.

All of these effects will have impacts on airlines' prices, routes, and services. They are all far more disruptive to airlines' methods of service than other state regulations that have been struck down, such as the signature requirement for packages at issue in *Rowe*. 552 U.S. 364. They will also affect airlines' prices because disruptions to the supply chain and the larger market will raise costs for airlines, and those costs will inevitably be passed on to consumers.[19]

Any argument that the economic impact from the rule will be felt by fuel producers, not airlines themselves, is also misplaced. Higher costs for fuel producers will be passed on to the airlines and it is beyond dispute that higher costs translate into higher prices. "It is freshman-year economics that higher prices mean lower demand, and that consumers are sensitive to the full price that they must pay, not just the portion of the price that will stay in the seller's coffers."

---

[19] While the ADA does not prevent a state that owns or operates an airport from carrying out its proprietary powers and rights (49 U.S.C. § 41713(b)(3)), the regulation of jet fuel does not fall within said powers, and 49 U.S.C. § 44714 recognizes no exception to its express preemptive language. *see also Arapahoe* County, 242 F.3d at 1221-22 (explaining the interactions of FAA's preemptive authority and the "proprietary powers" exception).

Sanchez, 590 F.3d 1027 at 1030 (citing *Buck v. Am. Airlines, Inc.*, 476 F.3d 29, 36 (1st Cir. 2007)).

CARB's Program in its Current Form Would Violate the Commerce Clause

CARB's Program also is not in conformity with the Dormant Commerce Clause. Courts have refused to enforce state regulations with the type of burdens that are proposed here on instrumentalities of interstate transportation—trucks, trains, and the like. *See, e.g., Bibb v. Navajo Freight Lines, Inc.*, 359 U. S. 520, 523–530 (1959) (concerning a state law specifying certain mud flaps for trucks and trailers); *Southern Pacific Co. v. Arizona ex rel. Sullivan*, 325 U.S. 761, 763–782 (1945) (addressing a state law regarding the length of trains).[20]

These cases support a prohibition on state regulations that impose improper or discriminatory extraterritorial burden, and apply a balancing of legitimate interests which has not been undertaken here. At a minimum, these cases condemning state laws that "although neutral on their face . . . were enacted at the instance of, and primarily benefit," in-state interests. *Raymond Motor Transp., Inc. v. Rice*, 434 U. S. 429, 447 (1978). These concerns predominate where preemption also applies state regulation of the entire field of aviation operations and fuels, and where a lack of national uniformity would impede the flow of interstate goods.

4. Concerns about the proposed guardrails on crop and forestry-based fuels through supply chain traceability and certification

299.5 During CARB's workshops held in 2022 and 2023 and the CARB Board Meeting held on September 28, 2023, CARB Staff and Board members expressed desire to establish "guardrails" for crop-based feedstocks. A4A and its members concur with CARB that "biofuel production must not come at the expense of deforestation or food production" and towards that end urge CARB to continue relying on its robust carbon intensity methodology for assessing land use change,[21] including a quantification of the indirect effects associated with crop-based biofuels. The analytical, science-based methodologies used by CARB provide the necessary controls on feedstocks and fuels to ensure environmental integrity. As the available science continues to evolve, these models can be and are updated.

The proposal to establish supply chain traceability requiring certification through third party Sustainability Certification Systems (SCS) raises several concerns. First, this concept was not shared during workshops and thus does not have the benefit of stakeholder consideration and feedback. Stakeholder consultation would be needed to discover additional detail process requirements and definition necessary for implementation. As a result, the SCS certification program, as envisioned by CARB, may take longer to develop and implement than has been allocated by CARB.

---

[20] See generally *National Pork Producers Council et al. v. Ross*, 598 U.S. 356, 373 (May 11, 2023); *see also id.*at, 389 n.4 (dormant Commerce Clause protects the instrumentalities of transportation from state regulation).

[21] *See* 17 CCR § 95488.3.

Second, there are only two established third-party SCSs generally relevant to biofuels and both have been developed through Europe-based organizations. Both SCSs have requirements that have limited experience in being applied to U.S. agricultural feedstocks and supply chains. The proposal should instead rely on an existing U.S. government standard, such as controls incorporated into the EPA Renewable Fuel Standard.

Third, the existing SCSs are struggling with capacity constraints in providing certifications under already established voluntary certification programs, EU RED, and ICAO CORSIA. Burdening the existing SCSs with an additional requirement for the CARB LCFS program could create an administrative bottleneck on qualifying feedstocks and supply chains for the LCFS program that would otherwise be qualified. This would have the adverse impact of slowing down supply growth, which for the still emerging SAF market is a constraint that must be avoided.

We urge CARB to reconsider the necessity of and timeline for this proposed requirement at this time. CARB should consider other options which may accomplish the same intent of providing reasonable assurance that biofuel production credited under the LCFS program does not come at the expense of deforestation or food production without creating undue administrative impediments to the availability of SAF supply that would otherwise meet sustainability requirements.

5. Concerns about SAF producer's ability to source low-carbon intensity electricity and hydrogen produced from low-carbon intensity electricity through indirect accounting

299.6

Under the existing LCFS Regulation, indirect accounting (aka book-and-claim accounting) is authorized for low-CI electricity supplied as a transportation fuel or to produce hydrogen through electrolysis if that hydrogen is used either as a transportation fuel or in the production of another transportation fuel (e.g., SAF). Through these provisions, SAF production facilities are explicitly authorized to source low-CI electricity from the grid to produce hydrogen that is used in the production of transportation fuels. Under the existing LCFS provisions, low-CI electricity can be sourced flexibly through the use of Renewable Energy Certificates (RECs) or via a qualifying Green Tariff program.

The proposed LCFS program revisions would dramatically narrow the power-sourcing landscape for SAF producers and limit the use of "Indirect Accounting" for "low-CI Electricity" to produce "Hydrogen as a transportation fuel." The proposed amendments would revoke the current authorization to source low-CI electricity for electrolysis through the REC mechanism when used for SAF production.

CARB's proposal will particularly and severely inhibit the growth of Power to Liquid (PtL) SAF production, availability and use in California. PtL is a promising fuels pathway that has the potential to provide very low CI SAF. Other jurisdictions (e.g. European Union and United Kingdom) have policies in place to attract PtL SAF, and CARB's proposal will encourage PtL SAF producers that utilize indirect accounting for the sourcing of low-CI electricity in their production to sell their fuels into those jurisdictions. Other types of biomass based SAF utilizing indirect accounting for use of low-CI electricity in their SAF production will have their CI scores lowered accordingly, which may make markets in other jurisdictions more attractive.

We recommend CARB preserve its existing policy allowing use of indirect accounting mechanisms for low-CI electricity that is used for hydrogen production in the production of a transportation fuel. We also recommend that CARB expand the use of its existing indirect accounting mechanisms to extend the use of book-and-claim RECs to facilities sourcing power to produce SAF, PtL and other alternative fuels.

CONCLUSION

A4A supports the existing opt-in crediting model under the LCFS, combined with U.S. federal incentives, as an effective approach for increasing SAF production, use and availability in California. With further collaboration and partnership, we see the potential to dramatically increase the production and use of SAF in California and other jurisdictions and are interested in identifying new opportunities to work together. A4A offers its technical and operational expertise to work together with CARB and other stakeholders in better understanding the challenges and opportunities for promoting the availability of SAF to achieve CARB's objectives of a sustainable and workable reduction of carbon emissions in the transportation sector. The proposal to remove the exemption for jet fuel used on flights within California, however, will not be an effective tool for stimulating SAF production, and instead would divert resources and attention away from SAF objectives shared by California and the aviation industry. In addition, CARB is federally pre-empted from removing the exemption for jet fuel and obligating conventional jet fuel as a deficit-generating fuel. We urge CARB to reconsider and withdraw the proposal to eliminate the exemption for jet fuel used on flights within California.

Chair Liane Randolph and the Members of the Board
California Air Resources Board
1001 I Street
Sacramento, CA 95814

RE: World Energy's Comments on the Proposed Amendments to the Low Carbon Fuel Standard

Dear Chair Randolph and Members of the Board,

World Energy values the opportunity to provide comments on the proposed amendments to the Low Carbon Fuel Standard (LCFS). We also wish to thank your staff for their hard work in updating the regulations in a timely manner. The LCFS continues to play a significant role in helping California transition to cleaner transportation and remains a model policy for other jurisdictions hoping to achieve similar emission reductions.

World Energy is one of the largest and longest-serving advanced clean energy suppliers in North America. We were the world's first producer of sustainable aviation fuel (SAF) and remain leaders in the field of renewable fuels. Our facility in Paramount, CA is in the final stages of conversion from a petroleum refinery to a 100% renewable fuels bio-refinery. When completed, World Energy's Paramount facility is projected to increase production capacity to approximately 350 million gallons of low carbon fuels per year.

We have made significant investments in continuously reducing the carbon intensity of our fuels and producing very-low carbon fuels for the California market. We have fuel pathways providing up to an 85% reduction in carbon intensity. Our fuels have helped the LCFS program meet and exceed its targets, and our Paramount plant is a premiere example of the clean energy future. World Energy continues our commitment to reduce transportation emissions including investing $4 billion in scaled manufacturing and new technologies to achieve our goal of supplying 1 billion gallons of sustainable aviation fuel annually by 2030.

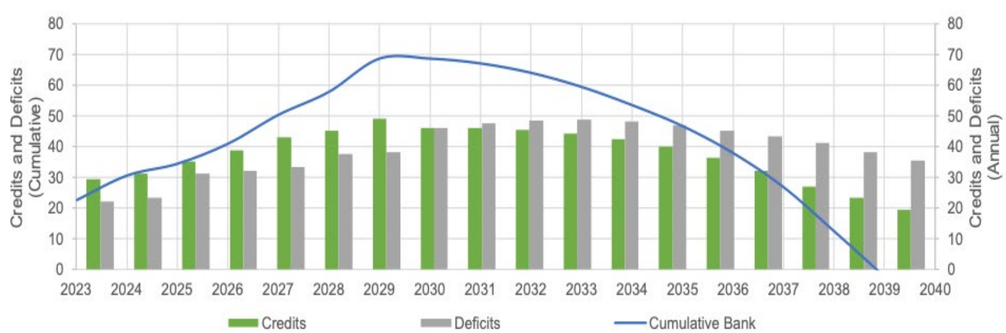
World Energy wishes to provide the following comments in response to the proposed amendments to the LCFS:

2030 Target

300.1 Increasing the 2030 target to 30% reduction is a step in the right direction, however, we urge CARB to consider a more ambitious target. As we see the market reacts to the large balance in the credit bank, weighed against a 30% reduction target, the corresponding drop in market prices makes it clear that more carbon reductions are possible.

Along with other stakeholders, World Energy has been working with ICF to model the LCFS targets. The recent ICF modeling relative to the ISOR[1] highlights that 30% CI by 2030 is still conservative and will leave an estimated 70 million in excess credits in 2029 (Figure 2). With such a large credit bank, program investors will have a low incentive to further invest in the newest technologies and innovations in carbon reduction. The ICF "Central Case" modeling shows more aggressive 2030 CI targets of 41-44% are readily achievable given the anticipated fuel volumes and CI reductions across various fuel pathways.

Figure 2. Credit-Deficit Balance in the ICF ISOR Case



In addition to increasing the 2030 targets, we recommend CARB consider changes to the proposed step-down and Auto Acceleration Mechanism (AAM).

Step Down

300.2 Increasing the step-down by at least 2% (for a total step-down of at least 7%) will right-size the current credit to deficit ratio and allow for the current robust credit bank to be utilized. This could potentially abate an immediate trigger of the Auto Acceleration Mechanism in its first eligible year.

Auto Acceleration Mechanism

300.3 The proposed Auto Acceleration Mechanism is an important new concept for credit generators in the LCFS. World Energy is very supportive of this proposal. The initial staff proposal is strong, but World Energy has a couple of suggestions for the proposed design. First and most important, our modeling suggests that the proposed 2030 target and 5% step-down will only serve to increase the credit bank and dampen investment in low carbon fuels. Moving the first eligible date of the AAM forward may be necessary to allow for the AAM to "catch" any near-term adjustments needed. In the current proposed amendments, the Executive Officer will announce whether the AAM has been triggered starting in May 2027, with an effective date in January 2028. Instead, a first eligible trigger announcement in 2026 for a 2027 effective date would be more appropriate. While the staff proposal is likely giving the market time to "adjust" to the new 2030 targets after a 2025 implementation, our experience is that the market reacts in real time. As of February 2024, the market has already modeled, reacted to, and priced the proposed 2030 targets, and the result has been a *decrease* in credit price. The current credit price reflects the market's belief that the package of design details is insufficient to draw down the credit bank precipitously. In that instance, the AAM is needed as soon as possible to help with a large oversupply of credits. With the current pace of the market and size of the credit bank, the AAM will be needed as soon as possible to recalibrate the program and account for the many GHG emissions that would go unaddressed if the AAM is delayed.

Alternative Jet Fuel (AJF) / Sustainable Aviation Fuel (SAF)

300.4 World Energy sees alignment between the staff proposal to include intrastate jet fuel under the provisions of the LCFS and the goals of the program, which are to abate climate impacts from the state's transportation sector. As AJF continues to develop and grow in the state, including incentives within the LCFS will only serve as encouragement for increasing production of AJF. World Energy is hopeful that it will foster additional growth in the use of AJF as a low-CI alternative for aviation in California.

Book-and-Claim

<u>Hydrogen</u>

300.5 World Energy would also like to express our support for the extension of book-and-claim to additional fuels like hydrogen. Book-and-claim is essential in maintaining and promoting the success of the LCFS program. It has enabled many GHG emission reductions and encourages more low-CI fuels to enter the California market. In part, World Energy believes that book-and-claim plays an important role for carbon reductions to happen wherever possible, without necessitating an unnecessary (and carbon intensive) shipment of products to disparate locations.

As CARB proposes including book-and-claim for hydrogen, we support the addition as it will aid in the deployment of renewable hydrogen in the state, a crucial component to transitioning California's hard-to-decarbonize transportation and other technologies.

One key area for improvement in the book-and-claim proposal is extending the provisions outside California, consistent with other LCFS provisions. The current proposal calls for a California pipeline connection in §95488.8(i)(3)(A). The requirement as written favors only in-state hydrogen pipelines and does not provide incentives for renewable fuel production outside California. Absent this allowance, CARB is implicitly providing no incentive for low carbon hydrogen over fossil-based hydrogen for fuels produced in other states. In order to advantage low CI hydrogen across the country, allowing book-and-claim for interconnected regional hydrogen pipelines will be necessary to overcome traditional hydrogen's cost advantages. As such, World Energy recommends modifying §95488.8(i)(3)(A) as follows:

Low-CI hydrogen is injected into a dedicated hydrogen pipeline physically connected to <u>a distribution system or a production facility that provides transportation fuel to California.</u>

<u>Electricity</u>

300.6

World Energy appreciates the introduction of power sourcing flexibility as proposed under the draft regulation in §95488.8(i)(1). This is important for facilities like our Paramount plant, which is in a dense urban area. Our plant's location will require us to site more remote new renewable energy projects, like the Mojave Desert, which will be within the same balancing authority but may not have a direct, dedicated connection. We believe in further reducing the CI of the fuels we produce at our plants but look to CARB for an investment signal in the value of this lower carbon electricity. To this end, there are key restrictions within the proposal that may not serve to advance the market.

Specifically, the proposal under §95488.8(i)(1)(C) should be broadened to apply to other renewable fuel / project types, including SAF. This will provide incentives for World Energy and other producers to further lower the CI of the electricity used to produce our renewable fuels, beyond what is available from the grid. We urge CARB to consider that biorefinery locations will frequently be near other industrial and distribution infrastructure, whereas new renewable energy generation will necessarily be sited in more remote areas of the state. Writing the regulation with respect to these land use realities will help World Energy and future renewable fuel production within the state's boundaries.

Sustainability Criteria and Soil Carbon Accumulation

300.7 We encourage CARB to recognize the low carbon regenerative agriculture practices used in the production of low carbon biofuels that minimize negative impacts of agriculture and encourage the environmental benefits (soil carbon restoration and GHG impacts) of bio-based fuels. EU RED now recognizes soil carbon accumulation in their lifecycle carbon assessments as described in Annex V – "Methodology for Determining the Emission Savings from Soil Carbon Accumulation Via Improved Agricultural Management" and there are new procedures through the Geneva based sustainability organization, RSB, to implement these practices.[1,1]

We encourage CARB to study and adopt current research from the EU which recognizes the use of biochar as a carbon negative soil amendment, a practice that has significant potential to reduce atmospheric CO2 and simultaneously sequester and restore healthy soil carbon through agricultural practices.

Ocean-going and Marine Vessels

300.8 Given the addition of intrastate fossil jet as a deficit generator in the LCFS proposed amendments, World Energy requests CARB to consider adding ocean-going and marine vessels to the program. Like aviation, ocean-going and marine vessels are hard-to-decarbonize and represent more than 150% of the GHG emissions from aviation. Similar to the other success stories of the LCFS, including ocean-going and marine vessels can signal for long-term investment in finding low-CI solutions. While this may not be an issue that staff can incorporate in this rulemaking period, we encourage staff to begin the learning process now for a future program update. One early example is biodiesel testing (B100) on Canada Steamship Lines in their Great Lakes / St Lawrence Seaway fleet.[1]

On January 1, 2024, the EU added maritime fuels into their ETS carbon trading system[1] and the International Maritime Organization (IMO) is following the lead of the International Civil Aviation Organization in their commitment to reduce GHG emissions similar to the commercial aviation industry.[1] Similar to California's lower carbon aviation fuel goals, California can encourage lower carbon maritime fuels through the LCFS program.

World Energy wishes to provide the following comments in response to the proposed amendments to the LCFS:

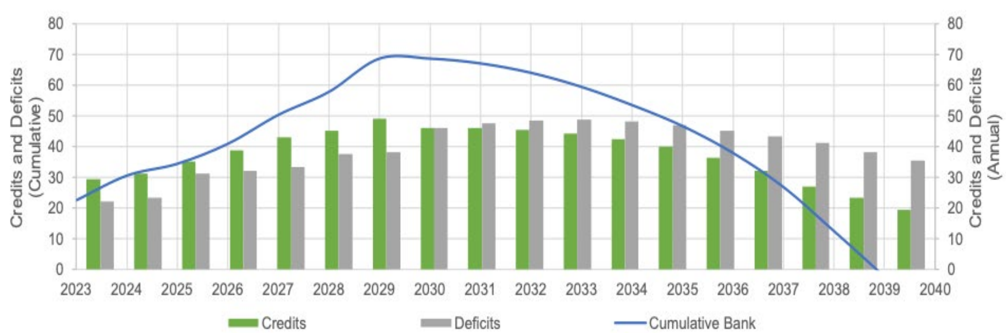
300.1

2030 Target

Increasing the 2030 target to 30% reduction is a step in the right direction, however, we urge CARB to consider a more ambitious target. As we see the market reacts to the large balance in the credit bank, weighed against a 30% reduction target, the corresponding drop in market prices makes it clear that more carbon reductions are possible.

Along with other stakeholders, World Energy has been working with ICF to model the LCFS targets. The recent ICF modeling relative to the ISOR[1] highlights that 30% CI by 2030 is still conservative and will leave an estimated 70 million in excess credits in 2029 (Figure 2). With such a large credit bank, program investors will have a low incentive to further invest in the newest technologies and innovations in carbon reduction. The ICF "Central Case" modeling shows more aggressive 2030 CI targets of 41-44% are readily achievable given the anticipated fuel volumes and CI reductions across various fuel pathways.

Figure 2. Credit-Deficit Balance in the ICF ISOR Case



In addition to increasing the 2030 targets, we recommend CARB consider changes to the proposed step-down and Auto Acceleration Mechanism (AAM).

Step Down

300.2 Increasing the step-down by at least 2% (for a total step-down of at least 7%) will right-size the current credit to deficit ratio and allow for the current robust credit bank to be utilized. This could potentially abate an immediate trigger of the Auto Acceleration Mechanism in its first eligible year.

e: info@worldenergy.net

As CARB proposes including book-and-claim for hydrogen, we support the addition as it will aid in the deployment of renewable hydrogen in the state, a crucial component to transitioning California's hard-to-decarbonize transportation and other technologies.

One key area for improvement in the book-and-claim proposal is extending the provisions outside California, consistent with other LCFS provisions. The current proposal calls for a California pipeline connection in §95488.8(i)(3)(A). The requirement as written favors only in-state hydrogen pipelines and does not provide incentives for renewable fuel production outside California. Absent this allowance, CARB is implicitly providing no incentive for low carbon hydrogen over fossil-based hydrogen for fuels produced in other states. In order to advantage low CI hydrogen across the country, allowing book-and-claim for interconnected regional hydrogen pipelines will be necessary to overcome traditional hydrogen's cost advantages. As such, World Energy recommends modifying §95488.8(i)(3)(A) as follows:

Low-CI hydrogen is injected into a dedicated hydrogen pipeline physically connected to <u>a distribution system or a production facility that provides transportation fuel to California.</u>

<u>Electricity</u>

300.6 World Energy appreciates the introduction of power sourcing flexibility as proposed under the draft regulation in §95488.8(i)(1). This is important for facilities like our Paramount plant, which is in a dense urban area. Our plant's location will require us to site more remote new renewable energy projects, like the Mojave Desert, which will be within the same balancing authority but may not have a direct, dedicated connection. We believe in further reducing the CI of the fuels we produce at our plants but look to CARB for an investment signal in the value of this lower carbon electricity. To this end, there are key restrictions within the proposal that may not serve to advance the market.

Specifically, the proposal under §95488.8(i)(1)(C) should be broadened to apply to other renewable fuel / project types, including SAF. This will provide incentives for World Energy and other producers to further lower the CI of the electricity used to produce our renewable fuels, beyond what is available from the grid. We urge CARB to consider that biorefinery locations will frequently be near other industrial and distribution infrastructure, whereas new renewable energy generation will necessarily be sited in more remote areas of the state. Writing the regulation with respect to these land use realities will help World Energy and future renewable fuel production within the state's boundaries.

Sustainability Criteria and Soil Carbon Accumulation

300.7 We encourage CARB to recognize the low carbon regenerative agriculture practices used in the production of low carbon biofuels that minimize negative impacts of agriculture and encourage the environmental benefits (soil carbon restoration and GHG impacts) of bio-based fuels. EU RED now recognizes soil carbon accumulation in their lifecycle carbon assessments as described in Annex V – "Methodology for Determining the Emission Savings from Soil Carbon Accumulation Via Improved Agricultural Management" and there are new procedures through the Geneva based sustainability organization, RSB, to implement these practices.[1,1]

We encourage CARB to study and adopt current research from the EU which recognizes the use of biochar as a carbon negative soil amendment, a practice that has significant potential to reduce atmospheric CO2 and simultaneously sequester and restore healthy soil carbon through agricultural practices.

Ocean-going and Marine Vessels

300.8 Given the addition of intrastate fossil jet as a deficit generator in the LCFS proposed amendments, World Energy requests CARB to consider adding ocean-going and marine vessels to the program. Like aviation, ocean-going and marine vessels are hard-to-decarbonize and represent more than 150% of the GHG emissions from aviation. Similar to the other success stories of the LCFS, including ocean-going and marine vessels can signal for long-term investment in finding low-CI solutions. While this may not be an issue that staff can incorporate in this rulemaking period, we encourage staff to begin the learning process now for a future program update. One early example is biodiesel testing (B100) on Canada Steamship Lines in their Great Lakes / St Lawrence Seaway fleet.[1]

On January 1, 2024, the EU added maritime fuels into their ETS carbon trading system[1] and the International Maritime Organization (IMO) is following the lead of the International Civil Aviation Organization in their commitment to reduce GHG emissions similar to the commercial aviation industry.[1] Similar to California's lower carbon aviation fuel goals, California can encourage lower carbon maritime fuels through the LCFS program.

Dairy Cares Policy Comments on the Proposed
Low Carbon Fuel Standard Amendments

February 20, 2024

Dairy Cares[1], appreciates the opportunity to provide these comments on the California Air Resources Board's (CARB) proposed, Low Carbon Fuel Standard (LCFS) amendments. Dairy Cares represents the California dairy sector, including dairy producer organizations, leading cooperatives, and major dairy processors.

Introduction

While the comments following are designed to provide a complete overview of California's comprehensive and highly successful efforts to reduce dairy methane in the state, two foundational conclusions remain indisputable:

301.1

1. California cannot achieve the 40% target in livestock methane reduction by 2030 without the continued implementation of dairy digesters which capture enormous quantities of methane on dairy farms in the state.
2. The continued implementation of dairy digesters in California hinges on the incentives provided by continued avoided methane crediting in the LCFS program.

Put simply, without appropriate avoided methane crediting and continued participation in the LCFS, California cannot successfully achieve 40% reductions in dairy and other livestock emissions by 2030 and will fail to achieve the state's overall short-lived climate pollutant (SLCP) targets as sought under SB 1383 and will fail to achieve the state's overall 48% targeted reduction in carbon by 2030.

These conclusions are consistent with any credible analysis of the state's climate strategies and policies, including the CARB 2022 Scoping Plan Update, as well as other CARB analysis[2], and those by UC Davis researchers.[3, 4]

Moreover, continued avoided methane crediting by digesters under the LCFS is fully consistent with CARB's stated goals as outlined in the Initial Statement of Reasons (ISoR) as follows:

Discussion

Livestock’s essential role

California nation-leading dairy sector plays a vital role in providing essential nutrition and supporting the livelihoods and resilience of countless families and communities in rural California. California dairy farms are the most productive and important agricultural commodity in the state and directly and indirectly account for over 180,000 well-paying, year-round, and benefited jobs, most of which are in the eight county San Joaquin Valley.

California dairy farms also play an integral role in California sustainable food systems. Dairy cattle upcycle agricultural and food waste from other agricultural commodities, food and wine processing, and urban food waste. Approximately 40% of California’s dairy feed is from agricultural and food waste, representing 5.5 million tons of feed that has zero additional carbon footprint, and would otherwise need to be landfilled or disposed, leading to significant additional methane and carbon avoidance. Upcycling agricultural and food waste also dramatically reduces land use, water use, use of fossil fuels, pesticides and synthetic fertilizer, as well as resulting in less energy needed to produce traditional feed crops. From 1964 to 2014 the increased use of agricultural byproducts and food waste, as well as improved animal nutrition and animal welfare, contributed to California’s rapidly rising milk product production efficiency, resulting in 89% less land, 88% less water, 45% less greenhouse gases, including reduced methane emissions and fewer fossil fuels used.

California’s dairy farms also provide a critical source of organic fertilizer that dramatically reduces the need for synthetic fertilizer production and use. Manure from California’s dairy farms is a tremendous source of crop nutrients for the state’s growing organic and regenerative farm practices and the advancement of healthy soils, a leading state priority.

When managed properly, dairy farms can reduce their footprint on the planet. California’s dairy farms play a vital role in developing sustainable food systems, a healthier environment, enhanced nutrition, and a better quality of life for all.

California’s comprehensive dairy methane reduction approach

The emission intensity, as well as emission sources of dairy production varies significantly across dairy livestock management practices, and even across regions in California. “Organic pasture-based” operations on California’s North Coast produce more enteric emissions than conventional “free-stall” farming operations in the San Joaquin Valley, while conventional operations in the San Joaquin Valley generally produce more manure methane emissions. “Dry-lot” farming operations generally found in the Chino basin and on older dairies in the San Joaquin Valley also tend to likely produce more enteric than manure methane. Each of these production systems possess unique characteristics, cost/benefits, interactions, and trade-offs. The size of dairy farm operations, while all owned by families, also varies greatly from a few hundred cows to several thousand cows. Recognizing these unique characteristics, CARB and CDFA have correctly recognized that there is no universal one-size-fits-all solution to lowering methane emissions from California’s dairy sector. CARB and CDFA also have correctly recognized that California is not building new dairies. California’s comprehensive approach has appropriately been tailored and designed to work with California’s unique and existing mix of pasture-based, dry-lot and conventional free-stall-barn dairy operations. California's comprehensive approach also recognizes that the effectiveness of intervention options depends on factors such as location, access to services, farmers' willingness to implement interventions, economic considerations, and uncertainty surrounding the efficacy of certain measures.

CARB and CDFA have designed a comprehensive five-part strategy to reduce dairy and other livestock sector methane. CARB and CDFA did not arrive at this comprehensive strategy alone. The strategy was developed with significant input from stakeholders representing broad and diverse interests, including the dairy and other livestock sectors, environmental and environmental justice NGOs, air and water quality regulators, leading scientists and academics, and other state agencies. Multiple stakeholder group meetings were conducted and followed by several public hearings held throughout California, as required by Senate Bill 1383.

The comprehensive approach that has emerged correctly recognizes the broad adoption of sustainable best management practices across California's diverse dairy and livestock farming systems and is crucial to delivering lower emissions and mitigating the environmental impact of dairy and other livestock systems. The approach also correctly recognizes that dairy methane comes from both manure (back end) and enteric (front end) sources and solutions for both are distinct, but necessary since both contribute significantly to the state's methane inventory. In fact, enteric methane counts for slightly more overall methane from the combined California livestock sectors (12 million metric tons) versus methane from livestock manure management (10 million metric tons).

<u>California's Dairy Cow Population Continues to Decline</u>
Fact: no new dairies in California of any significance have been built in the past 7 to 8 years and the state's cow population continues to steadily decline.

California's milk cow population peaked at 1.880 million cows in 2008 and since that time has declined by over 10% to 1.688 milk cows in 2022, according to the USDA's recently published Census of Agriculture (2017-2022). This significant decline is expected to continue and accelerate in the future due in large part to the lack of available water supplies[5] resulting from surface water curtailments and implementation of the Sustainable Groundwater Management Act (SGMA). Increased regulation, high feed costs, skyrocketing energy costs and rapidly rising cost of labor, coupled with historically low milk prices will further accelerate the decline.

The decline in California's milk cow population has already resulted in an estimated 2 million metric tons (MMT) reduction as each fewer milk cow represents an average reduction of about 10 metric tons of CO_2e reduction in the state's annual inventory[6]. Continued reductions in the

[5] Economic Impacts of SGMA on San Joaquin Valley Dairies and Beef Cattle – analysis by ERA Economics
[6] Analysis by UC Davis researchers: Meeting the Call: How California is Pioneering a Pathway to Significant Dairy Sector Methane Reduction

milk cow herd in California, similar to the 2017, 2022 reductions, which averaged approximately 13,000 cows per year, will lead to an estimated additional 100,000 cow attrition over the next eight years. (2023-2030). This continued reduction in cow herd will add another 1 MMT of CO2e reduction in California's inventory or more than 3 MMT of CO2e since 2008. These reductions will be higher if accelerated attrition occurs as no new dairies are expected to be built in the state and the number of operating dairies in the state continues to steadily decline. This latter trend is evidenced by the latest USDA Census of Agriculture, which showed the number of operating dairies in California declined by over 500 dairies from 2017 to 2022.

CDFA's Grant programs

These comments focus primarily on manure methane emissions, due to the important role played by the LCFS in incentivizing sustainable manure methane practices. As part of the comprehensive strategy, CARB and CDFA have designed two primary programs to address manure methane. These programs can broadly be characterized as methane avoidance and methane capture and beneficial use mitigation programs.

CDFA's Alternative Manure Management Program or AMMP has historically provided grants up to 100% of project cost to incentivize farmer adoption. AMMP projects are designed to work on dairies of all sizes and encourage adoption of alternative practices that avoid methane production on dairy farms. Practices include solid-liquid separation systems, conversion from flush to scrape or vacuum systems, conversion to pasture-based systems, or the adoption of compost pack barns. All of these practices avoid manure methane creation by limiting manure in anaerobic conditions where methane production increases. CDFA, with significant financial support from USDA ($85 million), has also recently deployed the Dairy-Plus Program which is designed to maximize methane avoidance on dairy farms. To date, CDFA has funded more than 185 AMMP (170), or Dairy-Plus (15) projects on California dairies. It should be noted, the incentives and funding for these alternative methane avoidance projects has grown substantially, and the number of grants awarded each year now exceeds both the number and dollars awarded under the Dairy Digester Research and Development Program. While AMMP methane avoidance projects are highly cost-effective compared to other programs funded by the state's climate investments, they currently only account for about 10% of the state's manure methane reductions. CDFA's implementation of the Dairy-Plus Program and funding more alternative projects each year will increase the contribution of AMMP projects in overall methane reduction efforts.

DDRDP – Methane Capture and Utilization

CDFA's Dairy Digester Research and Development Program (DDRDP) provides grants to dairy digester projects in California that are designed to buy down the capital cost of the technology. The program only funds a small portion (generally 25% or less) of the overall cost of a typical project. Total project costs can easily exceed $8 - $10 million per dairy farm or more. Additional revenue streams associated with the beneficial use of the captured methane, such as the LCFS, federal Renewable Fuel Standard, as well as the CPUC Biomat and RNG procurement programs, are also needed to incentivize investment.

The LCFS has become the primary program to fully incentivize the development of dairy digesters in the state. This investment has paid significant dividends in California, leading to an estimated 2.4 MMT of CO2e annually in dairy methane reductions from the 140 projects funded to date. These reductions represent about 90% of the total dairy methane reduction from projects funded by the state. These significant reductions are critical to the state's dairy methane reduction efforts, and without these reductions, the state's overall 40% SLCP and 48% GHG reduction targets cannot be met by 2030. The state's DDRDP is also highly cost-effective, returning 1 MT of CO_2e reduction for each $9 invested by the state. The return on investment is greatly magnified by the fact that the reductions are methane emissions and more valuable in short-term efforts to limit additional global warming. As a result, the state's DDRDP is widely regarded as the most cost-effective program. Equally important, the DDRDP is by far the most effective in achieving overall emissions reductions. According to the most recent California Climate Investments 2023 Annual Report produced by the state, the DDRDP accounts for 23% of GHG reductions from all climate programs invested in by the state with just 1.6% of total funds awarded. Moreover, the report highlights that 68% of funds expended on dairy digesters are benefiting priority populations, including disadvantaged communities.

Without participation in the LCFS, these projects are simply not economically feasible and will not be financed in California. Preclusion from participation in the LCFS, or the loss of avoided methane crediting would not only jeopardize existing dairy digester projects but would foreclose the ability to finance the additional 100 or so projects that will be necessary to achieve the state's methane reduction and climate targets.

Direct Regulation Will Prevent Achievement of Targets

While direct regulation of dairy methane reductions is outside the scope of this proceeding, we offer the following comments in response to repeated efforts by environmental justice organizations to directly regulate the dairy industry.

SB 1383 only authorizes CARB to implement regulation of the dairy and livestock sectors after January 1, 2024, and only after key conditions and considerations are met. These conditions and considerations include the determination by CARB and CDFA that any proposed regulations are technologically and economically feasible, cost-effective, and mitigate and minimize (prevent) leakage. SB 1383 also mandates an evaluation of progress made by incentive-based programs.

While none of these mandated considerations have been undertaken and the conditions cannot be met at this time, any effort to impose direct regulation will simply delay further progress toward the goals and ensure they will not be met. Efforts to develop regulations will take years, face significant legal challenges, and only ensure the state's methane reduction targets are not met. Efforts to directly regulate the dairy and beef cattle sectors only in California will also lead to massive methane leakage to other states, which is contrary to SB 1383 and California's leadership role in climate policy. Moreover, the existing comprehensive incentive-based program is clearly achieving the targeted reductions. Throwing out a successful program in search of a new, unproven direct regulatory scheme would be foolish and would ensure the state's climate policies are not followed by jurisdictions.

Conclusion

California's comprehensive approach to reducing methane from dairy operations is widely recognized as an effective model and fully consistent with national efforts being implemented by USDA and other federal agencies. The state's dairy methane reduction strategies are designed to provide cost-effective options and incentives for the state's diverse array of dairy farms. Continuation of these programs and efforts are critical to achieving the state's methane reduction and overall climate goals by 2030. In December 2022, a UC Davis report, *Meeting the*

Call: How California is pioneering a pathway to significant dairy sector methane reduction[7], summed it up as follows:

"Our analysis shows that continued implementation and commitment to the incentive-based climate-smart solutions that are currently driving voluntary dairy methane reduction in California should by 2030 achieve the full 40% reduction in dairy methane sought by the state's regulators without the need for direct regulation."

---

California Hydrogen Coalition

CALIFORNIA HYDROGEN BUSINESS COUNCIL

Hydrogen Means Business in California!

GREEN HYDROGEN COALITION

February 20, 2024

Ms. Liane Randolph
Chair
California Air Resources Board
1001 I Street
Sacramento, CA 95864

Re: Proposed Low Carbon Fuel Standard Regulation

On behalf of the undersigned organizations and companies, we are pleased to submit the following comments for consideration as the California Air Resources Board (CARB) deliberates the proposed updates to the Low Carbon Fuel Standard (LCFS). We would like to express our gratitude for the diligent efforts undertaken to shape the low-carbon fuel standard to address the role of hydrogen. This supports the vision in the Scoping Plan and is crucial to recognize the comprehensive strides made in addressing the essential components of this transformative pathway for achieving carbon neutrality. While acknowledging the inclusion of significant policy components, we must underscore the importance of nuanced adjustments to ensure the success of hydrogen – a success that is also vital for achieving the standards set forth in Advanced Clean Fleets (ACF), Advanced Clean Trucks (ACT), Innovative Clean Transit (ICT), and Advanced Clean Cars 2 (ACC2) regulations. Our comments are largely focused on very specific intricacies that improve the operability of the initial proposal and we look forward to continuing to work closely with the Board and staff to finalize this regulation.

Ambition and Market Stability – *Near Term Proposal*
The regulatory aspirations of California's LCFS have had significant influence in California and beyond – with states like Oregon, Washington, and Minnesota carefully watching this proceeding. The rapid expansion of low carbon fuel alternatives has been remarkable. However, accompanying this progress is a pressing near-term challenge that demands attention to ensure market stability.

302.1 Upon thorough market modeling analysis, we express reservations regarding the proposed one-time 5%[1] stringency step-down. We contend that this increment is insufficient for market stabilization. Consequently, we advocate for the implementation of a one-time 9% increase in stringency, set to commence in 2025. This adjustment is anticipated to yield a substantial 22.75% Carbon Intensity (CI) reduction, a notable enhancement from the initially proposed 18.75%. Moreover, we support a linear progression in stringency, reaching 30% from 2026 through 2030 after the initial 9% increase.

[1] The one-time 5% stringency step-down is essentially cancelled out by the 5% Diesel baseline CI increase noted in Table 7-1 – accordingly a more aggressive CI increase of 9% is needed.

Table 7-1[2] delineates the CI adjustment for the Diesel baseline. The proposed 5% increase elevates the CI benchmark for Diesel from 100.45 to 105.76, inadvertently augmenting the number of credits in the market. This unintended consequence is particularly pertinent due to the outsized impact of biodiesel and renewable diesel on the credit bank. Addressing this, we recommend a 9% increase in CI, effective from 2025, to align with CARB's objectives and stabilize the market.

302.2 Acknowledging CARB's ambition to manage the market's "potential overperformance," it becomes imperative to recognize the cumulative impact on the credit bank through 2030 by adjusting the Diesel baseline CI. As a precautionary measure, we advocate for CARB to incorporate an annual program review of the credit bank, encompassing both deficits and credits, along with a forecast of anticipated fuel demand and production. If the annual review validates the program's feasibility, we propose triggering the Automatic Acceleration Mechanism (AAM) in 2025, rather than waiting until 2027. The earliest market impact of the AAM would be felt in 2026, contingent on meeting market conditions.

While endorsing CARB's endeavors to manage the swift progress in fuel decarbonization, we underscore the urgency to make timely adjustments that will effectively influence the market in this regard. The immediacy of these adjustments is crucial to ensuring the continued success of the LCFS program.

Capacity Crediting

Light and Medium Duty Station Capacity

302.3 To optimize the effectiveness of the Low Carbon Fuel Standard (LCFS) program, a strategic focus on enhancing Light-duty (LD) Hydrogen Refueling Infrastructure (HRI) capacity is imperative. This is particularly crucial to accommodate the unique needs of medium-duty (MD) vehicles, given their co-mingling with LD fleets. The alignment of LCFS capacity credits with market behavior is paramount for station crediting.

In light of this, incentivizing 600kg stations should be reconsidered in the context of California's near- and long-term vehicle and fleet deployment goals. MD vehicles typically require larger stations, and their integration with LD fleets, as opposed to heavy-duty (HD), underscores the importance of incentivizing larger stations. Larger stations, proven to be more reliable, better align with California's policy goals and the current market dynamics.

Maintaining the existing 1200kg credit is recommended, considering its success in driving private sector investment without relying on state grants. This credit has proven effective in supporting the existing HRI, and its continuation is aligned with the ongoing success of the infrastructure.

The US Auto Manufacturers' letter to CEC[3] underscores the industry's perspective on MD vehicles and their operational needs. Specifically, we believe that these stations and the HRI credits supporting them should contemplate high-flow refills at 10 or more kilograms per session of vehicles that have a gross vehicle weight rating of 26,000 lbs or lower, often referred to as class 6.

---

[2] https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2024/lcfs2024/lcfs_appa1.pdf

[3] *Necessity for H_2 Refueling Stations for Medium-Duty Fuel Cell Electric Vehicles in the U.S.*, United States Council for Automotive Research, August 23, 2023

Limitations on Locations

To enhance the viability of hydrogen refueling station, flexibility in locations for both HD and LD is paramount. The current absence of a comprehensive station network argues against stringent geographic limitations. These limitations have the immediate consequence of limiting decarbonization

302.4 and air quality impacts of transitioning from fossil fuels, especially in the overburdened communities along these statewide transportation corridors.

While the implementation of the screenings within the CalEnviroScreen tool and the definitions in regulations provide some flexibility there is still a greater need for adaptability in station placement. Additionally, the impact of inflation and LCFS pricing on GFO 19-602 station buildout necessitates a reassessment of location constraints. The proposed restriction on HD locations are particularly limiting as the SR-60 corridor is not eligible. For example, an existing site supporting the refueling of heavy-duty trucks and wants to add H2 or charging for that matter but isn't technically located in "the right location", will not be eligible for capacity credits even if they are proximate to or there is a nexus to supporting trucks that go into disadvantaged communities. We believe additional discretion should be provided to the Executive Order (EO) on station location crucial to accommodate the evolving landscape.

HyCap Modeling and Multi-Modal Stations

The complexity in modeling multi-modal stations for capacity crediting necessitates ongoing

302.5 collaboration with CARB staff and the National Renewable Energy Laboratory (NREL) to refine the HyCap model. The model must evolve to consider diverse weight classes refueling at the same location. These refinements and functionality are essential and should progress concurrently with the adoption of the LCFS. We will work diligently with CARB staff and NREL to refine and test the model to reflect real world practices and fueling profiles.

Inequity in Capacity Crediting Standards

The imposition of an 80% renewable content requirement exclusively for HRI raises pertinent questions,

302.6 particularly in comparison to Fast-Charging Infrastructure (FCI). This requirement places hydrogen at a competitive disadvantage against other energy sources, which benefit from substantial federal, state, and ratepayer subsidies not extended to hydrogen. The absence of a pathway to generate Hydrogen-Renewable Identification Numbers (H-RINs) in the federal Renewable Fuel Standard (RFS) further disadvantages hydrogen compared to Renewable Natural Gas (RNG) and electricity.

Moreover, the 80% renewable content mandate introduces cost implications. While our industry strives for a high renewable content aligns with market goals, the exclusive application of this requirement to hydrogen is deemed discriminatory. Both the LCFS and HRI send robust signals that have prompted hydrogen station operators to provide decarbonized and renewable hydrogen. However, given the thin market supply and the exclusive application of this requirement to hydrogen, it is crucial to reassess the fairness and practicality of this stipulation.

We suggest that this additional requirement should be eliminated as it is unnecessary and counter to the carbon intensity focus and technology neutral principles that have driven innovation and investment in the LCFS program to date. Existing requirements to state funded projects could be grandfathered but is unnecessary as the LCFS sets the standard and drives commercial decisions that favor lower carbon products. Going forward, the requirement is discriminatory, will reduce available supply, increase the cost of H2 thereby hindering adoption and achievement of the state's zero carbon goals.>

Crediting Window

The shift from a 15-year to a 10-year timeframe for capacity credits has a significant impact on station financing and economics.

302.7

Notably, this change introduces a new challenge for HD stations, which are both larger and more capital-intensive. The shorter 10-year timeframe contrasts with the previously longer capacity crediting period, creating a misalignment with the capital costs associated with HD infrastructure. The substantial capital investment demands a longer-term perspective to ensure the economic viability and sustainability of HD stations. Reevaluating the timeframe in consideration of the unique characteristics and financial requirements of HD infrastructure is crucial for fostering a conducive environment for hydrogen development in this sector.

Capacity Credits for Private Depots

As a principle we believe that public programs should support only publicly available infrastructure. The crediting of private refueling locations under HRI should be grounded in several considerations.

302.8

This approach fails to expand the availability and optionality of hydrogen/fuel cells in the current-year or near-term obligations. The reduced number of publicly available stations limits the options for fleets complying with ACF, particularly impacting the adoption of fuel cell electric trucks.

Private depots should not be overbuilt and capacity crediting for private fleets is counterproductive to the purpose and intent of HRI. It hinders effective utilization of resources and undermines the efficiency of the infrastructure. Private depots carry no risk, they control their own demand. The purpose of the HD HRI program is to eliminate the risk of underutilization and promote the installation of HD H2 stations absent adequate bilateral contracts that would secure offtake and return on capital invested. Private transit facilities incur no such risk.

The HD HRI is intended to eliminate the chicken and the egg problem, by promoting deployment of stations in anticipation of zero-emission vehicle fleet growth. If HD HRS development is dependent on bilateral contracts, it will take a lot longer to deploy and penetration of HD FCETs into the market will take much longer.

Timing and Approvals

302.9 The stipulated 24-month timeline from HRI approval to bringing the Hydrogen Refueling Station (HRS) online raises concerns due to permitting and supply chain delays that have been common to date. The retraction of an approved HRI award has a substantial impact on the viability of a project. We propose granting the Executive Officer the discretion to extend this timeline, provided tangible progress is evident, similar to the flexibility afforded in ACF regulations.

Moving to the approval process for HRI applications, while we agree with the imperative to expedite approvals, the suggestion of tying approvals to a calendar quarter seems overly rigid. Instead, we advocate for a more streamlined 90-day approval period, maintaining efficiency without compromising the thorough evaluation of applications.

Lastly, the current practice of requiring Original Equipment Manufacturer (OEM) certification for a station before operations appears antiquated in the current landscape. It is pertinent to reconsider and potentially eliminate this requirement, aligning with industry advancements and ensuring regulatory practices remain synchronized with technological progress.

In essence, these proposed adjustments aim to strike a balance between expeditious progress and a comprehensive evaluation, fostering an environment conducive to the dynamic and evolving nature of hydrogen infrastructure development.

Reporting

302.10 The introduction of a new quarterly reporting requirement (Appendix A-1, §95491(d)(4)(D)) for hydrogen (H2) fuel sold through pathways utilizing book-and-claim accounting poses notable challenges, particularly for fuel retailers with mixed product inventories supplied from multiple sources.

Comparatively, electricity, utilized for charging does not face a similar reporting burden and gets to maintain a three-quarter temporal requirement and no additionality requirements. This creates an inequitable disparity in policy standards between hydrogen and electricity, placing hydrogen at a distinct disadvantage. The differential treatment risks compromising the equitable evolution of both energy sources within the ZEV landscape, warranting a reassessment of reporting requirements to ensure consistency and fairness.

Tier 1 Calculator

302.11 The liquification energy needs appear to be higher than experienced by actual operation, prompting a need for further evaluation and adjustments to align with realistic energy requirements.

We urge consideration of broadening eligibility criteria by including "process energy" for book and claim in the Tier 1 calculator. The exclusion of process energy is highlighted through a sample calculation, raising the possibility of necessitating Tier 2 pathway submissions solely for process energy credits. This approach is deemed burdensome for all parties involved and merits reconsideration.

Tier 1 Hydrogen Pathway Summary

FOR APPLICANT ONLY - CONTAINS CONFIDENTIAL BUSINESS INFORMATION - DO NOT DISTRIBUTE

Applicant Information	
Application #	
Company Name	
Company ID	
Facility ID	
Pathway Type	Steam Methane Reformation
H2 Production Data	Default Values
Operational Data Period	

Hydrogen Production Quantities		Unit	Total	Gaseous Hydrogen (GH2)	
Total Hydrogen Produced		kg	90,000	90,000	
		MJ, LHV	10,800,000	10,800,000	
H2 for LCFS Pathway(s)	Produced	kg	90,000	90,000	
	T&D Loss Factor	%	1.0%	1.7%	
	Dispensed	kg	88,479	88,479	
	(Calculated)	MJ, LHV	10,617,531	10,617,531	
				Without B&C	With B&C RNG
Maximum Matchable B&C		MMBtu , HHV	12,142		12,142
Hydrogen Reportable by Pathway		kg	90,000	0	90,000
Delivered H2 for CI Calculations		MJ, LHV	10,617,531	0	10,617,531

Carbon Intensity (CI) Calculations								
Fuel Pathway Inputs				Emission Factors		Emissions	GH2 CI (gCO_2e/MJ, LHV)	
Category	Name	Value	Unit	Value	Unit	gCO_2e	Without B&C	With B&C RNG
Feedstock	North American Natural Gas	9,243	MMBtu, LHV	75,496	gCO_2e/MMBtu, LHV	697,776,824	65.72	
Process Energy	North American Natural Gas	3,945	MMBtu, LHV	75,496	gCO_2e/MMBtu, LHV	297,800,042	28.05	28.05
	GH2 Compression	171,000	kWh		gCO_2e/kWh			
	Balance of Low-CI Electricity	1,354	kWh		gCO_2e/kWh			
	Balance of Grid Electricity	21,825	kWh		gCO_2e/kWh			
Book-and-Claim	RNG Matched to GH2	12,142	MMBtu, HHV	57,662	gCO_2e/MMBtu, HHV	700,120,753		65.94
Transportation and Distribution	GH2 Tube Trailer Truck	9,000,000	kg-miles	12.01	gCO_2e/kg-mile	108,094,529	10.18	10.18
	GH2 Fueling	10,617,531	MJ GH2, LHV	3.25	gCO_2e/MJ H_2, LHV	34,532,267	3.25	3.25
Fuel Pathway CI (gCO_2e/MJ H_2, LHV)							107.20	107.42
Margin of Safety (entered by applicant)								
Fuel Pathway CI with Margin of Safety							**107.20**	**107.42**

These suggestions aim to refine the Tier 1 Calculator, ensuring accuracy in energy needs and streamlining the credit allocation process for process energy without imposing undue administrative complexities.

Developing the Hydrogen Economy

To stimulate robust demand for hydrogen, crucial for the rapid expansion of distributed Low-Carbon
302.12 Intensity (CI) hydrogen production, we propose reinstating CARB's prior eligibility provision for LCFS electricity book-and-claim. Previously, this provision encompassed "hydrogen used in the production of a transportation fuel."

While we appreciate CARB's recent decision to extend eligibility to Low-CI hydrogen derived from sources meeting the criteria outlined in §95488.8(i)(3), we express concern over the LCFS Proposal's restrictive stance on how hydrogen can be used as a fuel. Specifically, the proposal limits book-and-claim eligibility to "hydrogen used as a transportation fuel," deviating from existing regulations that include hydrogen used in the production of a transportation fuel.

CARB's rationale for this restriction is grounded in concerns about the limited availability of Low-CI power in California and the constraints on power supply expansion. Although we acknowledge these concerns and the intent to ensure sufficient Low-CI power for Zero Emission Vehicles (ZEVs), we assert that limiting the use of Low-CI book-and-claim to neat/unblended hydrogen for Fuel Cell Electric Vehicles (FCEVs) impedes the substantial growth of hydrogen supply essential to achieving CARB's ambitious 1,700x growth target by 2045.

Our market-based concern stems from the limitation's impact on the addressable hydrogen market demand, constraining it from small to infinitesimal. To develop multiple facilities in California, hydrogen project developers require substantial capital, and investors seek a clear return on investment (ROI). Arbitrary limitations on electrolytic hydrogen contradict state policies and market conditions.

Book-and-Claim

We respectfully propose that CARB modifies the LCFS amendments to make book-and-claim available for hydrogen used to produce transportation/alternative fuels. Specifically, hydrogen used for transportation
302.13 fuels would adhere to the Strict Power Purchase Agreement (PPA) book-and-claim power sourcing regime. To align with CARB's goal of maximizing Low-CI power for FCEVs, we recommend reinstating hydrogen used as a fuel in FCEVs to the flexible Renewable Energy Certificate (REC) power sourcing regime outlined in the LCFS Proposal for Low-CI electricity supplied to Battery Electric Vehicles (BEVs) under §95488.8(i)(1)(A)-(B). This approach restores parity between BEVs and FCEVs in book-and-claim power sourcing flexibility.

Recognizing the priority given to ZEVs in the Scoping Plan, hydrogen used neat in FCEVs would be subject to the Flexible REC Book-and-Claim, while hydrogen used to produce transportation fuel (e.g., power-to-liquids, sustainable aviation fuel, or renewable diesel) would adhere to the Strict PPA Tier requirements. This two-tier system accelerates hydrogen supply growth while aligning with the Scoping Plan's emphasis on ZEVs over internal combustion engines.

Conclusion

We appreciate CARB staff's work on the development of the proposed rule and their commitment to improving the LCFS. Successful adoption of battery and fuel cell electric vehicle technologies requires changes in LCFS to reinforce market pricing, parity in policy, and encourage deployment of fueling and charging infrastructure for zero-emission fleets. The undersigned associations and companies will continue to develop the vehicles and infrastructure as well as low-carbon, zero-carbon and renewable hydrogen needed to build this market and reduce emissions. We look forward to continuing to work with CARB staff on the necessary details to achieve consensus for the upcoming workshop and rulemaking proceeding.

Sacramento, CA 95812

Re: Northern California Power Agency's Comments on Proposed Amendments to the Low Carbon Fuel Standard Regulation

The Northern California Power Agency ("NCPA") respectfully submits these comments to the California Air Resources Board ("CARB") regarding amendments to the Low Carbon Fuel Standard ("LCFS") regulation as drafted in the Proposed Regulation Order posted on December 19, 2023.

NCPA was established in 1968 to construct and operate renewable and low-emitting generating facilities and assist in meeting the wholesale energy needs of its 16 members: the Cities of Alameda, Biggs, Gridley, Healdsburg, Lodi, Lompoc, Palo Alto, Redding, Roseville, Santa Clara, Shasta Lake, and Ukiah, Plumas-Sierra Rural Electric Cooperative, Port of Oakland, San Francisco Bay Area Rapid Transit District, and Truckee Donner Public Utility District – collectively serving nearly 700,000 electric consumers in Central and Northern California.

NCPA supports the LCFS program as an essential and effective strategy for diversifying California's transportation fuels and significantly reducing greenhouse gas ("GHG") emissions from the transportation sector to further the state's climate change goals. POUs are uniquely positioned to complement the state's transportation electrification efforts by tailoring programs to the specific needs of the communities they serve. As POUs have no shareholders or profit motivations and are directly accountable to their customers through locally elected public officials, they serve as their customers' caretakers of LCFS credits. LCFS credit revenue is a critical funding source for transportation electrification incentive programs, and LCFS funds are directed back into the community.

303.1 With regards to the Proposed Regulation Order, NCPA supports an increase in the carbon intensity targets and the inclusion of the automatic acceleration mechanism to address current and future imbalances in the credit market. However, NCPA requests the following specific changes to the Proposed Order:

I. THIRD-PARTY VERIFICATION OF ELECTRICITY CREDITS

The proposed order expands the applicability of Verification of Quarterly Fuel Transactions Reports in section 95000(c) to include all types of electricity credits except for base credits. While some verification of electricity credits may be warranted, the Proposed Order does not adequately recognize fundamental differences between electricity and other fuel types. This change will disproportionately impact small fleets, non-profits, and small and rural cities.

A. Low-Volume Charging Should Be Exempt from Verification Requirements

303.2 The deferment of verification for entities generating fewer than 6,000 credits doesn't go far enough to protect entities from the high costs of verification, as even verification every three years may lead to costs that exceed the proceeds from credits generated during that period. Entities generating a low number of credits, perhaps under 2,000 credits per year, should continue to be exempt from the verification requirements to ensure that we aren't inadvertently causing barriers to entry for smaller entities. These barriers exist for entities generating a low volume of electricity credits as well as entities dispensing low volumes of low-carbon liquid fuels like compressed natural gas.

Many NCPA members own and operate a small number of EV chargers within their territories as a public service for their communities and to ensure charger availability. This service is especially critical in remote areas, underserved areas, and areas with lower EV adoption, as it may not yet be profitable for larger charger companies to invest in infrastructure in such locations. However, if Cities and Utilities are not generating enough LCFS credits to cover the cost of verification, they will be less likely to participate in the LCFS, expand charger availability, and invest credit proceeds into their communities.

Based on our experience, costs for annual verification services could easily exceed the proceeds generated NCPA, NCPA Members, and customers with small fleets. It's also unclear whether there are enough accredited verifiers available to support verification of every entity participating in the LCFS, which may cause costs to increase further. Expanding the existing verification requirements may cause the cost of LCFS to be far greater than the benefits provided to small entities looking to invest in lower-carbon fuels.

NCPA itself, as a public agency with a small fleet, has invested in charging infrastructure at its headquarters, and its participation in the LCFS allows the aggregation and sale of credits on behalf of NCPA Members. The proposed verification requirements would likely cause NCPA to drop out of the LCFS, making it more difficult for our small utility Members to participate as well.

B. Site Visits Should Be Based on an Assessment of Risk

303.3 The specific process for third-party verification is set forth in section 95501 and is essentially unchanged by the amendments, despite the expansion to various types of electricity credits.

The regulatory requirements for site visits are drafted inflexibly and do not differentiate between fuel pathways and quarterly fuel reports. For example, the regulations require the same verification steps for a hydrogen facility as a single EV charger reporting 1 MWh of charging per month. EV charging stations are largely standardized pieces of equipment with existing accuracy regulations. Requiring site visits will yield very little data of value and will instead be wasteful of time and resources.

The regulation should be amended so that site visits are not required for quarterly fuel reports for electricity credits; instead, desktop reviews should be relied on whenever possible. The language in 95501 (b)(3) *Site Visits* should be amended to recognize that the verifier should only conduct site visits if warranted after assessing risk. Residential charging, in particular, must be exempt from site visits, as a requirement to visit hundreds of thousands of homes would be disruptive and, frankly, alarming to residents. CARB should also consider additional methods for reducing the burden of verification, such as data sampling.

C. The Less Intensive Verification Process Should Be Allowed for Entities with Deferred Verification

303.4 While the regulation does incorporate a new process allowing for "less intensive verifications" for certain entities only reporting electricity transactions, the mechanism also appears to require annual verifications, thereby undoing any good achieved by the deferment for entities under 6,000 credits. The provisions in section 95501 should remove the word "annual."

II. REQUIREMENTS FOR UTILITY HOLDBACK CREDITS

303.5 The amended section 95483(c)(1)(A)(6) of the Proposed Regulation Order makes several changes to the use of proceeds from residential base credits issued to electrical distribution utilities ("EDUs"). NCPA supports the revisions to the percentage allocation of base credits to holdback credits as it will further transportation electrification programs tailored to community needs and invested in hard-to-reach communities, including disadvantaged and low-income communities.

However, the requirements for holdback credits must recognize that program needs will vary based on territory and population being served, and should not establish barriers to participation that keep out utilities with a need for funding to support transportation electrification programs.

A. Caps for administrative costs for equity programs should remain at 10%

303.6 The costs associated with the development and implementation of equity programs are vital to the success of such programs, and reducing the current cap from 10% to 5% is unrealistic and inconsistent with the needs for administering such programs. Smaller utilities, in particular, have higher administrative costs and fewer resources to administer programs that support the adoption of EV technology and deployment of EV infrastructure in equity communities.

Administrative costs contain a number of fixed costs that cannot be simply cut in half due to a change in the regulation, and those fixed costs may naturally require a higher percentage of program costs for smaller utilities. Furthermore, programs run by small utilities will never benefit from the economies of scale that a larger program like the Clean Fuel Reward will experience.

CARB should maintain the current cap of 10% for administrative costs and its current guidance detailing what costs are included. If CARB finds it necessary to amend its definition of administrative costs or its cap, it should include a distinction between large EDUs and small and medium EDUs.

B. The definition of "Rural" should be updated to reflect a change in U.S. Census Data

303.7 NCPA supports the continued inclusion of "rural areas" as eligible for equity project funding; rural communities face unique challenges that require additional assistance and support to ensure the adoption of zero-emission vehicle technologies. However, the definition of "rural" needs to be updated as the U.S. Census Bureau no longer reports rural percentages for census tract population.

The Census Bureau now defines rural as "all population, housing, and territory not included within an urban area." NCPA recommends amending the definition of "rural" within the LCFS to align with the U.S. Census Bureau's use of "non-urban" for rural census tracts:

"Rural Area" means a census tract ~~with at least 75 percent of its population~~ identified as ~~rural~~ non-urban by the latest US Census data.

C. The Equity Requirement for POUs should Remain at 50%

303.8 In alignment with the posted "Purpose and Rationale for Low Carbon Fuel Standards Amendments," the equity requirements for POUs should remain at 50%. POUs represent specific and limited territories within the State, with a wide variety of populations, EV densities, and community needs. Designing and implementing effective transportation electrification programs for low-income and/or disadvantaged communities can be challenging, and the uptake and timing of projects is difficult to predict. There will be natural fluctuations in program spending year-to-year, and an annual requirement of 50% allows for better planning to maximize the impact of equity spending.

The current regulatory structure successfully prioritizes transportation electrification support for equity communities, and the continuation of flexibility in annual program spend is needed to ensure the design of successful and meaningful programs in POU territories. In addition to the POUs' equity programs, POUs are investing in transportation electrification in a myriad of ways that benefit their communities as a whole, such as grid modernization and public charging infrastructure.

D. The LCFS should not require specific rate structures as a barrier to accessing base credits

303.9 The requirement in section 95483 (c) for EDUs to specifically provide rate options is inappropriate and will potentially have negative consequences for transportation electrification programs in areas with low EV adoption. Rates are adopted by POU Governing Boards through a public process and developed to balance system needs and system costs. The five largest utilities in the state already offer rate options to encourage off-peak charging, as do most medium-sized POUs. However, there are POUs that are either 1) unable to adopt such a rate option due to current limitations in metering infrastructure, or 2) do not yet have a need for such a rate option.

Adopting rate options to encourage off-peak charging is an ongoing consideration for all utilities as the deployment of transportation and building electrification increases. It can take years to develop and approve new rate structures. In the meantime, such POUs can encourage off-peak charging through non-rate mechanisms. Requiring a rate option as an eligibility requirement to access base credits could potentially cause POUs to drop out of the LCFS program and, therefore, cease funding for transportation electrification programs in those territories.

Therefore, NCPA recommends striking the following from 95483 (c)(1)(A):

~~*(1) EDUs seeking eligibility to generate base credits must provide rate options that encourage off-peak charging and minimize adverse impacts to the electrical grid;*~~

E. Additional support is needed to jumpstart transportation electrification in Small POU territories

303.10 Approximately 20 small electric distribution utilities (EDUs) in California have not yet opted into the LCFS, often due to limited staff resources and lower EV penetration. The LCFS allocates base credits based on the percentage of EVs in every utility territory, and allocates those credits directly to utilities participating in the LCFS so they can invest in programs that further transportation electrification adoption in their respective territories. Utilities that have not yet joined the LCFS program are unable to receive their allocated base credits, and without base credits they often do not have enough funding available to launch transportation electrification programs, further exacerbating inequities in the deployment of EV charging infrastructure and adoption.

Pursuant to section 95483(c)(1)(A), unallocated base credits are deposited into the joint Clean Fuel Reward (CFR) account but are tracked separately by the CFR program administrator. These accumulated credit proceeds could potentially be reallocated to the state's smallest utilities to help provide the additional funding needed for start-up costs involved in designing and launching transportation electrification programs.

NCPA recommends including regulatory language that allows the CFR Steering Committee to work with the Executive Officer to design one-time transfers to qualifying small EDUs:

Proceeds from non-opt-in EDU base credits that were allocated to the Large EDUs beginning with the deposit of Q2 2019 credits through the deposit of Q2 2024 credits and then transferred to the Clean Fuel Reward program pursuant to section 95483 (c)(1)(A) may be transferred by the Clean Fuel Reward Program Administrator to small EDUs opted in to the LCFS program by March 31, 2025. Any base credit proceeds reallocated in this manner must be spent by the recipient small EDU in accordance with section 95491 (e)(5). The Executive Officer must approve the Clean Fuel Reward Program Administrator's plan for distribution of previously unallocated base credit proceeds prior to any transfers.

F. The list of Holdback Programs should be reorganized and clarified

303.11 NCPA supports the California Electric Transportation Coalition's (CalETC) proposed revisions to the list of holdback programs in section 95483 as detailed in its comment letter, which includes the following improvements:

- There should be one pre-approved list of programs, rather than maintaining different program lists for equity and non-equity. Many program types may contain an equity and non-equity component, and the current reporting structure already requires documentation to account for the portion directly benefitting equity communities. Maintaining two separate lists causes confusion and delays in program design.
- NCPA supports including projects for medium- and heavy-duty (MHD) electrification as an "equity" project, but believes the regulations should clarify that any such project should qualify as equity without consideration to location. Pollutants from MHD vehicles disproportionately impact low-income and disadvantaged communities due to their traffic patterns, regardless of where they may be domiciled or refueled.
- The list of agencies that POUs may consult in the creation of workforce development projects should be expanded to include other pertinent entities, such as California Community Colleges, community-based organizations, and POU Governing Boards.
- Education and outreach projects pertaining to transportation electrification technologies and focused on equity communities are still important tools for increased adoption in equity communities, and should be included on the project list.
- Panel upgrades should be explicitly included in the project list, as they are an important component of the infrastructure needed for transportation electrification, particularly in older buildings.
- The project list should consolidate and clarify the eligibility of projects related to clean mobility solutions.

III. CLEAN FUEL REWARD PROGRAM

303.12 NCPA supports the revisions to the California Clean Fuel Reward program to prioritize electrification of MHD vehicles and to update the required transfer percentages for utilities. The regulatory language should be amended to clarify that both new and used MHD vehicles are eligible for funding, to provide flexibility for future funding needs for the MHD market. Additionally, the Proposed Order's 5% cap of CFR admin costs should be rejected, and the cap should instead revert to 10% on allowable combined administrative and ME&O costs for the Clean Fuel Reward program, as authorized in the current version of the LCFS Regulation and CPUC Resolutions.

IV. FIXED GUIDEWAY CREDITS

303.13 NCPA encourages CARB to revisit the credit mechanisms for fixed guideway systems to ensure that transit systems generate the credits warranted for their role in transitioning Californians to transportation electrification. It is unreasonable for pre-2011 fixed guideway systems to receive a fraction of the LCFS credits that post-2010 fixed guideway systems receive, considering there is no efficiency difference recorded in the actual operation of newer vs. older railway systems. Systems like the Bay Area Rapid Transit (BART) provide public transit services that are essential to California's climate goals, and the inequitable treatment of fixed guideway credits should be rectified in the current rulemaking to help ensure that transit agencies can continue to provide services.

V. CONCLUSION

We appreciate the Board's consideration of these comments, and would like to recognize CARB staff for the robust public process they have managed over the past months to develop the Proposed Regulation Order. We look forward to continuing our collaboration with CARB and other stakeholders to advance transportation electrification and reduce GHG emissions from California's transportation sector.

Respectfully submitted,

Emily Lemei

Re: CBE Comments on the Proposed 2024 Low Carbon Fuel Standard Regulation

Dear Chair Randolph and Members of the Board:

Communities for a Better Environment ("CBE") writes in opposition to the Proposed 2024 Low Carbon Fuel Standard ("LCFS") Regulation. CBE is an Environmental Justice ("EJ") organization, representing East Oakland, Wilmington, Richmond, Southeast Los Angeles, and surrounding communities, heavily impacted by fossil fuel pollution from mobile sources, oil refineries and drilling operations, power plants, and many other sources.

304.20 CBE supports the recommendations provided to CARB by the Environmental Justice Advisory Committee.[1] CBE has also submitted comments alongside other EJ organizations titled "Climate and Environmental Justice Organizations Recommendations for the LCFS," and we support the full set of demands included in that letter. This comment focuses on a more specific set of issues that are highly important for California communities living alongside oil refineries and other fossil fuel infrastructure.

The Low Carbon Fuel Standard, one of the most consequential regulations serving California's climate targets, must follow the requirements and principles of California's climate laws. AB 32 instructs CARB to design greenhouse gas emission reduction measures "in a manner that is equitable [and] seeks to minimize costs and maximize the total benefits to California,"[2] and ensure that these measures "do not disproportionately impact low-income communities"[3] or interfere with "efforts to achieve and maintain federal and state ambient air quality standards and to reduce toxic air contaminant emissions."[4]

Unfortunately, the proposal described in the Initial Statement of Reasons ("ISOR") does not follow these statutory requirements. This comment provides detail on the following reasons why CARB must make critical changes to the proposal:

---

[1] *Assembly Bill 32 Environmental Justice Advisory Committee Recommendations to the California Air Resources Board on the Low Carbon Fuel Standard Regulation Updates* (Aug. 28, 2023), https://ww2.arb.ca.gov/sites/default/files/2023-08/EJAC%20DRAFT%20Low%20Carbon%20Fuel%20Standard%20Recommendations%20Version%202%20082823.pdf.
[2] CAL. HEALTH & SAFETY CODE § 38562(b)(1).
[3] CAL. HEALTH & SAFETY CODE § 38562(b)(2).
[4] CAL. HEALTH & SAFETY CODE § 38562(b)(4).

304.1 • The proposal's incentives for biofuel consumption, particularly renewable diesel, will interfere with efforts to reduce pollution in oil refinery communities and will create new health and safety risks in those communities.

304.2 • The ISOR's analysis of the proposal and regulatory alternatives overlooks important evidence that would result in lower estimated climate and health benefits from biofuels. Including this evidence would likely increase the estimated benefits of a cap on crop-based biofuels.

304.3 • A cap on crop-based biofuels would also better achieve the maximum technologically feasible and cost-effective greenhouse gas emission reductions.

304.4 • The proposed guardrails for biofuels will not address the most important land use change risks from biofuels, and CARB needs better analysis to measure the land use change effects of internationally sourced feedstocks.

304.5 • Without a rapid phaseout of avoided methane crediting and biomethane combustion crediting for livestock manure, these credits will increase pollution in communities already deeply burdened by fossil fuel pollution.

304.6 • Credits for carbon capture and sequestration projects at oil refineries have no economic or technological justification and will worsen air pollution and safety risks.

304.7 • CARB's choice to increase program stringency rather than restrict supply of combustion fuels will disproportionately harm low-income communities due to higher program costs and missed opportunities to expand access to zero emission transportation options.

304.8 • Additionally, CARB's CEQA analysis is inadequate and must be corrected before CARB finalizes the regulation.

We request that the Board direct CARB staff to substantially revise the proposal and its accompanying CEQA documents. Additionally, in consideration of the fact that the proposal includes significant changes from what was presented at public workshops and at the September 2023 Board meeting, CBE requests that the CARB Board hold an additional, non-voting meeting to discuss the LCFS proposal, prior to the final vote.

Below, we provide detailed comments on the problems in this proposal and explain how CARB should correct the proposal to align with the requirements of AB 32.

I. THE PROPOSAL'S INCENTIVES FOR BIOFUELS VIOLATE STATUTORY REQUIREMENTS AND ARE BASED ON INACCURATE ANALYSIS.

304.1 reference

The proposal violates sections 38560, 38562(b), and 38562(d) of the California Health & Safety Code because it fails to achieve the maximum technologically feasible and cost-effective reductions in greenhouse gas emissions, fails to design the LCFS in a manner that is equitable, fails to ensure that compliance activities complement efforts to attain air quality standards and do not disproportionately impact low-income communities, and fails to achieve real greenhouse gas emission reductions that are in addition to those otherwise required by law.

First, the proposal will disproportionately impact low-income communities and interfere with efforts to attain air quality standards by incentivizing production of biofuels with serious health impacts in environmental justice communities. The proposal will encourage renewable diesel to become the most important fuel in the LCFS, and it does not adequately address the major climate and health risks of this fuel. Renewable diesel is already dominating the program: in the first three quarters of 2023, renewable diesel alone earned nearly 40% of the total program credits, and it earned 1.6 times more credits than electricity.[5] Production of renewable diesel and other biofuels is largely taking place in refinery communities and interfering with much-needed efforts to achieve air pollution improvements in these environmental justice communities. Further increases in renewable diesel consumption under this proposal will extend and deepen refinery pollution burdens.

304.2, 304.10 reference

Second, the analysis in the ISOR has several important omissions that cause CARB to overestimate the climate and air quality benefits of biofuels and thus overestimate the overall benefits of the proposal. Specifically, CARB did not consider the effects of biofuel reshuffling under the federal Renewable Fuel Standard. This omission results in inaccurate emission estimates, and it also conflicts with CARB's duty to ensure that emission reductions are real and in addition to those otherwise required by law. Additionally, CARB overlooked a federal Environmental Protection Agency study and other evidence that raise uncertainty about the climate intensity benefits of soybean-based diesel, and it failed to consider a study that it commissioned about the air pollution impacts of biomass-based diesel combustion. CARB should remedy these omissions and reassess the proposal as well as the regulatory alternatives that were rejected.

304.3 reference

Third, CARB should take a step toward addressing biofuels' climate and health problems by putting a cap on credits for crop-based biofuels at 2020 energy levels and conducting a risk assessment of biofuel feedstocks. This measure will better serve CARB's statutory mandate of achieving maximally technologically feasible and cost-effective emission reductions by boosting incentives for truly clean, scalable technologies including electrification. It is also critical for addressing the harms of biofuel refining as well as its global deforestation and food security risks.

304.4 reference

Fourth, in addition to placing a cap on crop-based biofuels, CARB should take further steps to protect against high-risk biofuel feedstocks. The "guardrails" included in the proposal will not address the risks of indirect land use change from crop-based biofuels. One basic step CARB should take is to calculate land use change effects for each region that provides imported crop-based feedstocks in the program.

Addressing these serious problems in the proposal will make the LCFS more sustainable, equitable, and aligned with the requirements of AB 32.

A. The lack of meaningful safeguards on biofuels disproportionately burdens low-income communities of color and interferes with efforts to attain air quality standards.

[5] CAL. AIR RESOURCES BD., 2023 LCFS REPORTING TOOL (LRT) QUARTERLY DATA SUMMARY REPORT NO. 1 (2024).

AB 32 requires that CARB, in adopting regulations to achieve greenhouse gas emission reductions, design the regulation "in a manner that is equitable"[6] and ensure that activities undertaken to comply with those regulations "do not disproportionately impact low-income communities."[7] CARB must also ensure that compliance activities "complement, and do not interfere with, efforts to achieve and maintain federal and state ambient air quality standards and to reduce toxic air contaminant emissions."[8] By incentivizing the continued, unrestricted growth of biofuel production and consumption, the proposal fails to follow these legislative mandates.

304.1 reference

1. <u>LCFS biofuel incentives are extending pollution burdens in oil refinery communities.</u>

The LCFS is undermining much-needed cleanup of pollution in refinery communities. LCFS biofuel incentives are driving rapid increases in California renewable diesel production, and the most significant expansions in renewable diesel production capacity are occurring at oil refineries.[9] Renewable diesel production is expected to accelerate under CARB's proposal, and additional refinery conversions are likely. In CARB's 2022 Scoping Plan, it began planning for a phasedown in oil and gas refining by 2045.[10] This phasedown would create major pollution relief in overburdened communities via direct reductions in refinery emissions and associated reductions in truck, rail, and marine pollution; however, this desperately needed relief is unlikely to come if oil refineries are instead revamped to produce biofuels.

Oil refineries are generally located in areas with higher pollution burdens that are largely comprised of low-income households and people of color, due in part to a history of racist housing discrimination. Three refinery biofuels conversions—Phillips 66 Rodeo, Marathon Martinez, and Altair Paramount—provide illustrative examples. The first two are within the San Francisco Bay Area Air Basin, which is out of attainment with state standards for particulate matter (PM10), fine particulate matter (PM2.5), and ozone.[11] The cities of Rodeo and Martinez contain environmental justice communities where residents are disproportionately burdened by pollution and vulnerable to health risks. According to CalEnviroScreen, residents in the census tract closest to the Phillips 66 refinery experience a pollution burden greater than 86 percent of census tracts in the state.[12] For the census tracts nearest the Marathon refinery, their pollution burden is greater than 82–91 percent of state census tracts.[13] Communities near these refineries

experience increased rates of asthma and cardiovascular disease, and newborns born near the refineries have increased risk of low birthweight.[14] Both the Rodeo and Martinez refinery communities are designated as "disadvantaged communities" by the California Environmental Protection Agency under SB 535.[15]

Encouraging major oil refineries to produce large volumes of renewable diesel conflicts with CARB's statutory requirement to complement efforts to attain air quality standards and its duty to avoid disparate harms in low-income communities and communities of color. The experiences at Phillips 66 Rodeo, Marathon Martinez, and AltAir Paramount refineries provide examples of how biofuel refining extends existing pollution and creates new harms in disadvantaged communities.

Marathon Martinez and Phillips 66 Rodeo together account for a major share of the new renewable diesel capacity coming online in 2023 and 2024.[16] The Marathon Martinez oil refinery suspended operations in 2020 and was shut for several years before it reopened as a biofuel refinery. In the Environmental Impact Report for the conversion project, the county estimated that the biofuel refinery would require 180 diesel truck trips through the area per day, 63 railcars per day (an increase compared to the oil refinery due to the transport of biofuel feedstocks), and 400 marine vessels per year (also an increase compared to the oil refinery).[17] Looking at cumulative impacts on air pollution, the county found that the conversion would have a significant and unavoidable impact on PM2.5 exposure for residents and workers in the area.[18] Similarly, the Phillips 66 Rodeo refinery conversion is estimated to have significant impacts on pollution-causing activities. The refinery is now one of the largest biofuel refineries in the world. The Environmental Impact Report for the conversion found that the refinery's increased need for delivery of feedstocks would cause marine and rail traffic to increase substantially compared to when the refinery processed oil: rail car unloads per day would increase from 4.7 to 16, and tanker vessel and barge calls per year would more than double.[19] The refinery requires approximately 16,000 diesel truck trips per year.[20]

While Phillips 66 Rodeo and Marathon Martinez are two of the biggest biofuel producers in the state, they are hardly the only facilities creating biofuel pollution in oil refinery communities. In another stark example of environmental injustice, the Paramount refinery in

[20] *Id.*

Paramount, California took small steps toward producing biofuels in 2013, after it had ceased processing crude oil and gone idle in 2011.[21] In 2018, the refinery proposed a plan to substantially expand its operations to 25,000 barrels per day of biofuel feedstock throughput (up from 3,500 barrels per day). The City of Paramount is majority people-of-color and is considered an environmental justice community, where residents are exposed to a range of industrial pollutants, including the highest levels of hexavalent chromium (a cancer-causing air toxin) in Los Angeles County.[22] Paramount is in the South Coast Air Basin, which is in "extreme" non-attainment of many federal air quality standards, including ground-level ozone.[23] The Environmental Impact Report for the expansion project estimated that the expanded refinery would release 1,743 pounds of VOCs and 2,133 pounds of NOx emissions per day, and it would require 50 rail car unloads per day and 540 diesel truck trips.[24] The Paramount refinery demonstrates how biofuel incentives can encourage previously shuttered oil refineries to expand refining operations, even when they are located within environmental justice communities that already face air pollution levels far beyond what is considered safe for human health.

These refinery conversions make it clear that, contrary to CARB's assertions in the LCFS proposal, biofuels are not delivering the air quality improvements needed in heavily polluted environmental justice communities. Without serious safeguards to limit the growth of biofuel production in California, communities living near refineries—often in areas that are already severely out of attainment with state and federal air quality standards—will be stuck with refinery pollution for decades longer.

2. <u>The proposal fails to recognize evidence of new health and safety risks associated with biofuel refining.</u>

The existing biofuel conversions have also demonstrated that biofuel refining creates new
304.9 health and safety risks for local communities, which CARB does not recognize in the proposal. Biofuel refining may require more intensive use of hydrogen compared to fossil fuels, which can cause more frequent flaring hazards.[25] This is supported by site-specific evidence: since the Marathon Martinez facility reopened as a biofuel refinery in late 2022, there have been over 46 flaring incidents reported by the refinery.[26]

[26] *Health officials conduct surprise inspection at Martinez refinery after recent incidents*, ABC7 NEWS (Dec. 26, 2023), https://abc7news.com/martinez-refining-company-surprise-inspection-refinery-flaring-air-quality/14228185/.

The Martinez refinery has also had an alarming number of health and safety emergencies. In a 2022 incident that the refinery failed to report, it released 20 to 24 tons of spent catalyst chemicals into the community, where residents found dust containing heavy metals settled onto front yards and vehicles.[27] In November 2023, the refinery had two major fires that refinery officials described as "facility-wide emergencies;" one of these fires resulted in life-threatening injuries for a refinery worker and released over 200,000 pounds of renewable diesel fuel.[28] These incidents have triggered a federal investigation by the U.S. Chemical Safety Board and led the Contra Costa Health department and Bay Area Air Quality Management District to conduct a surprise inspection at the facility, and local health officials have publicly expressed concerns about the frequency of safety incidents at the refinery since reopening.[29]

Despite this clear evidence that producing biofuels at oil refineries can create serious, under-studied health and safety risks, CARB's proposal has not acknowledged these risks nor accounted for them in its analyses of the proposal and the regulatory alternatives.

B. The proposal, and CARB's rejection of the regulatory alternatives, relies on incomplete analysis that overstates the climate and air quality benefits of biomass-based diesel.

CARB overestimates the benefits of the proposal by disregarding evidence that would
304.2 reference lower the calculated benefits of biomass-based diesel. First, the proposal does not consider the reshuffling of biofuel consumption into California under the federal Renewable Fuel Standard, and a fairer accounting of emissions reductions attributable to the LCFS would result in fewer climate benefits. Second, CARB has not considered evidence that land use change effects of crop-based biofuels are likely greater than what CARB's modeling estimates. Third, the proposal overlooks a recent study, commissioned by CARB, that suggests biomass-based diesel has fewer air quality benefits than previously estimated.

A more thorough analysis of the climate and air quality impacts of biomass-based diesel would likely affect the comparison of regulatory alternatives. CARB compares the proposal to "Alternative 1," a scenario with lower carbon intensity stringency and a cap on crop-based biofuels, and to the "Comprehensive Environmental Justice Scenario," which involves a cap on crop-based biofuels and limits on livestock biogas. CARB concludes that the proposal performs better than these two alternatives in part because the proposal displaces more fossil diesel with biomass-based diesel, which creates improvements in greenhouse gas emissions and air pollution. Given that CARB's dismissal of these regulatory alternatives relies heavily on the climate and air quality benefits of biomass-based diesel, CARB must update its analysis of the proposal and the comparison to regulatory alternatives.

[29] *Id.*; ABC7 NEWS, *supra* note 26.

1. <u>The proposal overlooks the effects of biofuel reshuffling under the federal Renewable Fuel Standard, in violation of CARB's duty to ensure emission reductions are additional.</u>

CARB's analysis of the greenhouse gas emissions reductions associated with increasing biomass-based diesel consumption takes credit for reductions that should be attributed to the federal Renewable Fuel Standard ("RFS"). The LCFS is not the only law that incentivizes production of biofuels. The federal RFS mandates production of increasing volumes of biomass-based diesel; it also allows for credit trading across regions, wherein overcompliance in one
304.10 region can be used to offset undercompliance in another region. The interaction between the LCFS and federal RFS encourages biofuel producers to concentrate consumption in California because they can take advantage of the added LCFS incentives here.[30] This has led to California consuming an increasingly large share of the country's biodiesel and renewable diesel, and in 2022 California consumed half of all the biomass-based diesel consumed in the U.S.[31] Meanwhile, consumption outside California is declining.[32] This dynamic means that a share of the biomass-based diesel consumption that CARB attributes to the LCFS is actually reshuffled from other states, where it would be consumed anyway due to the federal RFS.

CARB avoided this double counting problem in previous rulemakings by conducting an attribution analysis, but it provides no explanation why it removed the attribution analysis in this proposal. In the 2018 LCFS rulemaking, CARB calculated the greenhouse gas emissions reductions attributable to the LCFS in order to count only reductions where "complying with the LCFS can be argued to be the primary reason for the action."[33] For biomass-based diesel, CARB only gave attribution to the LCFS for products with a carbon intensity below what the federal RFS required. Under this attribution analysis, CARB rightly took credit only for the emissions reductions that were additional to what the federal RFS required; consequently, the emissions reductions associated with biomass-based diesel were reduced. In the current proposal, CARB provides no attribution analysis and does not account for the LCFS program's interaction with the federal RFS. The result of CARB's backsliding is that emission reductions associated with biomass-based diesel appear larger than they should.

This faulty analysis not only overestimates the benefits of the proposal; it also conflicts with CARB's statutory requirement to ensure that emission reductions are additional. CARB must ensure that any greenhouse gas emission reductions achieved are "real"[34] and are "*in addition to* any greenhouse gas emission reduction otherwise required by law or regulation, and

[34] CARB must ensure that "[t]he greenhouse gas emission reductions achieved are real, permanent, quantifiable, verifiable, and enforceable." CAL. HEALTH & SAFETY CODE § 38562(d)(1).

any other greenhouse gas emission reduction that otherwise would occur."[35] By removing its attribution analysis for reductions associated with biomass-based diesel consumption, CARB has provided inflated emission reduction estimates. It takes credit for emission reductions that, without the LCFS, would occur anyway in other states due to the federal RFS production requirements. This constitutes a failure to ensure emission reductions are real and additional to reductions that are already required by law and would otherwise occur.

2. <u>The proposal underestimates the risks of land use change effects from increased production and import of biofuel feedstocks.</u>

304.11

CARB underestimates the climate harm of crop-based fuels and thereby over-incentivizes biofuels. The asserted climate benefits of the proposal are based in part on the carbon intensity advantages that biomass-based diesel has over fossil diesel; however, CARB's analysis is rooted in an incomplete evaluation of the climate impacts of biomass-based diesel. These climate impacts are highly dependent on a) the feedstocks used to produce biomass-based diesel and b) where those feedstocks come from. Biomass-based diesel in California is increasingly produced from virgin vegetable oil, primarily soybean oil,[36] and producers are starting to import soybean oil from South America.[37] These crop-based feedstocks have numerous harmful effects, including climate impacts from deforestation, loss of indigenous lands, and increased food insecurity. The proposal, which allows crop-based biofuels to grow unchecked, will accelerate these effects. It is therefore especially important for CARB to accurately estimate the land use change effects of crop-based feedstocks.

The proposal overlooks evidence suggesting that the land use change impacts of crop-based feedstocks are greater than CARB estimates. CARB estimates land use change effects using the Global Trade Analysis Project ("GTAP") model, but this is just one of several global economic and land use models available. The federal Environmental Protection Agency ("EPA") recently published a "Model Comparison Exercise," which evaluates the climate impacts of an increase in soybean oil-based biodiesel using three different models, including GTAP.[38] Only the GTAP model found that displacing fossil diesel with soybean diesel led to lower greenhouse gas emissions, and the other two models found that soybean biodiesel could emit *more* greenhouse gas than fossil diesel due to deforestation.[39] This EPA publication suggests, at the very least, that the GTAP model may be seriously underestimating the land use change effects of crop-based feedstocks.

The proposal also appears to calculate land use change effects based on feedstock production shocks occurring in the U.S., which does not reflect land use change effects of imported feedstocks. CARB has already approved fuel pathways for a major biofuel producer,

[39] Dan Lashof, *EPA's New Renewable Fuel Standard Will Increase Global Carbon Emissions – Not Lower Them*, WORLD RESOURCES INST. (Jul. 3, 2023), https://www.wri.org/insights/us-renewable-fuel-standards-emissions-impact.

Phillips 66, to produce biofuels from soybean oil imported from Argentina,[40] and imports from South America are likely to accelerate under the proposal. Land use change effects vary by region due to specific domestic economic factors and trade dynamics, and South American soybean oil presents particularly strong deforestation risks.[41] One study that looked at soybean oil cultivation in Brazil found that its direct and indirect land use change impacts could outweigh the carbon benefits of replacing fossil diesel.[42] By focusing its land use change analysis on U.S. feedstock production shocks, CARB is underestimating the carbon intensity of the feedstocks that this proposal will incentivize. Given that CARB provides credits to biofuels sourced from imported crop-based feedstocks, the proposal's failure to thoroughly evaluate land use changes by region produces indefensibly inaccurate carbon intensity estimates.[43]

Underestimation of the land use change effects of biofuels can have catastrophic consequences. In South America, deforestation linked to soybean farming is destroying critical tropical forests like the Gran Chaco Forest in Argentina and Paraguay, which is one of the biggest carbon sinks in the world, provides a critical habitat for thousands of plant and animal species, and is an ancestral home to many Indigenous communities. The proposal's incentives for soybean oil cultivation will do permanent damage to these critical natural and cultural resources.

3. The proposal does not consider recent evidence that air quality impacts from biomass-based diesel are higher than previously estimated.

304.12 By overlooking recent evidence about biomass-based diesel combustion emissions, the proposal overestimates the air quality benefits of biomass-based diesel. A 2021 study prepared for CARB evaluated the NOx and PM emissions from biomass-based diesel used in legacy and new technology diesel engines.[44] It found that the air quality benefits of using renewable diesel in legacy engines did not occur in new technology diesel engines.[45] Given that CARB has taken steps to require use of new technology diesel engines, this study shows that the emissions benefits of using biomass-based diesel in on-road fleets are uncertain and likely overestimated. CARB must account for this study in its evaluation of the proposal and the regulatory alternatives.

4. The emission factors used for biofuel production are likely not characteristic of biofuel production in California.

[44] CAL. AIR RESOURCES BD., LOW EMISSION DIESEL (LED) STUDY: BIODIESEL AND RENEWABLE DIESEL EMISSIONS IN LEGACY AND NEW TECHNOLOGY DIESEL ENGINES (2021).

[45] *Id.* at 53–54.

The proposal appears to calculate the air pollution impacts of renewable diesel, renewable gasoline, and alternative jet fuel using emissions factors from a simple oil refinery – specifically, Kern Oil & Refining Co.[46] This refinery is not characteristic of many refineries in California that are producing biofuels.

304.13 Because the Kern refinery is not a complex refinery, its emissions profile is likely very different from other biofuel-producing refineries. The Kern refinery includes a distillation process, a hydrotreater, and a small amount of reforming. Most biofuels in California are produced at refineries that are far complex. Complex refineries include distillation, catalytic cracking, hydrocracking, alkylation, reforming, desulfurization, sulfur recovery, hydrogen production, coking, in addition to hundreds of thousands of seals for valves, flanges, pumps, and compressors, major storage tank farms, and more, all of which can produce emissions. To produce a more accurate estimate of air pollution from biofuel production, CARB should conduct a more thorough analysis of the refineries that will foreseeably produce biofuels and generate emissions factors that are more characteristic of those from the foreseeable set of biofuel refineries.

In sum, CARB's emissions assumptions are inaccurate and inadequate to support its adoption of the proposal. CARB's failure to assess federal renewable fuels requirements backslides from prior LCFS analyses and violates the additionality requirements. CARB's narrow assumptions about crop-based biofuels render the proposal's land use change analysis arbitrary and capricious. Complete information about emissions impacts from the transition to combustion of biofuels shows lower air quality gains, and CARB's omission of this relevant information is arbitrary and capricious. Finally, CARB must conduct a more thorough analysis of the refineries that will foreseeably produce biofuels before it can rely on any emissions factors for biofuel refineries. Given that CARB's dismissal of the regulatory alternatives relies heavily on the climate and air quality benefits of biomass-based diesel, CARB must update its analysis of the proposal and the comparison to regulatory alternatives.

C. A cap on credits for crop-based biofuels would better achieve the maximum technologically feasible and cost-effective emission reductions.

304.3 reference A cap on crop-based biofuels at 2020 energy levels is an important step toward addressing the local and global environmental harms of biofuels; it also better serves CARB's statutory objectives. Under AB 32, CARB's primary regulatory objective is to "achieve the maximum technologically feasible and cost-effective reductions in greenhouse gas emissions. . . in furtherance of achieving the statewide greenhouse gas emissions limit."[47] The proposal, which encourages unchecked increases in crop-based biofuels, does not maximize technologically feasible and cost-effective reductions. Capping crop-based biofuels would open up room in the LCFS to prioritize investments in scalable technologies that are truly clean and drive us toward our goal of carbon neutrality by 2045.

Biofuels, produced in the volumes contemplated in the proposal, will not provide cost-effective emission reductions. The lion's share of the program's biofuel credits will not go to

[46] *Standardized Regulatory Impact Assessment* B-2.
[47] CAL. HEALTH & SAFETY CODE §§ 38560, 38560.5(c).

strategic advanced fuels that require investment to scale up; rather, they will go to expensive fuels that offset the regulatory burden for fossil fuel producers. Analysis by the International Council on Clean Transportation and the Union of Concerned Scientists shows that biomass-based diesel will likely only be economical to produce when it is subsidized, because the costs of producing vegetable oils are regularly higher than the costs of wholesale diesel (without even considering the costs of producing diesel from vegetable oils).[48] It is unlikely that subsidies from the LCFS will help achieve improvements in production costs, given that vegetable oil production is already a mature global industry.[49] Further, many of the new renewable diesel production facilities are oil refineries. For these refineries, part of the benefit of converting to biofuels is the opportunity to offset their compliance burden and delay a costly facility closure process.[50] LCFS incentives will thus be used to enshrine the oil giants' impacts to local communities despite a transition away from fossil fuels.

The glut of credits for renewable diesel will also undermine LCFS incentives for electrification and other scalable clean transportation technologies. Setting a cap on biofuels would help stabilize credit prices and focus credit money on electrification.[51] In the proposal, CARB recognizes that achieving carbon neutrality will require a massive shift towards electric vehicles, and that this transition is technologically feasible. Yet the proposal delays progress toward this transition by allowing biofuel credits to crowd out opportunities for regulated parties to invest in electrification.

D. The proposed guardrails do not address the problems with crop-based biofuels.

304.4 reference

The proposal recognizes some of the harmful effects of crop-based biofuels and includes guardrails it posits will address these effects. The guardrails, called "Crop-Based Biofuels Sustainability Criteria" include point-of-origin tracking, independent certification, and a ban on palm oil. The guardrails will not, however, address biofuels' harmful effects in any meaningful way. The proposal does not thoroughly explain what point-of-origin tracking and independent certification would achieve, but they are unlikely to significantly reduce the direct land use change effects of biofuel feedstock cultivation, and they do not seem to address indirect land use change effects at all. And the ban on palm-derived fuels does not address the real risks of palm oil-associated deforestation in the LCFS. The real palm oil deforestation problem comes from consumer substitution between palm oil and other vegetable oils, wherein increased demand for biofuel feedstocks like soybean oil drives up the price of soybean oil and food consumers respond to higher soy prices by substituting with palm oil.[52] The LCFS' continued crediting of biofuels derived from soybean oil will indirectly cause tropical deforestation via increased palm oil production for food, and the palm oil crediting ban will do nothing to address it.

E. CARB should require region-specific analysis of land use change effects for fuel pathways that involve imported feedstocks.

304.14 One basic way CARB should address land use change risks is by providing more thorough analysis for fuel pathway applications. As Sections I.B.2 and I.D of this comment explain, crop-based biofuels present serious, likely underestimated, direct and indirect land use change risks, and CARB's proposed guardrails will not reduce these risks. One of the most important reasons to accurately estimate land use change effects is that these estimates are used in Tier 2 fuel pathway applications to calculate carbon intensity values for crediting biofuels. In this context, underestimating a land use change value results in over-crediting a biofuel project.

CARB should provide a region-specific direct and indirect land use change analysis for fuel pathway applications that rely on imported crop-based feedstocks. CARB's current land use change analysis models U.S. crop production shocks,[53] but pathway applicants have been permitted to use this analysis for imported feedstock pathways.[54] If CARB provided modeling analysis that reflected a region-specific production shock, it would more accurately account for domestic economic factors and trade dynamics to arrive at a carbon intensity estimate that better aligns with the true climate impacts of the feedstock.[55]

II. THE PROPOSAL'S SUPPORT FOR PATHWAYS THAT PERPETUATE FOSSIL FUEL EMISSIONS BURDENS LOW-INCOME REFINERY COMMUNITIES AND INTERFERES WITH ATTAINMENT OF AIR QUALITY STANDARDS.

304.15 In addition to the biofuel incentives, the proposal supports several other technology pathways that will be used by the fossil fuel industry, including at oil refineries, and will extend air pollution from fossil fuels. These include incentives for fossil-based hydrogen production, pathways for avoided methane crediting from livestock manure, delayed phaseout of petroleum project crediting, and incentives for carbon capture and sequestration (CCS) and direct air capture (DAC). To the extent that these incentives delay the phase down of oil refining in California, they violate AB 32's requirements to ensure emission reductions do not disproportionately burden low-income communities and do not interfere with efforts to achieve air quality standards.[56]

Most of California's oil refineries are in the San Francisco Bay area, Los Angeles area, and San Joaquin Valley, none of which are in attainment of state and federal air quality standards. Oil refineries are predominantly concentrated near communities of color and low-income communities due to decades of racist housing and land use policies. One important example of an area experiencing extreme environmental injustices due to the oil industry is the Carson/Wilmington/Long Beach area, which has five oil refineries that account for over a third

---

[53] *See* CALIFORNIA AIR RESOURCES BOARD, DETAILED ANALYSIS FOR INDIRECT LAND USE CHANGE I-20–21 (2015), https://ww2.arb.ca.gov/sites/default/files/classic/fuels/lcfs/iluc_assessment/iluc_analysis.pdf.

[54] For example, in December 2023 CARB approved two Tier 2 fuel pathway applications by Phillips 66 Company that involve import of soybean oil feedstocks from Argentina. The applicant's analysis relied upon the land use change impact value for soy biodiesel that is listed in Table 6 of the LCFS regulation.

[55] *See U.C. Davis Comments*, *supra* note 43, at 2–3.

[56] CAL. HEALTH & SAFETY CODE § 38562(b)(2) & (4).

of the state's overall refining capacity.[57] Carson/Wilmington/Long Beach residents also deal with pollution from a large oilfield, two major ports, nine rail yards, four major freeways, and multiple chemical facilities.[58] Most of the residents living in this area are people of color. Air pollution levels in this area regularly exceed federal and state standards, and oil refineries are one of the area's largest industrial sources of criteria pollution and toxic pollution. To reduce the pollution burden of communities in Carson/Wilmington/Long Beach, along with all other California refinery communities, the LCFS cannot continue to support the oil industry's false climate solutions.

A. CARB should end avoided methane crediting and biomethane combustion crediting for livestock manure.

To start, CARB should rapidly phase out pathways that provide avoided methane crediting and biomethane combustion crediting for livestock manure, including pathways that are linked with hydrogen production. The proposal would extend these pathways through 2040, and through 2045 for projects linked to hydrogen production. In addition to incentivizing livestock pollution management practices that pollute the air and water of agricultural communities, these pathways harm refinery communities. The credits encourage oil refiners and other hydrogen producers to produce fossil fuel-based hydrogen, because they can make fossil-based hydrogen look carbon negative by purchasing avoided methane credits from dairy digesters that may not even operate in California. They also enable oil refiners to offset their compliance burdens using lavish biomethane combustion credits.

304.5 reference

CARB has already approved many fuel pathways in which hydrogen producers earn highly valuable credits by matching fossil-based hydrogen with avoided methane credits. For example, Shell Energy has two certified pathways for production of fossil-based hydrogen (produced from natural gas via steam methane reformation) at facilities in Wilmington and Carson (as explained above, these are areas with already exceptionally high fossil fuel pollution).[59] Shell uses book-and-claim accounting to claim the environmental attributes of biomethane derived from manure digesters in Minnesota; Minnesota biomethane does not have to actually reach California. Under this scheme, CARB has certified Shell to earn LCFS credits using carbon intensity values of -147 and -152 gCO2e/MJ—these low carbon intensity values make the pathway more valuable than most electric vehicle pathways.[60] Shell is thus earning highly valuable LCFS credits to produce fossil-based hydrogen in deeply burdened environmental justice communities.

[60] *See LCFS Pathway Certified Carbon Intensities*, CAL. AIR RESOURCES BD., https://ww2.arb.ca.gov/resources/documents/lcfs-pathway-certified-carbon-intensities (last visited Feb. 20, 2024).

In addition to subsidizing production of fossil-based fuels in environmental justice communities, avoided methane crediting for livestock manure also fails to produce real, additional greenhouse gas emissions reductions as AB 32 requires.[61] First, many of the digesters that produce avoided methane credits were funded by other state and federal programs, which means that the LCFS is claiming credit for reductions that would have occurred anyway. Second, CARB has a legislative mandate in AB 1383 to adopt regulations to directly regulate methane emissions from livestock manure, yet it relies on its failure to act on that mandate as justification for these avoided methane credits. Rather than achieving real emission reductions by requiring reductions from livestock operations (as CARB has clear authority to do under AB 1383), the avoided methane credits function as a convoluted offset program that perversely encourages livestock operations to produce more methane to earn more credits. Third, CARB has a concerning lack of data about livestock operations and the effectiveness of digesters at capturing methane, and research from Food & Water Watch suggests that California digesters receiving LCFS credits allow significant volumes of methane to escape.[62] CARB must carefully analyze the effectiveness of digesters to ensure that the emission reductions it is claiming are real.

B. CARB should rapidly phase out crediting for petroleum projects, including for CCS projects.

304.6 reference

CARB should end crediting for projects that directly subsidize oil refineries. The proposal would not phase out these petroleum project credits until 2040, and it would not phase out credits at all for CCS projects. The LCFS already gives fossil fuel producers incentives to reduce the carbon intensity of their products via deficit generation; it is unnecessary to subsidize projects that may entrench fossil fuel operations further into the future.

Importantly, CARB should remove crediting for CCS at refineries. CARB's justification for keeping these credits in the program is that the 2022 Scoping Plan identified CCS projects as an important strategy for meeting AB 1279 targets. However, CBE and the California Environmental Justice Alliance provided comments to CARB during the Scoping Plan process showing that CCS for oil refineries is an unproven technology that has major implementation barriers and creates health and safety hazards.[63] Specifically, the comments explained that CCS for oil refineries requires specialized design and has limited applicability to a small number of CO_2-emitting combustion units.[64] They also provided evidence that widespread CCS units at

[64] *CBE Scoping Plan Comments*, *supra* note 63, at 6.

refineries would increase safety risks from refinery fires and explosions.[65] Given the barriers and risks associated with deployment of CCS at oil refineries, this LCFS proposal should not rely on it as a climate solution.

C. CARB should not allow indirect accounting for fossil-based hydrogen.

304.16 The LCFS should only incentivize green hydrogen produced in a manner consistent with Environmental Justice Equity Principles.[66] Unfortunately, the proposal expands the program's support for non-green hydrogen projects by adding book-and-claim crediting for hydrogen produced outside California. Particularly concerning is CARB's proposal to add book-and-claim eligibility for fossil-based hydrogen that uses CCS or book-and-claim biomethane. This would allow out-of-state producers to create hydrogen from fossil fuels and earn LCFS credits by using CCS or purchasing book-and-claim biomethane credits. As a result, California drivers will subsidize the out-of-state production of fossil-based hydrogen.

III. CARB'S CHOICE TO INCREASE PROGRAM STRINGENCY RATHER THAN LIMIT CREDIT SUPPLY FOR COMBUSTION FUELS DISPROPORTIONATELY HARMS LOW-INCOME DRIVERS.

304.7 reference The proposal reflects a choice by CARB to ramp up the stringency of carbon intensity targets instead of meaningfully restricting the supply of credits for combustion fuels through limits on biofuel and biomethane crediting. This decision will increase program costs without prioritizing much-needed incentives to expand access to zero emission transportation options. In the 2023 Standardized Regulatory Impact Assessment ("SRIA"), CARB projects that the proposal will pass through significant costs to gas prices. The ISOR instead focuses on the proposal's minimal impacts on the average cost per mile for all fuels including clean fuels; however, this analysis fails to discuss that zero-emission vehicles are not equitably distributed in California. So far, affluent, white communities have been the main benefactors of government investment in zero-emission vehicles. Electric vehicles are still rare in low-income and rural communities and communities with the largest percentages of Black and Latinx residents.[67] CARB should prioritize increasing investment and reducing access barriers to ensure low-income communities receive benefits from the LCFS and do not disproportionately bear its costs.

By prioritizing expansion of combustion fuels like biofuels and biomethane, the proposal misses opportunities to accelerate equitable access to zero-emission vehicles and other zero-emission transportation options. Limiting the supply of these combustion fuels would increase credit incentives for electrification, and it would reduce the need to ramp up stringency of carbon intensity targets. Moreover, CARB should expand crediting opportunities that facilitate electrification. The proposal's extension of incentives for light-duty vehicle refueling is a solid

start, but CARB can take further action. For example, CARB should add a credit multiplier for zero-emission mass transit vehicles, including transit buses and school buses. These changes are critical to ensure that the program lifts up low-income communities rather than leaving them stuck in combustion vehicles paying the program's costs.

IV. THE DRAFT ENVIRONMENTAL IMPACT ANALYSIS DOES NOT SATISFY CEQA REQUIREMENTS.

304.8 reference

CARB has been authorized to implement its own certified regulatory program under the California Environmental Quality Act ("CEQA"), and failure to comply with that regulatory program violates CEQA.[68] The Draft Environmental Impact Analysis ("EIA") for the proposal violates CEQA in several respects. First, the set of alternatives CARB chose is not sufficient to evaluate feasible alternatives that could lessen significant environmental impacts. Specifically, CARB should include alternatives that involve a cap on biofuels. Second, CARB concludes that impacts on air quality are unavoidable without considering feasible mitigation options that are within its authority. Third, CARB's conclusion that odor impacts are less-than-significant overlooks relevant information. Finally, CARB's suggestion that land use and permitting authorities can adequately mitigate the indirect land use impacts of biofuel feedstocks is not consistent with the experience at existing biofuel refineries, and its conclusion flatly contradicts both records evidence and reality.

A. The EIA should include alternative scenarios that cap credits for crop-based biofuels.

CARB's certified regulatory program requires CARB to produce a staff report that analyzes whether any feasible alternatives are available that would substantially lessen any significant environmental impacts.[69] The alternatives "should focus on reducing or avoiding significant environmental impacts associated with the project as proposed."[70]

The alternatives that CARB identifies in the Draft EIA are not effective in helping to evaluate feasible alternatives that could substantially lessen the proposal's significant environmental impacts. Many of the proposal's significant environmental impacts stem from the high supply of credits for combustion fuels including biofuels and biomethane. But the alternatives included in the Draft EIA (specifically Alternatives 1, 3, and 4) primarily modify the stringency of the carbon intensity targets and provide only minor variations in the supply of different types of credits. These alternatives cannot be expected to significantly change the environmental impacts identified in the proposal.

An adequate alternatives analysis must include alternatives that cap crop-based biofuels. There are several reasons why the lack of an alternative with a biofuels cap in the Draft EIA prevents CARB and the public from fully evaluating the range of regulatory options and their environmental impacts.

---

[68] *POET, LLC v. State Air Resources Bd.*, 218 Cal.App.4th 681, 270 (2013).
[69] CAL. CODE REGS. Tit. 17, § 60004.2(c)(2).
[70] *Draft Environmental Impact Analysis* 172.

First, CARB is clearly considering a regulatory option that includes a cap on biofuels. "Alternative 1" in the ISOR's "Evaluation of Regulatory Alternatives" is a scenario with lower carbon intensity stringency and a cap on virgin crop-based biofuels. However, the EIA does not include a comparable scenario. Including a biofuels cap scenario in the EIA would enable consideration of a variety of environmental resource impacts that are not studied in the ISOR. By excluding a biofuels cap scenario from its CEQA analysis, CARB fails to evaluate an alternative that it has already demonstrated is feasible and under consideration in the ISOR.

Second, the analysis of "Alternative 1" in the ISOR does not satisfy CARB's CEQA requirements. The ISOR's analysis of regulatory alternatives allows CARB to compare scenarios across specific factors including costs, overall climate benefits, and overall air quality benefits. The Draft EIA's analysis of feasible alternatives considers a broader range of significant environmental impacts from the proposal. For example, the Draft EIA determines that the proposal will have a significant impact on land use related to feedstock production; agricultural and forest resources due to feedstock cultivation; and biological and cultural resources, in part due to increased use of biofuel feedstocks. Analyzing a biofuel cap alternative in the EIA would enable CARB to evaluate whether a reduced supply of biofuel credits could reduce the significant impacts identified in the proposal.

Third, CARB omitted a biofuel cap from the "Focused Crediting Scenario," and provides no reason for leaving out this component of the Comprehensive EJ Scenario requested by the EJAC and a variety of stakeholders. CARB previously committed to evaluating the Comprehensive EJ Scenario, which includes a cap on crop-based biofuels, a rapid phaseout of avoided methane crediting, and other environmental justice priorities. It is unclear why the version of this scenario evaluated in the Draft EIA leaves out a biofuel cap. In its current form, the "Focused Crediting Scenario" is unresponsive to the EJAC's request.

CARB should therefore include a scenario comparable to "Alternative 1" in the ISOR, and it should modify the "Focused Crediting Scenario" to include a biofuel cap, making it comparable to the requested EJAC scenario.

B. CARB has feasible options, within its authority, to mitigate significant air quality impacts.

CEQA requires CARB to identify feasible mitigation measures that would "substantially lessen the significant environmental effects" of the proposal.[71] "Feasible" mitigation means
304.17 measures "capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and technological factors."[72] Contrary to what the Draft EIA concludes, CARB has feasible options to mitigate the air quality impacts of the proposal.

The Draft EIA correctly concludes that Short-Term Construction-Related and Long-Term Operational-Related Impacts on Air Quality are significant, although it does not thoroughly

[71] CAL. PUB. RESOURCES CODE § 21002.1; CEQA GUIDELINES § 15126(a); CAL. CODE REGS. Tit. 17, § 60004.2(c)(2).
[72] CAL. PUB. RESOURCES CODE § 21061.1.

discuss the potential causes of local emissions increases. CARB estimates that "localized increases in emissions" could occur near biofuel production facilities, routes for biofuel feedstock, and routes for finished fuel transportation.[73] CARB should also consider potential local increases in emissions around facilities that produce fossil-based hydrogen matched with biomethane credits (for example, at the Shell Energy natural gas-based hydrogen facilities in Carson and Wilmington).[74]

The Draft EIA's conclusion that air quality impacts are unavoidable is not correct. CARB argues that there are no feasible mitigation options because CARB does not have authority to require implementation of mitigation for projects that are under control of local and state land use and permitting authorities. However, there are many feasible mitigation options that are squarely within CARB's authority.

First, CARB can require, as a condition for earning LCFS credits, that trucks carrying feedstocks and finished fuels to and from biofuel, hydrogen, and biomethane facilities are zero-emissions vehicles. CARB has authority to place conditions on pathway holders (for example, the proposal would impose sustainability certification conditions on pathway holders for crop-based biofuels). CARB also has authority, which it deploys in the Advanced Clean Fleets Rule, to require fleets to phase in zero-emission vehicles. And thanks in part to CARB's groundbreaking vehicle emissions regulations, the use of zero-emission trucks is a feasible technology option to use for mitigation.

Second, CARB can prohibit or invalidate approval of pathways at facilities that are out of compliance with state and federal air quality regulations. This is a common-sense, necessary measure to ensure that the LCFS does not continue incentivizing unlawful releases of air pollution. For example, in 2021 CARB approved three pathways for Phillips 66 Rodeo to produce renewable diesel, despite receiving notice via the pathway application comments that the facility was under investigation by the Bay Area Air Quality Management District for operating an unpermitted renewable diesel hydroprocessing unit.[75] CARB has clear authority to prevent these situations, as CARB's Executive Officer can "restrict, suspend, or invalidate credits" that are "generated... in violation of other laws, statutes, or regulations."[76] This option is also plainly feasible, because it merely requires compliance with existing air quality regulations.

Third, CARB can prohibit approval of pathways that produce significant air pollution in areas out of attainment with air quality standards, and/or in environmental justice communities. This would be highly effective in mitigating localized air pollution impacts, and it fits squarely within CARB's authority to decide which fuel pathways are eligible to receive credits under the program.

---

[73] *Draft Environmental Impact Analysis* 62.
[74] *See, e.g.*, Shell Hydrogen Pathway Applications, *supra* note 59.
[75] *Comments on Phillips 66 – Application No. B0241 for Three Low-Carbon Fuel Standard Tier 2 Fuel Pathways*, submitted by Communities for a Better Environment & Natural Resources Defense Council (Dec. 17, 2021), available at https://www.arb.ca.gov/lists/com-attach/905-tier2lcfspathways-ws-BXVdbVRjBAhWPABj.pdf?_ga=2.161580924.1729481274.1707759900-1149230758.1693940701.
[76] CAL. CODE REGS. Tit. 17, § 95495(a).

These are just three examples of feasible mitigation options that CARB should consider before concluding that air quality impacts are unavoidable.

C. CARB's finding that odor impacts are less than significant is likely incorrect.

304.18 The Draft EIA's finding that long-term operational impacts from odors are less than significant is likely incorrect because it overlooks odor impacts at biofuel refineries. In both the Phillips 66 Rodeo and Marathon Martinez refinery conversions, the Environmental Impact Reports for both conversion projects found that odor impacts could be significant without mitigation measures.[77] Although the elimination of petroleum refining has beneficial impacts on refinery odors, the use of animal-based feedstocks can create odors similar to those from animal and food processing facilities.[78] The risks of these odor impacts led Contra Costa County to require odor mitigation measures at both biofuel refineries. Given these findings of significant odor impacts from specific biofuel refinery facilities, CARB should reconsider its finding of less-than-significant odor impacts.

D. CARB's conclusion that significant land use impacts from biofuels are "unavoidable" leaves no real opportunities for mitigation.

304.19 The Draft EIA finds that biofuels cause numerous significant environmental impacts related to indirect land use change, but it does not acknowledge that there are few realistic ways to ensure that those impacts are analyzed and mitigated. Increased demand for biofuel feedstocks can lead to indirect land use changes by diverting food crops to produce biofuels. This has significant global impacts on agriculture and forest resources, biological resources, cultural resources, and geology and soils. For each of these resource areas, CARB concludes that significant impacts are unavoidable because CARB does not have authority to require mitigation that would be implemented by local authorities, and CARB provides a list of "recognized practices" that are "routinely required" by other authorities that are likely to minimize such impacts.

In practice, communities are left in a catch-22 in which no state or local authority in California will evaluate the indirect land use impacts of biofuel feedstocks and consider mitigation options. The Phillips 66 Rodeo biofuel refinery provides an instructive example of this problem. During CEQA review of the refinery conversion, communities asked Contra Costa County to analyze the project's indirect land use change effects, but the County refused to conduct this analysis on the grounds that these effects were too speculative because the specific mix of feedstocks used at the refinery could not be predicted.[79] The Contra Costa County Superior Court agreed, holding that the mix of feedstocks used at the facility could not be

accurately predicted to support an indirect land use change analysis.[80] The local permitting process thus provided no opportunity to evaluate indirect land use change effects and consider mitigation options, despite the fact that throughout this CEQA process, Phillips 66 was already receiving credits from CARB for fuel pathways based on specific feedstocks.

This experience shows that although fuel producers are able to provide CARB with sufficient information about their feedstocks to enable analysis of land use change effects, this information is unlikely to be used in CEQA analyses for biofuel projects. This casts doubt on CARB's conclusion that land use change impacts could be reduced to less-than-significant levels with mitigation from land use agencies and permitting agencies. It also exposes the lack of realistic options for evaluating and addressing the proposal's land use change impacts.

CBE appreciates the opportunity to provide comments on this proposal, and we urge the Board to direct CARB staff to make critical changes that will align the LCFS with AB 32 requirements and the needs of environmental justice communities.

Sincerely,

Amelia Keyes
CBE Attorney & Legal Fellow

DUCTOR®

February 20, 2024

Matthew Botill
California Air Resources Board
1011 I Street
Sacramento, CA 95814

Subject: Comments on the Proposed Low Carbon Fuel Standard Tier 1 Calculators

Dear Mr. Botill:

Thank you for the opportunity to comment on the Proposed Low Carbon Fuel Standard (LCFS) Amendments and updated Life Cycle Analysis (LCA) and Documentation.

Ductor was founded in 2009 with the ambitious aim of creating a solution that would help solving today's environmental challenges in the energy and agricultural sectors. Today we build, own, and operate turnkey microbiological facilities that turn organic resources from the agricultural sector into sustainable fertilizers and biogas. We are focused on building and operating anaerobic digestion facilities throughout the United States, including in California, that will reduce agricultural emissions.

We recommend the following minor changes to the proposed Tier 1 calculators. We believe our insights can help refine the calculators to better serve a broad range of fuel developers and accelerate the growth of alternative fuels in California.

Our specific comments and recommendations are summarized below.

Recommendation for Tier 1 Organic Waste (OW) Calculator: Recognize Diversity and Address N_2O Emissions in all Waste Treatments

305.1 California has seen an increase in composted materials since the implementation of SB1383. However, the Tier 1 Organic Waste (OW) calculator has not been updated to reflect these changes in waste management. We suggest:

- Introducing options to indicate the percentage of Other Organic Waste (OOW) diverted from composting, in addition to landfilling.
- Incorporating user inputs for site-specific baseline CH_4 emissions.
- Including user inputs for site-specific baseline N_2O emissions.

Recommendation: Align Tier 1 Calculators with CA GREET4.0 Livestock Categories

In the CA GREET4.0 RNG tab, livestock categories include Beef, Dairy Cow, Dairy Heifer, Swine, Layer, and Broiler and Turkey. However, the Tier 1 calculator for animal manure (tier 1 DSM) presently covers only dairy cow, heifer, and swine categories. We suggest minor changes to align the tier 1 DSM with CA GREET4.0: CARB should incorporate poultry manure categories into the DSM, using corresponding baseline manure management emissions described
305.2 in CAGREET4.0 (Figure 1). To reflect these changes, we propose renaming the Tier 1 Dairy and Swine Manure Calculator to the Tier 1 Livestock Manure calculator.

	Beef Feedlots [2]		Layer Operation		Broiler and Turkey Operation	
	Dry Lot	Liquid/Slurry	Anaerobic La	Poultry w/o	Pasture	Poultry w/o Litter
Manure Region Management System Usage (MS%)						
U.S. Average	100.0%	0.7%	12.9%	87.1%	1.0%	99.0%
Manure Management System MCFs						
U.S. Average	1.2%	30.4%	71.5%	1.5%	1.2%	1.5%
Direct N2O Emission Factors (kg N2O N/kg N)	0.02	0.005	0	0.001	0	0.001
N Loss Factors through Volatilization of NH3	23%	26%	54%	34%	0%	34%

Figure 1. Snapshot of CA GREET4.0 Waste Tab showing manure management system baseline MCF values.

We also note that livestock manures, and especially poultry manure, emit significant amounts of N_2O under traditional management systems. These emissions are amplified by the increasing concentration of modern livestock and poultry operations. This concentration leads to an overabundance of nutrients, exceeding the capacity of nearby crops to absorb them. Without effective manure management solutions to distribute these excess nutrients, they accumulate in concentrated areas, creating hotspots with devastating environmental consequences. These consequences include, but are not limited to, the eutrophication of water bodies and the proliferation of harmful algal blooms[1].

Ductor's technology transforms nitrogen-rich organic resources from agriculture, aquaculture, and other organic sources into energy and fertilizers. We specialize in feedstock that cannot be used directly in conventional anaerobic digestion and biogas facilities. This feedstock is fed into the Ductor pre-process, where an IP-protected consortium of microorganisms and the IP-protected Ductor process converts them via fermentation and subsequent ammonia recovery into organic and sustainable liquid nitrogen fertilizer. The digestate is further processed into additional fertilizing and soil-improving products. Ductor's liquid fertilizer and soil-improving products can be delivered to markets requiring nutrients, easing the effects of concentrated livestock operations on our soils and watersheds.

We urge CARB to consider including avoided N_2O emissions in all manure-to-RNG pathways and the associated Tier 1 calculator. The state can enable significant reductions in agricultural N_2O emissions and mitigate the effects of concentrated livestock operations by accounting for avoided N_2O emissions in LCFS pathways.

Conclusion

Biogas and RNG offer immediate solutions for reducing emissions in the waste, agricultural, and livestock sectors. We believe that the changes to the Tier 1 calculators suggested above will facilitate these reductions.
Thank you for your consideration of these comments, and please do not hesitate to reach out with any questions.

Subject**:** Letter of Comment on Credit Adjustment and Margin of Safety for Proposed Amendments to the LCFS, posted December 19, 2023

Dear Chair Randolph:

Life Cycle Associates would like to take this opportunity to provide our comments on the Proposed Amendments to the Low Carbon Fuel Standard Regulation, posted on December 19, 2023. This letter is focused on two key components of the proposed amendments: Credit Adjustment and Margin of Safety.

Proposed Credit Adjustment
The following is an excerpt from the proposed regulation:

"Credit True Up after Annual Verification. Beginning with the 2025 annual Fuel Pathway Report data reporting year, the Executive Officer may perform credit true up for a fuel pathway that has a lower verified operational CI upon receiving a positive or qualified positive verification statement for the associated annual fuel pathway report and quarterly fuel transactions reports, notwithstanding the prohibition on retroactive credit generation in section 95486(a)(2). To implement this true up, the Executive Officer will calculate an equivalent number of credits representing the difference between the reported CI and the verified operational CI from annual Fuel Pathway Reports for each fuel pathway code reported with non-liquid transaction types and with the following liquid fuel transaction types "Production in California," "Production for Import," and "Import" during a compliance year, and place those credits in the account of each appropriate fuel reporting entity after August 31 for the prior compliance year. The credits will be calculated according to the following equation:"

Expected Impact of Proposed Credit Adjustment

- If a fuel pathway holder's operational CI exceeds their certified CI, 4.0× credits are taken away per § 95486.1. (g).
- The clarity of this penalty eliminates uncertainty associated with non-compliance
306.1 but does not include any consideration of specific conditions leading to non-compliance.
- If the operational CI is below the certified CI, the under-generated credits may be returned to the fuel pathway holder.
- Pathway holders now have an artificial incentive for an inflated margin of safety (MOS). The expected outcome is election of highly inflated margin of safety to avoid any CI non-compliance risk while still (retroactively) generating all of the credits associated with the operational CI improvement. This measure also

Stefan Unnasch
1.650.461.9048 direct
unnasch@LifeCycleAssociates.com
884 Portola Road, Suite A11
Portola Valley, CA 94028 USA

provides an incentive for deferring the generation of credits and prevents reporting the benefits of the LCFS program as timely and accurately as possible.

Rationale

306.1 cont
- CI exceedances are often out of the control of fuel producers, often arising from black swan events outside the scope of a facility's operational control. Black swan examples include extreme weather events or global/regional supply chain disruptions due to the war in Ukraine or COVID-19. These events can create a discrepancy between the certified CI and operational CI for many fuel pathway holders, unrelated to their operation.
- In such situations, fuel producers should not receive high penalties for exceedances that they are unable to mitigate.
- High margins of safety results in skewing of credit reporting and deferred cash flow.

Recommendations:
Application of a Margin of Safety

306.2
- Oregon CFP has adopted a quantitative variability approach to determine a margin of safety for their fuel pathways, requiring pathway holders to submit their quantitative variability analysis to support the margin of safety election.
- We find that the quantitative approach under the Oregon CFP may be an appropriate framework for calculating the conservative margin of safety "of a magnitude determined by the applicant", within California's LCFS.
- We recommend inclusion of a similar provision to prevent election of overly conservative MOS as a way to entirely avoid CI non-conformance while creating a significantly large true-up accounting burden on CARB.

Reduced True-up factor for Communicating CI Exceedance in Advance

306.3
- We recommend inclusion of a provision that allows for reduced penalty consideration for specific cases:
  - If a fuel producer informs CARB well in advance, in writing, of projected CI exceedance and retains a matching credit balance in their LCFS Reporting Tool (LRT) account at the end of the reporting year, CARB may reduce the CI exceedance factor from 4.0 to 2.0.
- Such a relief should be strongly considered for CI exceedances arising from black swan events.

Thank you for your consideration in reviewing our comments and incorporating them into the final regulation. If you have any questions, please reach out to me directly.

Subject	GTAP Model in CARB

Comment

I am submitting the attached co-authored report evaluating the economic foundations of the GTAP model. This model is used by CARB to estimate emissions from indirect land use change ILUC for the Low Carbon Fuel Standard. It results in far lower estimates than biophysical models would estimate of the land use costs of converting land to produce the quantity of crops that are incorporated into a mega joule of each biofuel.

Our report is based on on-going research sponsored by the Tobin Center for Economic Policy at Yale. The report finds that the GTAP model lacks an economic basis and is particularly unable to project changes in land use. Our report also finds that both unsupported structural features and parameters systematically lead to these low ILUC estimates. Accordingly, GTAP does not
307.1 provide a reasonable scientific basis on which to estimate ILUC nor to support a conclusion that crop-based biofuels reduce greenhouse gas emissions when replacing gasoline or diesel. For this reason, it would be inappropriate to make regulatory changes designed to reduce greenhouse gas emissions that incentive any increased use, or even continued use, of these biofuels.

The inability of GTAP to provide an economically grounded estimate of ILUC does not mean that the use of land to produce biofuels should be considered carbon-free. One reasonable alternative approach is to factor in the carbon opportunity cost of using for biofuels. It this land would be equally appropriate to use a biophysical model to estimate what the average carbon losses have been to produce the cropland that in turn generates the crops used for biofuels (amortized according to CARB policy over 30 years). Either approach is likely to conclude that using crop-based biofuels substantially increases greenhouse gas emissions relative to the use of fossil fuels.

Evaluating the Economic Basis for GTAP and Its Use for Modeling Biofuel Land Use

Steven Berry, Timothy Searchinger, and Anton Yang
(February 20, 2024)[1]

Increased biofuel use requires crops, producing crops requires cropland, and producing cropland causes losses of carbon from vegetation and soils. In a typical lifecycle context for products other than biofuels, carbon accounting attributes to each product the emissions from inputs, including fixed inputs if they are significant, so some of the emissions from each fixed input are assigned to each output. For example, some of the emissions of producing a car factory are assigned to each car. Following this approach, the carbon emissions of biofuels are high: as discussed below, the emissions to generate a hectare of cropland greatly exceed the reduced emissions from gasoline or diesel by substituting 30 years of biofuel production on that hectare.

In determining the emissions from the use of cropland for biofuels, the convention has been instead to use an economic analysis to determine how much carbon land conversion will occur to replace crops diverted lost from land conversion as a result of the consumption of specific biofuels. There are sound economic and biophysical reasons to believe that economic responses will not be substantially less than those associated with the average loss of carbon in the past to create the requisite quantity of cropland.

Global cropland for annual crops is expanding at an increasing rate: according to a recent, high-quality satellite-based study at a net rate of 10 million hectares per year (and a gross rate of roughly twice that) (Potapov et al. 2021), roughly equal to the annual harvested cropland area of Iowa. Although data limitations impede analysis of net changes in pasture area, satellites show that expansion of pasture is an even larger direct source of deforestation than cropland (Weisse and Goldman 2021). Sound econometric studies have shown that shocks to agricultural supply translate into prices for crops around the world (Roberts and Schlenker 2013). This connection means that increases in demand for biofuels in one region will cause similar price increases in different parts of the world and thereby stimulate cropland expansion wherever it is cheapest to do so. And where robust econometric studies are available, they

[1] The research on which this report is based is ongoing. Comments welcome to sberry@yale.edu, and some further improvements are likely. Berry: Yale University Department of Economics and Tobin Center. Searchinger: Princeton University and Tobin Center. Yang: Yale University and Tobin Center.

have found that cropland expansion is highly sensitive to crop prices in carbon-rich parts of the world, such as Brazil and the Amazon, particularly over any period longer than short-term (Souza-Rodrigues 2019) (Sant'Anna 2024). These same rigorous studies have found that yield effects are an extremely small fraction of the estimated area effects, which implies that cropland expansion is the dominant way the market replaces crops.

To estimate these effects, however, governments have sometimes relied on models that seek to predict how biofuel demand will reallocate world land use through global market pricing mechanisms, sometimes including interactions with the entire global economy. The resulting emissions are known as emissions from indirect land use change or "ILUC." GTAP is one model used to estimate ILUC, with one version used by the California Air Resources Board (CARB) and changed versions used as inputs to the GREET model at the U.S. Department of Energy. In both versions, estimated ILUC carbon losses from a gallon of corn ethanol and soybean biodiesel are extremely low, meaning there is little carbon cost for diverting even prime farmland to biofuel production.

To serve this function, the GTAP model must be scientifically credible. This memo evaluates GTAP's scientific foundation. We find that GTAP lacks any appropriate economic foundation. It is particularly unable to evaluate land use changes.

- Of thousands of economic parameters, only a small number claim to have any direct, empirical basis. Of these, few of the cited empirical studies make any use of credible techniques for distinguishing correlation from causation and, most fundamentally, supply from demand. Regardless, these parameters are all or nearly all misapplied to data, regions, and functional forms that differ fundamentally from the original empirical results. In effect, these parameters are claimed to predict changes in supply and demand they do not.

- We also find that functional forms of the GTAP model, to which parameters are misapplied, lead to findings of low ILUC. In multiple ways the purely assumed structural form leads to extremely limited conversion of forests. As one example, the functional form leads GTAP to select a single, average parameter from the one study relied upon for estimating the likelihood of land use change, which explicitly underestimates the level of cropland expansion and greatly overestimates the economic resistance of forests to this conversion. These features also also causes forests to instantly reappear in new areas. In some cases, the structural form leads to bizarre results.

- GTAP's basic economic structure is particularly unsuited to the analysis of land use change because it does not reallocate land among different uses but instead destroys or creates large quantities of physical land. This land must then be arbitrarily "adjusted back" to respect the actual finite quantity of land. These adjustments radically reduce the ILUC results and further shrink the share of land use change from GTAP's proxy for forests.

- The model's structural form also cannot allow conversion of unmanaged land, which is much of the world's carbon rich land. It also contains no notion of a standing forest that can exist for multiple reasons – there is only land that exists to produce wood. These assumptions, required by the structural form, not only forces the model to ignore a major direct source of potential land use change but works backward to limit the model's conversion of this proxy for managed forests and even of grasslands.

- GTAP uses an outdated trade model that is designed to capture patterns of trade in manufactured goods. Applying this model to agricultural products artificially limits the predicted effects of US policy on world land use.

- We also review how additional, empirically unsupported decisions added to the model since the first version used for CARB have further reduced the estimated ILUC. These include unjustified pure assumptions that ensure that to the extent the model claims the need for more cropping area, it does not actually result in additional land conversion.

Benchmarking ILUC

To determine a useful benchmark for ILUC, we can ask on average how much carbon has been lost from vegetation and soils to produce the crops that go into one gallon (or one mega joule) of each biofuel. Following both national and California policy, we can then amortize this carbon loss over 30 years of biofuel production. This calculation generates an ILUC if the crop, such as corn diverted to biofuels, is replaced by the same quantity of corn on new cropland with the average global yield and with the average carbon losses that occurred from previous cropland expansion for corn This is the same general approach taken for inputs in lifecycle analyses, including for other inputs used for corn.

As shown in Table 1 (and estimated in (Timothy D. Searchinger et al. 2018), this theoretical ILUC is 200 gCO_2/MJ for corn ethanol and 330 gCO_2/MJ of biodiesel. That number, which excludes the production emissions from use of fertilizer and fossil fuels, is roughly 3-4.5 times the direct fossil fuel savings from the use of the biofuel. By this benchmark, the GTAP ILUC estimate used by CARB is only around 10% of these average emissions in generating cropland to produce corn and soybeans. That estimated ILUC is also only around 25% of the carbon that could be sequestered by allowing U.S. corn land to grow forest (assuming 3tC/ha/year). (See Table 1). The GTAP versions incorporated into the GREET model are even lower. Implicitly, they are claiming that all the cropland in Iowa can be diverted to biofuel production -- or to any other use -- with almost no effect on global land use elsewhere or climate consequences.

The GTAP estimates are also far below estimates of some other recent economic model estimates. In (Lark et al. 2022), the authors found that ILUC emissions in the U.S. alone were 39 grams CO_2/MJ without counting international ILUC emissions. In (Merfort et al. 2023), the authors estimated an ILUC of 92 grams CO_2/MJ for ethanol from high-yielding energy crops.

Table 1: Comparison of GTAP ILUC Estimates with Biophysical Carbon Costs

	Average global carbon loss to produce crop	Land use cost of not reforesting land at 3tC/hectare at U.S. yields	GTAP California ILUC estimate	GTAP-BIO ILUC estimate used by GREET	Exhaust pipe emissions from gasoline or diesel
Grams CO_2/mega joule					74
Corn ethanol	200	83	22	7.8 – 14.3	
Soybean biodiesel	330	179	27	9.1-12.1	

Biofuel figures are "land use cost" figures measured by the different methods excluding production emissions and excluding the portion of land attributable to co-products. Sources: Column 1 (Searchinger et al. 2018), column 2, author's calculations, column 3, CARB emissions estimates, column 4, GTAP results incorporated into GREET model outputs.

An economic model might estimate these much lower carbon costs than the average carbon cost of producing the biofuel crop for one or a combination of three reasons, all of which contribute to GTAP's low ILUC estimates.

- First, a model may estimate that much of the food diverted to biofuels is not replaced because higher food prices depress consumption. New cropland is not therefore needed to replace much of the food. In the original GTAP estimates of ILUC from corn ethanol for CARB, roughly half of the food calories are not replaced. (Hertel et al. 2010)(T.D. Searchinger et al. 2015).

- Second, a model may claim that higher prices may induce farmers to increase output per acre on existing agricultural land: This can occur by increasing crop yields, by intensifying pasture, or by increasing double-cropping or other forms of "cropping intensity. These effects also play a major role in GTAP (Malins, Plevin, and Edwards 2020) (Hertel et al. 2010) (T.D. Searchinger et al. 2015). In recent modeling, for example, the model predicts that 80% or more of additional cropping area in most regions is supplied not by new cropland but by growing crops on existing cropland more frequently. (Malins, Plevin, and Edwards 2020).

- Third, the model may claim that converting land for new cropland releases little carbon. In recent GTAP runs for corn ethanol, 89% of the new cropland comes from grassland, with only 11% from forests (Table 1) (Farzad Taheripour, Zhao, and Tyner 2017) (Table 1). As discussed in Malins et al. (2020), some new versions of GTAP used for GREET also claim that converting much of this pasture to cropland gains soil carbon.

These functions may interact. In GTAP, for reasons discussed below, farmers directly convert mostly grassland rather than forest, and in turn, livestock producers do not then significantly convert forests to replace grazing land either because of reduced meat consumption or because of livestock intensification.

The ILUC calculation depends in essence on the ratio of three different responses to increased prices: agricultural land expansion, intensification, and food demand reductions. This means that all three responses must be soundly estimated to produce a scientifically useful ILUC estimate.

Specific recent GTAP modifications that lead to a low ILUC

GTAP was originally used by the California Air Resources Board to establish an ILUC in 2010 but has undergone subsequent revisions. This section discusses specific parameter decisions made regarding GTAP, critiqued in (Malins, Plevin, and Edwards 2020), and to which some GTAP modelers responded in (F. Taheripour, Mueller, and Kwon 2021). These decisions by themselves will generate extremely low ILUC estimates in three ways:

- By increasing the "intensification" effect of cropland, so new cropland is not needed to replace crops;
- By increasing the intensification effect on pasture, so if pasture is converted to cropland, conversion of forest to pasture is not needed to replace the meat or milk;
- Through adjustments to ensure that even more cropland expansion comes out of grassland not forest, plus related changes to the estimated carbon effects of converting much of this grassland to cropland. Both changes reduce the carbon losses from expanding cropland.

Although the major contribution of this paper is to focus on the underlying model, we discuss first the issues raised by these recent changes because of their ability to greatly lower ILUC and because they help illustrate how a model can generate low ILUC estimates. We agree with the critiques in Malins et al., and we add some relevant additional observations.

1. Double cropping or other increases in cropping intensity

A major feature introduced into the model is an elasticity that ensures that 80% of the increase in cropping area in most regions, including the U.S., results not from expansion into native lands but from cropping the same cropland more frequently. (Malins, Plevin, and Edwards 2020). Such a change is modeled as an increase in "cropping intensity." This can occur, for example, by increasing the acres that produce two crops in a year, known as "double cropping." Because doing so reduces the need for new cropland; an 80% increase in cropping intensity reduces ILUC by 80% (relative to the estimate without this effect).

As discussed in Malins et al., the GTAP authors have neither conducted nor cited any economic analysis that estimates that increased demand causes increases in double cropping or otherwise increases cropping intensity. What the authors appear to have done is simply adopt elasticities tailored by region, which they feel matches recent cropland trends in these regions. Even if there were a trend toward increased cropping intensity, that does not mean that increased demand for crops drives this trend, let alone by how much if it contributes at all.

One way to highlight the flaw in this analysis is to compare the author's claim that 80% of U.S. cropping will be provided by increases in cropping intensity with the contrary evidence of what has happened. Although there appeared to be a small increase in double-cropping in the U.S. in the first years of the renewable fuel standard mandate, there has since been a significant decline. Double cropping over the last five years was roughly 40% lower than between 2007-2011 and among the lowest levels ever recorded in USDA data. For overall cropping intensity, which also factors in how often land is left fallow or crops fail, there has been no discernible U.S. trend for decades. (USDA data available at https://www.ers.usda.gov/data-products/major-land-uses/major-land-uses/#Cropland). (For the remainder of the world, poor data makes it impossible to determine even what the true trends really are.[2]) If nothing else, this data calls the authors' assumptions into question.

But this change also helps illustrate the improper economic data-analysis methods that are frequently used in designing the GTAP model. The "method" here is to treat short-run observed changes in double-cropping as reflecting a large, long-run causal effect of crop prices on double-cropping. Having now seen the recent data on double-cropping, if they followed their own method, the GTAP modelers would make adjustments and remove this double-cropping effect for the U.S. But of course, the original decision was not based on any serious attempt to distinguish causal relationships in the data. In fact, none of this data tells us about the real effect of prices on double-cropping in either direction. We discuss these issues more broadly below.

More broadly, these kinds of ad hoc adjustments turn modeling into mathematical forms of storytelling. But any number of stories could be told from the same snippets of information. For double-cropping, alternative potential stories include that the original increase in double-cropping was driven by non-price factors. Alternatively, increases in cropping intensity could be explained as a short-term response to increased demand before cropland area expanded to meet demand at a lower cost. The large number of potential and contradictory story lines are why economics requires rigorous methods to tease out the effects of changes in demand or supply.

[2] As Malins et al. correctly observe, the data from the FAO that estimates a country's area of cropland and that estimates its area harvested come from different sources using different methods. The limitations in our understanding of cropping intensity are discussed in (T. Searchinger et al. 2019), which provides examples of how FAO statistics can conflict with results from satellite studies.

2. Demand-induced yield gains of cropland and pasture

The GTAP modelers have similarly incorporated a substantial price-induced yield effect. This was originally based on a claimed set of U.S. papers for corn and then applied that to every crop and to every country in the world. The lead author here reviewed these papers for the California Air Resources Board and determined that the papers relied upon actually as a whole found no yield intensification effect after the 1960's (ST Berry 2011). In fact, as discussed in Malins et al., corn yields in the U.S. follow an intensely linear trend independent of price. Furthermore, applying this intensification effect to other crops and to other regions lacks any foundation at all as the physical and economic factors that determine the ratio between land expansion and intensification will vary greatly by country.

In revisions to the model, as discussed in Malins et al., a large intensification effect has also been applied to pasture. As a result, when cropland expands into pasture, little pasture expands into forest to replace the meat or milk. As quoted in Malins et al. (2020), the GTAP authors conceded that this estimate does "'not have an empirical basis.'"

We add that this is a particularly significant, pure assumption. Expansion of pasture into forest is the main direct source of global deforestation (Weisse and Goldman 2021). Although lacking economic rigor, several papers have found statistical associations in Brazil between conversion of pasture to cropland and knock-on expansion of pasture into forest. (Lapola et al. 2013)(Lapola et al. 2010) (Arima et al. 2011). A rigorous, econometric study has shown that increases in beef prices have a strong effect on deforestation in the Brazilian Amazon (Araujo, Costa, and Sant' Anna 2020), which implies a significant knock-on effect if pasture is converted to cropland elsewhere. Other unjustified model features, discussed below, lead GTAP to project hat cropland will expand into pasture. This pure assumption therefore has the effect of additionally assuming away much ILUC.

3. Cropland pasture

The introduction of a category of land called cropland pasture was one of the model features that leads the model to project even more conversion of pasture rather than forest. Cropland pasture is land that is occasionally cropped but is used for pasture, and it became the dominant modeled source of new cropland in both the U.S. and Brazil. This was not based on any kind of economic analysis but on an observation that as U.S. biofuel production rose, USDA was reporting a continuing decline in a land use category called cropland pasture. The primary effect of this change, given the GTAP structure, is to make it even more likely that cropland will expand into pasture rather than forest. (GTAP assumes that cropland will more likely switch from one crop use to another than expand into new non-crop uses.) As Malins et al. observe, the GTAP-GREET versions of the model then further assume that this conversion increases soil carbon, contrary to virtually all other estimates of the effect of pasture conversion. One effect of this assumption is that the cropland pasture assumption, as well as other elements of the model that lead cropland to expand into pasture rather than forest, cause even larger reductions in ILUC.

As discussed in both Malins et al. (2020) and Lark et al. (2022), this trend in cropland pasture is as likely based on definition changes and measurement inconsistencies as real changes, as USDA has cautioned. Malins et al. also observe that the GTAP authors employed no economic estimates to differentiate any changes in cropland pasture due to biofuels from trend line changes. And they observe that there is no international category of cropland pasture. [3] We agree with these critiques and add two observations.

First, the GTAP authors claim that the FAO category of "temporary pastures and meadows" is the global equivalent of cropland pasture, so they can apply it in Brazil (F. Taheripour, Mueller, and Kwon 2021). Even if this were true, in Brazil this category of land use has had a steady increase during the rise of biofuels, increasing in area by 20% from the average of 2003-05 average to the of 2019-2021.

Second, the claim that converting cropland pasture to cropland increases soil carbon is not merely empirically unsupported but flawed conceptually because it is based on a failure to distinguish fluctuations in price from a structural shift in demand. This claim assumes that cropland pasture is marginal cropland that rotates in and out of cropping, which depresses its carbon stock relative to land used consistently as pasture (F. Taheripour, Mueller, and Kwon 2021). However, due to fluctuations in price, there will always be "frictional" cropland, i.e., land that is cropped in some years and not others. Even at a higher level of demand for crops due to the growth of ethanol, there will continue to be fluctuations in prices, so there will continue to be land cropped only in some years. There could be other structural economic changes that alter cropland pasture area, but there is no conceptual reason to believe, let alone econometrically established relationship, that the quantity of frictional cropland will decrease due to the rise of biofuels or other increases in demand.

GTAP'S Economic Foundation

This section goes beyond the specific, recent modeling choices discussed in *Malins et al.* to evaluate the GTAP model more generally. This part first explores the parameters and

---

[3] In (F. Taheripour, Mueller, and Kwon 2021), the GTAP authors claim that the decline in cropland pasture was based on USDA data and large enough to accommodate increased land for biofuels even assuming losses to alternative uses. But this claim does not address the critiques. The GTAP authors did not perform an economic analysis to determine if increased demand leads to a decrease in cropland pastures. Moreover, if the data on cropland pasture is fundamentally flawed, it could not be be used for economic analysis. There might be some trend in behavior, but not knowing the true quantity of cropland pasture, it would not be possible even to try to determine its causal factors. As stated in Lark et al. 2022: "[T]he source of cropland-pasture data in the United States is the 5-year interval Census of Agriculture, where the category is a subjectively interpreted aggregate variable that has undergone significant definition changes (Bigelow and Borchers 2017) and measurement inconsistencies (USDA 2019; 2002) across time, further rendering it inappropriate for LUC assessment."

economic structure of the model. It finds that these lack an economic foundation. We then focus on the specific modeling of land use. We find that ILUC is reduced both by the general structure of the model and by the specifics of land use in the model.

In both parts of this discussion, we show some results from running the 2010 version of GTAP-BIO. This is the only reasonably well-documented version of GTAP-BIO and it is the version applied, with some adjustments, to generate the ILUC estimates for crop-based biofuels originally incorporated into regulations by CARB. Among our findings, we find that the basic structure of the model, by itself, can lead to odd and hard-to-explain results. One such flaw is that the economic equations in GTAP lead the model to destroy or create large quantities of land, which the model handles via a bolted-on adjustment factor that brings total land area back to its original level. In doing so, the model greatly reduces ILUC and the role played by deforestation.

This "hand of God" nonprice adjustment also contradicts the core rationale for using GTAP to study ILUC. The GTAP community often argues that one needs some global equilibrium price model to evaluate ILUC. Both the climate benefits and costs of biofuels, including ILUC, are indeed driven entirely by the mechanisms of price changes. But GTAP's behavioral responses to price changes do not allocate actual physical land. The resulting ad hoc nonprice adjustments contradict the entire rational for using GTAP in the first place. Whatever its other qualities, GTAP is therefore particularly inappropriate for estimating land effects.

1. **Basic Structure of Model**

At its essence, GTAP is a model for estimating shifts in supply and demand. For demand, it estimates how much changes in price for one good, whether corn, electricity, or various services, cause shifts in its consumption. (In economics, this is known as an "own-price" effect, often expressed as an "own-price elasticity."). GTAP also estimates how this change affects the consumption of other goods. For example, if the price of corn increases, and its consumption for food and feed declines, GTAP estimates what (and to what degree) other crops or foods replace those losses. (These are known as "cross-price" effects, often expressed as a "cross-price elasticity.") Prices changes can affect consumption and production in a multitude of ways. For example, if corn prices increase, not only may livestock producers shift to other feeds, but the price of livestock products will increase, causing food consumers to shift to other foods and potentially to reduce their consumption of food overall, buying more of other goods. GTAP purports to predict all these effects.

The same adjustments occur on the supply side as producers of goods shift from one input to another. For example, if the demand for one form of energy increases, producers may not only shift to another form of energy but also reduce their energy consumption overall and shift a little to alternative inputs. GTAP purports to measure both the decline in consumption of each input whose prices increase and the shift to other inputs. GTAP purports to project these shifts, which are the core of the model, in a highly disaggregated ways: by country or groups of countries, by multiple agroecological zones (AEZs) within countries, and by product.

To do this, GTAP creates a hierarchical "tree" structure of layers, or "nests" of equations. Lower level nests results in aggregate products that are inputs to higher level nests. For example, a lower nest has the cropland used for different crop types, which compete with each other for use of cropland. The aggregate of these different uses of cropland generate a total cropland area, which is included in a higher level nest. At this higher level, cropland overall competes for the uses of total land with other uses of land, particularly grassland used for livestock and wood-producing land (GTAP's proxy for forests). Throughout the model, GTAP modelers group goods and inputs based on an intuition of which are likely to compete more directly with each other.

Within each nest, responses to price changes are based on two factors. First, there is a "substitution parameter", a single number, which is supposed to determine in general how likely it is that the quantity of goods produced, or the inputs used increase or decrease as a result changes in price. We call this the "nest parameter."[4] However, this parameter by itself does not determine the sensitivity of change, i.e., the elasticity of supply or demand. Instead, as discussed more below, this elasticity depends both on that parameter and on a product's share of the total revenue of all products, or all inputs, within that nest. For example, the elasticity of cropland area within each agroecological zone, i.e., the extent to which the area of cropland varies with a 1% change in price, depends on both the nest parameter and on the share of total rent from all land uses supplied by cropland.[5] As discussed more below, the revenue share is also the sole factor determining how much other inputs or outputs in the nest change as substitutes when the supply or demand for one product increases or decreases.

As a result, all supply and demand elasticities are determined by a single nest parameter for all products within a nest, and by the share of revenue or cost of each product within that nest.[6] This formula is chosen for its computational tractability not for its empirical reality. (As discussed below, it actually contradicts the limited economic analyses cited by the modelers to justify their choice of nest parameters.) This choice is understandable as a research strategy, but it does not produce a model that can be treated seriously as a policy tool.

---

[4] In the literature, in ways that vary across the components of the model, this parameter might be called the "CES substitution parameter" or the "CET transformation parameter" or the "elasticity" parameter. The terms CES and CET refer to the restrictive functional forms of the model. The CES is somewhat modified in the consumer demand portions of the model, adding some additional flexibility, especially with respect to income.

[5] As discussed more in Appendix B, the precise formula is the nest parameter, which uses the Greek letter sigma, multiplied by 1 minus the revenue share. For example, if the sigma is .2 and the cropland has 60% of the total revenue, then the elasticity will be .2 * (1-.4) = .12 This means that a 100% increase in price will cause a 12% change in cropland area.

[6] A parameter on an upper-level nest will then determine the percentage changes in the upper-level nests. Cost/expenditure/revenue shares play a similar role at the upper levels, interacting with the nest parameter to produce a set of computationally convenient results. At the upper level, the relevant price is a price index for the composite commodity.

2. **Absence of economically estimated parameters**

The first problem is that even if the overall formula were empirically grounded, its legitimacy still depends on thousands of necessary nest parameters. GTAP only even claims to base a handful of these parameters directly on *any* empirical economic analysis.

For the parameters that are claimed to have an empirical basis, none appear to be derived using modern econometrics. There is a very large literature on how to properly estimate demand and supply elasticities, including cross-price effects. It is the strong consensus of the economics profession that such estimates require changes in demand conditions ("instruments") to estimate supply, and vice-versa. For a famous application to biofuels, see Roberts and Schlenker (2013). For the consensus around this broad idea, see papers ranging from Wright (1928) to Berry and Haile (2021). To our knowledge, none of the thousands of parameters in GTAP is based on a high-quality application of consensus econometrics.

For others, although some reference may be made for an elasticity parameter, this nearly always based on a particular product in a particular location. GTAP's approach is to apply the same parameters often to quite different products or inputs and in multiple or all regions. In some cases, whole categories of parameters are set to a fixed fraction (such as one-half) of some other set of parameters.[7]

The land use nest parameters illustrate these problems. To estimate the elasticity of cropland area, and therefore cropland expansion, the GTAP authors originally relied on a single study, which we call *Lubowski,*[8] focused exclusively on changes in the United States. The use of the *Lubowski* results is a "best case" for GTAP, because this is a respectable, although still imperfect, empirical study. This solely US-focused study generated highly different estimates for different land use transitions in different locations. GTAP boiled down these different elasticities down to a single nest parameter for all transitions in all locations and applied this parameter to each type of land transition, in each agroecological zone, and in each of multiple countries or regions (F. Taheripour, Mueller, and Kwon 2021) (Hertel et al. 2010).

In reality, the relationship between cropland expansion and price will depend on widely different physical conditions in different locations, such as soil qualities, rainfall and slope, as

---

[7]As examples, the elasticity of substitution in value-added-energy sub-production for many goods is the same for every region. The elasticity of substitution between domestic and imported goods is the same for firms and households, although it is not clear why demand and supply parameters should be equal. The relationship between sources of inputs and the domestic/imported allocation follows the so-called "rule of two." For example, the so-called Armington CES for regional allocation of imports of gasoline is 4.2 and the domestic/imported allocation is one half of that. The CES elasticity of import demand for oil across sources is 10.4, and the CES elasticity between domestic and imported goods is one half of that, and so forth. .

[8] Versions of roughly the same empirical study design were published in several versions with different policy applications including (R. Lubowski 2002), (R. N. Lubowski, Plantinga, and Stavins 2006) (R. N. Lubowski, Plantinga, and Stavins 2008)

well as economic factors such transportation costs, energy costs, property rights, and differential access to capital. *Lubowksi* modeled detailed *plot-level* transitions, factoring in such variables as soil quality and prior land use. Not surprisingly, *Lubowski* found wide differences in the elasticities that should apply to different plots of land (as well as different types of shift in land uses as discussed below).

The land use nest parameter chosen by GTAP was intended to be an average of these different elasticities in the U.S. Given both the vast physical differences around the world, and the different economics of different land uses in different parts of the world, it would be an extraordinary coincidence if this US-derived parameter could be validly applied to multiple regions and multiple countries.

This is not a correct way to do global analysis. It *is* economically consistent to use globally estimated parameters from global datasets to predict global responses. The biofuel analyses of Roberts and Schlenker (2013) illustrate how this can be done. GTAP-Bio 2010 instead uses local estimates from one country to distill a single parameter that is then applied to many different agroecological zones in many different regions where the parameter interacts with land use data from that zone and region. Doing so is virtually guaranteed to create invalid results as well as a spurious implication of specificity and precision where none is warranted.

Interestingly, the principal GTAP modelers decided in 2013 that applying the *Lubowski* parameter to the whole world was not justified, and they purported to "tune" this elasticity parameter to different regions. But they did not provide any economic analysis for any other country or region. Instead, they appeared to still use the U.S. parameter as a kind of global, middle benchmark, although it was not. Then, after surveying regions with more or less cropland expansion, the authors subjectively raised or lowered their nest parameter from this benchmark in different regions. They did so without the use of any standard econometric method, most particularly without any attempt to determine if observed land transitions are caused by price changes as opposed to changes in any other determinants of demand and supply. The lack of economic basis is so extreme that the modelers informally chose price elasticity parameters without making use of any systematic data on prices.

Among the resulting alterations, it appears that the GTAP modelers lowered the cropland expansion parameter and therefore elasticity in the U.S. to 10% of the value ascribed to *Lubowski*. Although this U.S.-derived parameter remains the *only* land use change parameter for which the GTAP authors claim to have *any* econometric support, they picked a new U.S. value that contradicted that basis.

Model parameters matter. The lack of empirical support for GTAP is therefore disqualifying all on its own.

In a recent commentary, some GTAP authors claimed that without econometrically derived parameters, it is appropriate to "use a calibration/tuning process to proxy the missing parameters" (F. Taheripour, Mueller, and Kwon 2021). If there is strong econometric support for a model and its key parameters, it might be appropriate to use a sensitivity analysis to test an unknown parameter. But this model lacks virtually any parameters that are derived from appropriate econometric method applied to appropriate data variation. In this case, appropriate data would include variation in prices, quantities, and in demand side factors that shift demand curves, tracing out land supply. In contrast, the authors are not even using any combination of statistics and data to even roughly "fit" a price-quantity relationship– itself an inappropriate technique. As in the case of double cropping, they appear to be picking parameters to fit a narrative.

3. **The role of revenue shares, which leads to misapplication of these parameters, and contradiction with their underlying economic analyses**

Even if some or all the parameters used in the model had some empirical basis, GTAP changes their meaning by misusing them to project wildly different relationships. That is because, as discussed, all the demand and supply elasticities in GTAP, which in govern the supply and demand changes, are governed also by the share of costs or revenues each product or input has within each "nest." This feature was presumably selected because this cost share data is relatively easily available, which may be fine as a research project, but not in a serious policy realm. Its use to determine elasticities, which has large consequences, both lacks an empirical basis and contradicts the limited economics cited by the modelers.

A cake recipe can help illustrate both how a revenue share formula works and why it cannot in general be used to replace empirical estimates of how demand or supply for specific products or inputs varies with price. Baking a cake may require flour, milk, butter, eggs, granulated sugar, powdered sugar, chocolate or vanilla, salt, sprinkles, and baking powder Increased use of some of these ingredients may be able to partially compensate if others increase in price, but that will depend not only on the price of each but on the physical role each plays. For example, a baker might be reasonably willing to substitute powdered sugar for granulated sugar. But given the special need for baking powder, it is unlikely that increasing its cost would cause bakers to use less per cake baked. That is particularly true given the modest contribution to the total costs of a cake of a tablespoon or two or baking powder. With a high enough price increase, it is conceivable that a baker might substitute more egg white to generate the rising effect, but other ingredients probably cannot be substituted at all.

As this example illustrates, demand and supply responses in general depend on a variety of functional attributes and consumer preferences that are specific to those products, inputs, and various alternatives. Consumers will more readily substitute green beans for broccoli than lard. Producers will more readily substitute internet-based news for a newspaper than a massage, although all may be characterized as services. In none of these examples is the overall share of the cost necessarily a single factor let alone a determinative factor in determining these substitutions.

However, under the basic structure of the GTAP model, if the ingredients for a cake are put into the same nest, and the price of baking powder rises, the percentage share of each other cake ingredient will determine what is substituted. As a result, if the price of baking powder rises, GTAP would predict that consumption of baking powder will decline and will be replaced by at least some of *all* the other ingredients. Moreover, the ratios of quantities of the other ingredients replacing baking powder will be based solely on their cost share. As a result, milk, butter, and chocolate would likely be the largest replacements, in proportion to their cost shares, even though their functional roles are distinct.[9]

Cakes are not specifically in GTAP, but this revenue-share (or cost-share) function is what determines the elasticity of demand or supply of all products and all inputs. For example, if demand for cropland and therefore its price increases, the quantity of cropland expansion will depend on a nest parameter, but also on its revenue share. And in general, substitute inputs (the diversion ratios) will depend exclusively on their relative revenue shares.

Appendix C uses the energy sector to illustrate how this structure leads to non-credible, results. For example, as modeled, the ethanol mandate leads to a large price increase for gasoline, producing a decline in the aggregate consumption of gasoline and ethanol. It also causes substantial declines in household electricity use, and consumption of natural gas, coal and oil for uses other than for transportation. As explained in the Appendix, these results, which lack an empirical basis and do not seem to have actually occurred, are driven by the structural form of the model. In particular, this result is driven by the expenditure share assumption together with the multi-level tree structure of the nests.

This theory that revenue or expenditure shares determine elasticities also *contradicts* the few economic analyses cited to generate inputs, and results in invalid use of their parameters. Again, GTAP claims that the elasticities governing shifts between cropland, pasture and forest – the prices at which land shifts from one use to another --- are based on each land use's share of the total revenue of all land uses within each agroecological zone. To provide parameters for these shifts, the authors rely exclusively on *Lubowski*. However, that study found that elasticities vary with soil and prior land use, <u>not</u> with AEZ level revenue shares.

An analogy helps to explain the nature of the error. Consider a careful, data-based study of a health treatment that finds success varies with weight. The results might imply that the treatment should only be applied to higher weight people. Now consider a new researcher who has constructed a model that, without evidence, varies treatment success with height. This researcher could (but should not) fit an average treatment effect to people of all heights that matches the average effect found for people of all weights. This researcher could then say "my model uses the results of the earlier treatment/weight study," but that would be misleading. The interactions with height were purely invented. This new model could not validly be used to advise people to obtain treatment based on their heights.

[9] The formal way to discuss these "patterns of substitution" is as a "diversion ratio," as in the land "diverted" from alternative uses to corn land when the return to corn land increases. See Conlon and Mortimer (2021). In the CES/CET functions of GTAP, within-nest diversion ratios do not depend at all on any parameter, but only on revenue/expenditure shares.

As described more precisely in Appendix B, the GTAP modelers have engaged in this kind of statistically invalid effort to convert elasticities found using one kind of relationship to project changes based on entirely different relationships, i.e., changes based on revenue share. This is true for shifts among land but also true for all, or nearly all, other statistical relationships in the model.

How the Model Structure and Assumptions Lead to Physical Impossible Economic Projections and Low ILUC Estimates

This section focuses specifically on the effects of this model structure and choice of parameters on the land functions in GTAP. This function plays a key role in determining how much cropland expands and whether that expansion occurs into pasture or forest.

1. GTAP economic functions commonly destroy or create land, and GTAP then uses an artificial constraint to adjust land area in ways that greatly reduce ILUC and further lower conversion of forests.

Because land area is fixed, a land use model needs to be able to determine if cropland expands and how much of this land area comes from alternative land uses, such as pasture and forest. GTAP, however, does not actually base its economic function for allocating land on physical land areas and as a result it can (and will) create or destroy land.

The reason is that the competition between different land uses, such as cropland, grasslands, and managed forest, is represented by their share of their combined revenue within an agroecological zone. When there is a shock to the system, such as more demand for cropland for biofuels, roughly speaking, not the physical areas but the revenue from changes in pasture and managed forest need to match the revenue increase from cropland. Because each hectare has a different rent, the physical areas do not match. Depending on the different price changes and other characteristics in different agroecological zones, the model "creates" physical land or "destroys" it. As shown in Appendix A, this features results in vast discrepancies, with changes in total land area several times larger than the projected changes in cropland area.

One fundamental problem with GTAP is therefore that a viable economic model of land use change cannot create or destroy total land. If the economics claim that land is created, the economics are incorrect.

The second problem is how the remainder of the model responds to these economic claims. To deal with this problem of fictionally created or destroyed land, GTAP modelers have added a pure adjustment factor, which reduces the area of pasture and forest automatically to match the area. Such an arbitrary adjustment does not make the model economically valid. If a model claims that individual incomes increase in total vastly more than the total national income increases, it is not a sign of a valid model that the model then reduces individual incomes proportionately to match the national income.

In addition, the adjustment factor applied by GTAP generates results that are inconsistent with its economics and result in less forest conversion and a lower ILUC. In Appendix A, we show the results before and after final adjustment of the GTAP model for the U.S. using the 2010 model version of GTAP-BIO for corn ethanol.

- As shown in Table A3, the economic projections in the model are for a total of 7,952 million tons of CO_2 emissions from land use change, but these shrink to 536 million tons with the adjustment (7% of the originally estimated ILUC).
- While the economic portion of the model projects that 54% of the non-cropland converted to cropland comes from forest, Table A2 shows this share shrinks to 34% after the adjustment. In other words, the adjustment does not just reduce total ILUC area, but it also sharply reduces the contribution of forests to land use change.
- In several agroecological zones, including AEZ7, which has the largest quantity of cropland expansion, the model shifts the forestry results and transforms a large decline in forestry area into an increase.

To summarize, the structure of the economics of the model produces physically impossible results. Even if the economics were reliable, the imposed adjustment factor generates an inconsistent result and lower ILUC.

2. GTAP cannot allow conversion of unmanaged land, and thereby forces intensification and demand reduction versus agricultural land expansion.

Previous commentary on GTAP has noted that it cannot model and does not allow conversion of unmanaged land. Unmanaged land can be a large part of a country's agricultural region, and its conversion is a major focus of global agricultural land expansion. Making it available for conversion would roughly double the potential area of forest conversion in GTAP (Plevin et al. 2022). It is difficult to imagine how a model that does not allow conversion of unmanaged land can be used to calculate ILUC. Not surprisingly, using a different model, modelers have found that incorporating unmanaged land leads to a substantially larger ILUC (Plevin et al. 2022).

The significance of this gap in GTAP will even more depress ILUC because the lack of unmanaged land also leads to more limited conversion of grassland and managed forest. In effect, grasslands and managed forest exist in GTAP only to supply livestock or wood products. Yet under GTAP, if increased crop prices were to encourage cropland conversion of these lands, livestock products and wood products cannot be alternatively supplied by expansion into unmanaged land. If cropland begins to expand into grassland, the only options are: (a) for livestock production to be intensified to replace the meat produced; (b) for meat consumption to decline, or (c) for pasture to replace "wood-producing land" not unmanaged land. In turn, for wood-producing lands, the only options are (a) intensification, which the model does not count as causing emissions, (b) a decline in wood consumption, or (c) for wood-producing lands to replace pasture elsewhere. Of these six options, five cannot cause ILUC emissions and one reduces ILUC emissions.

In effect, because the model does not allow people to bring more land into human use, the model will structurally favor cropland responses that do not cause ILUC. Then, because of the inability of wood production or livestock production to expand into more unmanaged land, the model will project price increases in livestock and wood products that lead to increase the profitability of grassland and wood-producing land. These price increases will further push back against cropland expansion according to essentially the same formula that causes cropland to expand. None of this is based on economic analysis but flows from the unwarranted assumption that only land with a rent can be converted, and that its conversion depends on its revenue share.

In short, the model structure both makes it impossible for cropland to expand into unmanaged land, which is much of the concern with land use change, and artificially reduces the conversion of grassland and wood-producing land, GTAP's concept of forest.

3. The revenue share formula requires parameter choices that reduce conversion of forest and conflict with the sole economic source of this parameter.

The *Lubowski* study, which is the sole, claimed economic basis for land conversion elasticities in GTAP, not surprisingly found that increases in cropland profitability had a far larger effect on conversion of noncropland than increases in the profitability of forest had on conversion of cropland to forest. In fact, the study found that even a doubling of the profitability of forest caused only "extremely small" changes in forest area (R. Lubowski 2002). (This can be seen visibly in Appendix B.) The reason is intuitive. Wood production and therefore rents are much lower than cropland rents (R. Lubowski 2002), so it would take large percentage increases in the profitability of forestry to outcome any cropland. As a result, any viable model, and specifically any model based on the results of *Lubowski*, should have a lower response of managed forest area to changes in the profitability of forest than of changes in cropland area to the profitability of crops.

But GTAP requires that the same nest parameter that is used to estimate how much cropland expands into other lands with a change in price of cropland also controls how much other land expands into cropland with a change in its price. To provide this single parameter, the GTAP authors chose a parameter that averages the elasticities of the different land uses. (Appendix B provides a more specific description.) As a result, GTAP deliberately chose a parameter that simultaneously understates the elasticity of conversion of cropland and overstates the conversion of cropland to forestry multifold. This means that relative to the findings of Lubowski, cropland will not expand as much in GTAP. It also means that GTAP will overestimate the rebound effect that curtails cropland expansion by overestimating the effect rising wood prices have on resisting cropland expansion.

In short, the functional form causes GTAP to fundamentally misuse the results in *Lubowski* leading to far less forest conversion than the *Lubowski* results imply and thereby to a misleadingly low ILUC.

4. Additional, incorrect assumptions about managed forests work together with the revenue-share structure to cause forests to instantly reappear elsewhere and to reduce net forest conversion*.*

Both the inability to convert unmanaged land to other uses, including wood production, and the misuse of *Lubowski*'s parameters lead to a strong need to preserve the existing area of managed forest to maintain wood production. Adding to this is the assumption that wood production lost due to conversion of managed forests cannot be replaced just by cheaply harvesting more wood from existing managed forests, resulting in carbon losses. In the real world, managed forests are growing, in significant part due to higher carbon dioxide fertilization and other aspects of climate change itself (Harris et al. 2021)(Pan et al. 2011)(Ruehr et al. 2023). They have abundant more wood that can be harvested, which means that they can supply more wood – with a carbon cost not counted in GTAP – to replace managed forests.

These limitations of the GTAP structure work together lead not only to resist forest conversion but also to a "rebound" of agricultural land to forests. In other words, if some forests are converted to agriculture in one agroecological zone, new managed forests can reappear at the expense of agricultural land in another US zone. This is not based on any actual economic estimates – and is contradicted by the estimates in the *Lubowski* analysis that even a doubling of the profitability of forest has "extremely small" effects on forest area (R. Lubowski 2002).

5. How inappropriate modeling of international trade limits GTAP's projection of U.S. biofuel consumption on world land use.

In Appendix D, we discuss the GTAP trade model. This model is based on a late 1960s idea that trade patterns in manufactured goods can best be explained by a "home bias" for domestic products. GTAP applies such a model to world agricultural trade. As explained in the appendix, this goes against a large high-quality empirical literature that there is a well-integrated world market for homogeneous agriculture products, without home bias, limited only by transportation costs. An implication of this literature is that cross-country prices differences for core agricultural commodities are severely limited by cross-country arbitrage, constrained only by (relatively low) transportation costs. GTAP does not impose this arbitrage constraint, instead allowing the modeled "home bias" to limit trade.

The empirically contradicted GTAP trade model forces much of the adjustment to U.S. biofuel policy to remain in the US. The model predicts very large changes in U.S. crop prices that are not matched by changes in other countries. This then forces much of the equilibrium adjustment onto predicted U.S. consumption and U.S. livestock intensification. A realistic model of world trade could easily predict that much more of the adjustment would take place outside of the US, particularly along active forest/crop boundaries, as in the well-measured empirical papers cited in the introduction.

Summary

In summary, we find that GTAP lacks an economic basis, is peculiarly unsuited to estimate changes in land use, and systematically and without economic foundation leads to low ILUC estimates:

- Of thousands of parameters, only a few are claimed to have any credible economic foundation. Even these parameters that are referenced by the model are misapplied. Most importantly, they are claimed to project economic changes based on revenue or cost shares, which has large consequences, even though the original empirical studies made no such projections.

- The structure causes the model not to allocate land but to create or destroy large quantities of land relative to changes in cropland, which makes it not credible for analyzing land use change. A subsequent "hand-of-God" readjustment to conserve physical land area. This adjustment both greatly reduces ILUC estimates, and in particular, reduces the role of deforestation – and therefore its high emissions - in contributing to additional cropland.

- The structure of the model, including its unsupported use of revenue and cost-shares, leads to low ILUC.

    - The structure prevents GTAP from allowing conversion of unmanaged land, which includes roughly half of all forests and is a major focus of global land use change. The inability to convert unmanaged land in turn leads the model to project increased profitability of managed forest and pasture profitability that limits their own conversion to cropland.
    - The structure requires GTAP to select a single parameter, which resulted in a parameter that understates the expansion of cropland in response to price increases and vastly overstates the role that increased profitability of forestry has in resisting conversion to cropland or pasture.
    - The structure does not model standing forests and so requires an assumption that all "forestry land" is currently fully engaged in the production of wood. If forestry land is converted to cropland in one zone, this creates pressure to create forestry land in other zones, to meet the continuing demand for wood. In the model, these new "forests" do not even need to grow and mature, rather they instantly appear.

- The trade model, borrowed from non-agricultural markets and without econometric support, underestimates the role that trade in agricultural goods similar changes in crop prices across countries and thereby leads to large underestimates of the global land use change from U.S. changes in biofuels.

- More recent changes to the model, also without economic support, further lower ILUC in a variety of ways. One assumes without economic support, and in contradiction to experience in the U.S., that most of the new cropping area is supplied by increases in double cropping or other cropping intensity. Another assumes a large, unjustified response of pasture-intensification to grassland conversion, which greatly reduces the need for pasture to expand into forest to maintain meat and milk production. A third greatly reduces the carbon losses associated with conversion of grassland.

Many of these unjustified effects work together to generate an extremely low ILUC. Several effects cause the economic component of the model to select conversion of pasture rather than pasture. The ad hoc adjustment at the end then further reduces the role of forest conversion relative to grassland. The pasture intensification function avoids the pressure to clear forest to replace pasture converted to cropland. After these factors combine to limit forest conversion, the claim that much of the grassland conversion to cropland increases soil carbon makes the remaining conversions carbon "cheap."

In Taheripour et. al. (2021), the GTAP modelers do not claim to have significant econometric support but contend, in effect, that it is appropriate to assume a model structure and most of the parameters and then adjust it to data. That is incorrect. Across the sciences, particularly those that cannot use direct experiments, there has been widespread attention to statistical abuses. Economics went through a credibility revolution in which even otherwise valid regressions were shown to be improper because they did not use "instruments" to separate correlations from causal effects (Angrist and Pischke 2010). But the calibration exercise the GTAP modelers are employing – many that involve ad hoc adjustments to parameters -- are not even making statistical errors because they are not using statistics to try to explain the effects of changed prices. They are at best assuming some stories to explain what is happening in the world and then altering parameters to fit their assumed stories. This effort is illegitimate: it is always possible to use different stories to explain the data, with different implications for the role of biofuels or any other source of increased demand.

Economics requires more. As shown, GTAP is generating results that project the lost carbon from land to supply additional future crops is only a very small fraction of the average carbon lost to generate the crop that supplies biofuel crops today. As shown in Table 1, this average would indicate that crop-based biofuels do not come close to reducing greenhouse gas emissions from transportation over 30 years. This average from experience should not be disregarded absent sound economic evidence to the contrary.

Appendix A: GTAP-Bio's Projections of Changed U.S. Land Use and ILUC Projections With and Without Adjustments

This appendix shows results from the GTAP-BIO 2010 ethanol expansion policy experiment. The columns are U.S. agroecological zones (AEZs). The columns labeled "With Adjument … " are the reported land use changes. These are given in percentage terms in Table A1 and in physical terms in Table A2. The U.S. does not have the full set of AEZ, so while GTAP produces "percentage changes" for these zones, they correspond to no physical change in land. The three columns labeled "economic predictions" are the values net of the ad-hoc adjustment. These are not equilibrium outcomes as defined in the model, but they are the "economic output" of the model, to which the adjustment is applied. In Table A1, we see that forestry and livestock land are arbitrary reduced by the same number of percentage points. The cells in red represent cells where the adjustment causes projections of forest area decline by the economic model to turn into forest area increases after the adjustment. The table further shows how the model does not allow changes in unmanaged land.

Table A1.

Non-Market Ad-hoc Adjustment vs Economic Predictions in the GTAP-BIO Model (in % Change)

Note: The values in the table are presented in percentage terms.

The results in Table A3 (on the next page) applies the GTAP land change CO_2 to the physical land changes in Table A2. These changes are dramatic. The "hand of God" adjustment turns large CO_2 emissions from forestry land destruction into small positive or negative changes in $C0_2$. For U.S. ILUC, the arbitrary adjustment factor has a huge effects on the predicted results.

Appendix B: How GTAP Transforms Lubowski Land Use Transformation Elasticites to GTAP Parameters and the Resulting Inconsistencies

The ways in which GTAP uses the estimated elasticities from Lubowski (2002) can be seen in the following graphs taken from the GTAP working paper (Ahmed, Hertel, and Lubowski 2009), which are reproduced below. Lubwoski (2002) actually used a functional form that estimated different elasticities over different years, in other words, it estimated that land use conversions would occur more over time. The GTAP authors decided to use the estimated elasticity after 5 years. As can be seen in what the Ahmed paper labeled Figure 2, the percentage change in the area of forest in response to changes in forestry's own profitability is extremely small. By contrast, the response of cropland area to a percentage change in the price of cropland is multiple times larger. In other words, for the same percentage change in their own profitability, cropland should expand by a much larger percentage than forestry.

Figure 3 shows how GTAP translated this "own price" elasticity into the very different transformation elasticities used in GTAP, which we have called "nest parameters," and which the GTAP authors call CET values. These "nest parameters" (CET values) are not themselves elasticities in GTAP, which depends both on the nest parameter and on the share of revenue each land use type has in each agroecological zone in each country. The formula for the ultimate elasticity is this nest parameter (for which they use the Greek letter sigma) multiplied by one minus the revenue share of that land use. For example, if the sigma is 0.2 and cropland in an AEZ has 60% of the revenue, the elasticity would be 0.2 * (1-.6), which equals 0.08. Running GTAP for the U.S., the authors determined the average CET's for each of the three different land uses (cropland, pasture/range and managed forest) that results in the relevant elasticity predicted by Lubowski. Figure 3 shows that matching nest parameters are very different for the different land uses, particularly between managed forestry and pasture or cropland. The authors chose a roughly average parameter of the three different land use types at the period of 5 years, or 0.2. They did so because the GTAP function requires the same parameter be used for all items, such as all land uses, in the same nest.

As discussed in text, this approach has two fundamental flaws that both ensure the predictions of GTAP will not actually match those implied by Lubowski (2002), the claimed source, and that it will result in far less conversion of forest. One flaw is simply that the resulting CET value will result in wildly different elasticities for different land uses and in different agroecological zones and countries based on their different revenue shares. Yet Lubowski (2002) did not find that elasticities vary by revenue share. The GTAP function is therefore not just inconsistent but contradicts the findings in Lubowski even as it purports to base the model on Lubowski.

The second flaw is that this approach both underestimates the (own price) elasticity of cropland and overestimates the elasticity of managed forest. Both contribute to an underestimate of cropland expansion and a particularly strong underestimate of conversion of forest. The reason an excessive forestry elasticity also reduces cropland expansion is that the model predicts increases in the price of managed forest due to some loss of forest area, and then, as forestry prices increases, this excessive elasticity will cause the model to over-resist net conversion of forest to cropland. As discussed in text, this excessive own price forest elasticity far beyond that found in Lubowski will also cause forests to expand in other agroecological zones at the expense of cropland.

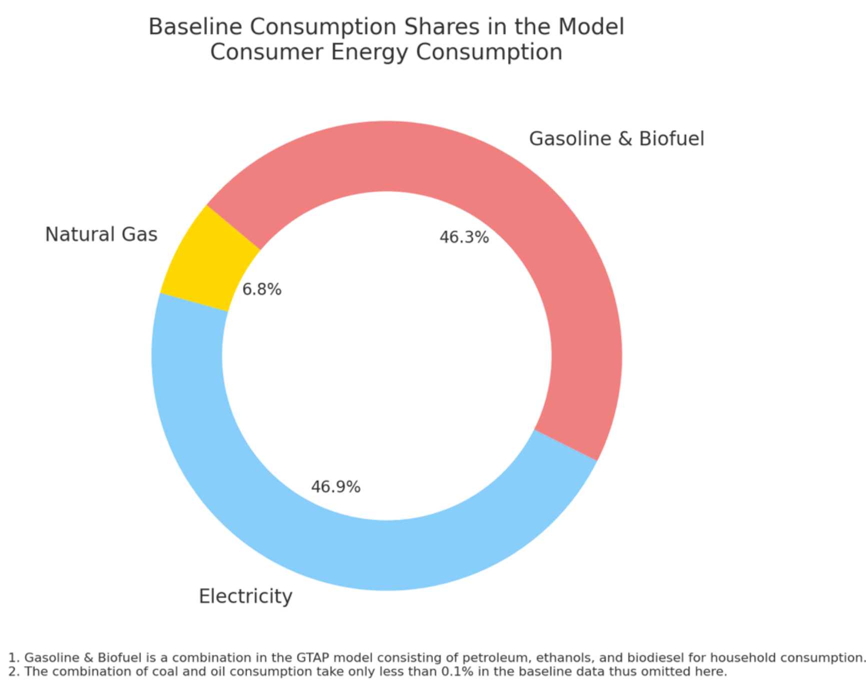
Appendix C: Example and Discussion: Household Energy Consumption and the Counterintuitive Effects of the GTAP Model Structure

It is useful to look at the GTAP household energy consumption nests. This serves as a pedagogical exercise to understand the structure of GTAP and it also serves to indicate why that structure tends to generate odd and counterintuitive results that likely bear little resemblance to reality. In particular, we describe how the GTAP structure artificially causes household electricity consumption to fall as ethanol policy causes a large increase in the price of gasoline. The only reason for this substantial decline in electricity consumption is the choice of nesting structure for household energy nest, a choice that is very hard for policy makers to see and understand.

The following figure displays the GTAP-bio (2010) data on baseline household energy expenditure shares in the in base year of the model.[10] "Gasoline and Biofuel" is an aggregate created by a lower-level nest from a combination of gasoline-biofuels. As noted, quantities and types of energy substituted are determined by these expenditure shares, and do not even depend on the nest parameter. This result means that the very structure of the model will create a large substitution effect if a policy changes the consumption of the gasoline-biofuel bundle.

Figure C1.

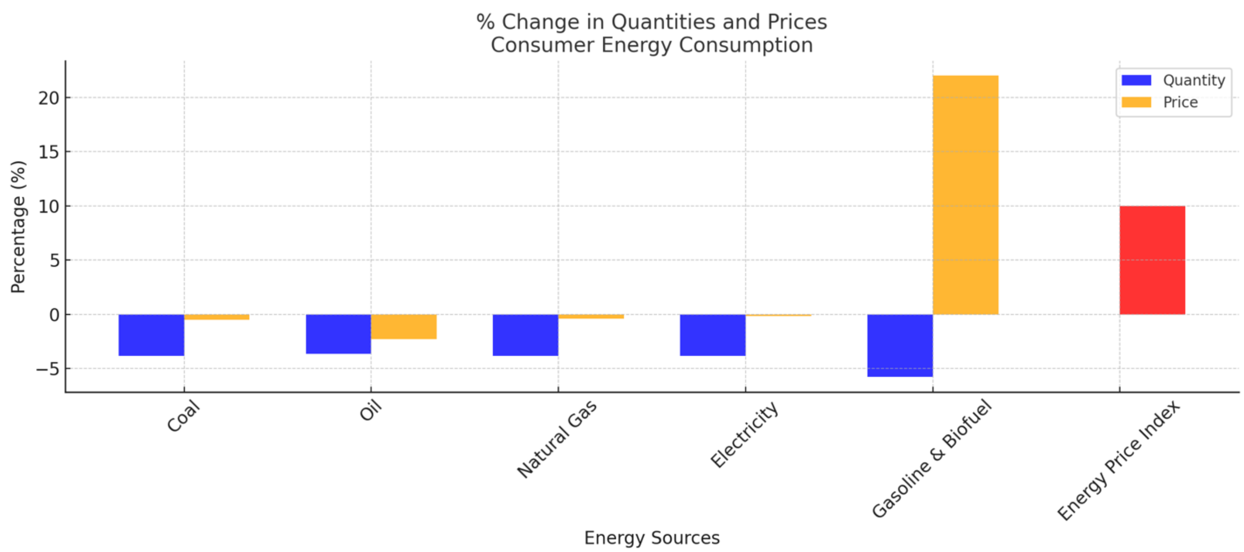


---

[10] We frequently rely on the 2010 version of GTAP-bio because it is by far the best documented version of the model. We have verified that most key features remain in place in a later CARB version of the model, although some components of the overall model are further elaborated by CARB.

The result of the GTAP ethanol policy simulation exercise is shown in the following figure. (It reveals market prices before taxes.)

Figure C3.



Gasoline & Biofuel is a combination in the GTAP model consisting of petroleum, ethanols, and biodiesel for household consumption.

We see that the price of the gasoline-biofuel bundle is predicted to increase by over 20%. This causes the use of the combination of gasoline and biofuel to drop by more than 5%. Surprisingly, though, the consumption of household electricity and natural gas falls by more than half as much in percentage terms. One can see in the graph that these startling effects are not caused by a raising price for non-gasoline energy. We know of no attempt in the GTAP modeling community to validate their predictions that ethanol policy will cause the consumption of natural gas, fuel oil and electricity to decline without any corresponding price increase.

It turns out that these odd results are caused by a combination of (1) the simplified way that GTAP models ethanol policy and (2) the use of a particular price index to model overall household energy consumption. The second effect, the use of special nest price indices, has important effects throughout the GTAP model.

On the first point, the modelers assume a target level of corn ethanol use (a more than 750% increase over pre-policy levels) and assume that this will be achieved via a consumption subsidy to corn ethanol. In the model, the subsidy is paid for via a tax on gasoline.[11] This is contrary to reality, but the modelers can only do simple policy exercises. They require that

---

[11] The choice of how to simplify a policy (and other exogenous factors) inside of GTAP is called the “closure” of the model. Discussion of model predictions are rarely related back to the decisions made about the closure, even though the choice of the closure can have large effects on policy outcomes.

government policy is budget-balanced and so the subsidy has to be offset by some tax. In the GTAP computation, the required taxes and subsidies are very large.

This artificial policy then interacts with the very structure of the model to create the odd (and very likely incorrect) results. In GTAP, a higher-level nest determines consumer expenditure on dollar-valued “household energy bundle.” The consumption of this bundle is driven by a single price index. The percentage change in this price index is calculated as a weighted average of the percentage price changes across all the products in the nest. The weights are the fixed base-year expenditure shares displayed in the prior chart.

Since gasoline is a large part of the energy bundle, the predicted increased price of gasoline drives up this price index, as shown in the red bar of the last chart. One can see that the overall “price of energy” is now 10% higher. In the GTAP structure, this price increase causes a decrease in the fictional “energy composite,” which drives down the consumption of energy. That sounds reasonable, but the GTAP structure simply distributes this declining energy consumption across all the energy products, even those whose price does not increase. The change is distributed using the product-level price changes but relies heavily on the base-year expenditure shares.

Appendix D. The GTAP Trade Model

As noted elsewhere in our report, there is strong empirical evidence of a moving cropland frontier in some places in the world. Given world trade in agricultural products, this means that diverting corn production to ethanol in the US will likely result in land use changes along these more active non-US land use frontiers. The GTAP model was originally built as a trade model and it contains a complex model of these effects.

Over decades, the GTAP approach to trade has been rendered obsolete in the academic literature. New trade models (e.g. Eaton and Kortum (2002) and Adao, Costinot and Donaldson (2017)) are explicitly motivated by a desire to avoid the problems of models with thousands of poorly justified parameters. These new trade models feature product differentiation, imperfect competition and, above all, a key role for the effects of distance and market size (the empirically impressive “gravity” model of trade). This is very different from GTAP.

GTAP has parameters that reflect a strong “home bias” in consumption. This reflects, for example, the traditional tendency of French consumers to buy French cars while German consumers buy German, but not French, cars. The home bias effect is motivated by trade in manufactured goods and certain kinds of services. However, there is an important literature that rejects the idea of a large home bias for agricultural products. Shipping distance may still have a strong effect on fresh goods (although these are often shipped very long distances) but likely has much lower effects for non-branded bulk products like grain or food oil. It is difficult to believe that many consumers care intensely about the country-of-origin of the grain or food oil in processed foods.

In contrast to GTAP, Roberts and Schlenker (2013), published in the prestigious American Economic Review with 581 citations, uses rigorous econometric tests to show that Brazilian crop price responses to US corn yield shocks are statistically indistinguishable from US responses to US shocks. This indicates a high degree of world market integration, consistent with the existence of large international companies who are in the business of agricultural commodity arbitrate. This empirical finding conflicts with the GTAP “home bias” assumption that restricts trade in agricultural commodities. Roberts and Schlenker also cite Fackler and Tastan (2008), who develop statistical procedures to test for market integration. They consider the market for soybeans, which they say is well-understood to be integrated. Their statistical tests confirm that "the United States/Brazil/Rotterdam markets appear to be fully integrated" in soybeans.

Berquist et al (2022) argues persuasively that credible policy analysis in agricultural policy cannot rely on GTAP style models (which are a subset of the more general traditional “CGE models”.) That paper criticizes GTAP-style models that “largely abstract from modeling the granular economic geography of farm production, consumption and trade costs” that are key to policy analysis. The paper properly distinguishes trade in manufacturing costs, for which variations in products create loyalties that slow shifts in trade, from trade in homogenous goods like commodity crops. The paper showed how trade is still influenced by transportation costs that vary with distance, but once cross-location price differences are enough to overcome the transportation cost, new and expanded trade links can be created very quickly.

In (Villoria and Hertel 2011), the authors conceptually defend the GTAP trade model through analysis claiming that data does not prove an integrated world model of prices. Their analysis, which conflicts with papers cited above, is not convincing:

- It does not use any kind of exogenous shock ("instrument") to test market integration. The paper therefore of necessity confuses different supply and demand effects and cannot produce credible empirical results (Angrist and Pischke 2010); (Berry and Haile 2021), (Pearl 2009). By contrast, Roberts and Schlenker (2013) do make use of such shocks, which makes their results showing close price integration are far more credible.
- The paper does not reference any modern trade literature.
- Although the paper rejects a theory of one global price, that does not justify use of the GTAP model, which just imposes a restriction for unknown reasons on the degree of shift in trade in response to prices. The alternative to account for differential prices is to factor the effect on prices of real, measured, transportation costs, which is an approach consistent with modern trade theory. The two approaches reach different results. A transportation cost model, with otherwise homogeneous goods such as soybeans, would impose maximum price differences between two points (with the difference being the transport cost). GTAP does not impose these maximum differences, which can result in unrealistic trade barriers because it allows US prices to rise tremendously more than European or Brazilian prices.

Overall, there is a lack of evidence to support the GTAP approach to agricultural trade and a large well-cited literature that advocates very different approaches. These are critical. By artificially restraining trade effects in agriculture, GTAP is artificially restricting the effects of biofuel policy to the US. Because the crop/forest frontier is more settled in the US than elsewhere, and because quickly expanding trade links are plausible, this trade feature will underestimate the world-wide effects of land use change.

Re: <u>Comments on the Proposed Amendments to the Low Carbon Fuel Standard</u>

Dear Honorable Members of the California Air Resources Board:

This firm represents the Leadership Counsel for Justice and Accountability ("Leadership Counsel") in matters relating to the California Air Resources Board's ("CARB") Proposed Amendments to the Low Carbon Fuel Standard Regulation ("Proposed Amendments" or "Project"). Central Valley Defenders of Clean Water & Air, Animal Legal Defense Fund, and Food & Water Watch have informed us that they also join in this letter. CARB's adoption of the Proposed Amendments is subject to the California Environmental Quality Act ("CEQA").[1] CARB's Draft Environmental Impact Analysis ("Draft EIA") must therefore: evaluate all reasonably foreseeable impacts of the Proposed Amendments in sufficient detail; adopt all feasible mitigation measures to lessen the severity of the Proposed Amendments' environmental impacts; and consider all feasible alternatives that would achieve the goals of the Proposed Amendments while lessening the severity of the Proposed Amendments' environmental impacts. Public Res. Code §§ 21002.1; 21100. The Draft EIA fails to comply with each of these obligations.

[1] CARB acts pursuant to a certified regulatory program which exempts the agency from preparing an Environmental Impact Report ("EIR") because the environmental analysis CARB is required to undertake is deemed the functional equivalent of an EIR. 17 Cal. Code. Regs. §§ 60000-60007; *POET, LLC v. State Air Resources Bd.* (2013) 218 Cal.App.4th 681, 710 CARB's actions are subject to all other applicable provisions of CEQA. 14 Cal. Code Regs. § 15250; *POET, LLC*, 218 Cal.App.4th at 710.

As discussed in more detail below, the Proposed Amendments will increase the already significant incentive concentrated animal feeding operations ("factory farms") have to create more Low Carbon Fuel Standard-eligible fuels and expand their operations to increase fuel production. Despite this inevitable effect of the Proposed Amendments, CARB's Draft EIA fails to mention—let alone analyze—the environmental impacts associated with factory farm expansions or anaerobic digestion-related fuel production. The Draft EIA acknowledges that the installation of anaerobic digesters, which are necessary to generate LCF-eligible fuel from manure methane emissions, will have significant environmental impacts. However, the Draft EIA fails to adequately discuss and analyze these impacts, which include impacts to air quality and water quality and adverse public health impacts on communities living in close proximity to factory farms.

In addition, the Draft EIA fails to propose adequate mitigation measures to address the project's impacts and fails to adequately analyze alternatives to the project. These inadequacies require that the Draft EIA be revised and recirculated so that the public and decision-makers are provided with a proper analysis of the project's significant environmental impacts and feasible mitigation for those impacts. See CEQA Guidelines § 15002(a)(1) (listing as one of the "basic purposes" of CEQA to "[i]nform governmental decision makers and the public about the potential, significant environmental effects of proposed activities").

This letter is submitted along with comments prepared by: Silvia Secchi, Ph.D., Professor, Department of Geographical and Sustainability Sciences, University of Iowa, Attachment A ("Secchi Comments"); and Paul Rosenfeld, Ph.D., Principal Environmental Chemist, Soil Water Air Protection Enterprise ("SWAPE"), Attachment B.

I. The Proposed Amendments incentivize factory far expansion and the installation of anaerobic digesters.

The Proposed Amendments will greatly increase the incentive that already exists under the Low Carbon Fuel Standard ("LCFS") for factory farm expansion and digester installation.

This is evidenced in the stated Project objectives, which specify the following objectives:

- Increase credit prices by increasing the carbon intensity benchmarks (Objectives 1-4, Draft EIA at 13)
- Incentivize more digesters to achieve the Senate Bill 1383, Senate Bill 32, and Assembly Bill 1279 GHG reduction targets (Objective 5, Draft EIA at 13).

- Use the LCFS to build out and then transition biomethane infrastructure from supplying transportation fuels to supplying hydrogen fuels for stationary sources (Objective 5, Draft EIA at 13).

Therefore, CARB has designed the Proposed Amendments to increase carbon intensity targets, which in turn, will increase demand for credits and increase credit prices. Currently, biomethane accounts for approximately 20 percent of credits generated but only 1 percent of energy used for transportation.[2] The quantity and growth of biomethane credits in the LCFS has contributed to a glut of credits at low prices and diminished incentive for biogas investors to expand their investments.[3] The Proposed Amendments would increase the value of LCFS credits and incentivize investors to build more digesters and generate more credits. The Proposed Amendments incentivize fuel production practices that will, in fact, increase GHG emissions and result in significant environmental impacts.

The Proposed Amendments include three distinct changes to the LCFS that will increase the incentives factory farms have to expand their operations and install anaerobic digesters: (1) strengthening the carbon intensity benchmark, thereby increasing the price of credits for eligible fuel pathways, including electricity, natural gas, and hydrogen generated from factory farm manure methane emissions; (2) limiting biomethane pathways eligible for LCFS credits with deliverability requirements, which will also increase the price of credits for eligible fuel pathways; and (3) restricting new compressed natural gas and hydrogen fuel pathways that qualify for 35 years of avoided methane crediting to those that CARB certifies or that break ground by December 31, 2029.

By strengthening the carbon intensity benchmark from a 20% reduction in carbon intensity by 2030 to 30% by 2030 and establishing a new 90% carbon intensity reduction benchmark by 2045, CARB will increase demand for LCFS credits in the near-term, especially with the “step down” in 2025.[4] The intended and inevitable effect of this change will be to increase the demand of LCFS credits available for purchase, thereby increasing credit prices. Thus, those fuel pathways that qualify for credits after the amendments go into effect—including electricity, natural gas, and hydrogen derived from

[4] CARB Staff Report: Initial Statement of Reasons, at 22-26 (December 19, 2023) (“ISOR”).

factory farm manure—will receive more money per credit sold. The Proposed Amendments will therefore incentivize factory farms to increase their herds to maximize manure methane production (credit generation). This proposed change will also provide incentives for the installation of digesters at factory farms, and thus result in GHG and air pollutant emissions.

Additionally, the amendments include new deliverability requirements that will limit the biomethane eligible for LCFS crediting to biomethane "carried through common carrier pipelines that physically flow within California or toward end use in California."[5] Currently, all factory farms across the nation can qualify for LCFS credits on the same basis as factory farms in California. As with the carbon intensity benchmark change, these deliverability requirements will further limit the supply of LCFS credits, thereby increasing the amount of money eligible fuel producers receive per credit. Also, by limiting eligibility to those factory farms that have a connection to California, these deliverability requirements will further incentivize factory farm expansion specifically in California along with the installation of digesters at livestock facilities in California.

Lastly, the Proposed Amendments draw a bright line between factory farm fuel pathways that are certified before, and after, January 1, 2030, with respect to avoided methane crediting.[6] If a factory farm fuel pathway is certified before January 1, 2030, that pathway is eligible to be renewed for up to three consecutive 10-year crediting periods. However, fuel pathways for bio-CNG, bio-LNG, and bio L-CNG from projects that break ground after December 31, 2029 can only generate avoided methane credits through December 31, 2040. Similarly, fuel pathways for hydrogen from projects that break ground after December 31, 2029 can only generate avoided methane credits through December 31, 2045. The Proposed Amendments therefore provide a significant incentive for factory farms to expand their herds and install digesters before December 31, 2029.

The Proposed Amendments' incentives to expand CAFO herds and install polluting anaerobic digesters by increasing the monetization of manure methane will have significant impacts on the environment which the Draft EIA fails to adequately analyze and fails to require feasible mitigation or project alternative, as described below.

[6] ISOR, at 31.

II. The Draft EIA's Environmental Impacts analysis violates CEQA.

A. The Draft EIA fails to analyze the Proposed Amendments' environmental impacts.

1. Expansion of factory farm herds is a reasonable expected result in response to the Proposed Amendments.

CEQA requires lead agencies to analyze all reasonably foreseeable environmental impacts caused by a project they are proposing to approve. *Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 396-98; *Ebbets Pass Forest Watch v. Cal. Dept. of Forestry & Fire Protection* (2008) 43 Cal.4th 936, 954-55. A public agency can only omit analysis of its project's impact if it is "speculative." *Santa Rita Union School District v. City of Salinas* (2023) 94 Cal.App.5th 298, 334-36. An agency's conclusion that a particular environmental impact is too speculative to be adequately analyzed must be supported by substantial evidence. *Id* at 335. To support such a conclusion, the CEQA Guidelines require lead agencies to conduct a "thorough investigation" and "note its conclusion" that the impact is too speculative to be considered. 14 Cal. Code Regs. § 15145; *County of Butte v. Dept. of Water Resources* (2023) 90 Cal.App.5th 147, 161; *Citizens' Committee to Complete the Refuge v. City of Newark* (2021) 74 Cal.App.5th 460, 479.

The Draft EIA's analysis is "based on reasonably foreseeable compliance responses that are based on a set of reasonable assumptions" and purportedly "includes actions that could likely occur under a broad range of the potential scenarios."[7] As explained in Section I, *supra*, the Proposed Amendments include three distinct changes that increase factory farms' incentive to generate more LCFS-eligible fuel by expanding existing herds and installing digesters. The Draft EIA considers the installation of anaerobic digesters a reasonable compliance response because the Proposed Amendments would "incentivize the collection and use of biomethane gas from dairies."[8]

The same elements of the Proposed Amendments that incentivize collecting existing biomethane at factory farms also incentivize increasing the volume of biomethane at factory farms. This incentive to produce more methane necessarily includes expanding factory farm herds to generate more manure. However, the Draft EIA ignores this potential impact entirely. The Draft EIA fails to provide any evidence, let

[7] ISOR, at 39.
[8] Draft EIA, at 64.

alone substantial evidence, supporting its omission of factory farm expansion as a reasonable compliance response.

As explained in Dr. Secchi's comments, the analysis of Project-related impacts related to resulting factory farm expansion fails for two reasons. First, the "ISOR offers no monitoring data showing whether the LCFS has caused, or the proposed amendments will cause, herd expansions at dairies or hog facilities located in California or outside of California."[9] Without such data, the Draft EIA has no evidence to support an assumption that the use of digesters at factory farms results in a reduction of methane emissions overall.

Second, the evidence demonstrates that since the adoption of the low carbon fuel standard and Federal subsidy programs encouraging use of digesters, factory farms have expanded both inside and outside of California.[10] Dr. Secchi posits that, in reality, the incentives created by the Proposed Amendments are likely to result in significant expansion of factory farms that will, in turn, increase the amount of methane produced.[11] Recent deregulation of biodigesters in Iowa is correlated with dairy expansions in that state.[12] As explained above, by increasing the carbon intensity benchmark and the value of credits, the Proposed Amendments will incentivize increased expansion and concentration of dairy operations leading to increased adverse environmental impacts (as discussed further below). The aforementioned is a reasonably foreseeable compliance response that is not accounted for in the ISOR or the Draft EIA.

Recent data from the USDA Ag Census further demonstrates that during the period that CARB has implemented its avoided methane crediting policy (since the 2018 LCFS amendments), the number of milk cows at large, California dairies have increased while the number of milk cows at smaller dairies have decreased, showing that the California dairy herd is consolidating into larger dairies that produce and store sufficient quantities of manure to finance and generate revenues from captured methane. The data show that for dairies with 2,500 or more milk cows, the milk cow herd increased from 808,503 milk cows in 2017 to 1,025,716 milk cows in 2022, or an increase of 28.6 percent. In contrast, the data show that for dairies with less than 1,000 cows, the milk cow herd *decreased* from 303,746 milk cows in 2017 to 144,472 milk cows in 2022, or a

[9] Attachment A, Secchi Comments, at 1.
[10] Id. at 5 and 6.
[11] Id.
[12] Id. at 3.

decrease of 52.4 percent.[13] While correlation does not establish causation, the data strongly suggest that the LCFS has had a substantial effect on the increase in milk cows at the largest dairies which are most likely to install digesters and monetize their manure.[14]

2. The Draft EIA fails to adequately analyze nitrogen-based emissions from digesters that contribute to PM2.5 nonattainment and climate change.

Having failed to properly analyze the foreseeable expansion of factory farms as a result of the Project, the Draft EIA fails to analyze the Project's related impacts. It is well-established that "industrial dairies in the San Joaquin Valley are a major source of local air and water pollution, nuisance odors, groundwater overdraft, and greenhouse gas emissions."[15] Specifically, dairies are the largest source of volatile organic compounds, in the San Joaquin Valley. Oxides of nitrogen result from combustion of fuels, including biogas fuels from anaerobic digesters. Volatile organic compounds and NOx are precursors to ozone formation, which can cause a variety of respiratory illnesses, especially in children and for people who have asthma.[16] Factory farms and the resulting digestate are also a significant source of ammonia, which impacts nearby residents as a toxic gas and also reacts to form ammonium nitrate, a form of fine particulate matter for which the EPA has classified the valley as nonattainment with the federal health-based National Ambient Air Quality Standard.[17]

---

[13] The data also show that for dairies with more than 1,000 cows, the milk cow herd increased from 1,446,583 milk cows in 2017 to 1,543,730 milk cows in 2022, an increase of 6.9 percent.

[17] *See* 87 Fed. Reg. 60494 (Oct. 5, 2022) (proposed disapproval of plan to attain the 2012 annual PM2.5 standard), attached as Attachment G.

In addition, contaminated runoff can result in water pollution in both surface and ground water; the intensive water use required by factory farms results in overdraft of groundwater supplies; and caustic ammonia emissions can result in illness and odors. As discussed below, the Draft EIA's failure to analyze the impacts of the Proposed Amendments, both resulting in significant expansion of factory farms and due to increased use of digesters, implicates the EIA's analysis of all of the aforementioned environmental impacts. Even where the Draft EIA did purport to evaluate impacts, the analysis is perfunctory.

(a) Ammonia Emissions

Ammonia, a toxic, odorous gas, causes respiratory issues; irritation to the throat, lungs, and eyes; and lung damage if exposure to elevated ammonia levels is prolonged.[18] In addition to the health risks imposed by increased local emissions, ammonia also reacts with nitrogen oxides (e.g., NOx) in winter and contributes to the formation of ammonium nitrate, a fine particulate matter ("PM2.5").[19] In the United States, ammonia from agriculture accounts for the formation of almost one third of $PM_{2.5}$.[20] Exposure to PM 2.5 is linked to premature deaths in people with heart or lung disease, heart attacks, irregular heartbeat, aggravated asthma, decreased lung function and long-term lung conditions including cancer.[21] Yet, the Draft EIA's analysis of the Project's public health and safety impacts is cursory at best.

(b) Greenhouse Gases

The Draft EIA analysis omits a full accounting of greenhouse gas emissions resulting from both a foreseeable expansion of factory farms and increased use of digesters.[22] For example, as the Rosenfeld Comments explain, during biogas combustion in the anaerobic digestion process, ammonia is oxidized into nitrous oxides. Furthermore,

[22] Attachment A, Secchi Comments, at 6.

digestate solids emit significant nitrous oxide emissions that negate methane captured by the digester. According to the EPA, nitrous oxide ("N2O") has a Global Warming Potential that is 273 times that of carbon dioxide ("CO2") for a 100-year timescale.[23] Therefore, N2O emitted today remains in the atmosphere for more than 100 years, on average.[24] Yet, the Draft EIA omits any evaluation impacts from Project-related increases of N2O.

In another example, NOx emissions react with volatile organic compounds in the presence of sunlight to form ozone, which also contributes to climate change. Ozone (O3) is the third most important anthropogenic greenhouse gas after carbon dioxide (CO2) and methane.[25] NOx also reacts with ammonia to form ammonium nitrate, a form of PM2.5. The San Joaquin Valley of California, where most factory farms and biodigesters are located, is a nonattainment area for both ozone and PM2.5National Ambient Air Quality Standards. However, the Draft EIA provides only a cursory—and internally inconsistent—discussion of the potential impacts related to ozone and PM2.5 formation. On the one hand, the Draft EIA states the Proposed Amendments "*could* result in an overall decrease in long-term operational NOx and PM2.5 emissions…in all state-designated ozone non-attainment areas from 2024 through 2046," (emphasis added) with a corresponding reduction in health impacts.[26] But the Draft EIA then pivots to conclude that long-term impacts from NOx and PM 2.5 emissions "could be potentially significant and unavoidable."[27]

The Draft EIA's conclusion that the Proposed Amendments could reduce NOx and PM2.5 emissions fails to account for emissions resulting both from the increased use of digesters and the expansion of factory farms. To the extent the Draft EIA makes any attempt to acknowledge the potentially significant impacts of increased NOx and PM2.5, it does not provide any of the information required by CEQA to explain the extent and severity of these impacts. The Draft EIA's failure to provide meaningful information about the significance of these impacts violates CEQA. *Cleveland Nat'l Forest Foundation v. San Diego Assn. of Governments* (2017) 3 Cal.5th 497, 514 ("an EIR's designation of a particular adverse environmental effect as 'significant' does not excuse

the EIR's failure to reasonably describe the nature and magnitude of the adverse effect"); *Berkeley Keep Jets Over the Bay Com. v. Board of Port Cmrs.* (2001) 91 Cal.App.4th 1344, 1371 ("simply labeling the effect 'significant' without accompanying analysis of the project's impacts … is inadequate to meet the environmental assessment requirements of CEQA").

3. The Draft EIA Fails to Adequately Analyze NOx emissions from Flaring.

The Draft EIA refers to the air quality analysis in the Standard Regulatory Impact Assessment ("SRIA") as the basis for its estimates of criteria pollutants.[28] In the SRIA, CARB estimated emissions from flaring at digesters. The Draft EIA states that "[S]taff assumed that about 10% of methane produced is flared. Hence, flaring is the only source of local emissions used in estimating emissions from dairy biomethane."[29] Ammonia in flared biogas causes increased NOx emissions.[30] However, the SRIA only used air district emission factors for flares.[31] Thus, the EIA fails to adequately analyze NOx emissions from flaring biogas. A revised EIA should recalculate digester flare emissions using flared biogas.

4. The Draft EIA Fails to Adequately Analyze NOx emissions from Biomethane Electric Fuel Pathways.

In its evaluation of Project-impacts related to biomethane electric vehicle fuel pathways, the Draft EIA indicates that "[T]he LCFS modeling assumes use of fuel cells to generate this electricity, which do not rely on combustion."[32] Thus, staff calculate near zero NOx from electricity production of biomethane using an emission factor of 0.00085 tons/GWh.[33] However, this assumption underlying the analysis is questionable for multiple reasons. First, to date, CARB has certified only one biomethane electric vehicle fuel pathway that relies on Bloom fuel cells at a dairy to produce electricity, and that is at

[28] Draft EIA, at 58.
[29] SRIA, Appendix C-1 at B-2 Table 49.
[30] Attachment B, Rosenfeld Comments at 4.
[31] SRIA, Appendix C-1 at B-2.
[32] Draft EIA, at 27; SRIA, Appendix C-1 at B-3, (citing a dead link Bloom Energy (2002). *The Bloom Energy Server 5 Data Sheet*. https://www.bloomenergy.com/wp-content/uploads/es5-300kw-datasheet-2022.pdf)] .
[33] Id.

Bar 20, one of the largest dairies in California. By contrast, CARB has certified 19 biomethane electric vehicle fuel pathways that rely on internal combustion engines[34] .

Second, Bloom fuel cells are more expensive to purchase and maintain than internal combustion engines, and the San Joaquin Valley Unified Air Pollution Control District has declined to find that fuel cells are cost-effective and thus Best Available Control Technology ("BACT"). Instead, the District has issued Authority to Construct Permits and found that internal combustion engines represented BACT. Therefore, CARB lacks substantial evidence to support its unfounded assumption Bloom fuel cells will be used for electric vehicle fuel pathways. And while Bar 20 has permits for and operates fuel cells, there is no record on the Air District public notice log of *any* BACT determination for fuel cells at Bar 20.[35]

Furthermore, the most recent internal combustion engine Authority To Construct Permit from the San Joaquin Valley Air District found that fuel cells were not cost-effective and not BACT. Instead, the Air District required internal combustion engines as BACT.[36] This approach is inconsistent – on the one hand, the Air District does not consider fuel cells as BACTs or cost effective and does not require fuel cells as BACT; on the other hand, CARB's analysis of impacts from digester projects that generate electric vehicle fuel contends that all such fuel pathways will rely on fuel cells to emit near-zero NOx.

NOx emissions from digester-related internal combustion engine used for electric vehicle fuel pathways are significant. For example, the Lakeview Dairy Biogas project in Kern County uses two internal combustion engines to produce over 1,000 kW of electricity on-site.[37] And this project, as permitted by the Air District with required internal combustion engines, still emits 4.58 tons/year of NOx, 1.98 tons/year of PM2.5,

[37] SJVAPCD, Notice of Preliminary Decision – Authority to Construct (Mar. 22, 2016), http://www.valleyair.org/notiCes/Docs/2016/03-22-16_(S-1143770)/S-1143770.pdf, attached as Attachment N; CalEPA & Cal. Air Res. Bd., LCFS Tier 2 Pathway App. B0104 (certified TBD), attached as Attachment O and available at https://ww2.arb.ca.gov/sites/default/files/classic/fuels/lcfs/fuelpathways/comments/tier2/b0104_summary.pdf.

and 3.18 tons/year of VOC *after* the imposition of BACTs as required by the State Implementation Plan.[38] Compared to a natural gas combined cycle power plant in Avenal, also permitted by the Air District, the Lakeview digester project produces much higher levels of NOx, sulfur oxides (SOx), and VOC emissions per unit of electricity generated.[39] However, unlike the natural gas plant, Lakeview Dairy Biogas is not required to purchase emission reduction credits for the air pollution emitted. This facility, and others like it with internal combustion engines, emit significant levels of NOx even after Clean Air Act-required controls.[40] Therefore, the Draft EIA wrongfully omitted analysis NOx emissions from these facilities and fuel pathways.[41]

In summary, given that (a) the Proposed Amendments increase carbon intensity benchmarks, and thus credit prices, and will incentivize more pathways for electricity from internal combustion engines, (b) CARB does not require fuel cells as mitigation, and (c) the San Joaquin Valley Unified Air Pollution Control District does not consider fuel cells as BACT, it is reasonably foreseeable that more digesters with IC engines will apply for such pathway certifications. For these reasons, the Draft EIA must be revised to correct this error and to evaluate NOx impacts from biomethane electric vehicle fuel pathways that rely on IC engines.

5. The Draft EIA Fails to Adequately Analyze NOx emissions after 2039.

The Draft EIA fails to analyze NOx emissions from biomethane fuel pathways after 2039, despite authorizing crediting for biomethane fuel pathways well beyond 2039. The Draft EIA's PM2.5 and NOx emissions analysis explicitly relied on the Standardized Regulatory Impact Assessment ("SRIA"), including Tables 47-59.[42] Table 47 of the SRIA assumes no hydrogen or electricity will be produced from dairy biomethane after 2039.[43] However, as discussed in Section I, the Proposed Amendments explicitly

authorize CARB to certify electricity and hydrogen fuel pathways well beyond 2039. The Draft EIA's analysis of NOx emissions is grounded on an inaccurate assumption. The Draft EIA must evaluate the impacts of NOx emissions over the time period during which these emissions will occur. 14 Cal. Code Regs. § 15126 ("[a]ll phases of a project must be considered when evaluating its impact on the environment"); *Make UC a Good Neighbor v. Regents of University of California* (2023) 88 Cal.App.5th 656, 667; *In re Bay-Delta etc.* (2008) 43 Cal.4th 1143, 1169.

6. The Draft EIA fails to adequately analyze Project-related ammonia emissions associated with digestate.

Aside from omitting analysis of the impacts resulting from factory farm expansion and use of anaerobic digesters described above, the Draft EIA presents an incomplete analysis of the project's ammonia impacts because it fails to evaluate the impacts from production and application of substantial increases of anaerobic digestate.[44] Apart from the size of the herd, the production and application of digestate to agriculture land is much more polluting and more hazardous to public health compared to raw manure.[45] CEQA requires an analysis of these impacts.

The Draft EIA's conclusion that the Project may have significant air quality impacts—without consideration of the extent and severity of those impacts—cannot cure this deficiency. Merely stating that an impact will occur is insufficient; an EIR must also provide "information about how adverse the adverse impact will be." *Cleveland Nat'l Forest Foundation*, 3 Cal.5th at 514; *Berkeley Keep Jets Over the Bay Com.*, 91 Cal.App.4th at 1371. This information, of course, must be accurate and consist of more than mere conclusions or speculation. *Id*. The Draft EIA's analysis of air quality impacts fails to fulfill this mandate in several instances.

(a) Air pollution

Anaerobic digestate results in higher emissions in part because anaerobic digestion decomposes the waste into smaller molecules, which allows it to more easily volatilize into the atmosphere.[46] In this way, digestate results in significant releases of higher

---

[44] Draft EIA at 56-62 (concludes impacts to air quality are significant); at 64-65 (concludes impacts from odor are not significant); Attachment B, Rosenfeld comments, at 2 and 3.
[45] Johns Hopkins Center for a Livable Future comments on LCFS Amendments at 2.
[46] Attachment B, Rosenfeld comments, at 3.

amounts of ammonia, a toxic gas, and NOx emissions than unprocessed manure.[47] The Draft EIA concludes that long-term operational air quality impacts related to PM2.5 and NOx would be significant and unavoidable.[48] We do not disagree that the Project's emissions would be significant. However, the DEIR fails to disclose the extent and severity of this impact.[49] A revised analysis must provide more details about the impacts and must account for increased application of digestate on agricultural land. *Cleveland Nat'l Forest Foundation*, 3 Cal.5th at 514; *Berkeley Keep Jets Over the Bay Com.*, 91 Cal.App.4th at 1371.

Furthermore, the Draft EIA's conclusion that odor impacts from ammonia emissions would not be significant is unsupported. As explained in the Rosenfeld Comments, ammonia emits a strong odor that is easily detectable at low concentrations and contributes to irritation such as immediate burning of the nose and respiratory tract.[50] In addition, anaerobic digestion significantly increases the amount of ammonia emissions compared to a dairy without an anaerobic digester.[51]

As discussed above, ammonia also contributes to the formation of $PM_{2.5}$ (e.g., formation of ammonium nitrate), exposure to which is linked to a variety of serious health problems).[52] CARB's own ammonia data show that ammonia contributes to PM2.5 formation.[53] Therefore, CARB must include a full evaluation of ammonia emissions.

(b) Public Health and Safety

Health and safety effects, including adverse health impacts from air pollutants, may constitute significant environmental impacts for the purposes of CEQA. See, e.g., *Sierra Club v. County of Fresno* (2018) 6 Cal.5th 502, 517-22; *Bakersfield Citizens for*

[53] 2023 CARB Ammonia Demonstration re 1997 PM2.5 plan standard SJV at 3, attached as Attachment S.

Local Control v. City of Bakersfield (2004) 124 Cal.App.4th 1184,1219-21. 14 CCR § 15126.2(a). Here, as discussed above, in the anaerobic digestion process substantial amounts of ammonia are produced as a byproduct.

In addition to the health risks imposed by increased local emissions, emissions and impacts on nearby communities, ammonia also contributes to the formation of $PM_{2.5}$.[54] In the United States, ammonia from agriculture accounts for the formation of almost one third of $PM_{2.5}$.[55] Exposure to PM 2.5 is linked to premature deaths in people with heart or lung disease, heart attacks, irregular heartbeat, aggravated asthma, decreased lung function and long-term lung conditions including cancer.[56] Yet, the Draft EIA's analysis of the Project's public health and safety impacts is cursory.[57] While the Draft EIA discloses that an increase in emissions of criteria pollutants associated with production of biofuels is possible, it falls short of actually evaluating the potential health impacts of these emissions.[58] Instead, once again the Draft EIA concludes that impacts would be significant, but then fails to describe the severity of those impacts.

Harmful emissions from expanded use of anaerobic digesters disproportionately affect communities in close proximity to dairies, which are often comprised of lower-income residents. Lower-income residents are often more vulnerable to the adverse effects of these emissions due to various factors, such as lack of resources, inadequate infrastructure, and the concentration of anaerobic digester facilities near these populations.

(c) Impacts Outside of California

The Draft EIA fails to analyze the Proposed Amendments' impacts outside of California. CEQA requires public agencies to analyze the potentially significant impacts of a proposed project that may occur in "the area which will be affected by [the] proposed project." 14 Cal. Code. Regs. § 15360; Public. Res. Code § 21060.5. CARB itself acknowledged its obligation to analyze out-of-state impacts in conducting its CEQA

[57] Draft EIA, at 61 and 62.
[58] Id.

review for the Renewable Electricity Standard in 2010.[59] Factory farms across the nation are eligible for LCFS credits, and are thus incentivized by the Proposed Amendments to install anaerobic digesters and expand existing herds, just as in-state factory farms are. The Proposed Amendments will therefore have adverse environmental impacts out-of-state. CARB's refusal to analyze such impacts is clear legal error.

7. The Draft EIA fails to adequately analyze Project-related discharges to groundwater associated with digestate.

The Draft EIA's analysis of increased digestate on groundwater is equally flawed. As explained in the Rosenfeld Comments, anaerobic digestion breaks down waste into a digestate of smaller molecules that makes digestate more susceptible to leaching into the groundwater.[60] Anaerobic digestion also leads to higher concentrations of ammonia in digestate, which can subsequently convert to nitrate.[61]

"[N]itrate pollution leading to groundwater contamination is much more likely to occur with anaerobically digested digestate, as the ammonia is more readily available for conversion into nitrate, which can then leach into groundwater."[62] Nitrate contamination in drinking water and food can lead to severe illness in infants, such as the onset of blue baby syndrome, also known as methemoglobinemia.[63] Yet, the Draft EIA fails to include any analysis of these potential impacts.

Although the Draft EIA concludes that the Project's long-term operational impacts to water quality are significant and unavoidable, the document lacks a thorough analysis of these impacts. As the Rosenfeld Comments explain, increased amounts of digestate have the potential to result in groundwater nitrate contamination, excessive accumulation of soil phosphorus, and eutrophication of surface waters from anaerobic digesters.[64] These impacts to water quality and public health must be evaluated in a revised EIA.

[64] Id. at 7.

In summary, the Draft EIA fails to grapple with an analysis of all of the foreseeable, significant, direct and indirect environmental impacts of implementing the Proposed Amendments. As discussed above and in several comment letters from other stakeholders, these impacts include, but are not limited significant air quality, climate change, water quality, and public health impacts. Furthermore, as discussed below, the Draft EIA fails to identify feasible mitigation measures to minimize acknowledged significant impacts resulting from the project. A revised EIA must correct these deficiencies in order for the public and decision-makers to fully understand the Project's impacts.

III. The Draft EIA fails to identify any enforceable mitigation measures to lessen the severity of the Proposed Amendments' significant impacts.

If, as here, a lead agency determines its project will have one or more significant environmental effects, CEQA requires that agency to adopt all feasible mitigation measures to reduce the severity of those impacts. Public. Res. Code § 21002; *Sacramento Old City Assn. v. City Council* (1991) 229 Cal.App.3d 1011, 1027; *POET, LLC*, 218 Cal.App.4th at 734-35. Mitigation can take many forms, including avoiding the impact altogether by not taking a certain action or parts of an action and minimizing impacts by limiting the degree or magnitude of the action and its implementation. 14 Cal. Code Regs., § 15370. Mitigation measures are only legally valid if they are fully enforceable. Public Res. Code § 21081.6(b); *Assn. of Irritated Residents v. Kern County Bd of Supervisors* (2017) 17 Cal.App.5th 708, 752.

The Draft EIA's approach to mitigation measures is woefully deficient. CARB has not proposed *any* enforceable mitigation measures to be incorporated as part of the Proposed Amendments. The Draft EIA's reasoning for doing so is based on a fundamental legal error. Because CARB has no authority over the projects and actions that will be undertaken in response to the Proposed Amendments, the Draft EIA asserts that CARB has no obligation to incorporate feasible mitigation measures into the Proposed Amendments themselves. CARB does have jurisdiction over the Proposed Amendments, and it must include measures that will reduce or eliminate the reasonable foreseeable impacts of the Amendments. 14 Cal. Code Regs. § 15126.4.

The Draft EIA's illogical reasoning is compounded by its unsupported assumption that the projects it identifies as reasonably compliance responses will be subject to future CEQA review. Factory farm expansions and digester installations are commonly considered exempt from CEQA review by the local agencies in Central Valley that routinely approve such projects. The Leadership Counsel proposes numerous feasible mitigation measures CARB can, and must, incorporate into the Proposed Amendments to lessen the severity of its significant impacts associated with digester installation and factory farm expansion.

1. The Draft EIA's approach to mitigation measures is legally erroneous.

CARB has not proposed *any* enforceable mitigation measures, despite the Draft EIA concluding that the Proposed Amendments will have numerous significant environmental impacts. According to the Draft EIA, CARB—one of the most powerful regulators in the State—has no ability or authority to mitigate the impacts associated with the Proposed Amendments. In attempting to off-load its obligation to impose feasible mitigation measures, CARB confuses the project before it—the Proposed Amendments—with the projects (e.g. anaerobic digesters, factory farm expansions) that will be undertaken *as a result* of the Proposed Amendments. Because CARB does not have authority over these projects, the Draft EIA asserts CARB has no ability to incorporate feasible mitigation measures within the Proposed Amendments.

However, CEQA requires CARB to determine whether changes or additions can be made to the *Proposed Amendments themselves* that will reduce the severity of their significant environmental impacts. 14 Cal. Code Regs. § 15126.4(a)(2) ("[i]n the case of the adoption of a plan, policy, regulation, or other public project, mitigation measures can be incorporated into the plan, policy, regulation, or project design"). CARB clearly has the authority to make changes or additions to its own Proposed Amendments, which will lessen the severity of their environmental impacts. Its failure to even consider doing so constitutes grave legal error.

2. CARB's EIA process is likely the last opportunity for environmental review and mitigation of the impacts of factory farm expansion and digester installation.

CARB's faulty reasoning is compounded by its unsupported assumption that the projects which will be undertaken as a result of the Proposed Amendments will be subject to future CEQA review and, thus, the obligation to mitigate significant impacts. However, in the Central Valley, where factory farms are predominately located, the installation of anaerobic digesters and the expansion of factory farms are commonly considered by local agencies to be exempt from CEQA review on the grounds that the projects are ministerial or qualify for a categorical exemption. Therefore, with respect to these projects, the Draft EIA process is likely the last stop for both detailed environmental review and the imposition of meaningful mitigation measures.

For example, Kings County has adopted local guidelines that inform its implementation of CEQA.[65] Included in these guidelines are a list of categories of projects that are exempt from CEQA review because they are subject to ministerial review. These ministerial projects include "Site Plan Reviews." In 2023 alone, Kings County approved two anaerobic digester projects, exempting them from CEQA review on the grounds they were subject to ministerial review.[66] Kings County thus had no obligation under CEQA to analyze and mitigate the adverse impacts associated with either of these projects.

Other jurisdictions have exempted digester projects from CEQA review—and the obligation to mitigate significant impacts—on the grounds that these projects qualify for a Categorical Exemption. For example, Tulare County issued a Notice of Exemption in 2020 for a pipeline construction project intended to transport dairy biogas on the grounds the project qualified for the Class 1 (minor alterations to existing facilities) and Class 3 (new construction of small structures) Categorical Exemptions.[67] Tulare County also filed a Notice of Exemption to expand an existing biogas pipeline to connect an additional dairy digester to existing infrastructure. Other jurisdictions where similar projects have been exempted from CEQA review recently include Merced, Stanislaus, and Kern.

Tulare County also filed multiple Notices of Exemption in 2022 for factory farm herd consolidation projects, including a project that increased an existing herd size by

---

[67] Tulare County Notice of Exemption for Tulare Biogas Gathering Line (August 18, 2020), attached as Attachment X and available at https://files.ceqanet.opr.ca.gov/264014-2/attachment/ZQ976ZUWit1klndpB1s5MYMKZJQBpo6c-8VIweVKasCVOsmAyGVogK05MqqmSLuQk994sssNab-A3-7Q0.

almost 3,000 animal units.[68] Kings County filed a Notice of Exemption for a project that expanded the herd size of an existing calf ranch in 2023 on the grounds that the underlying approval was ministerial.

CARB's attempt to justify its refusal to adopt any enforceable mitigation measures on the grounds that the projects incentivized by the Proposed Amendments will be subject to future CEQA review fails. CARB's discretionary approval of the Proposed Amendments is likely the last chance to rigorously analyze and mitigate the significant impacts associated with many future factory farm expansions and digester development projects. CARB must use its authority as the regulatory agency tasked with crafting the LCFS to ensure all identified significant impacts are mitigated to the extent feasible.

3. CARB must adopt feasible mitigation measures that will lessen the severity of the Proposed Amendments' impacts on factory farm expansion and digester installation.

CEQA explicitly acknowledges that feasible mitigation measures can include changes that are incorporated into the regulation itself. 14 Cal. Code Regs. § 15126.4(a)(2). Each of the following mitigation measures is feasible and within CARB's authority to incorporate within the Proposed Amendments; CARB's failure to do so would constitute a clear violation of CEQA:

- Limit the generation of credits for fuel pathway holders for biogas derived from livestock manure to the volume of feedstock at each associated dairy or livestock operation on January 1, 2017, or on the date the pathway was certified, whichever is earlier.

- Restrict the generation of credits for fuel pathway holders for biogas derived from livestock manure located in Disadvantaged Communities as designation by the Office of Environmental Health Hazard Assessment pursuant to Senate Bull 535.[69]

- When calculating the carbon intensity of fuel derived from livestock manure, include all emissions of greenhouse gases generated from the production of the

[68] Cows, pigs, and other animals raised in factory farms and dairies are not "units," but are sentient beings, each of which has its own unique personality.
[69] An interactive map delineating the Disadvantaged Communities throughout the State is available at https://oehha.ca.gov/calenviroscreen/sb535. A copy of the state-wide map is attached as Attachment Y.

fuel and all emissions of greenhouse gases generated from the production of the feedstock. Update the carbon intensity of each pathway for fuel derived from livestock manure after making this calculation. These emissions include, but are not limited to,

- o Enteric emissions;
- o Emissions from production and storage of feed, transport of feedstock, or fuel;
- o Emissions resulting from digestate handling, composting, or treatment; and
- o Emissions resulting from land application of manure or digestate.

- Disapprove any application for a fuel pathway that includes the use of biogas derived from livestock manure which does not provide all information and calculations used to determine carbon intensity, including but not limited to:
  - o Herd size;
  - o Volume of feedstock produced or used;
  - o Volume of biogas produced.
- Make publicly available on CARB's website all information and calculations used to determine carbon intensity.

IV. The Draft EIA fails to analyze all reasonable alternatives by which the State can achieve its methane reduction goals.

As a preliminary matter, the Draft EIA's failure to disclose the extent and severity of the Project's broad-ranging impacts necessarily distorts the document's analysis of Project alternatives. As a result, the alternatives are evaluated against an inaccurate representation of the Project's impacts. Proper identification and analysis of alternatives is impossible until Project impacts are fully disclosed.

CEQA requires CARB's Draft EIA to describe a range of "reasonable alternatives to the project," which would "attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effect of the project," and evaluate the "comparative merits" of the alternatives. 14 Cal. Code. Regs. § 15126.6. The discussion of mitigation and alternatives is "the core" of CEQA analysis. *Citizens of Goleta Valley v. Board of Supervisors* (1990) 52 Cal.3d 553, 564.

The Draft EIA's alternatives analysis presents a series of false choices, that rests on the assumption that the only method by which the State can achieve its methane emissions reduction goals is through the LCFS's indirect, incentive-based regulation. Each alternative scenario is simply a version of the LCFS with different requirements than the Proposed Amendments. The Draft EIA fails to analyze a scenario where CARB uses its regulatory authority to directly regulate methane emissions from factory farms, as required by Health & Safety Code §§ 38562.5, 39730.7(b)(1), thereby achieving the State's methane reduction goals while reducing the incentive for factory farms to expand their environmentally damaging operations.

The Draft EIA must be amended to include analysis of an alternative scenario with the following components: (1) elimination of LCFS credits for fuel derived from manure methane emissions; (2) implementation of direct regulation of factory farms to achieve the same level of methane reduction CARB currently contemplates will be achieved through the LCFS; and (3) decrease the stringency of the LCFS' carbon intensity requirement, to ensure the elimination of credits for fuel derived from manure methane emissions does not affect credit prices negatively and risk the State failing to achieve its fuel decarbonization goals.

The State Legislature has granted CARB the regulatory authority to directly regulate the major sources of methane emissions within the State, including the dairy and livestock industry, landfills, and the oil and gas system. To date, CARB has taken action to directly regulate landfills (the Landfill Methane Regulation, Cal. Code of Regs., tit. 17 §§ 95460, et seq.) and the oil and gas system (the Oil and Gas Methane Regulation, Cal. Code of Regs., tit. 17, §§ 95665-77). However, CARB has yet to directly regulate the dairy and livestock industry—the largest source of methane emissions within the State.

The State Legislature, through Senate Bill 1383, mandated that CARB adopt regulations and mandated that CARB implement such regulations beginning in January of 2024 provided that CARB make certain findings. As CARB itself has stated, the agency shall adopt regulations and has authority to implement the regulations, "provided that CARB, in consultation with CDFA, determine the regulations are technologically and economically feasible, cost-effective, include provisions to minimize and mitigate potential leakage, and include an evaluation of the achievements made by incentive-based programs."[70]

CARB itself acknowledged in its 2022 Scoping Plan that direct regulation of the sources of methane emissions is integral to the State's methane emissions reduction strategy.[71] CARB's stated strategy for reducing the emissions of short-lived climate pollutants, most notably methane, is a "carrot-then-stick" approach.[72] This approach begins with the incentive-based, indirect regulations, such as the LCFS (the "carrot"), and then transitions into direct regulation, similar to those that have been promulgated for the landfill and oil and gas systems (the "stick"). The 2022 Scoping Plan ultimately recommends the carrot and stick approach for manure methane.[73] CARB acknowledged that the dairy and livestock industry must "achieve considerable methane emissions reductions to meet the 2030 target," which will "require implementation of additional methane emissions reductions strategies."[74]

Despite having the mandatory duty and authority to directly regulate methane emissions from the dairy and livestock industry, and explicitly stating that such regulation is integral to the State's emissions reduction strategy, CARB fails to analyze an alternative scenario where this direct regulatory authority is applied. The only alternatives CARB considers are those where the LCFS is the primary, if not sole, mechanism for achieving methane emissions reductions from the dairy and livestock industry. CARB has the authority to simultaneously reduce the methane emissions and adverse environmental impacts from factory farms, while not risking the State's fuel decarbonization goals. CARB's failure to consider such a scenario constitutes clear legal error.

V. Conclusion

Due to the foregoing and numerous adverse environmental impacts not fully disclosed and properly analyzed in the Draft EIA, the Leadership Counsel opposes the Project as proposed. Additional alternatives and mitigation measures are essential to avoid the Project's significant adverse impacts. The Leadership Counsel respectfully urges the Air Resources Board to delay further consideration of this Project until the agency recirculates a revised Draft EIA that fully complies with CEQA and the CEQA Guidelines.

Very truly yours,

SHUTE, MIHALY & WEINBERGER LLP

Ellison Folk

ATTACHMENT A

Comments on the Amendments to Low Carbon Fuel Standard

Silvia Secchi

My name is Silvia Secchi and I am a professor in the Department of Geographical and Sustainability Sciences at the University of Iowa. I have a Ph.D. in economics from Iowa State University and have been studying the environmental impacts of Midwestern agriculture for over a quarter of a century, my google scholar profile shows see my record of peer reviewed publications[1]. I have reviewed the Initial Statement of Reasons of the Proposed Amendments to California's Low Carbon Fuel Standard and associated Appendices. Based on my my professional expertise as an agricultural economist, I have several concerns about CARB's failure to adequately address the potential for changes in the Standard to encourage the development of concentrated animal feeding operations, both through the establishment of new dairies and the concentration of existing operations.

First, the ISOR offers no monitoring data showing whether the LCFS has caused, or the proposed amendments will cause, herd expansions at dairies or hog facilities located in California or outside of California. As a result, CARB cannot in good faith assert that the capturing of manure from CAFO is actually reducing methane emissions from dairy and/or hog operations, and that the LCFS will not result in rebound effect or Jevon's paradox: the technological improvement (in this case the biodigesters) change the behavior of consumers and producers so that the efficiency gains actually result in increased production and the net effects are not reductions but increases in resource use and – in this case – methane emissions. There is extensive evidence of this type of phenomenon in the agricultural sector[2].

CARB's lack of jurisdiction outside state borders exacerbates this problem by causing a "race to the bottom" in jurisdictions that build digesters as a way to attract new operations or allow existing operations to expand along with digester installation. Race to the bottom has been found to be a significant factor in determining location of Confined Animal Feeding Operations (CAFOs) for both dairy and hog operations[3].

Here I detail recent trends in dairy production in Iowa and the increase in biodigesters, to show that the LCFS is already having an impact. The data I present here are the result of several hours of search on the Iowa Department of Natural Resources (DNR) website. I conducted this research in the course of a project in which I am examining the effects of lax environmental regulations in the expansion of CAFOs, in particular in association with "climate smart" policies. This data is important because the EPA Agstar database[4] that experts like Prof. Aaron Smith at UC Davis have been using severely underreports the number of biodigesters compared to the Iowa DNR site. As a result, national level analyses are extremely likely to underestimate the rebound effect. This is likely to be compounded by the fact that the deployment of biodigesters and the expansion do not always occur in the same year, as evidenced in two cases reported in

Table 1. In these cases, the impacts of the biodigesters on expansion will easily be underestimated.

As Table 1 shows, there have been 15 digesters built in Iowa dairies since 2019. **The AgStar database only includes 4 of them.** These 15 digesters are associated with an increase of over 17,000 Animal Units (AUs). This corresponds to an increase of almost 20% in AUs. Milk production in Iowa had been growing, but it was doing so at a much slower pace before 2019 (Figure 1). Though it is not possible to formally attribute causality, it is notable that Iowa's dairy cows AUs increased by 35,000 between 2019 and 2023. **This means that a large portion of the increase in milk cows in the state is associated with biodigesters.**

Table 1 – Recent biodigesters installed in Iowa and associated capacity expansion

	Facility location	General Location	ID	Year	Initial size (AUs)	Final size (AUs)
Black Soil Dairy	Granville	North West	60565	2021	4,500	4,500
Geno	Blairstown	East Central	61209	2022	6,280	7,512
Kirkman Farms	Kirkman	West Central	64174	2021	8,500	11,900
Legacy Dairy	Sanborn	North West	60531	2022	3,920	6,160
Maassen	Maurice	North West	57177	2022	3,200	3,995
Marshall Ridge Farms	State Center	Central	60101	2020 digester 2023 expansion	8,499	11,425
Meadowvale Dairy North	Rock Valley	North West	62015	2021	20,300	20,300
Rock River Jerseys-Inwood Dairy	Doon	North West	66387	2019 digester 2022 expansion	8,499	14,000
Roorda Dairy	Paullina	North West	64981	2021	5,880	5,880
Salix Farms	Salix	North West	64623	2023	3,500	3,500
Sioux Jerseys	Salix	North West	62420	2023	6,300	6,300
Van Ess Dairy	Sanborn	North West	65143	2021	7,599	8,499
Winding Meadows Dairy	Rock Valley	North West	60218	2021	2,884	3,360

Again, it is not possible to demonstrate unequivocally that this growth in dairy operations is directly linked to the expanded use of biodigesters. But two laws deregulating biodigesters were recently passed in Iowa. In 2019 SF 534[5] repealed the statutory requirement for rulemaking for all waste control technology facilities, including biodigesters, and in 2021, HF 522[6] allowed large dairies (over 8,500 AUs) to exceed confinement capacity if they install an anaerobic digester to treat all manure. There is a strong correlation between the deployment of biodigesters and the dairy expansions. As Table 1 shows, there were 3 such operations that expanded as they deployed biodigesters. In my professional opinion, this very strongly suggests that the increasing availability and decreasing regulation of biodigesters is contributing to dairy expansion and concentration.

And while the dairies in Table 1 are not currently associated with approved pathways, biogas companies have already indicated their intent to avail themselves of the LCFS to generate credits at several of these facilities. Specifically, Gevo has announced that BP Canada Energy Marketing Corp. and BP Products North America Inc. will market Iowa-produced natural gas in California on its behalf[7]. Gevo is contracting with three of the dairies in Table 1, Meadowvale, Rock River Jerseys and Winding Meadows, two of which have expanded[8]. Another of the dairies

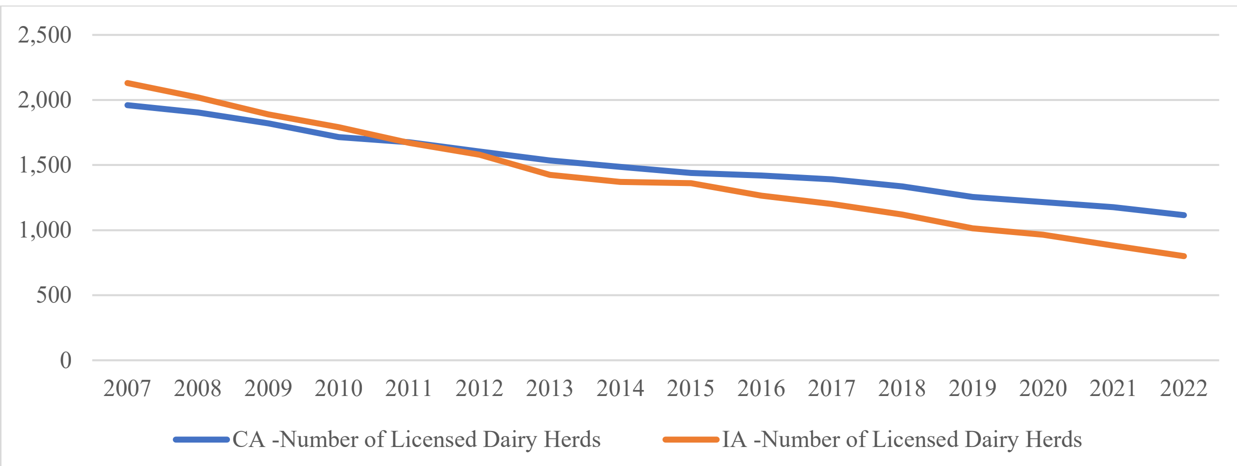
expanding, Kirkman, is partnering with California's Brightmark RNG Origination LLC[9], which sells RNG to U.S. Gain, which is active in the California LCFS market[10].

Based on my study of the effect outside of California of policies to incentivize the use of biodigesters and my review of the literature, I believe similar expansion phenomena are likely taking place in California's dairy sector and elsewhere. The proposed LCFS amendments will increase expansion and concentration[11]. For example, very recently, a local expert has argued that the flattening of the dairy herd in California in the last five years could be linked to biodigesters. Notably, both in California and Iowa, flat and increasing total herd sizes respectively have both been associated with a reduction in the number of diaries, as shown in Figure 1. Consolidation should be a concern for CARB, since there is extensive evidence that it is associated with more water quality problems, among other things[12].

Figure 2 – Number of licensed dairy herds in California and Iowa, 2007-2022



Source: USDA NASS Milk production reports
https://usda.library.cornell.edu/concern/publications/h989r321c?locale=en#release-items

The evidence strongly suggests that the rebound effect is already at work outside California's borders because of race to the bottom policies being enacted by other states. The current policy approach allows for negative crediting of biogas as a way to avoid leakage: the concern is that making California farmers pay for their methane emissions would cause milk production to move (leak) out of state, where emissions are unregulated. But while the approach ensures California farmers do not face an added burden, it does nothing to limit the expansion of dairies in and out of state. As a result, the proposed LCFS amendments likely will cause another type of leakage through the rebound effect: the expansion and concentration of dairy operations resulting

from the economic incentives provided by the LCFS and the decreased regulation of dairy operations will likely cause increased methane emissions that are not currently accounted for.

CARB's proposal to increase the carbon intensity target and therefore increase the economic value of methane captured from dairy operations will likely result in the expansion of dairy operations inside and outside of California.

I also want to note that the rebound effect has other substantial negative environmental impacts. In particular, as Table 1 shows, the expansion is occurring largely in Northwest Iowa, where CAFO production is already extremely elevated and there is little if any extra land available for spreading additional manure or digestate. This expansion will likely have both water quality and water quantity effects, and no entity is monitoring or assessing them. Notably, one of the Gevo dairies already leaked an estimated 376,000 gallons of manure water and was fined $10,000 in 2022. Another of the Gevo dairies started construction before receiving permission to do so[13].

This is particularly a concern because in 2017 EPA signed a settlement agreement limiting access to whatever information EPA has at its disposal regarding CAFOs[14] As a result, there is no national database that can be used to establish a national bottom-up[15] baseline of GHG emissions and other forms of pollution from CAFOs. This makes national level tracing of net changes in pollution and emissions as a result of the deployment of biodigesters extraordinarily difficult. In Iowa specifically, the DNR lack of monitoring capacity resulted in a de-delegation petition with EPA in 2007. As a result of the subsequent work plan[16], in 2017 the Iowa Department of Natural Resources identified 5,000 more animal feeding operations, some of which were CAFOs[17]. It is quite evident the Iowa DNR does not have the monitoring capacity to ensure compliance with the assumptions that CARB is making. CARB does not have that capacity either.

Recent changes to the USDA's Natural Resources Conservation Service (NRCS) list of practices eligible to receive subsidies under the Environmental Quality Incentive Program (EQIP) and substantial funding allocated to EQIP in the Inflation Reduction Act (IRA) also make it more likely that the rebound effect will increase in the United States. In particular, NRCS has added eligibility to receive subsidies to additional practices in their Climate-Smart Agriculture and Forestry (CSAF) Mitigation Activities List for FY2024 through EQIP and the Conservation Stewardship Program (CSP)[18]. These activities now include roofs and covers used to cover a waste management facility to capture biogas and waste storage facilities. The increased funding for the EQIP and CSP programs is substantial: $8.45 billion and $3.25 billion respectively[19]. Therefore, there are now subsidies available that will further incentivize the deployment of biodigesters. It is also important to note that CAFO operations that receive both federal subsidies to deploy biodigesters and LCFS subsidies for their methane could legitimately be considered a

[19] https://www.farmers.gov/loans/inflation-reduction-investments

form of double dipping, that is paying twice for the same activity. This raises questions about the additionality of the GHG emissions that could occur.

In my professional opinion, California's ill-conceived policy is poised to trigger a new iteration of Cochrane's treadmill that will result in overproduction, further consolidation, and multiple negative environmental consequences[20]. As in the past, landowners will be the main beneficiaries of the policy. Biodigesters' adopters will benefit from temporary increased profits, overproduction will ensue, and the government will be called in to address the fallout. The climate benefits of this approach are dubious at best.

In summary:

a) CARB has not adequately included a full accounting of greenhouse gas emissions that properly considers the impact of biogas market prices and state-level regulatory settings on the US dairy industry. CARB is also ignoring the expansionary effects of the Inflation Reduction Act and the lack of additionality for methane reductions from digesters funded by the IRA. The information I have shown here regarding already occurring out of state effects illustrates that there does not exist at the moment a comprehensive inventory of biodigesters and it is therefore impossible for CARB to adequately consider national level impacts and back up any claims that the incentives included in the proposed LCFS amendments will not result in industry expansion and consolidation. I have in fact presented evidence that expansion is already occurring in Iowa, it is very strongly associated with the deployment of biodigesters, and an increased market signal to produce more credits will further exacerbate that expansionary effect;

b) The economic incentive to monetize manure-methane emissions as proposed by CARB will likely lead to further expansion in the dairy sector in Iowa. If such expansion were to extend to hog CAFOs, given that Iowa already produces one third of US hogs, the environmental impacts could be devastating considering Iowa alone. The national level effects would be worse;

c) The amendments do not just have the potential to result in direct and indirect environmental impacts in California and other states. Combined with federal policy and enhanced by race to the bottom state deregulation, they will substantially alter incentives and result in industry expansion.

GRANTS

31. USDA NIFA. #DiverseCornBelt: Resilient Intensification through Diversity in Midwestern Agriculture. (L. Prokopy project PI, Secchi UIowa PI). 2021-2026. $10,000,000 (UIowa $ 467,776).

30. Healthier Workforce Center of the Midwest (NIOSH funding). Agricultural production practices and stress: a pilot study of women farmers in Iowa. (with C. Nichols). 2020-2021, $29,979.

29. NSF EAGER Germination - What we talk about when we talk about big ideas: Using case studies to train PhD students in ideation and questioning processes. Consultant (with A. Charles, N. Becker). 2018-2020, $117,729.

28. UIowa CGRER. A river runs through it: Surveying Iowa City residents' on water use, water quality and flood management (with K.E. Dalrymple). 2018-2020, $30,000.

27. Iowa State University - Land Use Impacts of RFS-Induced Agricultural Expansion 2018-2019, 71,540.

26. Walton Family Foundation - A Scorecard to measure States' Nutrient Reduction Strategies 2017-2019, $19,585.

25. INTERNAL - SIUC Undergraduate Research Assistantship. Creating an Atlas of Southern Illinois' Ecosystem Services. 2015-2016, $2,700.

24. USDA NIFA – Costs of continuous conservation tillage: estimation with incomplete data (with L.A. Kurkalova, T. Wade and R. Claassen), 2016-2018, $499,995.

23. Argonne National Lab (DoE funds) – Landscape by Design – Valuation of Ecosystem Services, 2015-2017, $49,736.

22. National Science Foundation - DYN COUPLED NATURAL-HUMAN. People, Water, and Climate: Adaptation and Resilience in Agricultural Watersheds (with D. Bennett, N. Basu, M. Muste, W. Gutowski) 2011-2017, $1,011,832.

21. Illinois DNR – Training, Certification, Pilot Incentive, Marketing, And Removal Research Project for the long-term strategy in reducing and controlling Asian Carp populations (with J. Garvey), 2011, $1,500,000.

20. National Science Foundation - DYN COUPLED NATURAL-HUMAN. Climate Change, Hydrology, and Landscapes of America's Heartland: A Multi-scale Natural-Human System (With C. Lant, S. Kraft, G. Misma, J. Nicklow, and J. Schoof) 2010-2014, $1,430,000.

19. USDA ERS Cooperative Agreement 58-6000-0-0056. Estimating the costs of continuous conservation tillage. 2010-2014. $30,887.

18. USDA CSREES AFRI Agribusiness Markets and Trade. An Analysis of the Impact of Biofuel Expansion through Linking of Agricultural and Energy Markets (With A. Elobeid and L.A. Kurkalova) 2010-2014, $360,396.

17. The Nature Conservancy. Floodplain Restoration Strategies Integrating Biomass plantings and Ecosystem Service Payments (With S. Kraft) 2009-2013, $112,536.

16. INTERNAL - SIUC Seed Grant. Economic And Environmental Assessment of the Use of Woody Biomass for Energy Production in Southern Illinois, 2009-2010, $14,985 + 1 month of Summer support.

15. INTERNAL - SIUC Undergraduate Research Assistantship. The Role of Federal and State Policy in Promoting Renewable Energy Production. 2009-2010, $5,400.

14. National Science Foundation Cyber-Enabled Discovery and Innovation Type II. Understanding Water-Human Dynamics with Intelligent Digital Watersheds. (with J. Schnoor, M. Muste, A. Kusiak and D. Bennett). 2009-2012, $899,391.

13. EPA, Region 7. Biofuel Feedstock Landscape Coverage for Five Biofuel Industry Scenarios (with R. Cruse, A. Elobeid and S. Tokgoz) 2008-2010, $150,000.

12. Iowa State University Agricultural Systems Initiative. Assessing alternative crop choices and environmental impacts of the bioeconomy: an integrated landscape approach (with M. Duffy and P.W. Gassman) 2007-2008, $15,000.

11. Agricultural Marketing Resource Center. Helping Farmers Make Decisions in the Bioeconomy: Mapping the Potential for Switchgrass in Iowa Relative to Corn and Soybeans. 2007-2008. (with B. Babcock and P.W. Gassman), $75,000.
10. Department of Energy-USDA. Expansion of ethanol production: evaluation of costs and benefits to rural communities in the Upper Mississippi River Basin. (with L. Kurkalova, C.L. Kling, P.W. Gassman, M. Jha, A. Carriquiry and D. Otto) 2006-2009, $676,722.
9. USDA Natural Resources Conservation Service. Environmental Credit Trading Handbook. 2006-2007 (with C.L. Kling), $84,150.
8. Prairie Rivers of Iowa R.C. & D and USDA Natural Resources Conservation Service. Rapid Watershed Assessment for the Boone River, the Upper Iowa and the South Skunk Watersheds (with T. Isenhart, C.L. Kling, P.W. Gassman and M. Tomer) 2006-2007, $72,500.
7. NASA and USDA Cooperative State Research, Education, and Extension Service. Interactive Drivers of Land Use/Land Cover Change in Agricultural Areas: Climate and Land Manager Choices. (with C.L. Kling, H. Feng, P.W. Gassman, and E. Tackle) 2006-2008, $465,900.
6. Iowa Farm Bureau, Leopold Center for Sustainable Development, Iowa Soybean Association, Iowa Corn Growers Association. Assessment of Conservation Practices on Agricultural Cropland in Iowa (with C.L. Kling, H. Feng, P. Gassman, and M. Jha) 2006, $72,500.
5. USDA CSREES Integrated Projects. Water Resource Degradation in the Boone Watershed: Integrating Stakeholder Knowledge and Preferences with Economic and Watershed Models (with C.L. Kling, M. Duffy, L. Kurkalova, H. Feng, P.W. Gassman, and J. Cooper) 2005-2008, $590,000.
4. Prairie Rivers of Iowa R.C. & D and Leopold Center for Sustainable Development. Boone River Watershed and Gordon's Marsh Project (with C.L. Kling, and P.W. Gassman) 2005-2006, $35,000.
3. Iowa State Water Resources Research Institute. Improving Water Quality in Iowa Rivers: Cost-Benefit Analysis of Adopting New Conservation Practices and Changing Agricultural Land Use (with C.L. Kling, H. Feng, P.W. Gassman, and L. Kurkalova) 2005-2006, $39,600.
2. National Science Foundation. Biocomplexity of Integrated Perennial-Annual Agroecosystems (Senior Personnel. Principal Investigators: H. Asbjornsen, R. M Cruse, C.L. Kling, M. Z Liebman, J. D Opsomer) 2005-2007, $ 99,998.
1. Iowa Department of Natural Resources. Costs of Adopting Conservation Practices on Agricultural Cropland in Iowa and Possible Nutrient Standards (with C.L. Kling, H. Feng, P. Gassman, and L. Kurkalova) 2004, $53,360.

TEACHING EXPERIENCE

Introduction to Sustainability (GEOG 2013). Class for the University's Gen Ed sustainability requirement Average class size 65.

Environmental Economics and Policy (GEOG 3800/5800). Double listed class for undergraduate and graduate students. Average class size: 30.

Environmental Impact Analysis (GEOG 4750). Average class size: 11.

Contemporary Environmental Issues (GEOG 1070). Class for the University's Gen Ed sustainability requirement. Average class size: 370.

Environmental and Energy Economics (GENV 422). Double listed class for undergraduate and graduate students. Average class size: 20.

Geography, People and the Environment (GENV 300i). Class for the University's core curriculum social sciences and interdisciplinary requirement. Average class size: 70.

Environmental Decision Making (Environmental Resources & Policy 502). Core class for the interdisciplinary ER&P Ph.D program. Average class size: 12.

Interdisciplinary Approaches to Environmental Issues (ABE 470). Team taught class, capstone for the Minor in Environmental Studies.

GRADUATE STUDENT ADVISEMENT

MASTERS STUDENT ADVISER
Amy Kopale – Masters in Geography, UIowa, 2019
Aleesandria Gonzalez- Masters in Geography, SIUC, 2017
Daniel Fucik - Masters in Geography, SIUC, 2016
Andisiwe Stuurman - Masters in Geography, SIUC (Fulbright scholar), 2015
Mohamud Esmail – Masters in Agribusiness Economics, SIUC, 2011
Alison Britt – Masters in Agribusiness Economics, SIUC, 2011
Kent Rupp – Masters in Agribusiness Economics, SIUC, 2011

PH.D. STUDENT ADVISER
Austin Holland – Ph.D. in Geography, UIowa, 2022
Shanna McClain (with C. Bruch) – Ph.D. in Environmental Resources & Policy, SIUC (IGERT fellow), 2016
Mukesh Bhattarai – Ph.D. in Environmental Resources & Policy, SIUC, 2016
Awoke Teshager (with J. Schoof) – Ph.D. in Environmental Resources & Policy, SIUC, 2016
Tom Shaw – Ph.D. in Environmental Resources & Policy, SIUC, 2015
Sarah Varble – Ph.D. in Environmental Resources & Policy, SIUC, 2014

MASTERS STUDENT COMMITTEE MEMBER
Tracy Fidler – Masters in Natural Resources and Environmental Sciences, UIUC, 2017
Jodie Hancock – Masters in Forestry, SIUC, 2017
Ann Rushing – Masters in Geography, SIUC, 2015
Brent Ritzler – Masters in Public Administration, SIUC, 2015
Lance Odum – Masters in Public Administration, SIUC, 2012
Andrew Johnson – Masters in Geography, SIUC, 2012

PH.D. STUDENT COMMITTEE MEMBER
Asif Rahman – Ph.D. in Geography, UIowa, current
Enes Yildirim – Ph.D. in Water Resources, UIowa, current
Oronde Drakes – Ph.D. in Geography, UIowa, current
Rebecca Kauten – Ph.D. in Geography, UIowa, 2019
Clara Mundia – Ph.D. in Environmental Resources & Policy, SIUC, 2017
Amanda Marshall – Ph.D. in Environmental Resources & Policy, SIUC, 2017
Dat Tran- Ph.D. in Energy & Environmental Systems, NCA&T University, 2016
Ross Guida – Ph.D. in Environmental Resources & Policy, SIUC, 2016
Obed Quaicoe- Ph.D. in Energy & Environmental Systems, NCA&T University, 2016
Artur Rombenso – Ph.D. in Zoology, SIUC, 2016
Wahid Rahman – Ph.D. in Environmental Resources & Policy, SIUC, 2014
Tim Stoebner – Ph.D. in Environmental Resources & Policy, SIUC, 2014
Steve Randall - Ph.D. in Energy & Environmental Systems, NCA&T University, 2012
Caroline Gottschalk Druschke – Ph.D in Rethoric, University of Illinois at Chicago, 2011

INVITED CONFERENCE AND SEMINAR PRESENTATIONS

Invited plenary presentation, "Slaughtering Sacred Cows: Tech Fixes Won't Correct the Extractive Nature of US Agriculture", Sustainable Phosphorus Summit, November 1-2, 2022, Raleigh NC.

Invited presentation, Economic & Land Use Policies to Limit Nutrient Pollution: Perspectives from the Great Lakes and Beyond, Alliance for the Great Lakes, April 4, 2022, virtual event.

Seminar presentation, "A lonely stick amongst many carrots: The Conservation Compliance Program in the 21st Century", Paul H. O'Neill School, Indiana University, February 25, 2021, virtual event.

Seminar presentation, "The US census of agriculture as lens and mirror of long term changes in the rural Midwest", Faculty of Land and Food Systems, University of British Columbia, September 16 2020, virtual event.

Invited presentation "The role of policy in promoting sustainable floodplain management" at Emiquon Science 2015: River Floodplain Restoration and Connection, February 19th, 2015, Lewistown, IL

Invited Presentation "Understanding the links between humans, climate change, water and carbon in a Corn Belt Watershed", at the AGU Fall meeting, December 15-19th, 2014, San Francisco, CA.

Invited presentation "Promoting Bioenergy Crops: An economic perspective on challenges and opportunities" at the workshop Incorporating Bioenergy in Sustainable Landscape Designs Workshop Two: Agricultural Landscapes June 24–26th, 2014, Argonne National Laboratory, IL.

Invited presentation "Increased Biofuel Production and Water Resources" at the National Academies Roundtable on Science and Technology for Sustainability, May 20-21, 2014, Washington DC. URL: http://sites.nationalacademies.org/cs/groups/pgasite/documents/webpage/pga_088191.pdf

Invited speaker at the Indiana University-Purdue University first "Rivers of the Anthropocene" conference, January 23-24th, 2014, Indianapolis, IN.

Invited speaker at the MISI-ZIIBI: Living with the Great Rivers, Climate Adaptation Strategies in the Midwest River Basins, co-sponsored by Washington University in St. Louis and the Royal Netherlands Embassy, March 23rd, 2013, St. Louis, MO.

Plenary speaker at the 2013 Missouri River Natural Resources Conference and BiOp Forum "Beyond the Banks" March 12th, 2013, Jefferson City, MO.

Luncheon speaker at the Soil and Water Conservation Society Modeling Summit 2011 - Advancing the Science of Modeling, March 30th, 2011, Denver, CO.

Invited lecture to the "Food, Energy, and Quality of Life in Iowa" graduate class at Iowa State University, on the difference between ecological and environmental economics approaches to agricultural policy, September 21st, 2009.

North Carolina A&T State University, Energy and Environmental Systems Seminar, April 12th, 2010.

Iowa State University Biobased Industry Center Energy Camp, May 21st 2010.

University of Minnesota, Applied Economics Department, Environmental and Resource Economics Seminar, April 26th 2010.

University of Illinois at Urbana-Champaign, Department of Agricultural and Consumer Economics Seminar, September 10th 2010.

University of Iowa, Department of Geography, Kohn Colloquium, October 29th 2010.

CONFERENCE PAPERS AND POSTERS

PROFESSIONAL ACTIVITIES

Editorial Board of Conservation, Review Editor, Frontiers, 2019-present

Editorial Board, Applied Economic Perspectives and Policy, 2015-present

Oklahoma EPSCoR External Advisory Board Member 2017-2018

Participant at invitation-only Purdue University University of Illinois workshop "Scientific Challenges to Operationalizing Payments for Agro-Ecosystem Services (PAgES)" (organized by Ben Gramig and Sylvie Brouder). Indianapolis, IN, November 2017

Consultant, Walton Family Foundation – Developing a Score Card for Iowa and Illinois' Nutrient Reduction Strategies. 2016-2017

Program Committee Member for the 6th World Congress of Environmental and Resource Economists, 2018

National Science Foundation, panelist, 2010, 2011, 2014, 2016, 2017, 2018, 2019 and 2023. Ad hoc reviewer, 2012, 2013, 2014, 2016, 2017

USDA – NIFA panelist, 2017 and 2018. Ad hoc reviewer 2014 and 2016

Reviewer for Selected Paper Sessions of the American Agricultural Economics Association meetings, 2002, 2003, 2008 and 2016

Author of working paper II for the USDA and C-FARE workshop, 'Economic Valuation of Conservation Based Ecosystem Services', July 21, 2015, Washington, DC

Participant, inaugural SESYNC short course, Teaching Socio-Environmental Synthesis with Case Studies, July 23-26, 2013, Annapolis, MD

Planning Committee Member, AWRA 2013 Spring Specialty Conference: "Agricultural Hydrology and Water Quality II", March 25-27, St. Louis, MO

Participant, NSF workshop on Developing and Sustaining Interdisciplinary Graduate Programs, 7-8 October 2012, Coeur d'Alene, ID

EPA Star Fellowship Panelist, 2012

Program Committee Member for the 18th and 19th Annual Meetings of the European Association of Environmental and Resource Economists, 2011 and 2012

Member of the Middle Mississippi Wetland Field Station Advisory Committee Southern Illinois University, 2009- 2017

Rapporteur at the JRC/EEA/OECD Expert Consultation: "Review and inter-comparison of modeling land use change effects of bioenergy", Paris, France, 29-30 January 2009

Reviewer for the National Institutes for Water Resource - U.S. Geological Survey Competitive Grants Program, 2009 and 2011

Reviewer for the Collaborative, Highly Interdisciplinary Research Program at the Swiss Federal Institute of Technology, Zurich Research Commission, 2009

Reviewer for Selected Paper Sessions of the 3rd World Congress of Environmental and Resource Economists, 2006

Reviewer for USDA-CSREES Conservation Effects Assessment Project, 2005 and 2006

Reviewer of the Union of Concerned Scientists' report "CAFOs Uncovered: The Untold Costs of Confined Animal Feeding Operations" URL: http://www.ucsusa.org/food_and_environment/sustainable_food/cafos-uncovered.html.

Reviewer for: Agriculture, Agricultural and Resource Economics Review, Agriculture and Human Values, Agronomy Journal, Appetite, American Journal of Agricultural Economics, Applied Economic Perspectives and Policy, Applied Geography, Biofuels, Biological Invasions, Biomass & Bioenergy, BioScience, Choices, Ecology, Ecological Applications, Ecological Economics, Ecosystem Services, Energy Policy, Environmental and Development Economics, Environmental and Resource Economics, Environmental Management, Environmental Research

UNIVERSITY SERVICE

2019 – current, Governmental Relations Committee

2019 – current, Office of Sustainability Advisory Board

2019 – current, Center for Global & Regional Environmental Research Executive Committee

2018 – current, Center for Health Effects of Environmental Contamination Executive Committee

2020 – 2021, Sustainability Investment & Purchasing Practices Subcommittee

2019 – 2022, Underrepresented Students in Sustainability Mentoring Program Mentor

2018 – 2022, Faculty Assembly

ACADEMIC HONORS AND AWARDS

Southern Illinois University Early Career Faculty Excellence Award, 2012 [inaugural winner].

Yellow Ribbon Poster Presentation, with L.A. Kurkalova, and P. W. Gassman, Agricultural and Applied Economics Association, 2009.

2009 Editor's Choice Award, Journal of Soil and Water Conservation: Secchi, S., J. Tyndall, L.A. Schulte, and H. Asbjornsen. 2008. High crop prices and conservation: Raising the stakes. *Journal of Soil and Water Conservation* 63(3):68A-73A.

Iowa State University College of Agriculture and Life Science Team Award, to the Resource and Environmental Policy Division. 2008.

Second Place Poster Presentation, with M. Jha, L.A. Kurkalova, C.L. Kling, H. Feng, P.W. Gassman, and T. Campbell, American Agricultural Economics Association, 2005 and 2006.

Second Place Poster Presentation, with C.L. Kling, H. Feng, L.A. Kurkalova, P.W. Gassman, M. Jha, T. Campbell, A. Bhaskar, C. Burkart, S. Sengupta and R. Olson, American Agricultural Economics Association, 2004.

First Place Poster Presentation, with C.L. Kling, L.A. Kurkalova, and P.W. Gassman, American Agricultural Economics Association, 2003.

Outstanding Ph.D. Dissertation (Honorable Mention), American Agricultural Economics Association, 2001.

Professional Advancement Travel Grant, Iowa State University, 1999.

Premium for Academic Excellence Award, Iowa State University, 1996.

OUTREACH PRESENTATIONS AND PODCASTS

2021-2023 – We All Want Clean Water – Podcast co-host and producer (31 episodes)

2023 - The Power of Big Pork – Foodprint podcast

2022 - Iowa's Industrial Agriculture – The Checkout podcast

2022 - "Cows, Climate and Culture Wars: Putting Bad Policy Out to Pasture" virtual panel, Center for Biological Diversity.

2022 - "Human Rights and Climate Change: Iowa's Challenges & Opportunities" virtual panel, UI Center for Human Rights and the Environmental Law Initiative.

2022 – "Celebrating 50 years of the Clean Water Act", panel, Sierra Club, Waterloo, IA.

2020 – Webinars on Agriculture and Climate Change for the Iowa Farmers Union and Environment Iowa

2019 – Science Café, The current state of the Paris agreement, Fairfield and Mount Vernon, IA

2018 – Wonk Wednesday, America out of Paris: the current state of global climate change policy, University of Iowa, Iowa City, Iowa, United States

2018 – Rapid Response History, Liquid Gold or Fool's Gold? Biofuels in the US, University of Iowa, Iowa City, Iowa, United States

2011 – Carbondale Science Café' – Presentation on Biofuels, March 24

2009 – Speaker, "No Silver Bullets: Unintended Consequences Of Oil And Water Solutions", May 18, Indo-American Center, Chicago, IL

2008-2013 – The View: Expert opinions on a special series on energy for The Southern Illinoisan newspaper. 22 short perspectives 2022

Subject: Comments on the Proposed Amendments to the Low Carbon Fuel Standard

---

Dear Ms. Folk,

SWAPE was retained by Shute Mihaly & Weinberger LLP to provide written comments on the Proposed Amendments to the Low Carbon Fuel Standard ("LCFS") released by the California Air Resources Board ("CARB"), specifically the *Staff Report: Initial Statement of Reasons* ("ISOR") and the *Appendix D: Draft Environmental Impact Analysis for the Proposed Low Carbon Fuel Standard Regulation* ("EIA").[1, 2] Upon review, I have found that the ISOR and EIA inadequately addressed the following:

- Anaerobic digestate increases the potential for nitrate contamination of groundwater; and
- Anaerobic digestate increases N_2O and NOx emissions into the atmosphere; and
- Anaerobic digestate increases ammonia emissions, which is an odorous compound. Odor associated with anaerobic digestate soil application can result in odor complaints to nearby communities which are often of lower socioeconomic status resulting in environmental justice issues.

In "Table 1.1: Summary of Potential Environmental Impacts" in the ISOR, CARB listed the following impacts as "Potentially Significant and Unavoidable":[3]

- "Short-term Construction-Related and Long-Term Operational-Related Impacts on Air Quality"

- "Short-Term Construction-Related and Long-Term Operational-Related Impacts to Geology and Soils"
- "Short-Term Construction-Related and Long-Term Operational-Related Impacts to Hydrology and Water Quality"

Upon review, I find the ISOR and EIA are insufficient in addressing my concerns regarding anaerobic digesters' air quality and groundwater impacts. The following are my comments regarding these documents.

Anaerobic Digestion

Anaerobic Digester Digestate Impact on Air

In the ISOR, CARB listed the impacts of "Short-term Construction-Related and Long-Term Operational-Related Impacts on Air Quality" as "Potentially Significant and Unavoidable".[4] The following section highlights a clear indication that CARB's analysis fell short in adequately assessing the significance of these impacts on air quality.

Anaerobic digestion efficiently decomposes waste into smaller molecules, enhancing their propensity to volatilize into the atmosphere. During the anaerobic digestion process, quantities of ammonia are produced as a byproduct. This odorous compound possesses the potential to cause irritation and discomfort to the throat, lungs, and eyes, and prolonged exposure to elevated ammonia levels can lead to lung damage.[5] Furthermore, ammonia emits a strong odor that is easily detectable at low concentrations and contributes to irritation such as immediate burning of the nose and respiratory tract.[6] From a study by Rosenfeld et. al. in 2000, anaerobic digestion can emit enough ammonia to contribute to odor emissions. The study mentions:

> *"Odor emissions from land application of biosolids have become a concern for biosolids managers. Chemical odorant emissions from biosolids were identified using gas chromatography-mass spectrometry and included dimethyl disulfide (DMDS), dimethyl sulfide (DMS), carbon disulfide (CS2), ammonia (NH3), trimethyl amine (TMA), and acetone."*[7]

This confirms that ammonia emissions from biosolids (digestate) are broken down during the anaerobic digestion process, potentially leading to increased ammonia concentration and, consequently, odor and health irritation.

Another study, conducted by Holly et al. in 2017, evaluated the effects of anaerobic digestion on greenhouse gas and ammonia emissions during manure storage. According to Holly et al., anaerobic digestion can increase ammonia emissions. The study stated that the anaerobic digestion process "resulted in a gas emission tradeoff as it increased NH_3 [ammonia] emissions by 81% during storage, which could be mitigated by subsequent SLS [solid-liquid separation], manure storage covers, or other beneficial management practices."[8] The study further explains:

> *"During the AD process, methanogens and other microorganisms break down proteins, amino acids, and urea forming NH4 (Bernet et al., 2000). In addition, mineralization of organic N and volatile fatty acids during AD increases manure pH and available N (Petersen and Sommer, 2011), factors which increase NH3 emissions."*[9]

Holly et al. also found that nitrous oxide emissions were increased from anaerobically digested solids during storage:

> *"Overall, the methane emissions from storage were reduced by manure processing by 25%, 46%, and 68% for AD, SLS, and AD+SLS, respectively. However, these reductions from storage were somewhat negated when examing [sic] total GHG's to 44% and 27% for SLS and AD+SLS due to N2O losses from solid storage."*[10]

They concluded that greenhouse gas emissions were not further reduced when solid-liquid separation was employed in addition to anaerobic digestion as opposed to anaerobic digestion alone, as "anaerobically stacking digested solids increased emissions of N2O negating abatement of total GHG."[11] The findings of this study show the importance of considering nitrous oxide emissions from digestate solids in cumulative GHG emissions, which CARB failed to adequately address in the EIA. Furthermore, the ISOR and EIA claim methane reductions are achieved by digesters without any discussion of digestate-related N_2O, which Holly (2017) found negated methane reductions by more than 40 percent.

As anaerobic digestion breaks down organic material, biogas is produced. Preble et. al. (2020) explained that during biogas combustion in the anaerobic digestion process, ammonia is oxidized to nitrous oxides, which, in turn, increases nitrous oxide emissions.[12] The study "quantifies emission rates of GHGs, criteria air pollutants, and toxic/odorous compounds from the AD composting process."[13] The study further states:

> *"In situ measurements of key sources at two large-scale industrial facilities in California were conducted to quantify pollutant emission rates across the AD composting*

[13] Ibid.

> *process. These measurements established a strong relationship between flared biogas ammonia (NH3) content and emitted nitrogen oxides (NOx), indicating that fuel NOx formation is significant and dominates over the thermal or prompt NOx pathways when biogas NH3 concentration exceeds ~200 ppm."*[14]

The above study highlights a crucial aspect, noting that "biogas may contain significant amounts of ammonia (NH_3) that is produced during the degradation of amino acids during acidogenesis - one of the four primary stages in AD."[15] Additionally, it emphasizes the potential consequences, explaining that "the oxidation of NH_3 present in the biogas to nitrogen oxides ($NOx = NO + NO_2$) can cause elevated flare emissions that contribute to air quality problems and exceed permitted levels."[16]

Anaerobic digesters produce significant amounts of greenhouse gases, such as methane and carbon dioxide.[17] Notably, the combustion of biogas in an internal combustion engine yields high levels of air pollution, including carbon monoxide (CO), nitrogen oxides (NOx), sulfur dioxide (SO_2), and various hazardous air pollutants.[18] Biogas combustion also results in formaldehyde emissions. According to the EPA, formaldehyde is a "probable" carcinogen.[19] Based on an article by the Vermont Department of Environmental Conservation, anaerobic digesters can result in increased formaldehyde emissions from combustion of biogas. The article states:

> *"The use of internal combustion engines to burn biogas also generates substantially more formaldehyde emissions than would occur with other fuels or other combustion devices. According to the U.S. Environmental Protection Agency (US EPA), formaldehyde is ubiquitous and naturally occurring in the environment at low levels, contributing to asthma and eye and respiratory irritation. At higher concentration, it can cause severe irritation and is considered a probable human carcinogen by the US EPA."*[20]

The impact of emissions from anaerobic digestion on nearby communities, especially those in close proximity to dairy farms, is a critical aspect of environmental justice and public health. The emissions from anaerobic digestion can disproportionately affect nearby communities, particularly those adjacent to dairy farms, often comprising lower-income residents. Lower-income residents are often more vulnerable to the adverse effects of these emissions due to various factors, such as lack of resources, inadequate infrastructure, and the concentration of anaerobic digester facilities near these populations.

The above section clearly highlights CARB's lack of extensive analysis in assessing the potential impacts of anaerobic digestion on air quality.

Anaerobic Digester Digestate Impact on Groundwater

In the ISOR, CARB listed the impacts of "Short-Term Construction-Related and Long-Term Operational-Related Impacts to Geology and Soils" and "Short-Term Construction-Related and Long-Term Operational-Related Impacts to Hydrology and Water Quality" as "Potentially Significant and Unavoidable".[21] This section serves as a response to CARB's analysis of these impacts.

Anaerobic digestion breaks down waste into a digestate of smaller molecules that are more susceptible to leaching into the groundwater. Several studies have found that anaerobic digestion leads to higher concentrations of ammonia in digestate, which can subsequently convert to nitrate. The leaching of nitrates into drinking water and food can lead to the onset of blue baby syndrome, also known as methemoglobinemia.[22] The consumption of nitrate reduces the ability of red blood cells to transport oxygen, leading to illness in infants younger than 12 months and presenting as a distinctive blue or brown tint to their skin.[23]

Lamolinara et al. (2022) found that digestate, the nutrient-rich product from anaerobic digestion of organic waste, can "contribute to nutrient pollution without comprehensive management strategies."[25] This type of pollution can lead to harmful algal blooms, hypoxia, and eutrophication.[26] Improper application of digestate has the potential to adversely affect both plant growth and soil health.[27] The chemical composition of digestate can present challenges for sustainable disposal.[28] Early application of digestate may lead to nutrient loss, translocation to deeper soil layers, or discharges of $NO3^-$ into groundwater.[29]

Anaerobic digestion breaks down waste, rendering it more susceptible to seepage into groundwater than undigested manure. Treatment lagoons are used to facilitate the waste treatment process and are lined, inhibiting nitrate from entering the groundwater. Anaerobic digestate is more extensively broken down compared to sludge from treatment lagoons. One study by Agga et al. (2022) indicated that treatment lagoons can reduce nitrogen compared to aerobic digestion:

> *"Unlike anaerobic digesters, uncovered lagoons are open to the air, photosynthesizing bacteria may develop that act to reduce nitrogen and sulfur-containing compounds and help eliminate odor in the effluent storage layer."*[30]

Nitrate pollution leading to groundwater contamination is much more likely to occur with anaerobically digested digestate, as the ammonia is more readily available for conversion into nitrate, which can then leach into groundwater. A 2010 study titled "Biogas Digestates as Organic Fertilizer in Different Crop Rotations" assessed bioenergy cropping systems for yield performance, ecological impacts, and economic feasibility. The research revealed that treatments with high digestate application rates could elevate the risk of $NO3^-$ discharges into groundwater.[31] Another study, by Fermoso et al. in 2019, highlighted that the prolonged use of digestate from anaerobic digesters could result in rapid nitrification of ammonium (NH4+-N) in the soil, making it readily accessible to crops and prone to leaching, potentially causing groundwater pollution.[32] A study by Amon et al. (2006) found that anaerobic digester digestate increases nitrate loss potential.[33] The study states:

> *"Anaerobic digestion reduces manure carbon and dry matter content by about 50%. NH4-N content and pH in digested slurry are higher than in untreated slurry (Messner, 1988). Thus, potentials for NH3 emissions during slurry storage are enhanced. Due to*

the reduced dry matter content, biogas slurry can infiltrate more rapidly into the soil, which reduces NH3 emissions after slurry application. However, the increased NH4-N content and pH give rise to higher NH3 loss potentials."[34]

There is a potential for nitrate contamination of groundwater, excessive accumulation of soil phosphorus, and eutrophication of surface waters from anaerobic digesters.[35] The above section clearly highlights CARB's lack of extensive analysis in assessing the potential impacts of anaerobic digestion on groundwater quality.

Conclusion: Anaerobic Digester Impacts Inadequately Evaluated

CARB failed to adequately address air quality, soil and geology, and groundwater quality issues in the ISOR and EIA. Further analysis is required to quantify the impact of increased anaerobic digesters and the impacts on groundwater and air quality, especially in locations where digestate is applied to soil. Further assessment is essential to properly evaluate the impact of emissions to air and discharges to groundwater from anaerobic digestion on nearby communities, specifically lower-income neighborhoods.

Disclaimer

SWAPE has received limited discovery regarding this project. Additional information may become available in the future; thus, we retain the right to revise or amend this report when additional information becomes available. Our professional services have been performed using that degree of care and skill ordinarily exercised, under similar circumstances, by reputable environmental consultants practicing in this or similar localities at the time of service. No other warranty, expressed or implied, is made as to the scope of work, work methodologies and protocols, site conditions, analytical testing results, and findings presented. This report reflects efforts which were limited to information that was reasonably accessible at the time of the work, and may contain informational gaps, inconsistencies, or otherwise be incomplete due to the unavailability or uncertainty of information obtained or provided by third parties.

Paul Rosenfeld, Ph.D.

Chemical Fate and Transport & Air Dispersion Modeling

Principal Environmental Chemist

Risk Assessment & Remediation Specialist

Education

Ph.D. Soil Chemistry, University of Washington, 1999. Dissertation on volatile organic compound filtration.

M.S. Environmental Science, U.C. Berkeley, 1995. Thesis on organic waste economics.

B.A. Environmental Studies, U.C. Santa Barbara, 1991. Focus on wastewater treatment.

Professional Experience

Dr. Rosenfeld has over 25 years of experience conducting environmental investigations and risk assessments for evaluating impacts to human health, property, and ecological receptors. His expertise focuses on the fate and transport of environmental contaminants, human health risk, exposure assessment, and ecological restoration. Dr. Rosenfeld has evaluated and modeled emissions from oil spills, landfills, boilers and incinerators, process stacks, storage tanks, confined animal feeding operations, industrial, military and agricultural sources, unconventional oil drilling operations, and locomotive and construction engines. His project experience ranges from monitoring and modeling of pollution sources to evaluating impacts of pollution on workers at industrial facilities and residents in surrounding communities. Dr. Rosenfeld has also successfully modeled exposure to contaminants distributed by water systems and via vapor intrusion.

Dr. Rosenfeld has investigated and designed remediation programs and risk assessments for contaminated sites containing lead, heavy metals, mold, bacteria, particulate matter, petroleum hydrocarbons, chlorinated solvents, pesticides, radioactive waste, dioxins and furans, semi- and volatile organic compounds, PCBs, PAHs, creosote, perchlorate, asbestos, per- and poly-fluoroalkyl substances (PFOA/PFOS), unusual polymers, fuel oxygenates (MTBE), among other pollutants. Dr. Rosenfeld also has experience evaluating greenhouse gas emissions from various projects and is an expert on the assessment of odors from industrial and agricultural sites, as well as the evaluation of odor nuisance impacts and technologies for abatement of odorous emissions. As a principal scientist at SWAPE, Dr. Rosenfeld directs air dispersion modeling and exposure assessments. He has served as an expert witness and testified about pollution sources causing nuisance and/or personal injury at sites and has testified as an expert witness on numerous cases involving exposure to soil, water and air contaminants from industrial, railroad, agricultural, and military sources.

Paul Rosenfeld Ph.D. (September 19, 2005). Fate, Transport, Toxicity, And Persistence of 1,2,3-TCP. *PEMA Emerging Contaminant Conference.* Lecture conducted from Hilton Hotel in Irvine, California.

Paul Rosenfeld Ph.D. (September 26-27, 2005). Fate, Transport and Persistence of PDBEs. *Mealey's Groundwater Conference.* Lecture conducted from Ritz Carlton Hotel, Marina Del Ray, California.

Paul Rosenfeld Ph.D. (June 7-8, 2005). Fate, Transport and Persistence of PFOA and Related Chemicals. *International Society of Environmental Forensics: Focus on Emerging Contaminants*. Lecture conducted from Sheraton Oceanfront Hotel, Virginia Beach, Virginia.

Paul Rosenfeld Ph.D. (July 21-22, 2005). Fate Transport, Persistence and Toxicology of PFOA and Related Perfluorochemicals. *2005 National Groundwater Association Ground Water and Environmental Law Conference*. Lecture conducted from Wyndham Baltimore Inner Harbor, Baltimore Maryland.

Paul Rosenfeld Ph.D. (July 21-22, 2005). Brominated Flame Retardants in Groundwater: Pathways to Human Ingestion, Toxicology and Remediation. *2005 National Groundwater Association Ground Water and Environmental Law Conference.* Lecture conducted from Wyndham Baltimore Inner Harbor, Baltimore Maryland.

Paul Rosenfeld, Ph.D. and James Clark Ph.D. and Rob Hesse R.G. (May 5-6, 2004). Tert-butyl Alcohol Liability and Toxicology, A National Problem and Unquantified Liability. *National Groundwater Association. Environmental Law Conference*. Lecture conducted from Congress Plaza Hotel, Chicago Illinois.

Paul Rosenfeld, Ph.D. (March 2004). Perchlorate Toxicology. *Meeting of the American Groundwater Trust*. Lecture conducted from Phoenix Arizona.

Hagemann, M.F., **Paul Rosenfeld, Ph.D.** and Rob Hesse (2004). Perchlorate Contamination of the Colorado River. *Meeting of tribal representatives*. Lecture conducted from Parker, AZ.

Paul Rosenfeld, Ph.D. (April 7, 2004). A National Damage Assessment Model For PCE and Dry Cleaners. *Drycleaner Symposium. California Ground Water Association*. Lecture conducted from Radison Hotel, Sacramento, California.

Rosenfeld, P. E., Grey, M., (June 2003) Two stage biofilter for biosolids composting odor control. *Seventh International In Situ And On Site Bioremediation Symposium Battelle Conference* Orlando, FL.

Paul Rosenfeld, Ph.D. and James Clark Ph.D. (February 20-21, 2003) Understanding Historical Use, Chemical Properties, Toxicity and Regulatory Guidance of 1,4 Dioxane. *National Groundwater Association. Southwest Focus Conference. Water Supply and Emerging Contaminants*.. Lecture conducted from Hyatt Regency Phoenix Arizona.

Paul Rosenfeld, Ph.D. (February 6-7, 2003). Underground Storage Tank Litigation and Remediation. *California CUPA Forum*. Lecture conducted from Marriott Hotel, Anaheim California.

Paul Rosenfeld, Ph.D. (October 23, 2002) Underground Storage Tank Litigation and Remediation. *EPA Underground Storage Tank Roundtable*. Lecture conducted from Sacramento California.

Rosenfeld, P.E. and Suffet, M. (October 7- 10, 2002). Understanding Odor from Compost, *Wastewater and Industrial Processes. Sixth Annual Symposium On Off Flavors in the Aquatic Environment. International Water Association*. Lecture conducted from Barcelona Spain.

Rosenfeld, P.E. and Suffet, M. (October 7- 10, 2002). Using High Carbon Wood Ash to Control Compost Odor. *Sixth Annual Symposium On Off Flavors in the Aquatic Environment. International Water Association*. Lecture conducted from Barcelona Spain.

Rosenfeld, P.E. and Grey, M. A. (September 22-24, 2002). Biocycle Composting For Coastal Sage Restoration. *Northwest Biosolids Management Association*. Lecture conducted from Vancouver Washington..

Rosenfeld, P.E. and Grey, M. A. (November 11-14, 2002). Using High-Carbon Wood Ash to Control Odor at a Green Materials Composting Facility. *Soil Science Society Annual Conferenc*e. Lecture conducted from Indianapolis, Maryland.

Rosenfeld. P.E. (September 16, 2000). Two stage biofilter for biosolids composting odor control. *Water Environment Federation.* Lecture conducted from Anaheim California.

Rosenfeld. P.E. (October 16, 2000). Wood ash and biofilter control of compost odor. *Biofest.* Lecture conducted from Ocean Shores, California.

Rosenfeld, P.E. (2000). Bioremediation Using Organic Soil Amendments. *California Resource Recovery Association*. Lecture conducted from Sacramento California.

Rosenfeld, P.E., C.L. Henry, R. Harrison. (1998). Oat and Grass Seed Germination and Nitrogen and Sulfur Emissions Following Biosolids Incorporation with High-Carbon Wood-Ash. *Water Environment Federation 12th Annual Residuals and Biosolids Management Conference Proceedings*. Lecture conducted from Bellevue Washington.

Rosenfeld, P.E., and C.L. Henry. (1999). An evaluation of ash incorporation with biosolids for odor reduction. *Soil Science Society of America*. Lecture conducted from Salt Lake City Utah.

Rosenfeld, P.E., C.L. Henry, R. Harrison. (1998). Comparison of Microbial Activity and Odor Emissions from Three Different Biosolids Applied to Forest Soil. *Brown and Caldwell.* Lecture conducted from Seattle Washington.

Rosenfeld, P.E., C.L. Henry. (1998). Characterization, Quantification, and Control of Odor Emissions from Biosolids Application To Forest Soil. *Biofest.* Lecture conducted from Lake Chelan, Washington.

Rosenfeld, P.E, C.L. Henry, R. Harrison. (1998). Oat and Grass Seed Germination and Nitrogen and Sulfur Emissions Following Biosolids Incorporation with High-Carbon Wood-Ash. Water Environment Federation 12th Annual Residuals and Biosolids Management Conference Proceedings. Lecture conducted from Bellevue Washington.

Rosenfeld, P.E., C.L. Henry, R. B. Harrison, and R. Dills. (1997). Comparison of Odor Emissions from Three Different Biosolids Applied to Forest Soil. *Soil Science Society of America*. Lecture conducted from Anaheim California.

Teaching Experience:

UCLA Department of Environmental Health (Summer 2003 through 20010) Taught Environmental Health Science 100 to students, including undergrad, medical doctors, public health professionals and nurses. Course focused on the health effects of environmental contaminants.

National Ground Water Association, Successful Remediation Technologies. Custom Course in Sante Fe, New Mexico. May 21, 2002. Focused on fate and transport of fuel contaminants associated with underground storage tanks.

National Ground Water Association; Successful Remediation Technologies Course in Chicago Illinois. April 1, 2002. Focused on fate and transport of contaminants associated with Superfund and RCRA sites.

California Integrated Waste Management Board, April and May, 2001. Alternative Landfill Caps Seminar in San Diego, Ventura, and San Francisco. Focused on both prescriptive and innovative landfill cover design.

UCLA Department of Environmental Engineering, February 5, 2002. Seminar on Successful Remediation Technologies focusing on Groundwater Remediation.

University Of Washington, Soil Science Program, Teaching Assistant for several courses including: Soil Chemistry, Organic Soil Amendments, and Soil Stability.

U.C. Berkeley, Environmental Science Program Teaching Assistant for Environmental Science 10.

Academic Grants Awarded:

California Integrated Waste Management Board. $41,000 grant awarded to UCLA Institute of the Environment. Goal: To investigate the effect of high carbon wood ash on volatile organic emissions from compost. 2001.

Synagro Technologies, Corona California: $10,000 grant awarded to San Diego State University.
Goal: investigate the effect of biosolids for restoration and remediation of degraded coastal sage soils. 2000.

King County, Department of Research and Technology, Washington State. $100,000 grant awarded to University of Washington: Goal: To investigate odor emissions from biosolids application and the effect of polymers and ash on VOC emissions. 1998.

Northwest Biosolids Management Association, Washington State. $20,000 grant awarded to investigate effect of polymers and ash on VOC emissions from biosolids. 1997.

James River Corporation, Oregon: $10,000 grant was awarded to investigate the success of genetically engineered Poplar trees with resistance to round-up. 1996.

United State Forest Service, Tahoe National Forest: $15,000 grant was awarded to investigating fire ecology of the Tahoe National Forest. 1995.

Kellogg Foundation, Washington D.C. $500 grant was awarded to construct a large anaerobic digester on St. Kitts in West Indies. 1993

Cow Poop is Now a Big Part of California Fuel Policy

Are the state's new low-carbon fuel regulations full of BS?

by Aaron David Smith | January 22, 2024

Every day, California farmers milk 1.7 million cows. Each cow generates about 7 gallons of milk and 100 gallons of waste. Most farmers process the waste (mostly manure) by washing it into lagoons where microbes break it down and, in the process, emit methane, a potent greenhouse gas.

These facts raise two questions. First, can we prevent the manure-eating microbes from sending methane into the atmosphere? Second, can we capture the methane and use it for energy?

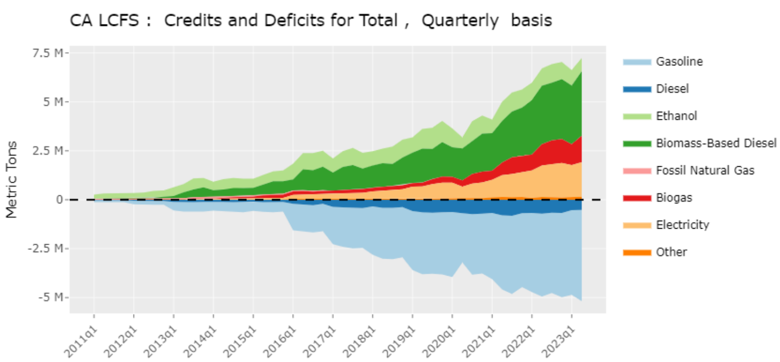
California has answered yes to both questions. On the first question, it aims to reduce methane emissions from livestock manure by 40% below 2013 levels by 2030 (codified in SB 1383). One way to achieve this goal would be to place the burden on farmers by charging them a methane emissions fee or requiring them to use practices or technologies that reduce methane emissions. This approach would raise the cost of producing milk and therefore increase the price consumers pay for dairy products. The cost increase may cause some farmers to move out of state, taking their methane emissions with them. This response, known as leakage, arises in many environmental policies, including in California's cap and trade program, as explained by Meredith in this blog.

California has chosen a different path. It has shoehorned dairy methane into a transportation program: the low carbon fuel standard (LCFS). This structure avoids leakage, but it makes consumers and producers of gasoline and diesel pay for reductions in dairy manure emissions.

Manure in the LCFS

To capture methane from manure lagoons, farmers install anaerobic digesters, which are essentially giant covers that seal manure in the lagoon to keep oxygen out while microbes feed on the contents. The captured methane — known as biogas — is then cleaned and injected into a natural gas pipeline, from which it has multiple uses including fueling a natural-gas powered vehicle and generating electricity.

This dairy biogas earns LCFS credits because it is considered a low carbon fuel. The LCFS sets a target for the average carbon intensity of transportation fuels consumed in the state. Fuels that are more carbon intensive than the target accrue deficits that must be balanced by credits earned by fuels that are less carbon intensive. The figure below shows that gasoline and diesel producers generate deficits, which they can offset by buying credits from producers of biogas and other lower-GHG fuels like electricity and renewable diesel.



Source: Our LCFS Data App. Click to view and download data using your web browser.

In the most recent LCFS data, dairy biogas contributed almost 20% of the credits in the LCFS program, yet it provided less than 1% of energy used for transportation. Dairy biogas has an outsized impact in the LCFS because it is treated very differently than most fuels. Last month's proposed LCFS amendments indicate that this differential treatment will continue.

The LCFS Assigns Dairy Biogas a Large Negative Carbon Intensity

Carbon intensity is the number of grams of carbon dioxide emissions produced per megajoule of energy. The California Air Resources Board (CARB) calculates this number for each fuel source using a life cycle analysis that accounts for tailpipe emissions as well as potential emissions throughout the fuel production process. For example, petroleum gasoline has a carbon intensity of 100.82 and an electric car powered by solar-generated electricity has a carbon intensity of zero. Most other fuels have carbon intensities between zero and 100.

The carbon intensity of dairy biogas ranges between -102.79 and -790.41 depending on characteristics of the digester. The current average carbon intensity for dairy biogas is -269.

CARB assigns dairy biogas a negative carbon intensity because it gives credit for preventing methane emissions that would otherwise have occurred. Their argument is that, if a farmer had not installed a digester on a manure lagoon, then it would have sent methane into the atmosphere.

Microbes produce different amounts of gas inside a digester than they would in an open lagoon because of differing environmental factors such as oxygen exposure and temperature. The carbon intensity number is determined by the estimated emissions from the open lagoon (avoided methane) per unit of biogas produced. For example, in highly productive digesters, the amount of prevented methane is low as a proportion of the biogas produced, so such a digester would get a relatively small negative carbon intensity.

In the LCFS, fuels with a negative carbon intensity are very helpful in meeting the policy target because they can offset a lot of high-carbon fuel. For example, adding one average biogas-powered vehicle to the fleet would produce enough LCFS credits to cover the deficits incurred by 26 similar gasoline-powered vehicles.

This accounting scheme is one reason why dairy biogas has increased from almost non-existent five years ago to half of all natural gas used for transportation in the state. The other half is contributed by biogas captured from landfills. However, landfill gas gets a carbon intensity of 53 because it does not get credit for avoided-methane emissions. So, even though its fuel volumes are similar to dairy, it generates only a fraction of the credits, as shown in the figure below. Biogas can also earn LCFS credits by generating hydrogen or electricity for use in transportation, but these pathways have been used very little so far.

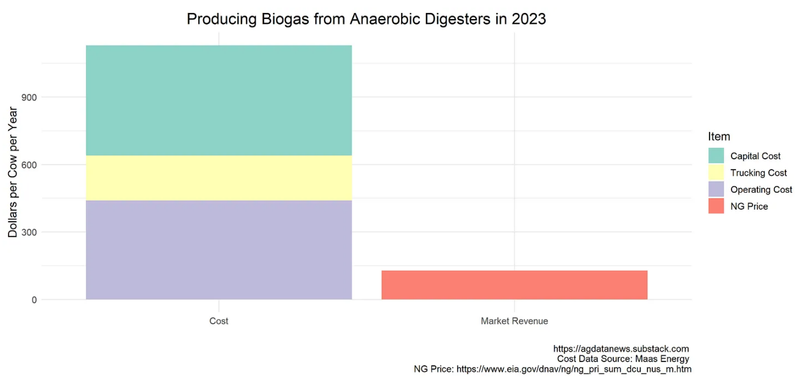
Costs and Benefits of Anaerobic Digesters

In this 2023 blog, I showed that the cost of an anaerobic digester is about 10 times the market value of the gas it produces. A representative new digester costs about about $1130 per milking cow per year, comprising $490 in capital costs and $440 in operating costs, plus $200 in trucking costs if unable to connect directly to a gas pipeline. In 2023, revenue from selling gas was about $128, for a net cost of about $1000 per milking cow per year. This representative digester has a carbon intensity of -355, which corresponds to about 6 metric tons of CO2 equivalent emissions per milking cow per year.

So, for $1000 we reduce CO2 emissions by 6 metric tons, or $167 per ton.

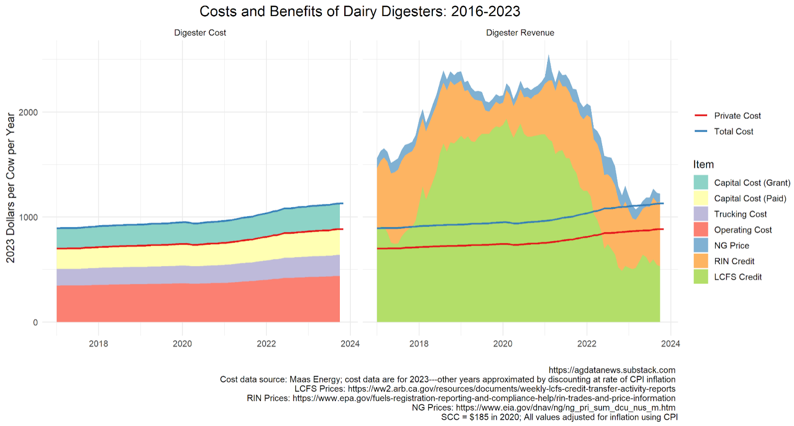
Methane is a far more powerful greenhouse gas than CO2, but it doesn't last nearly as long in the atmosphere. There is a vigorous scientific debate over how best to convert methane emissions into CO2 equivalent accounting for both how much it warms and when. Using an alternative approach would reduce the estimated emissions reduction by a factor of three and therefore raise the cost per ton by a factor of three. Moreover, all these numbers assume that CARB correctly estimates the amount of prevented emissions.



Incentives Facing Farmers

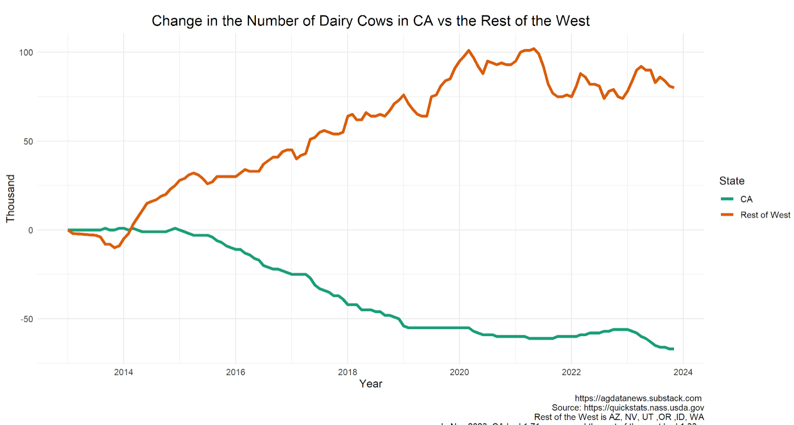
Anaerobic digesters receive government support through three programs. First, using proceeds from the state's cap and trade program, the California Department of Food and Agriculture offers grants to cover up to half the capital costs of building digesters. Second, sellers of dairy biogas generate credits in the federal renewable fuel standard (known as RINs). Third, they earn LCFS credits.

Between mid 2018 and the end of 2021, revenues from selling biogas and the associated RIN and LCFS credits were approximately double the cost of installing and running a typical digester, as shown in the figure below. LCFS credit prices have declined in the last two years, making the typical digester closer to a break even proposition. If and when credit prices go back up, then the profits will return.



High profits from operating digesters create the incentive for farmers to expand dairy herds for the purpose of generating manure rather than for producing milk. Between 2014 and 2019, California dairy cow numbers declined by 50,000 while the number of cows in other western states increased by 100,000 (see figure below). Since 2019, cow numbers have been relatively flat throughout the west.

It is possible that the advent of digesters in California stemmed the flow of cows out of the state. Dairy farmers outside California can access only two of the three digester programs accessible to California farmers. They are eligible to earn LCFS and RIN credits for their biogas, but they cannot receive California Department of Food and Agriculture grants to cover capital costs. Whether this grant funding is the difference between leaving and staying in California is an important topic for further research given the potential for emissions leakage if the state were to remove negative crediting but still require farmers to reduce manure methane emissions as per SB 1383.



What Next?

CARB is proposing several amendments to the LCFS. It considered removing the negative crediting of dairy biogas projects, but its proposal (which is currently out for comment) opted to continue negative credits until 2040 for biogas used directly in transportation and until 2045 for biogas used to produce hydrogen for transportation.

There is a long tradition in agriculture of governments paying farmers for environmental improvement, rather than placing the burden on farmers to make those improvements. As a result, consumers do not see the full cost to society of the food they eat. Instead, those costs are shifted to taxpayers or, in the case of dairy biogas, gasoline and diesel consumers. Such mispricing can cause costly misallocations of resources, as articulated often on this blog.

Leakage is the main argument given for continuing negative crediting. There are several ways to mitigate leakage. Some, such as border adjustments (tax dairy products coming into California) would be very difficult to operationalize. A good rule in policy is to directly target the problem you are trying to solve. In this case, the problem would be methane-mitigation costs imposed on farmers that cause them to move out of state. Negative crediting in the LCFS is a convoluted solution with numerous drawbacks. A direct solution could involve the state sharing the costs of methane mitigation practices, which they already do to some extent through California Department of Food and Agriculture programs.

I made the last three figures using this R code. This article is cross posted at the Energy Institute blog.

Briefing Paper

FACTORY FARM DAIRIES, BIOGAS, AND THE DANGEROUS PATH CALIFORNIA IS ON

I. INTRODUCTION

Industrial dairies in the San Joaquin Valley, packing thousands, and sometimes tens of thousands of cows into a single facility, are a major source of local air and water pollution, nuisance odor, groundwater overdraft, and greenhouse gas emissions. Over the last decade, California has created a regulatory landscape that pays this industry to continue these polluting practices while producing factory farm gas, otherwise known as dairy biogas. These policies favor large-scale industrial dairies over smaller operations and lock in the most environmentally harmful industry practices that disproportionately harm low-income communities of color. And these policies actually *encourage dairies to create* methane and only *appear* to succeed in achieving massive greenhouse gas emissions reductions as a result of an overly narrow life cycle analysis for the fuel's "well-to-wheel" climate impacts. The good news is that California can, and must, choose another path – one that aligns with our climate and environmental health and equity objectives.

II. BACKGROUND – THE EVOLUTION OF MASSIVE DAIRIES IN THE SAN JOAQUIN VALLEY DESPITE KNOWN CLIMATE AND ENVIRONMENTAL IMPACTS WAS A POLICY CHOICE

The expansion and concentration of the California dairy industry over the last several decades has occurred with policymakers' knowledge of the industry's climate and community impacts. The California dairy sector in the 1950s milked about 800,000 cows on almost twenty thousand pasture-based farms. California land use and environmental policy allowed for the dairy industry to transition into gigantic, full confinement, industrial-style operations that liquefy and manage manure anaerobically in gigantic so-called lagoons. Now, the industry milks between 1.7 and 1.8 million cows on about 1,100 farms – the vast majority of which, and the largest of which are in the San Joaquin Valley.[1]

This shift to massive dairies concentrated in the San Joaquin Valley was a policy choice and business choice – it was neither accidental nor inevitable.

1 https://www.dairycares.com/post/keeping-cows-in-california-is-good-for-people-and-planet.

In the late 1990s, water quality regulators drove the relocation of the southern California dairy herd from the Chino Basin in San Bernardino County to the San Joaquin Valley when groundwater pollution from manure affected water quality. Rising housing costs in the Inland Empire produced a windfall for those dairies as they sold their land to developers and raced toward cheaper land – and fewer regulations – in the San Joaquin Valley. San Joaquin Valley counties welcomed those Chino-based dairy operators with open arms and authorized hundreds of new dairies and dairy expansions as the California dairy industry increased in size dramatically to over 1.8 million in 2008.[2] By 2008, there were about 1,900 dairy farms in California not only producing milk, but massive amounts of manure. For context, a 2,000 cow industrial dairy produces approximately the same amount of fecal waste as a city of one million people.[3] Many of the factory farms in the San Joaquin Valley are 3 to 5 times that size. Local county governments in the San Joaquin Valley supported this expansion as modern dairy operations overwhelmingly opted for liquefied manure management despite the known climate impacts from methane and known risks of groundwater contamination.[4] Local governments and the dairy operators themselves *knew* that the liquefied manure model of dairy production relied on an externalization of climate and adverse local pollution impacts, and adopted statements of overriding considerations to approve those projects despite "significant and unavoidable impacts" as allowed by the California Environmental Quality Act (CEQA). Several counties adopted land use policies that facilitated dairy citing and expansion while others allowed (and are continuing to allow) dairy expansions without requiring CEQA environmental review.

III. MASSIVE DAIRIES HAVE SIGNIFICANT AND HARMFUL ENVIRONMENTAL IMPACTS

A. Industrial Dairies Contribute to Dangerous Air Pollution

Dairies emit large amounts of volatile organic compounds (VOC), ammonia, nitrogen oxides (NOx), and dust which all contribute to extremely poor air quality in the San Joaquin Valley, a region out of compliance with state and federal air quality standards.

- VOCs are a precursor to ozone formation. The San Joaquin Valley has been designated as Extreme Nonattainment for EPA's 2008 8-hour ozone standard and 2012 8-hour ozone standard.[5] The San Joaquin Valley is also Severe Nonattainment for the state one hour ozone standard.[6] Dairies are the largest source of VOCs in the Valley.

5 *Ambient Air Quality Standards and Valley Attainment Status*. Accessed January 9, 2022. Available at: https://www.valleyair.org/aqinfo/attainment.htm.

6 *Id.*

- Dairies also emit significant amounts of ammonia, a PM2.5 precursor. Recent research estimates that 1,690 people die in California annually as a result of agricultural ammonia emissions because ammonia and NOx create ammonium nitrate, the most prevalent form of PM2.5 in the San Joaquin Valley. The Valley is Serious Nonattainment for the Federal 1997 annual, the 2006 24-hour, and the 2012 annual PM2.5 standards.[7] Dairies are the largest source of ammonia in the Valley.

- Dairies also emit large amounts of NOx from manure application on crop land, which contributes to increasing the ozone concentration and PM2.5.

Both Ozone and PM2.5 result in serious and long lasting health impacts. Ozone can trigger chest pain, coughing, throat irritation, congestion, worsen bronchitis, emphysema, and asthma. Ozone also can reduce lung function and inflame the lining of the lungs. PM2.5 can cause eye, nose, throat and lung irritation, coughing, sneezing, runny nose and shortness of breath. Both ozone and PM2.5 exposures are correlated to increases in hospitalization, emergency room visits, and premature death from cardiovascular and respiratory disease.

In addition to PM2.5 and Ozone, dairies cause significant odors. Many Californians glimpse the impacts when they drive through the San Joaquin Valley, catch a whiff of manure odors, and roll up the windows. However, for residents who live near these facilities, there is no driving away from these extreme odors. Even going inside their homes does not always provide respite. Residents report odors following them indoors, permeating their clothes, and causing headaches.

B. Industrial Dairies Degrade Water Quality

With the average dairy cow producing approximately 148 pounds of manure each day,[8] California dairies contribute tens of millions of tons of manure each year. Untreated manure cannot be applied to crops for human consumption so there is limited acreage upon which manure may be applied. And there simply isn't enough. **Nitrate from manure leaches into groundwater and pollutes drinking water supplies**. Manure from lagoons, corrals, and, above all, applied to land leads to nitrate contamination.

The dairy industry's own report on nitrate pollution revealed the breadth and degree of groundwater contamination from dairies. The Central Valley Summary Representative Monitoring Report was prepared by the Central Valley Dairy Representative Monitoring Program, a nonprofit association of dairy owners and operators. It presents years of monitoring data from forty-two Central Valley dairies chosen to be representative of the industry in the region. Some findings of note:

- **Elevated nitrate-N (i.e., as nitrogen) concentrations were present beneath all monitored dairies.**[9]
- "…approximately 94 percent of nitrogen loading on dairies (that is, the portion of
- nitrogen that enters the soil and is not recovered by plants) occurs on cropland." [10]
- Dairies produce an "excess supply of nitrogen" in the form of manure than the amount that can be safely applied to cropland without causing or contributing to nitrate pollution.[11]

Larger, more concentrated herds mean more manure concentrated on the same or smaller land, thus exacerbating the issue of greater quantities of manure than cropland can absorb. A recent proposed dairy expansion in Merced notes that increased herd sizes (from under 3,000 to 7,300 cows) indicated in their environmental documents that manure exports would jump from about 9,000 tons to 49,000 tons annually. **No information was provided as to where that manure would be exported. Presumably, because there is nowhere for it to go.**

Nitrates in drinking water cause blue baby syndrome and have been linked to cancer. [12] The cost to treat drinking water – if treatment is even available – can make water bills unaffordable for many households and can be cost prohibitive for private well owners.

C. Industrial Dairies Are Water Hogs

The San Joaquin Valley is ground zero for critical groundwater overdraft and water scarcity.[13] Thousands of private and community water wells, upon which many Californians rely for drinking water, have already run dry.[14] Overdraft also impacts water quality. As groundwater supply decreases, concentrations of contaminants, especially arsenic, increase.[15]

Industrial dairies use massive amounts of water including groundwater in the extremely fragile San Joaquin Valley ecosystem. In addition to supplying large amounts of drinking water to cows, dairies need large amounts of water for liquefying and flushing manure and other pollutants for storage in lagoons, cooling animals, cleaning facilities, and irrigating crops. In addition, dairies rely upon water-intensive crops to feed dairy cows such as alfalfa. California's large dairies use an estimated 142 million gallons per day,[16] or almost 52 billion gallons per year.

D. Industrial Dairies Cause Dispoportionate Environmental Impacts

San Joaquin Valley residents are disproportionately Latino/a/e as compared to California as a whole. Seven central and southern San Joaquin Valley Counties (Kern to Stanislaus) have higher Latino/a/e populations than the state, with populations ranging from almost 50 percent to over 66 percent, as compared to the state population with 40 percent of residents classified as Latino/a/e. At least seven of eight San Joaquin Valley counties have a lower proportion of white residents as compared to the state as a whole.[17] **Therefore, policies that entrench and exacerbate air and water pollution in these regions have a racially disparate impact on Latino/a/e communities.**

Similarly, San Joaquin Valley counties are lower income and have more residents facing economic insecurity than the state as a whole. While median household income in California is approximately $84,000 countywide household median incomes in the central and southern San Joaquin Valley Counties range from approximately $57,000 to $68,000 The highest producing dairy counties in the state and in the San Joaquin Valley, Merced and Tulare, show median household incomes at $59,000 and $57,000 , 70% or less of statewide median income. Poverty rates hover around 22% and 19% in Merced and Tulare, respectively.

IV. FACTORY FARM GAS – AN INADEQUATE CLIMATE SOLUTION AND A HARM-INDUCING STRATEGY

A. Industrial Livestock Operations Contribute Significant Greenhouse Gas Emissions to the Atmosphere

In addition to local and regional air and water pollution, dairies are a substantial source of California's greenhouse gas emissions. **Livestock methane emissions account for 6.1 percent of statewide GHG emissions.**[18]

---

16 Big Ag, Big Oil and California's Big Water Problem, Food and Water Watch. Available at: https://www.foodandwaterwatch.org/wp-content/uploads/2021/10/CA-Water-White-Paper.pdf.

17 According to recent census data, 36.5 percent of the state population is classified as white, non-Latino, while 7 of the 8 counties in the San Joaquin Valley have white, non-Latino populations that range from only 26.5 to 33.2 percent. *Id.*

18 California Greenhouse Gas Emissions for 2000-2020, October 26. 2022, Page 9. Available at: https://ww2.arb.ca.gov/sites/default/files/classic/cc/inventory/2000-2020_ghg_inventory_trends.pdf.

Liquid manure-filled lagoons produce a significant amount, although not all, of livestock methane emissions. About half of a typical large dairy's methane emissions come from the cow's digestion processes (called enteric emissions). The industry's intentional decision to store manure in lagoons and subsequently apply wet manure to land is the direct cause of methane and nitrous oxide emissions from manure. Livestock operations remain free from regulation for greenhouse gas emissions despite their significant impact.

B. Dairy Digesters Do Not Adequately Address Climate and Other Pollutants from Livestock Operations and Perpetuate Dependence on Polluting Fuels

Dairy digesters purport to address methane emissions from massive amounts of liquefied manure stored anaerobically in lagoons. Digesters basically cover the intentionally-created manure pits, capture the various gasses, and deliver the gas to facilities that combust the fuel onsite or scrub out impurities leaving methane gas for off site combustion. Digesters do not do anything to address the roughly equal amount of GHG emissions from enteric fermentation (intestinal gasses) or from the composting and application of digested manure to land. The captured methane gas can be combusted onsite, used as a transportation fuel, combusted as a fuel, converted through steam reformation to produce hydrogen, or upgraded and injected into gas pipelines for transportation fuel, gas in buildings, generating electricity, and other uses. Some dairies have stand-alone digesters and some dairies participate in a factory farm gas cluster. A factory farm gas cluster connects several dairies and dairy digesters with an upgrading facility so that the gas from many dairies can be processed at one site and then injected into the gas pipeline. This "pipeline quality" gas, marketed as clean yet molecularly almost identical to conventional fossil gas, is subsidized by ratepayers and used to justify the continued operation of gas pipelines that otherwise should be phased out.

Digesters do not do anything to decrease overall air pollution or groundwater pollution from dairies.

C. The Relevant Regulatory History Has Exacerbated the Impacts from Industrial Livestock Operations

The Global Warming Solutions Act of 2006 (AB 32 [Nunez]) tasked CARB with developing a plan to reduce GHG emissions generally and in 2013, Senate Bill 605 (Lara) required CARB to develop a plan to reduce emissions of Short-Lived Climate Pollutants, including methane. In 2016, the legislature passed both SB 32 (Pavley) which built upon AB 32's GHG reduction mandates, and SB 1383 (Lara), which focused on methane and other short-lived climate pollutants. SB 1383 set methane emission targets and required CARB to develop and begin implementing a strategy to meet those targets. The bill specifically included a target for methane emission reductions from livestock manure and created both insulation from direct regulation of livestock methane and policies and incentives designed to increase production of factory farm gas. Notably, SB 1383 prohibited direct regulation of methane emissions from livestock manure until 2024 and required CARB to make significant findings of economic feasibility prior to instituting regulations and even further limited the state's authority to regulate enteric emissions.

Furthermore, it required CARB and the CPUC to develop financial mechanisms and incentives to support the production of dairy-produced energy.[19] In so doing, California transitioned from allowing the dairy industry to expand and emit more unabated methane regardless of its impact to rewarding the industry for its polluting practices and incentivizing the creation of even more liquefied manure at ever larger dairies. Protection from regulation coupled with increased subsidies and incentives illustrate the preferential treatment the dairy industry has been granted compared to other polluting sectors.[20]

In 2018, CARB updated the Low Carbon Fuel Standard (LCFS) program to incorporate "avoided methane" into the calculation of carbon intensity scores. The result: factory farm gas became the most carbon negative fuel in the LCFS market, and thus, the most valuable. The LCFS also allows dairies that are already being paid with public funds to reduce methane with dairy digesters to double-dip by claiming the LCFS incentive was the reason for the reductions, blatantly evading the AB 32 prohibition on "non-additional" reductions from being sold into market-based mechanisms.

D. Factory Farm Gas Production and Deployment is Significantly Subsidized and Therefore Highly Profitable for Large Dairies

The current regulatory landscape provides significant subsidies to dairies to install digesters and produce factory farm gas. This funding includes CDFA's DDRDP, CPUC ratepayer funding, CEC's PIER, EPIC, and Clean Transportation funding, and CARB's Aliso Canyon Mitigation Funding. To date just these direct cash subsidies total close to $700 million with the majority of this funding coming from legislative appropriations to the Dairy Digester and Research Development Program (DDRDP) and utility rate-payers. The Legislature, through annual appropriations from the Greenhouse Gas Reduction Fund and General Fund, has allocated over $200 million to the DDRDP and the CPUC has directed almost $400 million of rate–payer funds to support development and operations of dairy digesters and related infrastructure.

In addition to these direct subsidies along with credit sales available through California's Cap-and-Trade offset program, the Low Carbon Fuel Standard (LCFS) creates a lucrative credit market for industrial dairies that install digesters. CARB designed a life cycle analysis that excludes upstream and downstream greenhouse gas emissions and **treats liquified manure lagoons (and the methane they create) not as an intentionally chosen cost-cutting measure but as a necessary, inevitable part of operating a dairy, which it plainly is not.**

---

19 See "Veto Request – Senate Bill 1383 (Lara) – Dairy Industry Exemptions from short-lived climate pollutants: methane emissions" (September 13, 2016) https://drive.google.com/file/d/1OhQ4bpGX6eNEhgC64Mneel2jpH6Ja5xl/view?usp=sharing

20 The legislative hearing for Senate Bill 1383 sheds light on the unprecedented benefits the Legislature provided the dairy industry, provoking a lobbyist for the oil industry to warn that it would return to the Legislature for its version of special treatment. See Assembly Natural Resources Committee, Hearing on Senate Bill 1383, available at http://calchannel.granicus.com/MediaPlayer.php?view_id=23&clip_id=4009 (beginning at hour 1:12) (last visited October 24, 2022).

As noted earlier, CARB has determined that methane captured through the production of gas magically makes biomethane carbon negative, and thus generates far more credits for sale in the LCFS credit market than if CARB had treated it like every other fuel. The result has been a deluge of credits which creates a massive windfall for industrial dairies and factory farm gas producers.

The dairy industry is very aware of the monumental investment California made to support the production of factory farm gas and the lucrative LCFS credit market for gas. In fact, the dairy industry itself anticipates a future where "milk has become the by-product of manure production." [21]

Studies project that larger dairies can enjoy a third to a half of their revenue from LCFS credit revenues,[22] begging the question - what's worth more, a cow's milk or its poop?[23] And the necessary follow-up: if we're even asking these questions, what perverse incentives have we created and to what consequences will they lead?

E. The Resulting Profit Incentive Favors and Entrenches Harmful Practices and Drives Industrial Dairy Expansions

The narrative echoed by the dairy industry and those that profit from buying and selling LCFS credits treats the methane pollution as some kind of inevitable consequence, a natural by-product of dairy production that demands a solution. This narrative entirely ignores the fact that the liquefied manure and the associated massive methane problem was the path that state and local governments and dairy operators themselves chose to follow despite knowing the environmental degradation those decisions would create. And now the state's solution to our methane disaster has itself reinforced harmful manure management and industrial-scale dairy practices that entrench and intensify air and water pollution. Data show that all of these incentives have contributed to an intensification of dairy expansions as dairy operators and those profiting from the LCFS respond to the market demand for manure-based fuels and the lucrative credit markets by expanding dairy operations to produce more manure.

Merced County provides an apt example of the effect this regulatory landscape has on expanding industrial dairy operations. For instance, the Merced Planning Department posts recently prepared environmental documents on the Merced County website.Based solely on the information on this website, Merced County has permitted, or is in the process of permitting, two biogas pipeline and infrastructure projects, ten dairy expansions, and one new 28,000 cow dairy.[24]

24 See Environmental Documents, available at https://www.countyofmerced.com/414/Environmental-Documents (last visited December 19, 2022).

The biogas cluster and pipeline projects facilitate dairy expansions to monetize and incentivize increased dairy herds and manure generation. The total additional number of dairy cows (milk cows and support stock) from the above-listed projects is 46,148 cows. It's important to note that several counties do not require environmental review for dairy expansions. In those counties, it is much harder – if not impossible – to assess the extent to which dairies have grown and/or consolidated.

Both the historical expansion of the California Dairy industry and the more recent perverse effects of the LCFS that drive herd expansions show how local land use and Senate Bill 1383 have encouraged both dairy industry expansion and dramatic increases in methane pollution. And instead of requiring the industry to limit its pollution, the Legislature rewarded the reckless expansion by paying operators to profit from the methane emissions they chose to create in the first place. As one study on the impacts of the LCFS notes, "in this instance the largest polluter is the one receiving a large subsidy." [25]

F. Factory Farm Gas Production Itself Exacerbates Existing Environmental Impacts from Industrial Dairies

Factory farm gas production requires liquified manure lagoons, a profit-maximizing practice that exacerbates water pollution and as discussed throughout this briefing paper, subsidies for factory farm gas incentivize the growth of herds and concentration of animals, which results in increased air and water pollution. Additionally, the very production and use of factory farm gas creates pollution of its own.

Anaerobic digesters increase ammonia emissions, which in turn react with oxides of nitrogen (NOx) to form ammonium nitrate, which significantly contributes to fine particulate matter (PM2.5) pollution.[26] One study found that use of an anaerobic digester increased ammonia emissions from manure as a result of changes in the composition of digested, as compared to undigested, manure. [27]

Combusting factory farm gas on-site, including digester engines powering turbines to generate LCFS credits for electric vehicle fuel, emit significant and unabated additional NOx, PM2.5, and volatile organic compound (VOC) emissions in the air basin. Combined, both effects exacerbate the PM2.5 pollution crisis in the San Joaquin Valley. When upgraded to be used in place of fossil natural gas, it produces all the same emissions when combusted, whether as transportation fuel or used in buildings.

26 Michael A. Holly et al., Greenhouse gas and ammonia emissions from digested and separated dairy manure during storage and after land application Agriculture, 239 ECOSYSTEMS AND ENV'T 410, 418 (Feb. 15, 2017), https://doi.org/10.1016/j.agee.2017.02.007.

27 See Michael A. Holly et al., Greenhouse gas and ammonia emissions from digested and separated dairy manure during storage and after land application Agriculture, Ecosystems & Environment (2017).

Moreover, factory farm gas production relies upon methane digesters, which require "abundant water resources, with a ratio equal to 1:1 of the amount of water and manure to be loaded into the digester,"[28] to pump and dilute manure. In arid climates it may be necessary to pump groundwater for this purpose.[29]

G. Factory Farm Gas Credits Facilitate Ongoing Pollution from Fossil Fuel Production and Combustion

As described above, transportation fuels derived from dairy and swine manure receive LCFS credits and the amount of those credits entering the market has been drastically inflated as a result of improper negative carbon intensity values and non-additional credits. In 2021, these fuels represented approximately 10 percent of all credits sold.[30] Because the LCFS authorizes fuel producers to purchase credits to meet the LCFS market-based compliance mechanism's emission limits, the excessive and illegitimate credits generated by factory farm gas producers allow fossil fuel producers – oil companies – to refine and sell more of their fossil fuels. While communities in the San Joaquin Valley suffer the air, water, and nuisance pollution from factory farm gas fuel production, communities near refineries and near major transportation corridors endure racially disparate impacts from the production and combustion of fossil fuels benefitting from those credits. For example, Black Californians experience twice the PM2.5 burden of white Californians from Cap and Trade facilities, while "Black Californians experience PM2.5 concentrations from refineries that are three times greater than all other stationary source sectors combined that are covered by the Cap-and-Trade Program."[31] Further, "African American, Latino, and Asian Californians are exposed to more PM2.5 pollution from cars, trucks, and buses than white Californians. These groups are exposed to PM2.5 pollution 43, 39, and 21 percent higher, respectively, than white Californians." Additionally, "[T]he lowest-income households in the state live where PM2.5 pollution is 10 percent higher than the state average, while those with the highest incomes live where PM2.5 pollution is 13 percent below the state average."[32]

In other words, as a result of CARB's factory farm gas policies, communities on both sides of the LCFS credit transaction subsidize polluters with compromised health and well-being.

V. CHANGING COURSE: CREATING A NEW PATH FORWARD

We have the opportunity and need to reshape the regulatory framework for livestock methane and factory farm gas to effectively reduce greenhouse gas emissions from industrial livestock operations while cutting off profit motives for concentrating livestock and manure which intensify climate impacts, exacerbate environmental degradation, and perpetuate dumping on San Joaquin Valley communities. We lay out three approaches below for rectifying existing deficiencies: correcting inadequacies in the Low Carbon Fuel Standard program, regulating livestock methane emissions, and excluding factory farm gas from inclusion in our clean energy portfolio.

A. Fix the Low Carbon Fuel Standard Program

The legislature should step in to ensure an updating to the LCFS and other programs to account for full lifecycle emissions, prohibit claiming of non-additional reductions, prevent harm to lower income communities and communities of color, and eliminate windfall profits due to lack of regulation.

Although a number of regulatory actions are responsible for driving these troubling trends in California's dairy industry, the LCFS is currently the most directly responsible for incentivizing herd concentration and polluting manure management practices. CARB is preparing to open a rulemaking to update the LCFS yet,to date there has been no commitment to address the issues raised above. Although CARB staff have not released an official scope for the rulemaking, in a recent workshop CARB proposed continuing to issue the massively inflated credits until at least 2040.[33] Additionally, CARB has indicated that they will rely on the LCFS to ensure the ongoing profitability and viability of biomethane to facilitate its transition into industrial energy markets when its purported use as transportation fuels gives way to our electric vehicle future.

Given the urgency of the issue and CARB's demonstrated unwillingness to address the consequences of its failing regulatory approach, the Legislature is well-positioned to provide much-needed direction to CARB to ensure the program is in line with California's commitments to addressing GHG emissions and environmental injustice.

B. Eliminate Factory Farm Gas from Definitions of Renewable Energy

As brought to the forefront during hearings on SB 1020 last year, resources eligible to meet the requirements of the Renewable Portfolio Standard (RPS) and SB 100 (RPS plus zero carbon resources) include "digester gas" which includes factory farm gas.

---

33 See presentation for CARB Low Carbon Fuel Standard Workshop November 9, 2022. Available at https://ww2.arb.ca.gov/sites/default/files/2022-11/LCFSPresentation.pdf.

The definition of factory farm gas as “renewable” supports its inclusion in existing climate programs, such as the LCFS[34] and emerging energy technologies, such as hydrogen[35] and opens up or expands markets and subsidies for the dirty fuel. By eliminating factory farm gas from the definition of renewable energy, California can ensure current and future efforts to transition California’s energy and transportation systems are real environmental justice solutions and not a polluting cash cow. Cleaning up our energy sector is challenging enough already without false solutions muddying the water.

C. Regulate Livestock Greenhouse Gas Emissions

As stated above, SB 1383 permits CARB to directly regulate livestock methane emissions starting in 2024 but provides CARB discretion and several off-ramps that provide ready justifications for CARB to continue the failing LCFS-centered strategy, including using the LCFS to subsidize factory farm gas for to support its growth in industrial sectors. The Legislature must direct CARB to adopt mandatory regulations and acknowledge the last-minute dairy methane provisions in Senate Bill 1383 were an unprecedented and ill-advised industry giveaway. California must treat the dairy industry like every other major source of greenhouse gas emissions. We cannot continue to treat the most climate-impacting practices as inevitable and force the public to pay polluters to stop polluting thereby rewarding the biggest and worst polluters.

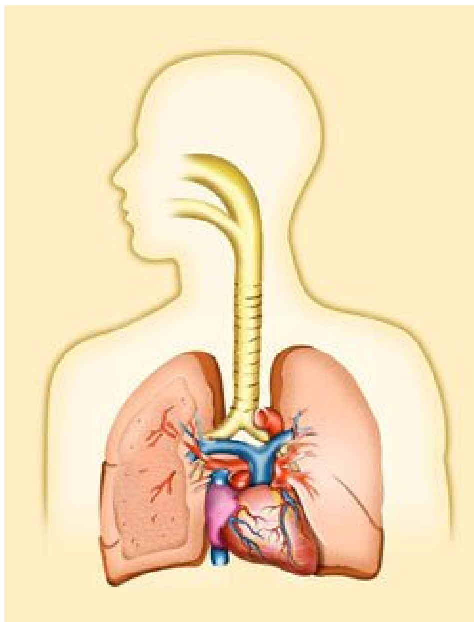
ATTACHMENT F

Health Effects of Ozone Pollution

Ozone in the air we breathe can harm our health, especially on hot sunny days when ozone can reach unhealthy levels. Even relatively low levels of ozone can cause health effects.



Ozone is a powerful oxidant that can irritate the airways.

For Healthcare Providers

Ozone and Your Patients' Health: Training for Healthcare Providers <https://epa.gov/ozone-pollution-and-your-patients-health>

Who is at risk?

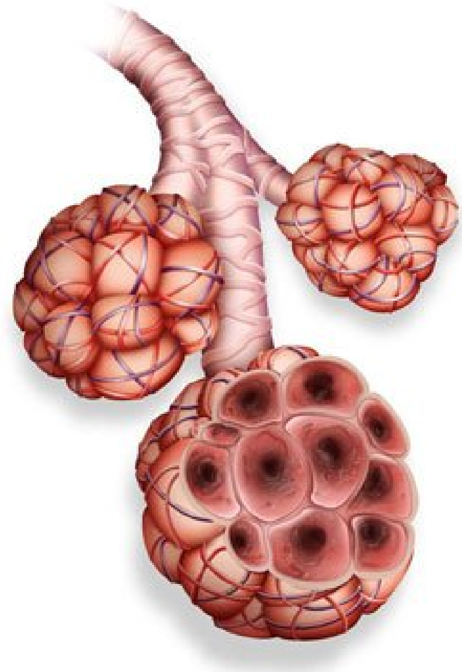
People most at risk from breathing air containing ozone include people with asthma, children, older adults, and people who are active outdoors, especially outdoor workers. In addition, people with certain genetic characteristics, and people with reduced intake of certain nutrients, such as vitamins C and E, are at greater risk from ozone exposure.

Children are at greatest risk from exposure to ozone because their lungs are still developing and they are more likely to be active outdoors when ozone levels are high, which increases their exposure. Children are also more likely than adults to have asthma.

What health problems can ozone cause?

Depending on the level of exposure, ozone can:

- Cause coughing and sore or scratchy throat.
- Make it more difficult to breathe deeply and vigorously and cause pain when taking a deep breath.
- Inflame and damage the airways.
- Make the lungs more susceptible to infection.
- Aggravate lung diseases such as asthma, emphysema, and chronic bronchitis.
- Increase the frequency of asthma attacks.



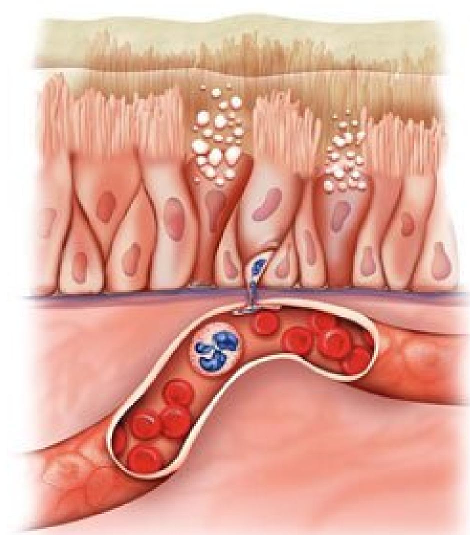
Ozone can cause the muscles in the airways to constrict, trapping air in the alveoli. This leads to wheezing and shortness of breath.

Some of these effects have been found even in healthy people, but effects can be more serious in people with lung diseases such as asthma. They may lead to increased school absences, medication use, visits to doctors and emergency rooms, and hospital admissions.

Long-term exposure to ozone is linked to aggravation of asthma, and is likely to be one of many causes of asthma development. Studies in locations with elevated concentrations also report associations of ozone with deaths from respiratory causes.

How can I reduce these health risks?

The AirNow Web site <http://www.airnow.gov/> provides daily air quality reports for many areas. These reports use the Air Quality Index (or AQI) to tell you how clean or polluted the air is.



With inflammation, the airway lining is damaged. It has been compared to the skin inflammation caused by sunburn.

EnviroFlash, a free service, can alert you via email when your local air quality is a concern. Sign up at www.enviroflash.info <http://www.enviroflash.info/>.

ENVIRONMENTAL PROTECTION AGENCY

40 CFR Part 52

[EPA–R09–OAR–2021–0884; FRL–9292–03–R9]

Clean Air Plans; 2012 Fine Particulate Matter Serious Nonattainment Area Requirements; San Joaquin Valley, California

AGENCY: Environmental Protection Agency (EPA).

ACTION: Proposed rule.

SUMMARY: On December 29, 2021, the Environmental Protection Agency (EPA or ''Agency'') published a proposed rule to approve the State of California's Serious area plan for the San Joaquin Valley (SJV) for the 2012 annual fine particulate matter ($PM_{2.5}$) national ambient air quality standards (NAAQS) for all Serious $PM_{2.5}$ area planning requirements, except for contingency measures, which the EPA proposed to disapprove. Based on adverse comments submitted on that proposed rule and as a result of a Ninth Circuit Court of Appeals decision on a related SJV $PM_{2.5}$ rulemaking for the 2006 24-hour $PM_{2.5}$ NAAQS, the EPA has reconsidered its prior proposal and now proposes to disapprove the State's plan for certain Serious area planning requirements for the 2012 annual $PM_{2.5}$ NAAQS. The nonattainment plan elements that the EPA proposes to disapprove include the plan's best available control measures (BACM) demonstration for ammonia and building heating, demonstrations of attainment and reasonable further progress, quantitative milestones, and motor vehicle emission budgets. The EPA is also proposing to disapprove the State's optional precursor demonstration for ammonia. We are not re-proposing any action on the Serious area requirements for emissions inventories nor contingency measures; our prior proposal to approve the emissions inventory element and to disapprove the contingency measure element of the nonattainment plan requirements for the 2012 annual $PM_{2.5}$ NAAQS remains unchanged. The EPA will accept comments on this new proposed rule during a 45-day public comment period and public hearing, as described in this notice.

DATES: Any comments must arrive by November 21, 2022.

Public hearings: The EPA will host two public hearings on this proposed rule. The first will take place November 2, 2022, 7:30 p.m. to 8:30 p.m. The second will take place November 3, 2022, 7:00 p.m. to 8:00 p.m. The hearings will be held to accept oral comments on this proposed rule. Immediately prior to each public hearing, and on October 28, 2022, the EPA will host public meetings on this proposed rule. For further information on the public hearings and public meetings, please see the **ADDRESSES** and **SUPPLEMENTAL INFORMATION** sections.

ADDRESSES: The November 2, 2022 public hearing will take place at Fresno City College, Old Administration Building, Room 251, 1101 E University Ave., Fresno, CA 93741. The November 3, 2022 public hearing will take place at Bakersfield College, Norman Levan Center, 1801 Panorama Drive, Bakersfield, CA 93305.

Submit your comments, identified by Docket ID No. EPA–R09–OAR–2021–0884, at *https://www.regulations.gov.* For comments submitted at *Regulations.gov*, follow the online instructions for submitting comments. Once submitted, comments cannot be edited or removed from *Regulations.gov*. The EPA may publish any comment received to its public docket. Do not submit electronically any information you consider to be Confidential Business Information (CBI) or other information whose disclosure is restricted by statute. Multimedia submissions (audio, video, etc.) must be accompanied by a written comment. The written comment is considered the official comment and should include discussion of all points you wish to make. The EPA will generally not consider comments or comment contents located outside of the primary submission (*i.e.,* on the web, cloud, or other file sharing system). For additional submission methods, please contact the person identified in the **FOR FURTHER INFORMATION CONTACT** section. For the full EPA public comment policy, information about CBI or multimedia submissions, and general guidance on making effective comments, please visit *https://www.epa.gov/dockets/commenting-epa-dockets.*

FOR FURTHER INFORMATION CONTACT: For questions regarding this proposed rule, please contact Rory Mays, Air Planning Office (AIR–2), EPA Region IX, (415) 972–3227. For questions regarding the public hearings and related public meetings, please contact Kelley Xuereb, Immediate Office (AIR–1), EPA Region IX, (415) 947–4171. Both can be reached by emailing *SJVPublicMeetings@epa.gov.*

SUPPLEMENTARY INFORMATION: In addition to the two in-person public hearings, the EPA will host three public meetings. The public meetings are an informal opportunity to speak with EPA staff about the action. We will not accept public comments during the public meetings. The first meeting will be held virtually on October 28, 2022, 12:00 p.m. to 2:00 p.m. Participants can register to attend the meeting at: *https://usepa.zoomgov.com/meeting/register/vJItc-qppzooGCZI10LqoTXf6OpNZIVbWco.*

The second will take place on November 2, 2022, 5:30 p.m. to 7:00 p.m. prior to the public hearing at Fresno City College, Old Administration Building, Room 251, 1101 E University Ave., Fresno, CA 93741. The third will take place on November 3, 2022, 5:00 p.m. to 6:30 p.m. prior to the public hearing at Bakersfield College, Norman Levan Center, 1801 Panorama Drive, Bakersfield, CA 93305. Spanish translation will be available during all three events. If you would like to submit a request for reasonable accommodation, please email *SJVPublicMeetings@epa.gov.* For additional information and updates, please visit: *https://www.epa.gov/sanjoaquinvalley.*

Throughout this document, ''we,'' ''us,'' and ''our'' refer to the EPA.

Table of Contents

I. Background for Proposed Action

The EPA discussed background, applicable State implementation plan (SIP) submissions, completeness review, and Clean Air Act (CAA or ''Act'') requirements for the SJV Serious $PM_{2.5}$

nonattainment area[1] in sections I, II, and III of our December 29, 2021 proposed rule on California's Serious area plan for the 2012 annual $PM_{2.5}$ NAAQS.[2] We refer to that proposed rule herein as the ''2021 Proposed Rule,'' briefly summarize the relevant CAA requirements and our previous proposed action with respect to those requirements here, and rely on the more detailed expositions in that proposed rule.

The EPA promulgated the primary annual $PM_{2.5}$ NAAQS of 12.0 micrograms per cubic meter (μg/m³) in 2012 (''2012 annual $PM_{2.5}$ NAAQS''),[3] designated and classified the SJV as Moderate nonattainment for this NAAQS in 2015,[4] and reclassified the SJV from Moderate to Serious nonattainment for this NAAQS in our final rule published November 26, 2021.[5] That reclassification action required California to submit a ''Serious area'' attainment plan. Such an attainment plan must include, among other things, provisions to assure that, under CAA section 189(b)(1)(B), the BACM for the control of direct $PM_{2.5}$ and $PM_{2.5}$ precursors are implemented no later than four years after reclassification of the area and a demonstration (including air quality modeling) that the plan provides for attainment of this NAAQS as expeditiously as practicable but no later than December 31, 2025. That reclassification action also triggered statutory deadlines for California to submit SIP submissions addressing the Serious area attainment plan requirements for the 2012 annual $PM_{2.5}$ NAAQS: June 27, 2023, for emissions inventories, BACM, and nonattainment new source review (NSR), and December 31, 2023, for the attainment demonstration and related planning requirements.

A. Applicable SIP Submissions, Completeness Review, and Clean Air Act Requirements

In this proposed rule, the EPA is proposing action on portions of two SIP submissions submitted by the California Air Resources Board (CARB) to address combined nonattainment plan requirements for the 1997, 2006, and 2012 $PM_{2.5}$ NAAQS in the SJV.[6] Specifically, the EPA is proposing to act only on those portions of the following two plan submissions that pertain to the Serious area requirements for the 2012 annual $PM_{2.5}$ NAAQS: (1) the ''2018 Plan for the 1997, 2006, and 2012 $PM_{2.5}$ Standards,'' adopted by the San Joaquin Valley Unified Air Pollution Control District (SJVUAPCD or District) on November 15, 2018, and by CARB on January 24, 2019 (''2018 $PM_{2.5}$ Plan''); [7] and (2) the ''San Joaquin Valley Supplement to the 2016 State Strategy for the State Implementation Plan,'' adopted by CARB on October 25, 2018 (''Valley State SIP Strategy'').

We refer to the relevant portions of these SIP submissions collectively in this proposal as the ''SJV $PM_{2.5}$ Plan'' or ''Plan.'' The SJV $PM_{2.5}$ Plan addresses attainment plan requirements for multiple $PM_{2.5}$ NAAQS in the SJV. CARB submitted the SJV $PM_{2.5}$ Plan to the EPA as a revision to the California SIP on May 10, 2019.[8] These SIP submissions became complete by operation of law on November 10, 2019.[9] In the 2021 Proposed Rule, we proposed to find that the 2018 $PM_{2.5}$ Plan and Valley State SIP Strategy each met the procedural requirements for public notice and hearing in CAA sections 110(a)(1) and (2) and 110(l) and 40 CFR 51.102.

In our 2021 Proposed Rule, we also summarized the CAA requirements applicable to Serious $PM_{2.5}$ nonattainment areas.[10] In the current proposed rule, we are proposing action with respect to the following requirements:

(1) Provisions to assure that BACM, including best available control technology (BACT), for the control of direct $PM_{2.5}$ and all $PM_{2.5}$ precursors shall be implemented no later than four years after the area is reclassified (CAA section 189(b)(1)(B)), unless the State elects to make an optional precursor demonstration that the EPA approves authorizing the State not to regulate one or more of these pollutants;

(2) A demonstration (including air quality modeling) that the plan provides for attainment as expeditiously as practicable but no later than the end of the tenth calendar year after designation as a nonattainment area (*i.e.,* December 31, 2025, for the SJV for the 2012 annual $PM_{2.5}$ NAAQS) (CAA sections 188(c)(2) and 189(b)(1)(A)(i));

(3) Plan provisions that require reasonable further progress (RFP) (CAA section 172(c)(2));

(4) Quantitative milestones that the State must meet every three years until the EPA redesignates the area to attainment and which demonstrate RFP toward attainment by the applicable date (CAA section 189(c)); and

(5) Motor vehicle emissions budgets (budgets) for 2025 (CAA section 176(c)).

We are also proposing to disapprove the State's optional precursor demonstration for ammonia.[11]

In addition, the State's Serious area plan must meet the general requirements applicable to all SIP submissions under section 110 of the CAA, including the requirement to provide necessary assurances that the implementing agencies have adequate personnel, funding, and authority under section 110(a)(2)(E); and the requirements concerning enforcement provisions in section 110(a)(2)(C).

---

[1] For a precise description of the geographic boundaries of the SJV $PM_{2.5}$ nonattainment area, see 40 CFR 81.305.

[2] 86 FR 74310 (December 29, 2021).

[3] 78 FR 3086 (January 15, 2013) and 40 CFR 50.18. Unless otherwise noted, all references to the $PM_{2.5}$ standards in this notice, including all instances of ''2012 annual $PM_{2.5}$ NAAQS,'' are to the 2012 primary annual NAAQS of 12.0 μg/m³ codified at 40 CFR 50.18.

[4] 80 FR 2206 (January 15, 2015) (codified at 40 CFR 81.305).

[5] 86 FR 67343 (November 26, 2021).

[6] In our 2021 Proposed Rule, we also proposed action on a third SIP submission dated July 19, 2019. 86 FR 74310, 74311. However, the relevant component of that submission pertained only to contingency measures, and we are not modifying our proposed action on contingency measures in this proposed rule.

[7] The 2018 $PM_{2.5}$ Plan was developed jointly by CARB and the District.

[8] Letter dated May 9, 2019, from Richard W. Corey, Executive Officer, CARB, to Mike Stoker, Regional Administrator, EPA Region IX. Previously, in separate rulemakings, the EPA has finalized action on the portions of the SJV $PM_{2.5}$ Plan that pertain to the 1997 annual $PM_{2.5}$ NAAQS, the 1997 24-hour $PM_{2.5}$ NAAQS, the 2006 24-hour $PM_{2.5}$ NAAQS, and the Moderate area plan for the 2012 annual $PM_{2.5}$ NAAQS. See 86 FR 67329 (November 26, 2021) (final rule regarding the 1997 annual $PM_{2.5}$ NAAQS); 87 FR 4503 (January 28, 2022) (final rule regarding the 1997 24-hour $PM_{2.5}$ NAAQS); 85 FR 44192 (July 22, 2020) (final rule regarding the 2006 24-hour $PM_{2.5}$ NAAQS, except contingency measures); and 86 FR 67343 (November 26, 2021) (final rule regarding the Moderate area plan for the 2012 annual $PM_{2.5}$ NAAQS and contingency measures for the 2006 24-hour $PM_{2.5}$ NAAQS).

[9] 87 FR 74310, 74311–74312. We note that, with respect to plans previously required for the 1997, 2006, and 2012 $PM_{2.5}$ NAAQS, including the Moderate area plan only for the 2012 annual $PM_{2.5}$ NAAQS, the EPA had made findings of failure to submit effective January 7, 2019, that triggered sanctions clocks. 83 FR 62720 (December 6, 2018). Following the May 10, 2019 submission of the 2018 $PM_{2.5}$ Plan and Valley State SIP Strategy, the EPA affirmatively determined that the SIP submissions addressed the deficiency that was the basis for such findings, resulting in the termination of the associated sanctions clocks. Letter dated June 24, 2020, from Elizabeth Adams, Director, Air and Radiation Division, EPA Region IX, to Richard W. Corey, Executive Officer, CARB. However, the findings of failure to submit did not apply to the Serious area plan for the 2012 annual $PM_{2.5}$ NAAQS because it was not yet required, and the June 24, 2020 completeness letter did not address the Serious area plan for the 2012 annual $PM_{2.5}$ NAAQS.

[10] 87 FR 74310, 74313.

[11] We are not re-proposing any action on the Serious area requirements for emissions inventories nor contingency measures; our prior proposal to approve the emissions inventory element and to disapprove the contingency measure element of the nonattainment plan requirements for the 2012 annual $PM_{2.5}$ NAAQS remains unchanged.

The EPA provided its preliminary views on the CAA's requirements for particulate matter plans under part D, title I of the Act in the following guidance documents: (1) ''State Implementation Plans; General Preamble for the Implementation of Title I of the Clean Air Act Amendments of 1990'' (''General Preamble''); [12] (2) ''State Implementation Plans; General Preamble for the Implementation of Title I of the Clean Air Act Amendments of 1990; Supplemental'' (''General Preamble Supplement''); [13] and (3) ''State Implementation Plans for Serious PM–10 Nonattainment Areas, and Attainment Date Waivers for PM–10 Nonattainment Areas Generally; Addendum to the General Preamble for the Implementation of Title I of the Clean Air Act Amendments of 1990'' (''General Preamble Addendum'').[14] More recently, in an August 24, 2016 final rule entitled, ''Fine Particulate Matter National Ambient Air Quality Standards: State Implementation Plan Requirements'' (''$PM_{2.5}$ SIP Requirements Rule''), the EPA established regulatory requirements and provided further interpretive guidance on the statutory SIP requirements that apply to areas designated nonattainment for all $PM_{2.5}$ NAAQS.[15] We discuss these regulatory requirements and interpretations of the Act as appropriate in our evaluation of the State's submissions below.

B. December 29, 2021 Proposed Rule

In our 2021 Proposed Rule, the EPA proposed to approve the SJV $PM_{2.5}$ Plan's: (1) emissions inventory for the 2013 base year; (2) precursor demonstrations that emissions of ammonia, sulfur oxides (SO_X), and volatile organic compounds (VOC) do not significantly contribute to exceedances of the 2012 annual $PM_{2.5}$ NAAQS in the SJV; (3) BACM demonstration for emission sources of direct $PM_{2.5}$ and nitrogen oxides (NO_X); (4) attainment demonstration based on air quality modeling [16] and emissions reductions related to aggregate commitments; (5) RFP demonstration; (6) quantitative milestones; and (7) motor vehicle emission budgets. We briefly summarize several aspects of those proposed approvals in the applicable sub-sections of section II of this proposed rule.

We also proposed to disapprove the Plan's contingency measures and noted the requirements for nonattainment NSR and the State's separate submission for the nonattainment NSR requirements. However, as we are not re-proposing any action on contingency measures nor nonattainment NSR in this proposed rule, we do not summarize those proposals herein.[17] In addition, we are not re-proposing any action on the Plan's precursor demonstrations for SO_X and VOC in this proposed rule; our 2021 Proposed Rule to approve the 2018 $PM_{2.5}$ Plan's demonstrations that emissions of SO_X and VOC do not significantly contribute to exceedances of the 2012 annual $PM_{2.5}$ NAAQS in the SJV remains unchanged.

Finally, we are not re-proposing any action in this proposed rule on the Plan's base year emissions inventory; our 2021 Proposed Rule to approve the 2018 $PM_{2.5}$ Plan's base year emissions inventory remains unchanged. Nevertheless, we briefly summarize our prior proposal [18] given the role that base year emissions inventories play in developing a plan's control strategy and attainment and RFP demonstrations.

The 2018 $PM_{2.5}$ Plan includes summaries of the planning emissions inventories for direct $PM_{2.5}$ and all $PM_{2.5}$ precursors (NO_X, SO_X,[19] VOC,[20] and ammonia) and related documentation. The Plan contains annual average daily emission inventories for 2013 through 2028 projected from the 2012 actual emissions inventory,[21] including the 2013 base year, the 2019 and 2022 RFP milestone years, the 2025 Serious area attainment year, and a 2028 post-attainment RFP year. The EPA proposed to approve the 2013 base year emissions inventory in the 2018 $PM_{2.5}$ Plan as meeting the requirements of CAA section 172(c)(3) and 40 CFR 51.1008. We also proposed to find that the future year baseline inventories in the 2018 $PM_{2.5}$ Plan satisfy the requirements of 40 CFR 51.1008(b)(2) and 51.1012(a)(2) and provide an adequate basis for the control measure, attainment, and RFP demonstrations for the 2012 annual $PM_{2.5}$ NAAQS in the 2018 $PM_{2.5}$ Plan.

C. Adverse Comments Submitted January 28, 2022

The EPA received adverse comments on our 2021 Proposed Rule from a coalition of 13 environmental, public health, and community organizations (collectively referred to herein as ''Public Justice'').[22] We are not responding to these comments (in the sense of a final rulemaking action) in this proposed rule, but the Agency has taken them into account with respect to the Serious area plan elements discussed in this proposed rule.

Overall, the commenters argue that the EPA must disapprove the 2012 annual $PM_{2.5}$ NAAQS portion of the SJV $PM_{2.5}$ Plan based on alleged nonattainment plan requirement deficiencies in the submissions. We introduce these comments in this section of this proposed rule and present more detailed summaries and discussion of the comments in sections II.A (ammonia precursor demonstration), II.B.2 (BACM for ammonia emission sources), II.B.3 (BACM for building heating emission sources), II.C (attainment demonstration), and IV (Title VI of the Civil Rights Act).

Regarding CAA requirements for $PM_{2.5}$, Public Justice points to a history of failures to timely attain the 1997 annual $PM_{2.5}$ NAAQS in the SJV and states that ''[r]egulators point to a host of excuses from weather, to international sources, to Federal inaction, but repeatedly the State and Air District have refused to adopt feasible controls or regulate politically powerful entities'' such as agricultural sources of air pollution.[23] The commenters take issue with the EPA's proposal to approve the plan for the stricter 2012 standard ''without performing its duty to hold [CARB] and the [District] accountable to meet the

[12] 57 FR 13498 (April 16, 1992).

[13] 57 FR 18070 (April 28, 1992).

[14] 59 FR 41998 (August 16, 1994).

[15] 81 FR 58010 (August 24, 2016).

[16] We described 2018 $PM_{2.5}$ Plan's air quality modeling and our evaluation thereof in section IV.C of the 2021 Proposed Rule.

[17] Regarding nonattainment NSR, please see the EPA's separate rulemaking on the State's November 20, 2019 SIP submission of amendments to SJVUAPCD Rule 2201 (''New and Modified Stationary Source Review''). 87 FR 45730 (July 29, 2022) (proposed limited approval and limited disapproval of the Rule 2201 amendments).

[18] See section IV.A of the EPA's 2021 Proposed Rule.

[19] The SJV $PM_{2.5}$ Plan generally uses ''sulfur oxides'' or ''SO_X'' in reference to SO_2 as a precursor to the formation of $PM_{2.5}$. We use SO_X and SO_2 interchangeably throughout this notice.

[20] The SJV $PM_{2.5}$ Plan generally uses ''reactive organic gasses'' or ''ROG'' in reference to VOC as a precursor to the formation of $PM_{2.5}$. We use ROG and VOC interchangeably throughout this notice.

[21] 2018 $PM_{2.5}$ Plan, App. B, B–18.

[22] Comment letter dated and received January 28, 2022, from Brent Newell, Public Justice, et al., to Rory Mays, EPA, including Exhibits 1 through 47. We note, however, that there is no Exhibit 23; so, there are 46 exhibits in total. Email dated February 1, 2022, from Brent Newell, Public Justice, to Rory Mays, EPA Region IX. The 13 environmental, public health, and community organizations are Public Justice, Central Valley Environmental Justice Network, Association of Irritated Residents, Central Valley Air Quality Coalition, Leadership Counsel for Justice and Accountability, Valley Improvement Projects, The LEAP Institute, Little Manila Rising, Center for Race, Poverty, and the Environment, Central California Asthma Collaborative, Animal Legal Defense Fund, National Parks Conservation Association, and Food and Water Watch (collectively ''Public Justice'').

[23] Public Justice Comment Letter, 2.

minimum requirements Congress imposed to protect human health.'' [24] The commenters assert that the EPA relies on flawed, outdated information, ignores feasible controls, refuses to require regulation of ammonia, accepts aggregate commitments in lieu of other control strategies, and fails to address pollution sources in disadvantaged communities in the SJV.[25] With respect to specific CAA requirements, the commenters argue that the EPA must disapprove the Plan's emissions inventory, ammonia precursor demonstration, BACM demonstration, and aggregate commitments.

Regarding Title VI of the Civil Rights Act, the commenters argue that California must provide necessary assurances that the SIP complies with Title VI of the Civil Rights Act, pursuant to CAA section 110(a)(2)(E), and failed to do so.[26] The commenters state that ''$PM_{2.5}$ pollution has a disparate impact on the basis of race in the San Joaquin Valley'' and assert that the Plan fails to meet CAA requirements and ''deliberately ignores obvious sources and control options and inflicts disparate impacts on Black, Latino, Indigenous, and people of color'' in the SJV. Therefore, the commenters advocate that the EPA must disapprove the 2012 annual $PM_{2.5}$ portion of the SJV $PM_{2.5}$ Plan.[27] We address the commenters' Title VI comments in section IV of this proposed rule.

The EPA is now proposing to disapprove the Plan with respect to certain CAA requirements (BACM/BACT for ammonia emission sources, BACM/BACT for building heating emission sources, aggregate commitments, attainment demonstration, RFP demonstration, quantitative milestones, and motor vehicle emission budgets). However, we are not in this proposal comprehensively addressing all issues raised in the Public Justice comment letter.[28]

D. Ninth Circuit Decision on Related SJV $PM_{2.5}$ Plan

In a final rule published July 22, 2020, the EPA finalized approval of the portions of the SJV $PM_{2.5}$ Plan [29] that addressed the 2006 24-hour $PM_{2.5}$ NAAQS (except for contingency measures, which the EPA acted on in a subsequent action).[30] On September 17, 2020, a group of five environmental, public health, and community groups (collectively referred to herein as ''Medical Advocates'') petitioned the Ninth Circuit Court of Appeals (''Ninth Circuit'' or ''Court'') for review of the EPA's July 22, 2020 final rule.[31] On April 13, 2022, the Ninth Circuit issued a Memorandum opinion that granted in part and denied in part the petition (''Memorandum Opinion'').[32]

The Ninth Circuit denied the petitioners' challenge with respect to the EPA's approval of enforceable commitments in general and the EPA's approval of the Plan's demonstration of BACM, BACT, and most stringent measures (MSM) for emission sources of direct $PM_{2.5}$ and NO_X for purposes of the 2006 24-hour $PM_{2.5}$ NAAQS.

Significantly, however, the Ninth Circuit also denied in part and granted in part the petitioners' challenge with respect to the EPA's approval of the specific enforceable commitments employed as part of the SJV $PM_{2.5}$ Plan's control strategy to attain the 2006 24-hour $PM_{2.5}$ NAAQS in the SJV by December 31, 2024. The EPA evaluates enforceable commitments based on three factors: (1) the commitment represents a limited portion of the required emission reductions, (2) the State is capable of fulfilling its commitment, and (3) the commitment is for a reasonable and appropriate timeframe. The Ninth Circuit denied the petitioners' challenge with respect to the first and third factors but granted the petitioners' challenge with respect to the second factor.

The Ninth Circuit found that the EPA had misapplied the second factor concerning the State's ability to fulfill the aggregate commitments. The Court reasoned that EPA ''fail[ed] to provide evidence or a reasoned explanation for its conclusion that California will be able to fulfill its commitment'' in the face of a potential multi-billion dollar funding shortfall for incentive-based control measure commitments, ''which could result in emission reduction shortfalls of approximately 7% of the total NO_X reductions and 8% of the total $PM_{2.5}$ reductions necessary for attainment.'' [33] The Court also rejected the EPA's arguments that: (1) the funding shortfall may be smaller than projected, (2) emission reductions may be less expensive than the strategy predicts, (3) certain yet-to-be-quantified sources of reductions in the Plan may make up for shortfalls, and (4) California and the District may identify other measures to fulfill their commitments. Instead, the Court decided that, ''[b]ecause these speculative assertions are unsupported by the evidence, they fail to ensure that California and the District have a plausible strategy for achieving this portion of the attainment strategy, and therefore do not collectively satisfy the second factor of the EPA's three-factor test.'' [34] The Court concluded that the EPA's analysis with respect to the second factor for evaluating enforceable commitments was arbitrary and capricious, vacated the final rule with respect to this factor, and remanded the matter to the EPA for further consideration of the second factor.[35]

The EPA is currently considering how to address the Court's vacatur and remand with respect to the 2006 24-hour $PM_{2.5}$ NAAQS portion of the SJV $PM_{2.5}$ Plan and is not proposing any action with respect to those standards in this proposed rule. However, the Ninth Circuit's decision is very relevant to this proposed rule because the State relied on a common control strategy, including the same enforceable commitments (*i.e.,* the same set of control measure commitments and aggregate tonnage commitments) for purposes of both the 2006 24-hour $PM_{2.5}$ NAAQS Serious area plan and the 2012 annual $PM_{2.5}$ NAAQS Serious area plan. The EPA acknowledges the deficiency in the factual support for the aggregate commitments identified by the Ninth Circuit and that this remains the case. If the EPA cannot approve the aggregate commitments, then this has a direct bearing on other elements of the State's Serious area SIP submissions for the 2012 annual $PM_{2.5}$ NAAQS. As discussed in section II.C of this proposed rule, based on our reconsideration of the facts concerning the enforceable commitments in the SJV $PM_{2.5}$ Plan with respect to the 2012 annual $PM_{2.5}$ NAAQS in light of the Ninth Circuit's decision, the EPA now proposes to disapprove the State's enforceable commitments and attainment demonstration.

II. Reconsideration of the San Joaquin Valley Serious $PM_{2.5}$ Plan

The EPA has reconsidered its 2021 Proposed Rule, based on adverse comments on that prior proposal and based on a Ninth Circuit Court of Appeals decision on a related SJV $PM_{2.5}$ rulemaking. After careful consideration of the issues raised by commenters and the court, the EPA now proposes to disapprove the State's plan for the 2012 annual $PM_{2.5}$ NAAQS in the SJV for certain Serious area planning requirements, including: (1) the Plan's precursor demonstration for ammonia; (2) BACM for ammonia emission sources and BACM for building heating emission sources; (3) the modeled attainment demonstration; (4) the RFP demonstration; (5) quantitative milestones; and (6) motor vehicle emission budgets.

In sections II.A through II.C of this proposed rule, pertaining to the Plan's precursor demonstration for ammonia as a $PM_{2.5}$ precursor; BACM/BACT analysis, and modeled attainment demonstration (including reliance on enforceable commitments), we present a brief summary of the 2021 Proposed Rule, a summary of the adverse comments and Ninth Circuit order, as appropriate, and our reconsidered proposal. In sections II.D and II.E, pertaining to the Plan's RFP demonstration, quantitative milestones, and motor vehicle emission budgets, we present a brief summary of the 2021 Proposed Rule and our reconsidered proposal.[36] We also note that sections II.A (ammonia precursor demonstration) and II.B.1 (BACM for ammonia emission sources) are inter-related in that potential control measures for ammonia emission sources play a role in both: (1) selecting a reasonable percent emission reduction to evaluate modeled ambient $PM_{2.5}$ responses to ammonia emission reductions; and (2) assessing the availability and application of BACM to such sources in the SJV.

A. Ammonia Precursor Demonstration

1. Summary of 2021 Proposed Rule

In our 2021 Proposed Rule, the EPA described the requirements for $PM_{2.5}$ precursor pollutants, summarized the State's submissions in the SJV $PM_{2.5}$ Plan, and presented our evaluation thereof.[37] We briefly summarize those here with respect to the Plan's demonstration for ammonia as a precursor to $PM_{2.5}$ for purposes of the 2012 annual $PM_{2.5}$ NAAQS in the SJV. For a comprehensive discussion of Federal requirements for $PM_{2.5}$ precursors and a summary of California's submission, please refer to the following headings in Section IV.B of the 2021 Proposed Rule: (1) Requirements for Control of $PM_{2.5}$ Precursors; and (2) Summary of State's Submission.

Regarding CAA requirements applicable to $PM_{2.5}$ precursors, we explained that the attainment plan requirements of Title I, subpart 4 apply to emissions of direct $PM_{2.5}$ and emissions of NO_X, ammonia, SO_2, and VOC as $PM_{2.5}$ precursors from all types of stationary, area, and mobile sources, except as otherwise provided in the Act. We further described how the EPA interprets section 189(e) concerning regulation of precursors from major stationary sources to authorize it to determine, under appropriate circumstances, that regulation of specific $PM_{2.5}$ precursors from other sources in a given nonattainment area is not necessary.

As explained in the $PM_{2.5}$ SIP Requirements Rule, a State may elect to submit to the EPA a "comprehensive precursor demonstration" for a specific nonattainment area to show that emissions of a particular precursor from existing sources located in the nonattainment area do not contribute significantly to $PM_{2.5}$ levels that exceed the standard in the area.[38] The contribution analysis may consider the sensitivity of $PM_{2.5}$ to decreases in emissions of the precursor, in addition to the contribution to ambient concentrations of $PM_{2.5}$.[39] If the EPA determines that the contribution of the precursor to $PM_{2.5}$ levels in the area is not significant and approves the demonstration, then the State is not required to control emissions of the relevant precursor in the attainment plan.[40]

The EPA issued the "$PM_{2.5}$ Precursor Demonstration Guidance" ("$PM_{2.5}$ Precursor Guidance"),[41] to provide recommendations to states for analyzing nonattainment area $PM_{2.5}$ and $PM_{2.5}$ precursor emissions and developing such optional precursor demonstrations, consistent with the $PM_{2.5}$ SIP Requirements Rule. The guidance also describes how the State may use a sensitivity-based test, in which the modeled sensitivity or response of ambient $PM_{2.5}$ concentrations to changes in emissions of the precursor is estimated and then compared to a contribution threshold. In addition to comparing the concentration or modeled response to the threshold, the State can consider other information in assessing whether the precursor significantly contributes. The EPA's recommended annual average contribution threshold for the 2012 annual $PM_{2.5}$ NAAQS is 0.2 μg/m³.[42] In other words, if the estimated contribution of a precursor at monitors is below this threshold, the EPA considers this evidence that the precursor does not contribute significantly to levels above the $PM_{2.5}$ NAAQS in the area in question; above this threshold, the EPA considers this evidence that the precursor does contribute significantly. The EPA considers this evidence in conjunction with additional information that the State may provide, and determines whether or not the precursor contributes significantly, and so whether the State must evaluate and implement controls of the precursor emissions to the appropriate level (*e.g.,* BACM).

The State presents its precursor demonstration primarily in Appendix G of the 2018 $PM_{2.5}$ Plan, with additional clarifying information in a series of emails available in the docket for this proposed rule. The State estimates that anthropogenic emissions of NO_X, ammonia, SO_X, and VOC will decrease by 64 percent (%), 1%, 6%, and 9%, respectively, between 2013 and 2025 based on its projected emissions accounting for existing and additional control measures in the Serious area plan.[43] Through a concentration-based analysis, CARB found that ammonium nitrate constituted 5.2 μg/m³ of the annual average $PM_{2.5}$ concentrations measured at the Bakersfield California Avenue monitor in 2015, exceeding the recommended threshold,[44] and proceeded to conduct a sensitivity-based analysis.

For analytical purposes in accordance with the EPA's guidance, the State then modeled the sensitivity of ambient $PM_{2.5}$ to hypothetical 30% and 70% reductions in anthropogenic emissions of ammonia in SJV for modeled years

[36] The Plan's RFP demonstration, quantitative milestones, and motor vehicle emission budgets were not the direct subject of adverse comments nor the Ninth Circuit decision. However, they are based on the Plan's control strategy to attain the 2012 annual $PM_{2.5}$ NAAQS and, thus, the flaws in the Plan's control strategy affect these additional required elements.

[44] 2018 $PM_{2.5}$ Plan, App. G, 3.

2013, 2020, and 2024. The results for 2024 are a proxy for the Plan's modeled attainment year of 2025 for the 2012 annual $PM_{2.5}$ NAAQS. For the 30% reduction results for 2024, upon which the State primarily relied, 2 out of 15 monitoring sites in SJV (Madera and Hanford) had modeled responses to ammonia reductions that were above the threshold. The ambient $PM_{2.5}$ response declines substantially from 2020 to 2024, with the decline being generally larger for the sites with the highest projected $PM_{2.5}$ levels. The State supplements the sensitivity analysis for ammonia with consideration of additional information such as emission trends, the appropriateness of future year versus base year sensitivity, available emission controls, and the severity of nonattainment.[45]

The State's precursor demonstration for ammonia also presents a review of District agricultural rules that control VOC emissions, but also provide ammonia reduction co-benefits. The State concludes that a 30% reduction is a reasonable upper bound on the potential ammonia reductions to model. Finally, the State's precursor demonstration presents extensive support for the State's conclusion that there is an ambient excess of ammonia relative to nitrate, *i.e.,* that particulate ammonium nitrate formation in SJV is NO_X-limited, and will become increasingly NO_X-limited as NO_X reductions increase into the future from the State's motor vehicle control program and other measures the State intends to undertake in the Serious area plan. Based on the forgoing considerations, the State concludes that ammonia emissions do not contribute significantly to ambient $PM_{2.5}$ levels that exceed the 2012 annual $PM_{2.5}$ NAAQS in the SJV.

The EPA presented its initial evaluation of the State's ammonia precursor demonstration in section IV.B.3.a of the 2021 Proposed Rule, with more detailed summaries and evaluation in two EPA technical support documents (TSDs): ''Technical Support Document, EPA Evaluation of $PM_{2.5}$ Precursor Demonstration, San Joaquin Valley $PM_{2.5}$ Plan for the 2006 $PM_{2.5}$ NAAQS,'' February 2020 (''EPA's $PM_{2.5}$ Precursor TSD''), and ''Technical Support Document, EPA Evaluation of Ammonia Precursor Demonstration, San Joaquin Valley Moderate Area $PM_{2.5}$ Plan for the 2012 $PM_{2.5}$ NAAQS,'' August 2021 (''EPA's Ammonia Precursor TSD'').

We noted that the EPA's $PM_{2.5}$ Precursor Guidance provides for consideration of future year sensitivity and that consideration of additional information beyond the concentration-based and sensitivity-based analyses may be appropriate in assessing a precursor's significance. We summarized the State's assertions that 30% is a reasonable upper bound for potential ammonia emission reductions based on research cited in Appendix C of the 2018 $PM_{2.5}$ Plan concerning ammonia emissions and potential control options for agricultural sources.[46] However, we did not elaborate in the 2021 Proposed Rule as to why we proposed to agree that 30% was a reasonable upper bound.

We stated that ambient $PM_{2.5}$ responses to ammonia emission reductions decline over time, and in concert with the large projected NO_X emission reductions, with the largest declines occurring at sites with highest projected $PM_{2.5}$ levels. For the two sites (Madera and Hanford) where the State's modeled response in 2024 to a 30% ammonia emission reduction exceeded the recommended 0.2 μg/m³ threshold, we evaluated additional information and, based on that information, gave the modeled projected responses above the threshold at these sites less weight.

We also considered studies cited by CARB on the 2013 DISCOVER–AQ aircraft measurements and 2017 satellite measurements, both of which suggest that ammonia concentrations are underestimated in the SJV. We noted that if modeled ammonia concentrations were closer to observations, then the modeled response to ammonia precursor reductions would be lower than shown in the 2018 $PM_{2.5}$ Plan's precursor demonstration. Similarly, an increase in modeled ambient ammonia concentrations would also make the model response more consistent with the evidence from the multiple ambient measurement studies that suggest a very low ambient sensitivity to ammonia, based on measured excess ammonia relative to NO_X, the abundance of particulate nitrate relative to gaseous NO_X, and the large abundance of ammonia relative to nitric acid. These ambient measurement studies all conclude that there is a large amount of ammonia left over after reacting with NO_X, so that ammonia emission reductions would be expected mainly to reduce the amount of ammonia excess, rather than to reduce the particulate ammonium nitrate, and thus provided strong evidence independent of the modeling that ambient $PM_{2.5}$ levels would respond comparatively weakly to ammonia emissions reductions.

Regarding changes in the effect of ammonia emission reductions over time as other pollutant levels change, we stated it was appropriate to consider changes in atmospheric chemistry that may occur between the base or current year and the attainment year because the changes may ultimately affect the nonattainment area's progress toward expeditious attainment. We stated that the 2024 model results would in this case better represent the point in time at which it is appropriate to evaluate what potential ammonia controls could achieve, because of the steep decline in NO_X emissions the State projects will occur by 2024 and 2025 as a result of existing or intended control measures. We also noted that the projected annual average $PM_{2.5}$ concentration of 12.0 μg/m³, occurring at the Bakersfield-Planz monitoring site in 2025, would be reduced by 0.12 μg/m³, which would not be considered significant (it is below the EPA's recommended threshold of 0.2 μg/m³).

In sum, we concluded that the State had evaluated the sensitivity of ambient $PM_{2.5}$ levels to potential reductions in ammonia emissions using appropriate modeling techniques; the modeled response to ammonia reductions is likely lower than reported; and the State's choice of 2024 and 2025 as the reference points for purposes of evaluating the sensitivity of ambient $PM_{2.5}$ levels to ammonia emission reductions was well-supported. Based on all of these considerations, the EPA previously proposed to approve the State's demonstration that ammonia emissions do not contribute significantly to ambient $PM_{2.5}$ levels that exceed the 2012 annual $PM_{2.5}$ NAAQS in the SJV.

2. Summary of Adverse Comments

Public Justice states that the ''EPA must disapprove the ammonia precursor demonstration'' and that ''CARB's tortured analysis (and EPA's proposed acceptance of it)'' is arbitrary and capricious. The commenter makes several assertions in support of this comment.[47]

First, Public Justice notes that CARB's analysis concluded that ammonia contributes 5.2 μg/m³ to annual average $PM_{2.5}$ concentrations, and that this is well above the EPA's recommended annual average contribution threshold of 0.2 μg/m³.[48] The commenters also

[45] Id. at App. G, 5.

[46] EPA's $PM_{2.5}$ Precursor TSD, 13.

[47] Public Justice Comment Letter, 16–18.

[48] The commenters note that 38% of the annual average ambient $PM_{2.5}$ in Bakersfield is ammonium nitrate. Public Justice Comment Letter, 6. See also, 2018 $PM_{2.5}$ Plan, Ch. 3, Figure 3–2 (''Bakersfield $PM_{2.5}$ Speciation (Average 2011 to 2013)'').

took issue with CARB and the EPA's arguments that such results overstate the role of ammonia because NO_X emissions decline over time, and the EPA's decision to look at the results of sensitivity modeling for the response of ambient $PM_{2.5}$ levels to potential ammonia emission reductions in the future year 2024. The commenters assert that this analytical approach of considering the projected sensitivity to ammonia reductions in the future year ''ignores the statutory imperative to demonstrate attainment as expeditiously as practicable,'' per CAA section 172(a)(2)(A), and that, even after evaluating the impact ''for the most favorable date'' (2024), CARB still found significant contribution for ammonia above the EPA's recommended threshold.

Second, Public Justice questioned CARB's reliance and the EPA's proposed acceptance of a sensitivity analysis that assumed only a 30% modeled reduction of ammonia emissions. Public Justice points out that the EPA's guidance for precursor demonstrations suggests that states should evaluate the effect of reducing emissions between 30% and 70%, and states that ''CARB argues, and EPA agrees, that only the minimal 30 percent control level is reasonable'' despite large ammonia sources (*e.g.,* ''industrial dairy and poultry operations'') never having been regulated in the SJV and the prospect for relatively easier and cheaper emission reductions than those for NO_X.[49] The commenters argue that ''[t]he analysis of potential controls is particular[ly] weak and ignores the wealth of literature demonstrating that strategies for reducing ammonia emissions from agriculture . . . are among the most effective for reducing PM concentrations,'' and cite several studies in support of this argument. The commenters further state that reducing ammonia emissions may be achieved through ''strategies such as improving livestock feed to reduce excreted nutrients, altering manure storage and handling practices to prevent [ammonia] emissions, and improving synthetic fertilizer use efficiency,'' again citing numerous studies.[50] The commenters state that agriculture is responsible for over 80% of ammonia emissions, and that confined animal facilities (CAFs) and fertilizer application account for 57% and 36%, respectively.[51] Moreover, the commenters assert that ''[n]o real analysis of control potential is offered'' in the State's precursor demonstration.

Third, with respect to the State and the EPA's evaluation of modeled ambient $PM_{2.5}$ responses to ammonia emission reductions in 2024, Public Justice states that, in the low (30%) emission scenario, 2 of 15 monitoring sites have responses over the 0.2 μg/m^3 recommended threshold and that the EPA argues ''with extremely biased evidence, that the results at one of the two monitors could be ignored and that ammonia emissions area likely underestimated.'' The commenters assert that ''EPA points to evidence that 'the State did not discuss' to discount the results'' for the Madera monitor, and that the EPA ''offers no excuse for discrediting the results at the other monitor.''

Fourth, the commenters claim that the EPA's evaluation of the precursor demonstration looked at supplemental ammonia emission studies but ignored supplemental studies showing that NO_X emissions from soil (''soil NO_X'') may be significantly underestimated. Public Justice states that the State and the EPA ''assert that NO_X emissions will be significantly reduced by 2024 even though the Plan currently does not explain how those NO_X reductions will occur.'' The commenters state that such approach is ''a one-sided attempt to explain away modeled results that ammonia contributes significantly to $PM_{2.5}$'' in the SJV and cannot overcome the Act's presumption that precursors must be controlled.

Finally, beyond the assertion that the State's precursor demonstration with respect to ammonia, and the EPA's proposed approval of it are incorrect, the commenters also argue that the State's failure to address ammonia as a precursor to $PM_{2.5}$ has disparate impacts on certain communities within SJV and ''avoids difficult political fights by sacrificing communities of color.'' Finally, the commenters refer to a 2021 research study that estimates that 1,690 people in California die annually due to agricultural ammonia emissions.[52]

3. The EPA's Reconsidered Proposal

The EPA agrees with certain points made by the commenters with respect to ammonia and disagrees with others. Overall, based on the adverse comments from Public Justice and a re-evaluation of the information provided by the State, we now conclude that the weight of evidence is insufficient to establish that ammonia does not contribute significantly to $PM_{2.5}$ levels above the NAAQS in the SJV. The EPA's further evaluation indicates that it is appropriate to retain the statutory presumption that ammonia must be regulated as a precursor for the 2012 annual $PM_{2.5}$ NAAQS in the SJV. Accordingly, if the EPA finalizes disapproval of the State's ammonia precursor demonstration, ammonia would remain a plan precursor, and the SJV would remain subject to the requirements to identify and implement BACM, BACT, and additional feasible measures on sources of ammonia emissions.

We first address the portion of the comment related to the sensitivity of the modeled $PM_{2.5}$ response to reductions in ammonia emissions and then turn to the portion of the comment addressing the amount of ammonia reductions that may be available.

a. Comments Related to Sensitivity Modeling Results

The measured ammonium nitrate portion of the annual average $PM_{2.5}$ concentration in Bakersfield in 2015 was 5.2 μg/m^3.[53] This is well above the EPA's recommended threshold in the $PM_{2.5}$ Precursor Guidance. However, the $PM_{2.5}$ SIP Requirements Rule, as interpreted by that guidance, provides the option for a State to conduct an analysis of the sensitivity of ambient $PM_{2.5}$ concentrations to emission reductions of a precursor pollutant to evaluate the significance of that precursor,[54] as the State did for the 2012

[49] Public Justice Comment Letter, 2, 5, and 16–17, and Exhibits 31 through 34.

We note that our TSD in turn cited to State data sources, including the 2018 $PM_{2.5}$ Plan, App. G, Figure 3.

[52] Public Justice Comment Letter, 18. See Domingo, N.G.G., Balasubramanian, S., Thakrar, S.K., Clark, M.A., Adams, P.J., Marshall, J.D., Muller, N.Z., Pandis, S.N., Polasky, S., Robinson, A.L., Tessum, C.W., Tilman, D., Tschofen, P., & Hill, J.D., ''Air quality–related health damages of food,'' Proceedings of the National Academy of Sciences (Vol. 118, Issue 20, p. e2013637118), 2021, available at *https://doi.org/10.1073/pnas.2013637118,* attached as Exhibit 35. See **SUPPLEMENTARY INFORMATION** for ''Air quality-related health damages of food,'' Table S2 (''Annual emissions and mortality caused by agricultural production in the 10 states where emissions of (A) primary $PM_{2.5}$, (B) NH_3, (C) NO_X, (D) SO_2, and (E) NMVOCs lead to the highest total mortality'').

[53] 86 FR 74310, 74318 and 2018 $PM_{2.5}$ Plan, App. G, 3.

[54] 40 CFR 51.1006(a)(1)(ii).

annual $PM_{2.5}$ NAAQS in the SJV. Thus, the concentration-based contribution analysis alone (*i.e.,* the 5.2 μg/m³) is not necessarily determinative of a precursor's significance.

The commenters stated that reliance on a sensitivity-based test for 2024 ignores the statutory imperative for expeditious attainment. But, as noted in the preamble for the $PM_{2.5}$ SIP Requirements Rule in explaining the rationale for a sensitivity-based test, ''if conditions in a particular area are such that control of sources of one or more precursors does not reduce $PM_{2.5}$ concentrations in the area, then those controls will not help the area attain (expeditiously or otherwise).'' [55] Thus, if a precursor demonstration were to show that control of a particular precursor is not effective for reaching attainment, then the absence of such control would not violate the requirement for expeditious attainment.

As commenters noted, the State relied on its sensitivity-based contribution analysis for a future year (2024) to evaluate the significance of ammonia as a precursor to ambient $PM_{2.5}$ concentrations in the San Joaquin Valley. In our 2021 Proposed Rule, we discussed the State's selection of 2024 as an acceptable analysis year, given the projected steep decline in ambient $PM_{2.5}$ sensitivity to ammonia reductions over time as a result of projected changes in emissions (*i.e.,* large NO_X emission reductions as contemplated in the Plan, through existing measures and aggregate commitments), consistent with the facts and circumstances recommended for consideration in the EPA's $PM_{2.5}$ Precursor Guidance.[56]

The $PM_{2.5}$ Precursor Guidance provides for consideration of sensitivity in an appropriate future year.[57] Based on the State's control strategy, including baseline emission reduction measures and its control measure and aggregate tonnage commitments, the State estimated it would achieve over 200 tpd NO_X reductions by 2024, representing over 60% of the 2013 base year emissions inventory for NO_X.[58] Existing baseline measures already in the SIP are projected by the State to reduce annual average NO_X emissions in the SJV by 173.5 tpd, which is 83.7% of the 207.38 tpd of NO_X reductions modeled to attain the 2012 annual $PM_{2.5}$ NAAQS. Over 90% of the baseline NO_X reductions between 2013 and 2025 are due to the existing mobile source control program.[59] These reductions will occur regardless of any EPA action on the precursor demonstration or the 2018 $PM_{2.5}$ Plan as a whole. Similarly, additional measures adopted by the State through the end of 2021 further reduce NO_X emissions. Given the large NO_X emission reductions projected to occur by 2024 and 2025, the EPA has concluded that that the 2024 sensitivity model results better represent the atmospheric chemistry around the attainment date and in subsequent years than sensitivity modeling results from 2013 and even 2020.[60] Due to continued existing and anticipated NO_X reductions, the apparent $PM_{2.5}$ benefit of ammonia reductions in earlier years declines with time and does not reflect the ultimate, lower, benefit of such controls near the attainment year and later.

Thus, the EPA reasons that the Plan's baseline and additional control measures will change (and have already changed) the atmospheric chemistry conditions in the SJV, leading to ambient $PM_{2.5}$ formation that is much less sensitive to ammonia emission reductions in the attainment year. We maintain that the State's reliance on its sensitivity-based contribution analysis for 2024 to evaluate the significance of ammonia as a precursor is reasonable, well supported, and consistent with the $PM_{2.5}$ SIP Requirements Rule and EPA guidance.

The commenter correctly states that 2 of 15 sites in the 2024 model scenario based on a 30% reduction in ammonia emission were modeled to have an ambient $PM_{2.5}$ response greater than the EPA's recommended contribution threshold of 0.2 μg/m³. However, we disagree with the commenter's characterization that our further review of the sensitivity of the Madera and Hanford sites to ammonia emission reductions was argued ''with extremely biased evidence.'' [61]

For the Madera monitor (estimated sensitivity of 0.21 μg/m³ in 2024 to a 30% ammonia emission reduction), the commenter refers to the EPA's statement that the 2018 $PM_{2.5}$ Plan did not discuss the evidence for the 2013 monitored concentrations at this site being biased high (as a matter of the physical recordings of the monitor). However, the EPA did reference the State's prior analysis of such evidence, which we considered in our evaluation.[62] Aside from pointing out that this analysis was not included in the Plan itself, the comment does not offer analysis to the contrary, and the EPA continues to think that we reasonably weighed the technical information before us and, given the role of the 2013 monitored data in the sensitivity modeling conducted by the State, correctly concluded that ''if more typical Madera concentrations were used, it is likely that the 2024 Madera response to ammonia reductions would be below the contribution threshold'' and that the extra year of NO_X reductions from 2024 to 2025 would likely decrease the sensitivity below the recommended 0.2 μg/m³ threshold.

We further disagree with the commenter's assertion that we offered no reason for giving less weight to modeled sensitivity results for the Hanford monitor (estimated sensitivity of 0.26 μg/m³ in 2024 to a 30% ammonia emission reduction). We stated that we gave both Madera and Hanford modeled sensitivity lower weight in our overall assessment of ammonia as a precursor. Specifically for Hanford, we described evidence that the modeled sensitivity there was likely overestimated. That evidence included an independent study using data from the 2013 DISCOVER–AQ campaign that ''found that the [CMAQ] model underestimated ammonia at Hanford by a roughly a factor of four or five.'' [63] In our assessment, if the model's ammonia concentrations better matched the observations then there would be more of an ammonia excess in the model, and the modeled response to ammonia reductions would be lower.

More broadly, prior to publishing the 2021 Proposed Rule, the EPA reviewed available research including from supplemental materials from CARB, and found a consistent theme based on modeling analyses and ambient measurement studies—that ''there is a large amount of ammonia left over after reacting with NO_X, so that ammonia emission reductions would be expected mainly to reduce the amount of ammonia excess, rather than to reduce the particulate ammonium nitrate.'' [64] It is important to note that this ammonia excess is *measured,* and is independent

[59] 2018 $PM_{2.5}$ Plan, App. B, Table B–2.

[60] We address the potential impact of ammonia emissions on the requirement for expeditious attainment in our re-evaluation of the attainment demonstration in section II.C.3, below.

[61] Public Justice Comment Letter, 18.

[62] 86 FR 74310, 74320, fn. 91, and fn. 92. This analysis concluded that 2011–2013 Madera data did not fit the geographic pattern historically seen in relation to other monitors but returned to the historic pattern after corrections were made to the monitoring instrument operating procedures. Concentrations were estimated to be about 10% high during the period in question.

[63] 86 FR 74310, 74320.

[64] Id. See also, EPA's Ammonia Precursor TSD.

of any assumptions about the size of the ammonia or NO_X emissions inventories, and also independent of any uncertainties in the modeling exercise. The concerns raised by Public Justice about relative levels of ammonia and NO_X estimation are not sufficient to cause the EPA to revise the conclusion that $PM_{2.5}$ is likely to have low sensitivity to ammonia reductions, which is supported by the actual observed conditions. The ambient measurement evidence is strong and leads the EPA to believe that the modeled response to ammonia in the State's precursor demonstration may be overestimated. Therefore, we maintain that the EPA may give lower weight to the modeled sensitivities of ambient $PM_{2.5}$ concentrations to ammonia emission reductions at the Madera and Hanford sites.

The commenter states that the EPA's argument on the relative levels of ammonia and NO_X emissions looks at such ammonia studies but ''ignores supplemental studies showing that . . . soil NO_X emissions [may be significantly underestimated].'' [65] Unlike the general consensus in the ammonia studies described above, with respect to the amount of NO_X emitted by soil in the SJV the EPA believes that there is conflicting research. A conclusion of Almaraz et al. (2018) and Sha et al. (2021) cited by the commenters is that soil NO_X emissions are underestimated, and that they comprise 30–40% of total NO_X emission in California. While higher levels of soil NO_X (or NO_X more generally) would tend to increase the modeled sensitivity of ambient $PM_{2.5}$ to ammonia, we maintain that there is not a sufficient basis to conclude that higher soil NO_X emissions should be used in the air quality modeling for the SJV.[66]

In contrast to the studies just cited, Guo et al. (2020) [67] did not find such a discrepancy in emissions estimates, concluding that soil NO_X is about 1% of anthropogenic NO_X emissions. The fraction of nitrogen applied as fertilizer released as NO_X to the atmosphere was estimated by Almaraz et al. to be 15%, while seven other studies reviewed by Guo et al. estimated it to be 2% or less. Yet Almaraz et al., Sha et al., and Guo et al. all reported high agreement between their modeled and observed soil NO_X emissions. The Almaraz et al. study acknowledged the limited number of surface measurements that were available for purposes of comparing the model results and the difficulty in comparing the model results to the observations and noted the need for more field measurements. Guo et al. stated that obtaining an emission factor correlating NO_X emissions to fertilizer application from the data available in various studies (including Almaraz et al.) would be ''difficult or impossible'' due to the sparsity of data collected in terms of sampling length, sampling frequency, and the episodic nature of nitrogen gas emissions from soil.

In light of the uncertainties and disagreements among studies, the EPA does not believe that available research provides sufficient certainty about the magnitude and proportion of soil NO_X emissions attributable to agricultural fertilizer application to require substantial revisions in the NO_X emissions inventory nor the $PM_{2.5}$ modeling at this time.

In addition, as just described, multiple studies of ambient measurements show excess ammonia in the atmosphere, which is strong evidence of low sensitivity to ammonia reduction that is independent of the accuracy of estimates of precursor emissions from any source, including soil NO_X, and independent of any modeling. Thus, we disagree that the EPA ''ignored'' the supplemental soil NO_X studies; we were aware of and considered them, but they did not change our conclusion.

b. Comments Related to Scale of Potential Ammonia Emission Reductions

The 2018 $PM_{2.5}$ Plan includes modeling of 30% and 70% reductions in ammonia emissions and focuses on the results of the 30% reduction based on the assertion that the area could not achieve more than a 30% decrease in ammonia emissions. Public Justice questions the basis for the assertion that no more than 30% reductions are available. In this section, we examine, based on the submission, the $PM_{2.5}$ Precursor Guidance, and the Public Justice comment, the ammonia reductions that may be available in the SJV. Specifically, we explore the uncertainty with respect to both the current state of ammonia emissions and controls in the SJV and available research examining additional control options that may be available. We conclude that, based on the information before us, the 2018 $PM_{2.5}$ Plan does not provide sufficient support for the assertion that 30% is a reasonable upper bound on available ammonia reductions in the SJV.

The District presented its analysis of ammonia control for the primary ammonia source categories in the SJV in Appendix C, section C.25 (''Ammonia in the San Joaquin Valley'') of the 2018 $PM_{2.5}$ Plan. The EPA had reviewed this analysis for our assessment in the 2021 Proposed Rule that 30% was, for analytical purposes, a reasonable upper bound for ammonia emission reductions in the SJV, and referred to prior EPA analysis for our action on the 2006 24-hour $PM_{2.5}$ NAAQS portion of the 2018 $PM_{2.5}$ Plan.[68] In evaluating the Public Justice comments on the potential control of ammonia, however, we have re-evaluated other portions of the 2018 $PM_{2.5}$ Plan, including Appendix C, section C.25 and Appendix G,[69] and reviewed the studies cited by the commenters, as well as others from the EPA's own literature search.

As noted in the EPA's $PM_{2.5}$ Precursor Guidance,[70] and consistent with the $PM_{2.5}$ SIP Requirements Rule (40 CFR 51.1010(a)(2)(ii), 51.1006(a)(1)(ii)), the EPA may require the State to identify and evaluate potential control measures for a precursor to determine the potential emissions reductions achievable, as a part of the precursor analysis. The guidance states that this evaluation is particularly important when the $PM_{2.5}$ response to a 30% reduction in precursor emissions is close to the contribution threshold. In the case of a nonattainment area classified as Serious, this analysis would include identification and evaluation of measures that would constitute BACM/BACT level controls for such pollutant.[71]

[69] See, *e.g.,* 2018 $PM_{2.5}$ Plan, App. G, 13, where CARB states that ''CARB staff, District staff, and the public process have not identified specific controls that are technologically and economically feasible to achieve reductions at the low end of the recommended sensitivity range (*i.e.,* 30 percent), much less at the upper end of the range.''

[70] $PM_{2.5}$ Precursor Guidance, 31.

[71] The $PM_{2.5}$ Precursor Guidance provides: ''[c]onsistent with the $PM_{2.5}$ SIP Requirements Rule, the EPA may in some cases require air agencies to evaluate available emissions controls in support of a precursor demonstration that relies on a

Even when the modeled responses are below the recommended 0.2 µg/m³ contribution threshold, or when particular responses are given less weight as we have discussed above for Madera and Hanford, the outcome of a sufficiently thorough controls evaluation and its conclusions on achievable emissions reductions may be important information for the EPA to consider in deciding whether to approve the precursor demonstration. Here, the State's ammonia precursor demonstration strongly relies on the assertion that no more than 30% ammonia reductions below current levels is achievable, but there is not a sufficiently thorough controls evaluation to support that assertion. Because the 30% value has not been adequately supported, the EPA cannot evaluate whether the modeled $PM_{2.5}$ reductions associated with a 30% reduction in ammonia represent the reductions that may be possible in the SJV.

The EPA also emphasizes that the 30% control threshold is part of an analytical test to help evaluate whether the State must regulate ammonia as a precursor for the 2012 annual $PM_{2.5}$ NAAQS in the area; it does not mean that if the State cannot control 30% of ammonia with BACM/BACT-level controls that there is per se no need to regulate ammonia. For example, if control of 25% of ammonia is necessary for attainment of the $PM_{2.5}$ NAAQS, then the fact that this is below 30% is irrelevant. Our attention to the 30% threshold in this notice is to help interpret the $PM_{2.5}$ responses to modeled ammonia emissions reductions in the State's precursor demonstration, which modeled a 30% reduction. This point is important analytically because, insofar as potential ammonia reductions could be larger than 30%, the modeled responses could be larger than those relied upon in the State's precursor analysis to support its determination that ammonia is not a significant precursor.

With respect to the State's assertion that 30% is a reasonable upper bound for potential ammonia emission reductions, we agree with the commenters that the analysis of potential ammonia controls provided by the State and the evaluation of that information by the EPA lacked detailed support and is not a sufficient basis for the EPA to affirm that 30% is a reasonable upper bound for potential ammonia emission reduction in the SJV. This, in turn, affects the EPA's interpretation of the results of modeled responses to ammonia reductions. There are two general deficiencies in the submitted analysis that create uncertainty as to the potential for ammonia emission reductions, as discussed below: (1) incomplete quantification of existing ammonia emission reductions from the largest sources of ammonia; and 2) incomplete consideration and evaluation of potential additional controls of ammonia emissions for sources in the SJV. We walk through these uncertainties for each of the largest sources of ammonia in the SJV (*i.e.,* CAFs and fertilizer application).

As an initial matter, the commenters state that ''[the State] argues, and EPA agrees, that only the minimal 30 percent control level is reasonable'' despite major ammonia sources never having been regulated in the SJV and the relatively easier and cheaper sources of emission reductions relative to NO_X. We understand this reference to ''major ammonia sources'' to mean the main source categories of ammonia emissions in the SJV, including CAFs and fertilizer application, which the State estimated to emit 57% and 36%, respectively, of the annual average ammonia emissions in the SJV in 2013.[72]

We agree with the commenters that neither CARB nor the District have imposed controls specifically to regulate ammonia. We note, however, that ammonia-specific controls are not required for approval of an ammonia precursor demonstration. Moreover, although there are not ammonia-specific controls in place for the largest source categories in the SJV, many sources of ammonia are in fact regulated by District rules, such as Rule 4570 (''Confined Animal Facilities''), Rule 4565 (''Biosolids, Animal Manure, and Poultry Litter Operations''), and Rule 4566 (''Organic Material Composting Operations''), which include enforceable requirements for VOC emissions that would, in general, achieve some degree of ammonia emission reductions. We agree with the general assertion, presented by the District in section C–25 (''Ammonia in the San Joaquin Valley'') of Appendix C of the 2018 $PM_{2.5}$ Plan, that some management practices to reduce VOCs in those rules also collaterally reduce ammonia emissions by limiting ammonia formation and volatilization, even though ammonia reductions are not legally required by these measures.[73]

Although we expect that existing VOC regulations are achieving a degree of ammonia control, there are multiple reasons why it is not clear, based on the record before us, how much reduction is being achieved, and thus how much additional reduction may be available. For example, regarding CAFs, as the EPA has previously noted,[74] the State has not sufficiently substantiated its calculation of 100 tpd of ammonia emission reductions attributed to Rule 4570. In the 2018 $PM_{2.5}$ Plan, the State referenced an outdated analysis from 2006 that relied on a different baseline emissions inventory, but has not supplemented this analysis, or reconciled it with more recent emissions inventory data.[75] We note that CARB has provided the EPA with significantly lower estimates of ammonia emission reductions achieved by SJVUAPCD Rule 4570 based on more recent calculations of reductions from a 2012 baseline emissions inventory.[76] The 2018 $PM_{2.5}$ Plan does not reconcile these differences, nor update the emission reduction estimate from the 2006-era analysis to the emissions inventory basis of the 2018 $PM_{2.5}$ Plan.

sensitivity analysis. [See 40 CFR 51.1009(a)(2) and 51.1010(a)(2).] It is particularly important for states to evaluate available controls where the recommended contribution threshold—that is, the threshold used for identifying an impact that is 'insignificant'—is close to being exceeded at the low end of the recommended sensitivity range (*e.g.,* 30 percent). In these cases, the EPA may determine that to sufficiently evaluate whether the area is sensitive to reductions, the State must determine the potential precursor emission reductions achievable through the implementation of available and reasonable controls for a Moderate area (or best controls for a Serious area).'' $PM_{2.5}$ Precursor Guidance at 31.

[72] See Public Justice Comment Letter, 6, citing EPA Region IX, ''Technical Support Document, EPA Evaluation of $PM_{2.5}$ Precursor Demonstration, San Joaquin Valley $PM_{2.5}$ Plan for the 2006 $PM_{2.5}$ NAAQS.''

[73] See, *e.g.,* 2018 $PM_{2.5}$ Plan, App. C, C–313 (for CAFs). The lack of controls specifically regulating *ammonia emissions* from the largest source categories through enforceable SIP requirements in the SJV is not an inherent deficiency of the precursor demonstration, but it does result in challenges for determining the potential for ammonia emission controls (*i.e.,* in determining the reductions that have already been achieved, and what additional reductions are available).

[74] 81 FR 69396, 69397–69398 (October 6, 2016).

[75] 2018 $PM_{2.5}$ Plan, App. C, C–311 to C–339 and SJVUAPCD, ''Final Draft Staff Report, Proposed Re-Adoption of Rule 4570 (Confined Animal Facilities),'' June 18, 2009, at Appendix F, ''Ammonia Reductions Analysis for Proposed Rule 4570 (Confined Animal Facilities),'' June 15, 2006 (discussing various assumptions underlying the District's calculation of ammonia emission factors without identifying relevant emissions inventories).

[76] Email dated September 3, 2015, from Gabe Ruiz, CARB, to Larry Biland and Andrew Steckel, EPA Region IX, regarding ''SJV Livestock Ammonia Emissions with and without Rule 4570.'' This email notes that 2011 ammonia emissions (pre-rule) were 316.8 tpd, 2012 emissions (without rule) were 323.8 tpd, and 2012 emissions (with rule) were 250.9 tpd. Thus, application of Rule 4570 would have achieved either 72.9 tpd of ammonia reductions, measured within 2012 with and without the rule, or 65.9 tpd, measured from the 2011 level (without rule) to the 2012 level (with rule).

In short, although we agree that some existing VOC controls will also result in ammonia reductions, a more detailed analysis it required to determine both the effectiveness of existing controls, and the additional controls that may be available. In the following, the EPA notes various uncertainties concerning ammonia emissions and in the amount of reductions achieved by specific rules as a byproduct of the existing VOC control measures. For a number of key source categories, ammonia measures require additional analysis to evaluate their potential to achieve additional emissions reductions, in part based on research studies included as exhibits to the Public Justice Comment Letter.

For CAFs, the District discusses in detail how Rule 4570 is structured (*e.g.,* to address varying types of CAFs); the five main CAF operations/emission sources: feeding, housing (including distinctions for housing configurations), solid waste, liquid waste, and land application of manure; the control menu requirements for each of those five operations; and research papers that estimate ammonia emission reductions from some of the measures.[77] However, the 2018 $PM_{2.5}$ Plan does not specify, even in an aggregated form, which control measures were selected by CAFs in their permits-to-operate with the District for each of the five operations and the scale of those selections by CAF size, nor does it quantify the emission reductions from those selections and scales. Thus it is unclear what level of ammonia control is being achieved, and, importantly for the precursor demonstration, unclear what level of further ammonia control may be possible. This uncertainty is increased by several provisions in Rule 4570 that allow CAF owners/operators to implement ''alternative mitigation measures'' [78] *in lieu of* the mitigation measures listed in the rule, without any requirement to ensure that such alternative mitigation measures achieve any particular level of ammonia emission reductions, or any ammonia reductions at all.[79]

Furthermore, for certain requirements, the 2018 $PM_{2.5}$ Plan assumes that a less effective control measure may be implemented given that the more effective control measure may be more costly. For instance, the District describes some research studies that relate to one or more of the options, but it is not clear whether and how the requirements of each option align with the practices evaluated in each study. The District cites a 2005 University of California study that manure from lagoons, diluted with irrigation water, and applied via surface gravity irrigation systems (*e.g.,* not applied with a drag hose or similar apparatus) commonly minimized ammonia losses from volatilization to the air to 10% or less.[80] However, it is not clear how the requirements of option H.2.a (liquid manure treated in an aerobic or anaerobic lagoon) or option H.2.b (24-hour limit for liquid manure standing on fields) may correspond to the study, whether any particular level of lagoon treatment or dilution prior to application would be needed, nor whether a combination of the two would be required to minimize ammonia losses to air to that degree.

For option H.2.c, the District states that use of a drag hose or similar apparatus could significantly reduce ammonia emissions, but without specifying how much or pointing to any supporting document, and only qualitatively asserting a relatively higher cost for using such equipment, and its limitations when a crop is growing.[81] The District states that ''[a]pplication of liquid or slurry manure with a drag hose or similar apparatus could result in significant [ammonia] reductions, but has higher costs compared to flood or furrow irrigation of liquid manure.'' [82] However, higher cost does not necessarily translate to the measure being economically infeasible, and thus the option to use flood or furrow irrigation alone may not represent the most appropriate method or level of control of ammonia for the land application of liquid manure. As a result, the District has not demonstrated that additional reductions are not feasible.

The District assumes that all dairies and other cattle facilities would select option H.2.b (24-hour limit for liquid manure standing on fields) and cites two studies that suggest substantial ammonia emission reductions from this limitation, assuming no ammonia emissions into the air after soil incorporation.[83] Based on one study, dairy CAF operations in the SJV would have hypothetically already reduced ammonia emissions to the air from land application of liquid manure from 66% ammonium nitrogen to 25% ammonium nitrogen by implementing option H.2.b (a 41% absolute reduction, or 62% relative reduction). Uncertainty about the options that are being chosen and implemented by regulated entities gives rise to uncertainty in the ammonia emission reductions that are being achieved. The permits-to-operate submitted by each dairy CAF are required to indicate which option has been selected.[84] Accordingly these permits, and associated compliance records, should contain information that would help to address this uncertainty. Furthermore, if injection via drag hose or similar apparatus (option H.2.c) is economically feasible, even if more expensive, implementation of such a measure could further reduce ammonia by 25% based on the same study, at least for a portion of the operating cycle (*e.g.,* when crops are not growing). Lastly, a combination of measures (*e.g.,* requiring that liquid manure be both treated in an anaerobic lagoon, aerobic lagoon, or digester, and that it be incorporated into the soil within 24 hours) or adjustment to existing options (*e.g.,* requiring incorporation of liquid manure within 6 hours, rather than 24 hours, and during cooler hours when ammonia volatilization is less) could hypothetically reduce ammonia emissions at these sources by more than 30%.[85]

In general, with respect to dairy CAFs, on a qualitative basis CAF operators have likely reduced ammonia emissions

[77] 2018 $PM_{2.5}$ Plan, App. C, C–312 to C–323.

[78] ''Alternative Mitigation Measure'' is defined in SJVUAPCD Rule 4570 as ''a mitigation measure that is determined by the APCO, [CARB], and EPA to achieve reductions that are equal to or exceed the reductions that would be achieved by other mitigation measures listed in this rule that owners/operators could choose to comply with rule requirements.'' SJVUAPCD Rule 4570 (amended October 21, 2010), section 3.4. Because SJVUAPCD Rule 4570 explicitly applies only to VOC emissions, the requirement for equivalent ''reductions'' in section 3.4 applies only to VOC emission reductions and does not apply to ammonia emission reductions.

[79] See, *e.g.,* SJVUAPCD Rule 4570 (amended October 21, 2010) at section 5.6, Table 4.1.F.

Albert Agriculture and Food, ''Ammonia Volatilization from Manure Application,'' February 2008 (''2008 Alberta Report''). That report estimates that injection into soil would reduce the average ammonium-nitrogen fraction loss (*i.e.,* to air) to 0% compared to incorporation within one day from surface application (25%) or compared to surface application with no incorporation (66%). 2008 Alberta Report, Table 2.

[82] 2018 $PM_{2.5}$ Plan, App. C, C–322 to C–323.

[83] 2018 $PM_{2.5}$ Plan, App. C, C–323, referring to two studies: the 2008 Alberta Report, and Chadwick et al. ''Emissions of Ammonia, Nitrous Oxide and Methane from Cattle Manure Heaps: Effect of Compaction and Covering,'' Atmosphere Environment, 39: 787–799 (2005); available at: *http://www.sciencedirect.com/science/article/pii/S135223100400994X.*

[84] Under District Rule 4570, section 5.1, owners/operators of CAFs subject to the rule must obtain a permit-to-operate for the facility, and that permit must include a facility emission mitigation plan, a facility emission inventory, and identify the mitigation measures selected for the facility.

[85] 2008 Alberta Report.

to a degree consistent with the options selected. However, there is not a quantitative basis to specify the degree and potential for further reduction. For some of the options within the menu of mitigation measures for each type of CAF in Rule 4570, there are research studies to support the basis of existing ammonia emission reductions. The generalized assumptions used by the State could be evaluated by an analysis of the options selected by CAFs in permits-to-operate with the District. Further assessment of available compliance records and examination of combinations of measures or adjustments to existing measures could help quantify additional potential ammonia emission reductions.

In addition, Public Justice cites several studies to support its assertion that reductions in agricultural ammonia emissions may be achieved through ''strategies such as improving livestock feed to reduce excreted nutrients, altering manure storage and handling practices to prevent [ammonia] emissions, and improving synthetic fertilizer use efficiency,'' and cites several studies to support this assertion.[86] The EPA considers these approaches to warrant examination as potential means to reduce ammonia and believes that more information regarding their efficacy as control measures and their economic and technical feasibility is needed to determine the amount of the potential additional ammonia control in the SJV.

For livestock feed, studies in 2005 and 2006 cited by the commenter found that ''decreasing the crude protein concentration of beef cattle finishing diets based upon steam-flaked corn from 13 to 11.5 percent decreased ammonia emissions by 30 to 44 percent.'' [87] A 2009 study cited by the commenter found that ''one feedyard feeding distillers grains averaged 149 grams of ammonia-N per head per day (NH3–N/head/day) over nine months, compared with 82 g NH3–N/head/day at another feedyard feeding lower protein steam-flaked, corn-based diets.'' [88] Nominally this would represent a 45% reduction in ammonia emissions from manure by going to a lower protein diet. However, the net ammonia emission reduction either from reducing crude protein levels in feed, or by providing a lower protein steam-flaked, corn-based diet rather than a distiller grain diet is unclear given the role of protein intake on the time for beef cattle to reach market weight or on milk production for dairy cattle.

For manure handling and storage practices, a 2011 inventory of mitigation methods by Price et al. identifies many mitigation methods for various kinds of CAFs, some of which may reduce ammonia emissions by 50–90%.[89] For example, Method 44 (''Washing down dairy cow collecting yards'') involves areas where dairy cows are collected on a concrete yard prior to milking and, after each milking event, the urine and manure in the area are removed by pressure washing or by hosing and brushing, resulting in up to 90% ammonia emission reductions. Method 62 (''Cover solid manure stores with sheeting'') involves covering solid manure heaps with plastic sheeting, resulting in ammonia emission reductions up to 90%.[90] However, the authors note that, for both Method 44 and Method 62, reducing ammonia emission from the milking areas would increase the ammonium content of the slurry, potentially leading to higher ammonia emissions during storage and spreading, but by a lower amount than the initial reduction amount. Method 71 (''Use slurry injection application techniques'') involves shallow (5–10 cm depth) or deep (25 cm depth) injection of slurry into the soil, resulting in ammonia emission reductions of 70% to 90%, respectively.

Mitigation methods are also described for other kinds of CAFs, such as pig farms and chicken farms. For example, Method 48 (''Install air-scrubbers or biotrickling filters to mechanically ventilated pig housing'') involves pig housing where specific technologies are used to capture up to 90% of the ammonia emissions into recirculation water that can then be used as a nitrogen-based fertilizer. Method 51 (''In-house poultry manure drying'') involves installation of ventilation/drying systems that reduce the moisture content of poultry litter, resulting in up to 50% ammonia emission reductions, though, as with the cattle examples, this could result in some increased emissions at subsequent steps (*e.g.,* storing poultry litter).

In addition to the 2011 inventory of mitigation methods, in September 2017, the EPA and the U.S. Department of Agriculture, Natural Resource Conservation Service released the ''Agricultural Air Quality Conservation Measures, Reference Guide for Poultry and Livestock Production Systems'' (2017 EPA–USDA Reference Guide). This reference guide discusses air quality conservation measures relating to nutrition and feed management, animal confinement, manure management, land application, and other supplemental practices. Among other things it includes Appendix A.1 (''Table of Mitigation Effectiveness for Selected Measures''), which lists 12 measures that may reduce ammonia emissions by more than 30%, Appendix A.2 (''List of State Programs and Regulations for AFO Air Emissions''), and Appendix A.3 (''List of AFO Air Quality Programs & Land-Grant Universities'').

In sum, various research studies on mitigating ammonia emissions from CAFs suggest that there may be potential for additional ammonia reductions from activities such as animal feeding and housing to manure storage, handling, and land application. While the Plan refers to and describes some of the research studies described herein (*e.g.,* the 2008 Alberta Report and the 2005 Chadwick paper), it is unclear the extent to which the higher emission reduction measures have been or could be implemented in the SJV and, when aggregated across all CAF operations, it remains unclear whether the total reduction from additional measures would be greater than the State's estimate of maximum available

Cole, and R.N. Clark, ''Reducing Crude Protein in Beef Cattle Diet Reduces Ammonia Emissions from Artificial Feedyard Surfaces.'' Journal of Environmental Quality. 35:(2), 404–411 (2006).

[88] Public Justice Exhibit 36, 10, referring to a study by Todd, R.W., N.A. Cole, D.B. Parker, M. Rhoades, and K. Casey. 2009. ''Effect of Feeding Distillers Grains on Dietary Crude Protein and Ammonia Emissions from Beef Cattle Feedyards.'' In Proceedings of the Texas Animal Manure Management Issues Conference, 83–90.

[89] Public Justice Comment Letter, Exhibit 39. Exhibit 39 is: Price et al., ''An Inventory of Mitigation Methods and Guide to their Effects on Diffuse Water Pollution, Greenhouse Gas Emissions and Ammonia Emissions from Agriculture, User Guide,'' December 2011. For mitigation measures that may reduce ammonia emissions by 50–90%, for example, methods 43, 44, 47–51, 54–55, 62, 64, 70–71, and 73–74 on pages 70–71, 74–78, 81–84, 93–94, 105–108, and 110–112 respectively, achievable control efficiencies from these measures in the SJV would depend on an applicability and feasibility review.

[90] We note that District Rule 4570, Table 3.1, section F and Table 4.1, section F provide mitigation measure options for the storage of solid manure and separated solids from large dairy CAFs, including measures that involve covering dry manure piles and separated solids, respectively, outside of pens with a weatherproof covering from May through October. Thus, such mitigation measures, if selected, would not be required for the remaining four months of the year (June through September). Similar mitigation measure options in Rule 4570 for covering dry manure piles apply for beef feedlots, other cattle, swine, poultry, and other CAF types.

reductions.[91] Accordingly, the EPA concludes that the available information in the Plan is insufficient to conclude that the State has sufficiently examined and justified its estimate for the ammonia emission reductions that may be available from CAFs, which emit a majority of the ammonia in the SJV.

Regarding fertilizer application, Rule 4570 and Rule 4565 have provisions addressing the land application of manure from CAFs and of biosolids, animal manure, and poultry litter from composting operations (though these lack specific enforceable requirements for ammonia). However, more broadly, the District states that fertilizer application is the second largest ammonia source in the SJV and that the District does not have statutory authority to regulate such activities.[92] Notwithstanding this statement, the District describes key research assessing nitrogen in California, as well as regulations adopted by the California Water Resources Control Board, including orders adopted by the Central Valley Regional Water Quality Control Board (*e.g.,* a Nutrient Management Plan), the Irrigated Lands Regulatory Program (*e.g.,* a Nitrogen Management Plan), or other individual mechanisms.[93] These orders subject agricultural operators, including dairies, bovine feedlots, poultry operations, and crop farmers to ''waste discharge requirements that protect both surface water and groundwater.'' [94]

The EPA anticipates that such regulations are, in practice, likely to enhance the retention of nitrogen (whether from manure or nitrogen-based chemical fertilizers) for productive purposes in the SJV (*e.g.,* growing crops and enhancing soil health) and limit the loss of nitrogen as pollution to water and air (*e.g.,* potentially reduce ammonia emissions). However, to our knowledge, these regulations do not impose any enforceable requirement for ammonia emissions to the air, and thus render quantification difficult, as with Rule 4570.[95]

In addition, the District states that ''the overall efficiency of nitrogen usage at California farms is expected to increase and emissions of reactive nitrogen, including [ammonia], are expected to decrease significantly.'' We agree that managing the amount of nitrogen applied to the environment should reduce the potential for pollution to air, water, and land. However, the District does not attempt to quantify or otherwise substantiate the scale and timing of such potential ammonia emission reduction benefits, nor their enforceability, nor does it attempt to analyze how much additional reductions may be available. Overall, the EPA finds that the available evidence is insufficient to conclude that the State has sufficiently examined and justified its estimate for the ammonia emission reductions that may be available from fertilizer application, the second largest ammonia emission source in the SJV.

c. The EPA's Conclusion for Ammonia Precursor Demonstration

The EPA does not believe that the State has presented sufficient evidence that ammonia does not contribute significantly to $PM_{2.5}$ levels above the NAAQS. In the absence of an approved precursor demonstration, ammonia remains a plan precursor subject to the requirements of BACM, BACT, and additional feasible measures.

As discussed in our 2021 Proposed Rule,[96] the modeled response to 30% ammonia emissions reductions is above the EPA's recommended contribution threshold of 0.20 μg/m^3 at two monitoring sites, Madera and Hanford, providing evidence that ammonia significantly contributes to $PM_{2.5}$ in SJV. In the previous proposal, we gave those responses less weight, because of specific evidence available for these sites that the responses were overestimated. For Madera, the monitoring data used in estimating the model response are biased high, and therefore the modeled response of 0.21 μg/m^3, just above contribution threshold, is likely overestimated. For Hanford, several analyses showed ambient ammonia concentrations are underestimated, and so we believe that the modeled response of 0.26 μg/m^3 is likely overestimated. Supporting that conclusion is the evidence from ambient concentrations of excess ammonia relative to nitrate, which suggest that $PM_{2.5}$ responses to reductions of ammonia emissions would be dampened by the NO_X-limited nature of ammonium nitrate formation in the SJV.

All of those considerations remain for the current proposal. But in light of comments received and re-evaluation of the available evidence, the EPA believes we should give the Hanford response more weight, because that response would be larger if the ammonia reductions modeled were larger than the 30% assumed in the State's precursor demonstration. The previous subsection gave several examples of the uncertainty and possible underestimation of the ammonia benefit of available control measures to the SJV. The EPA does not believe there is sufficient quantitative evidence to rely on 30% as the amount of achievable reductions, and as the amount to use an upper bound on the ammonia emission reductions modeled in the State's precursor demonstration. A robust controls evaluation could show that a larger amount of reductions is achievable. If it is, then not only would the Hanford modeled response be larger, but additional monitoring sites could have a modeled response above the contribution threshold.

For example, with respect to the modeled 2024 ambient $PM_{2.5}$ responses to a 70% emission reduction, we note that the modeled high site of Bakersfield-Planz would have a response of 0.36 μg/m^3, the site with the largest modeled response would be 0.75 μg/m^3 at Hanford, and six sites (including Hanford) would have modeled responses greater than 0.5 μg/m^3. As a more modest example, interpolating between the available 30% and 70% modeled results, if 32% reductions are achievable, then three additional monitoring sites (Turlock, Merced-S. Coffee St., and Modesto) would reach the 0.2 μg/m^3 contribution threshold. The uncertainty over the ammonia response means that we cannot rely on 30% as an upper bound for ammonia emission reductions, and so the weight of evidence shifts relative to that in the 2021 Proposed Rule.

The discussion in this proposed rule, and the heavy reliance in the 2021 Proposed Rule, on the State's use of a 30% upper bound for potential reduction from controls should not be interpreted as establishing a 30% ''bright line'' for deciding whether a precursor should be regulated. The $PM_{2.5}$ Precursor Guidance recommends that 30% to 70% emissions reductions be modeled as a way of implementing the $PM_{2.5}$ SIP Requirements Rule's option in 40 CFR 51.1006(a)(1)(ii) for a State to assess the sensitivity of the atmospheric $PM_{2.5}$ to precursor emission reductions. The sensitivity of the atmosphere to reductions is a separate question from what reductions are achievable from controls; the latter is properly part of the control evaluation for BACM, BACT, and additional feasible measures. However, it is important to note that under 40 CFR

[91] In evaluating the aggregate reductions available across all sub-activities, it may be important to evaluate the extent to which reductions at one sub-activity may affect emissions at other stages of the process.

[92] 2018 $PM_{2.5}$ Plan, App. C, C–311.

[93] 2018 $PM_{2.5}$ Plan, App. C, C–339 to C–343.

[94] Id. at C–341.

[95] Unlike Rule 4570, which has been approved into the California SIP to limit VOC emissions, the State's water-related regulations on fertilizer application have not been submitted for approval into the California SIP.

[96] 86 FR 74310, 74320.

51.1010(a)(2)(ii), the EPA may require a control evaluation to help the EPA evaluate the precursor demonstration. The $PM_{2.5}$ Precursor Guidance explains that the additional information from a control evaluation is particularly important when modeled precursor contributions are close to the threshold for a 30% reduction.[97] But the regulations and guidance do not establish an automatic ''off ramp'' for a State to be discharged from the requirements for BACM, BACT, and additional feasible measures via a showing that achievable reductions are below a particular percentage.

We have no evidence that emission reductions below current emissions levels from BACM on all ammonia sources in the SJV would be as large as 70%, but the lack of a developed record showing what ammonia control measures are feasible and what they could achieve makes it harder for the EPA to assess this point. We also lack sufficient evidence to conclude that reasonable ammonia control measures could achieve no more than 30% reductions, and so cannot rely on that supposition in weighing the modeled responses to reductions and other evidence. Better quantification of the possible ammonia reductions from current levels that could result from additional controls would help resolve this issue. Reconciliation of modeled sensitivity with that expected from ambient studies would also be appropriate.

The EPA has re-examined the 2024 sensitivity analyses to both 30% and 70% ammonia emission reductions in light of the uncertainty that 30% represents a reasonable upper bound for potential ammonia emission reductions. We note that the State modeled 30% reduction scenarios and predicted ambient $PM_{2.5}$ responses above 0.2 $\mu g/m^3$ at 2 of 15 sites in 2024; and modeled the 70% reduction scenarios and predicted responses above 0.2 $\mu g/m^3$ at all monitors in 2024.[98] The EPA maintains that the State's reliance on its sensitivity-based contribution analysis for a future year (2024) to evaluate the significance of ammonia as a precursor is reasonable, well supported, and consistent with the EPA's guidance. There are also good reasons for giving less weight to the modeled responses at the Madera and Hanford sites, although those are tempered by the consideration that there is not good support for limiting the modeled ammonia reductions to 30%, leading to the possibility of larger responses at Hanford and of additional sites with responses above the contribution threshold.

The weight of the evidence, including at least one site above the EPA's recommended contribution threshold and the possibility of additional ones depending on the unknown amount of reductions achievable, favor retaining the presumption that ammonia must be regulated as a $PM_{2.5}$ precursor for the 2012 annual $PM_{2.5}$ NAAQS in the SJV. For the reasons explained above, the Plan both indicates that there are levels of ammonia control that could have a significant impact on $PM_{2.5}$ levels at multiple monitors in the SJV and does not dispose the potential availability of ammonia emission reductions at a level that would have such impacts. Therefore, the EPA proposes to disapprove the State's ammonia precursor demonstration for the Serious area requirements for purposes of the 2012 annual $PM_{2.5}$ NAAQS in the SJV.

B. Best Available Control Measures

1. Statutory and Regulatory Requirements

Section 189(b)(1)(B) of the Act requires for any Serious $PM_{2.5}$ nonattainment area that the State submit provisions to assure that the best available control measures (BACM), including controls that reflect best available control technology (BACT), for the control of $PM_{2.5}$ and $PM_{2.5}$ precursors shall be implemented no later than four years after the date the area is reclassified as a Serious area. The EPA has defined BACM in the $PM_{2.5}$ SIP Requirements Rule to mean ''any technologically and economically feasible control measure that can be implemented in whole or in part within 4 years after the date of reclassification of a Moderate $PM_{2.5}$ nonattainment area to Serious and that generally can achieve greater permanent and enforceable emissions reductions in direct $PM_{2.5}$ emissions and/or emissions of $PM_{2.5}$ plan precursors from sources in the area than can be achieved through the implementation of reasonably available control measures (RACM) on the same source(s).'' [99]

The EPA generally considers BACM a control level that goes beyond existing RACM-level controls, for example by expanding the use of RACM controls or by requiring preventative measures instead of remediation.[100] Indeed, because states are required to implement BACM and BACT when a Moderate nonattainment area is reclassified as Serious due to its inability to attain the NAAQS through implementation of ''reasonable'' measures, it is logical that ''best'' control measures should represent a more stringent and potentially more technologically advanced or more costly level of control.[101] If RACM and RACT level controls of emissions have been insufficient to reach attainment, then the CAA Title I, Part D, subpart 4 provisions for $PM_{2.5}$ nonattainment plans contemplate the implementation of more stringent controls, controls on more sources, or other adjustments to the control strategy necessary to attain the NAAQS in the area. Thus, BACM/BACT determinations are to be ''generally independent'' of attainment for purposes of implementing the $PM_{2.5}$ NAAQS.[102]

Consistent with longstanding guidance provided in the General Preamble Addendum, the preamble to the $PM_{2.5}$ SIP Requirements Rule discusses the following steps for states to use in identifying and selecting the emission controls needed to meet the BACM/BACT requirements of 40 CFR 51.1010:

1. Develop a comprehensive emission inventory of all sources of $PM_{2.5}$ and $PM_{2.5}$ precursors from major and non-major stationary point sources, area sources, and mobile sources;
2. Identify potential control measures for all sources or source categories of emissions of $PM_{2.5}$ and relevant $PM_{2.5}$ plan precursors;
3. Determine whether an available control measure or technology is technologically feasible;
4. Determine whether an available control measure or technology is economically feasible; and
5. Determine the earliest date by which a control measure or technology can be implemented in whole or in part.[103]

The EPA allows states to consider factors such as a source's processes and operating procedures, raw materials, physical plant layout, and potential environmental impacts such as increased water pollution, waste disposal, and energy requirements when

[97] $PM_{2.5}$ Precursor Guidance, 31.

[98] 2018 $PM_{2.5}$ Plan, App. G, tables 4 through 7.

[99] 40 CFR 51.1000 (definitions). In longstanding guidance, the EPA has similarly defined BACM to mean, ''among other things, the maximum degree of emissions reduction achievable for a source or source category, which is determined on a case-by-case basis considering energy, environmental, and economic impacts.'' General Preamble Addendum, 42010, 42013.

[103] 81 FR 58010, 58083–58085.

considering technological feasibility.[104] For purposes of evaluating economic feasibility, the EPA allows states to consider factors such as the capital costs, operating and maintenance costs, and cost effectiveness (*i.e.,* cost per ton of pollutant reduced by a measure or technology) associated with the measure or control.[105] For any potential control measure identified through the process described above that is eliminated from consideration, states are required to provide detailed written justification for doing so on the basis of technological or economic feasibility, including how its criteria for determining such feasibility are more stringent than those used for determining RACM/RACT.[106]

Once these analyses are complete, the State must use this information to develop enforceable control measures for all relevant source categories in the nonattainment area and submit them to the EPA for evaluation as SIP provisions to meet the basic requirements of CAA section 110 and any other applicable substantive provisions of the Act.

2. BACM for Ammonia Sources

As previously noted, as part of the EPA's 2021 Proposed Rule, we reviewed the State's analysis of ammonia control for the primary source categories of ammonia in the context of our evaluation of the State's precursor demonstration.[107] Because our prior proposal to approve the State's ammonia precursor demonstration would have relieved the State of its obligation to implement BACM for ammonia sources, we did not present a summary of the 2018 $PM_{2.5}$ Plan with respect to the BACM requirements for ammonia for the 2012 annual $PM_{2.5}$ NAAQS, nor our evaluation thereof. Given our reconsidered proposal to disapprove the State's ammonia precursor demonstration, in the following sections of this proposed rule we evaluate the District's control analysis for the two most substantial source categories of ammonia, which together sum to more than 90% of the emissions in the SJV: CAFs and fertilizer application.

a. Summary of State's Submission

The District presents its analysis of ammonia controls for the primary ammonia source categories in the SJV in Appendix C, section C.25 (''Ammonia in the San Joaquin Valley'') of the 2018 $PM_{2.5}$ Plan. The District evaluated its emission control measures for compliance with BACM for CAFs and described water-related measures applicable to fertilizer application that have co-benefits to air quality. The District presents its reasoning that measures that control VOC emissions, such as Rule 4570 for CAFs, also reduce ammonia emissions due to the physical processes occurring in decomposing manure and subsequent volatilization of decomposition products (like VOC and ammonia). As part of its process for identifying candidate BACM, considering the technical and economic feasibility of additional control measures, the District reviewed the EPA's guidance documents on BACM, and control measures implemented in other nonattainment areas in California and other states.[108]

For CAFs, the District discusses in detail how Rule 4570 (''Confined Animal Facilities'') is structured (*e.g.,* to address varying types of CAFs, including applicability thresholds); the five main CAF operations/emission sources: feeding, housing (including distinctions for housing configurations), solid waste, liquid waste, and land application of manure; and the control menu requirements for each of those five operations.[109] The District summarizes the specific requirements applicable to each type of cattle-based CAF, including dairies, beef feedlots, and ''other cattle'' and describes its basis for ammonia emission reductions estimates, including cited research papers.

The District also compares Rule 4570 to other CAF rules imposed by the South Coast Air Quality Management District (AQMD), Bay Area AQMD, Sacramento Metropolitan AQMD, Imperial County Air Pollution Control District (APCD), and the State of Idaho.[110] The District evaluates a potential additional control measure—application of sodium bisulfate to reduce pH and bacterial levels in bedding for dairy cattle—and concludes that such measure is not feasible based on a number of factors, including health and safety of dairy workers and animals, impacts on water quality, and overall cost and effectiveness.[111]

For fertilizer application, as described in section II.A.3 of this proposed rule, the District states that fertilizer application is the second largest ammonia source in the SJV and that the District does not have statutory authority to regulate such activities.[112] Notwithstanding, the District describes how regulations adopted by the California Water Resources Control Board, including orders adopted by the Central Valley Regional Water Quality Control Board (*e.g.,* a Nutrient Management Plan), the Irrigated Lands Regulatory Program (*e.g.,* a Nitrogen Management Plan), or other individual mechanisms [113] subject agricultural operators, including dairies, bovine feedlots, poultry operations, and crop farmers to ''waste discharge requirements that protect both surface water and groundwater.'' [114]

Overall, the District concludes that ''the Valley's ammonia emissions have been significantly reduced through stringent regulations, that additional ammonia control measures are infeasible, and that Valley sources are already implementing BACM.'' [115]

b. Summary of Adverse Comments

Public Justice states that ''[w]eaker controls are consistently allowed for agricultural sources,'' including an ''expansive menu of control options'' in Rule 4570, that they assert provide little to no emission reduction benefit.[116] More broadly, as described in section II.A.2 of this proposed rule, the commenters assert that ''[t]he analysis of potential controls is particular[ly] weak and ignores the wealth of literature demonstrating that strategies for reducing ammonia emissions from agriculture . . . are among the most effective for also reducing PM concentrations,'' and cite several studies in support of this argument.[117] The commenters further state that reducing ammonia emissions may be achieved through ''strategies such as improving livestock feed to reduce excreted nutrients, altering manure storage and handling practices to prevent [ammonia] emissions, and improving synthetic fertilizer use efficiency,'' again citing numerous studies.[118] The commenters

argue that the EPA ''should reject the plan's BACM analysis for failing to justify these weaker controls, and for being inconsistent with the Title VI prohibition against policies and practices that inflict disparate impacts.''

c. The EPA's Reconsidered Proposal

As a result of our proposed conclusion that ammonia remains a regulated precursor for the 2012 annual $PM_{2.5}$ NAAQS in the SJV, the EPA has evaluated potential ammonia emissions control measures for the two most substantial source categories in the SJV and evaluated whether the State has implemented ammonia controls with a BACM/BACT level of stringency. Thus, the EPA has also evaluated the existing control measures that the State claims are BACM for two of the main sources of ammonia in the area, including confined animal facilities (CAFs) and fertilizer application.[119] As discussed below, we conclude that the SJV has not established that it has enforceable requirements in the SIP that meet a BACM level of stringency to reduce ammonia emissions from these two categories. Therefore, we propose to disapprove BACM for ammonia sources in the SJV.

Our basis for proposing to disapprove BACM for ammonia sources flows from the controls analysis we have reviewed and discuss in section II.A.3 of this proposed rule. We agree with the commenters that the analysis of potential controls in the 2018 $PM_{2.5}$ Plan was weak in two general areas: (1) incomplete quantification of existing ammonia emission reductions, and (2) lack of consideration of potential ammonia control measures identified in research studies. In that section we describe the Plan's weaknesses with respect to quantifying emission reductions and rely on that description for purposes of evaluating BACM.

Similarly, in section II.A.3, we discuss additional options for ammonia control that we will not reiterate here. Based on our review of the additional research studies cited by the commenters with respect to CAFs, measures such as those for adjusting the protein content of livestock feed (*e.g.,* reducing the portion of beef cattle finishing diets by 1.5% steam-flaked corn), manure handling and storage (*e.g.,* washing dairy cow collecting yards after each milking event, covering solid manure stores with sheeting), and land application of slurry (*e.g.,* injection application techniques), it appears that additional measures may be available to evaluate. Absent a thorough and more current evaluation of technological and economic feasibility of potential measures as applied in the SJV, we propose to find that the State has not demonstrated whether or how additional measures (*e.g.,* in the form of existing options that could also be feasibly implemented, or new options that may lead to increased reductions) may have been evaluated, implemented (even partially) by the existing rules, or set aside for reasons of technological feasibility or economic feasibility, consistent with the BACM requirements.

For fertilizer application, as discussed in section II.A.3 of this proposed rule, the District indicates that it does not have authority to regulate ammonia emissions from fertilizer application. Regardless of which State entity, as a matter of State law, has authority over this class of activities, CAA section 189(b)(1) requires that the State include provisions to ensure implementation of BACM for direct $PM_{2.5}$ and plan precursor emissions, and CAA section 110(a)(2)(E)(i) requires the State to provide necessary assurances that it has adequate authority to carry out the implementation plan for the area. While the Plan describes certain water-related measures (*e.g.,* Nutrient Management Plans and Nitrogen Management Plan) that subject agricultural operators, including dairies, bovine feedlots, poultry operations, and crop farmers to waste discharge requirements, and likely limit ammonia emissions to the air, to our knowledge, these regulations do not impose any enforceable requirement for ammonia emissions to the air, and thus suffer a similar problem as Rule 4570.[120]

We agree that as a general matter, managing the amount of nitrogen applied to the environment should reduce the potential for pollution to air, water, and land. However, the 2018 $PM_{2.5}$ Plan does not quantify or otherwise substantiate the scale and timing of such potential ammonia emission reduction benefits, nor their enforceability. We propose that the State has not adequately identified potential control measures, evaluated for BACM/BACT, nor demonstrated the implementation of BACM/BACT for controlling ammonia emissions from fertilizer application, the second largest source of such emissions in the SJV.

As a result of our proposal that the State has not demonstrated that BACM/BACT controls are in place for CAFs and fertilizer application, two source categories that make up more than 90% of the ammonia emissions in the SJV, we propose to disapprove the State's BACM demonstration for ammonia sources.

3. BACM for Building Heating Emission Sources

a. Summary of 2021 Proposed Rule

In our 2021 Proposed Rule, the EPA summarized the State's submission in the 2018 $PM_{2.5}$ Plan for the SJV and presented our BACM evaluation for emission sources of direct $PM_{2.5}$ and NO_X.[121] We briefly summarize those components here with respect to the State's BACM demonstration for building heating emission sources, such as water heaters and space heaters (*e.g.,* furnaces), in the SJV.

In Appendix C of the 2018 $PM_{2.5}$ Plan, the District identifies the stationary and area sources of direct $PM_{2.5}$ and NO_X in the SJV that are subject to District emission control measures and provides its evaluation of these regulations for compliance with BACM requirements. As part of its process for identifying candidate BACM, the District reviewed the EPA's guidance documents on BACM, additional guidance documents on control measures for direct $PM_{2.5}$ and NO_X emission sources, and control measures implemented in other ozone and $PM_{2.5}$ nonattainment areas in California and other states.[122] Based on these analyses, the District concludes that all best available control measures for stationary and area sources are in place in the SJV for NO_X and directly emitted $PM_{2.5}$ for purposes of meeting the BACM/BACT requirement for the 2012 annual $PM_{2.5}$ NAAQS.

With respect to building heating emission sources, the District presents its evaluations of Rule 4902 (''Residential Water Heaters'') and Rule 4905 (''Natural Gas-Fired, Fan-Type Central Furnaces'') in sections C.20 and C.21, respectively, of Appendix C of the 2018 $PM_{2.5}$ Plan. Both rules are point of sale rules that limit what kinds of residential water heaters and furnaces may be sold in the SJV. The District describes the types of equipment covered by each rule, compares the specific provisions of each rule that

ammonia emissions from artificial feedyard surfaces,'' J. Environ. Qual. 35, 404–411, 2006.

[119] By focusing on these two source categories, the EPA is not indicating that this is an exhaustive list of ammonia source categories that must be evaluated for BACM. However, because these two categories amount to more than 90% of the ammonia emissions in the SJV, we focus our analysis on these two categories.

[120] Unlike Rule 4570, which has been approved into the California SIP to limit VOC emissions, the State's water-related regulations on fertilizer application have not been submitted for approval into the California SIP.

[121] 86 FR 74310, 74324–74325.

[122] 2018 $PM_{2.5}$ Plan, Ch. 4, section 4.3.1.

limit NO_X emissions [123] to comparable rules in other California air districts, and concludes that each rule represents BACM for their respective source category.

Rule 4902 applies to natural gas-fired, residential water heaters with heat input rates less than or equal to 75,000 British thermal units per hour (Btu/hr). The District tightened the rule's NO_X limits in 2009; and the EPA approved the rule into the SIP in 2010.[124] The District estimates that, due to Rule 4902, annual average emissions of NO_X would decrease from 2.15 tpd in 2013 to 1.91 tpd in 2025 (0.24 tpd decrease) and annual average emissions of direct $PM_{2.5}$ would increase from 0.21 tpd in 2013 to 0.23 tpd in 2025 (0.02 tpd increase).[125]

In addition to comparing the NO_X limits in its Rule 4902 to rules in other California air districts, the District also presents a multi-factor comparison of natural gas-fired and propane-fired, water heaters to electric water heaters.[126] The District discussed the likely impacts of requiring electric water heaters, including the advantages such as no NO_X emissions,[127] less expensive purchase price, and smaller size, and the disadvantages such as higher cost of electricity, and the costs of residence modifications to convert to electric. Based on 2017–2018 data, which is consistent with the timing of Plan adoption in 2018, the District calculated emission reductions and cost effectiveness of the three kinds of water heaters by fuel type and concluded that ''[w]hile the lifetime cost of an electric water heater is higher than that of propane and natural gas, the emissions benefits may make converting to electric water heating a viable control strategy.'' [128] The analysis does not explore the cost effectiveness of such controls and Rule 4902 does not include any requirements regarding electrification.

Rule 4905 applies to natural gas-fired, fan-type central furnaces with heat input rates less than 175,000 Btu/hr and combination heating and cooling units with a rated cooling capacity of less than 65,000 Btu/hr. In 2015, the District tightened the rule's NO_X limits for residential units and expanded the rule to include commercial units and manufactured homes according to a phase-in schedule. The EPA approved the rule into the SIP in 2016.[129] The District estimates that, due to Rule 4905, annual average emissions for NO_X will decrease from 2.44 tpd in 2013 to 2.13 tpd in 2025 (0.31 tpd decrease) and annual average emissions for direct $PM_{2.5}$ will increase from 0.20 tpd in 2013 to 0.22 tpd in 2025 (0.02 tpd increase).[130] Given the need to extend certain compliance deadlines in subsequent amendments to Rule 4905 due to limited supply of certified compliant units,[131] the District states that it had identified no additional emission reduction measures for this source category as of that point in time.[132]

As noted in the EPA's 2021 Proposed Rule, we provided our evaluation of the District's BACM demonstration for stationary and area sources in general, and several source categories in more detail, in three documents: (1) section III of the EPA's ''Technical Support Document, EPA Evaluation, San Joaquin Valley Serious Area Plan for the 2012 Annual $PM_{2.5}$ NAAQS,'' December 2021 (''EPA's 2012 Annual $PM_{2.5}$ TSD''); (2) the EPA's ''Technical Support Document, EPA Evaluation of BACM/MSM, San Joaquin Valley $PM_{2.5}$ Plan for the 2006 $PM_{2.5}$ NAAQS,'' February 2020 (''EPA's BACM/MSM TSD''); and (3) the EPA's ''Response to Comments Document for the EPA's Final Action on the San Joaquin Valley Serious Area Plan for the 2006 $PM_{2.5}$ NAAQS,'' June 2020 (''EPA's 2020 Response to Comments''). In particular, the EPA's 2020 Response to Comments presented our evaluation of the District's BACM demonstration for residential water heaters and residential and commercial, natural gas-fired, fan-type central furnaces.[133] At that time we found that the requirements for residential fuel combustion covered by Rule 4902 and Rule 4905 represented BACM.[134] In addition, the EPA concluded that setting a zero-NO_X standard for heating appliances in new buildings reasonably requires additional consideration and analysis of technological and economic feasibility by the District because, per the 2018 $PM_{2.5}$ Plan, the most common types of residential water heaters and furnaces are those that use natural gas as fuel.

We also noted that the building codes referenced by commenters at that time appear to be green building code ordinances that restrict or prohibit installation of natural gas or propane appliances in new construction.[135] Such ordinances, most of which appeared to have been adopted in late 2019 and early 2020, fell within a category known as ''reach codes,'' which are city and county building code standards for energy efficiency that exceed California's State-wide standards. We stated that California law requires local governments to submit proposed ordinances to the California Energy Commission (CEC) for a determination that they will be both cost effective and more energy efficient than statewide standards; compliance with this procedure is necessary for such measures to be enforceable.[136] We also noted that ordinances adopted by city councils and county officials are legally distinct from measures adopted by the governing boards of the respective air districts and that it did not appear at the time that California air districts had adopted similar restrictions.

b. Summary of Adverse Comments

Public Justice states that further emission controls are available for building heating via the electrification of furnaces, water heaters, and other gas-fired appliances.[137] The commenters refer to comments submitted by a group of environmental, public health, and community organizations (collectively referred to herein as ''NPCA'') on the EPA's proposed rule on the 2006 24-hour $PM_{2.5}$ NAAQS portion of the SJV $PM_{2.5}$ Plan,[138] noting that building electrification requirements to reduce emissions from such sources already

[123] The District notes that equipment subject to Rule 4902 are fired on natural gas that meets California Public Utility Commission standards and, therefore, emit only low amounts of SO_X and direct $PM_{2.5}$. 2018 $PM_{2.5}$ Plan, App. C, C–288.

[137] Public Justice Comment Letter, 19.

[138] Comment letter dated and received April 27, 2020, from Mark Rose, NPCA, et al., to Rory Mays, EPA, including Appendices A through G. The seven environmental and community organizations, in order of appearance in the letter, are the National Parks Conservation Association (NPCA), Earthjustice, Central Valley Air Quality Coalition, Coalition for Clean Air, Central Valley Environmental Justice Network, The Climate Center, and Central Valley Asthma Collaborative (collectively ''NPCA'').

exist in over 30 jurisdictions in California and other states. The commenters state that, since that time, additional jurisdictions have moved forward with gas bans, appliance standards, and other strategies for building heating.[139]

With respect to the EPA's response to the NPCA comments in 2020,[140] Public Justice argues that the ''EPA merely asserted that the District had found increased building electrification infeasible,'' despite the record showing that other jurisdictions required such measures, and assert that the District noted the potential of such measures but rejected them without explanation. The commenters further argue that the EPA did not rebut evidence on the benefits and feasibility of such measures, instead noting the need for further consideration, and that two years later, the Plan does not provide further consideration.

c. The EPA's Reconsidered Proposal

Based on the adverse comments from Public Justice, the EPA has reconsidered our proposed approval of the State's demonstration of BACM for NO_X and direct $PM_{2.5}$ emissions from building heating appliances, such as residential water heating and residential and commercial space heating. As discussed below, we now propose to disapprove the State's BACM demonstration for such building heating emission sources.

Although the EPA has previously approved the State's BACM demonstration for building heating emission sources in 2020 with respect to the 2006 24-hour $PM_{2.5}$ NAAQS portion of the 2018 $PM_{2.5}$ Plan, and such approval was upheld by the Ninth Circuit Court of Appeals,[141] several factors have reshaped the facts and circumstances of controlling emissions from such sources as of 2022 and beyond. First, while building ordinances that restrict or prohibit installation of natural gas or propane appliances in new construction were starting to appear in 2019 and 2020, as Public Justice correctly asserts, two additional years have passed and additional jurisdictions have adopted gas bans, appliance standards, and other strategies for building heating.[142] A recent policy brief published by the UCLA School of Law states that 52 cities and counties in California have adopted building codes to reduce their reliance on gas for building heating appliances, and discusses several examples.[143] The growth in the number and types of local control measures to reduce pollution from building heating by restricting or limiting the use of natural gas-fired heaters support their general availability as technologically feasible measures.

Second, the time horizon of the 2012 annual $PM_{2.5}$ NAAQS portion of the SJV $PM_{2.5}$ Plan is one year later (2025 attainment date) than that of the 2006 24-hour $PM_{2.5}$ NAAQS portion of the Plan (2024 attainment date), affording additional time for potential control measures to achieve emission reductions that may assist attainment of the 2012 annual $PM_{2.5}$ NAAQS. Even if full implementation of such new measures is not possible by the applicable attainment date, the State should evaluate whether they could be implemented in part, consistent with the fifth step for BACM/BACT evaluation discussed in the $PM_{2.5}$ SIP Requirements Rule and the General Preamble (*i.e.,* to determine the earliest date by which a control measure or technology can be implemented in whole or in part).[144]

Third, some of the underlying bases for the District's cost comparison for residential water heating may have changed since the District's 2018 adoption of the Plan. For example, in comparing emission reductions and cost effectiveness of low-NO_X natural gas, propane, and electric water heaters, the District used data on energy factors and purchase price from Grainger Industrial Supply as of June 14, 2018, and lifetime energy cost data from the U.S. Energy Information Administration as of 2017. Furthermore, as claimed by Public Justice, the District did not explain its rejection of additional control measures of this type, other than to assert that they were generally more costly. Regarding residential and commercial space heating, CARB and the District did not provide a detailed economic feasibility analysis in the Plan. CARB and the District simply stated that, due to limited supply of certified compliant natural gas-fired units to comply with Rule 4905, they could identify no additional emission reduction measures. The incomplete cost analyses presented by the District, changes in costs over time, and lack of justification for rejecting measures to reduce pollution from building heating by restricting or limiting the use of natural gas-fired heaters indicate an insufficient economic feasibility analysis.

Fourth, CARB and at least one other air district (Bay Area AQMD) are moving forward in developing measures to set zero-emission standards for space heaters and water heaters. In developing its 2022 State SIP Strategy (for the 2015 ozone NAAQS), CARB has stated that the ''fuels we use and burn in buildings, primarily natural gas, for space and water heating contribute significantly to building-related criteria pollutant and GHG emissions and provide an opportunity for substantial emissions reductions where zero-emission technology is available.'' [145] Accordingly, CARB is developing zero-emission standard concepts and, given the intersection of air quality needs and other areas of building and energy regulation, and identifying other regulatory entities that they plan to engage, including the U.S. Department of Energy, CEC, and the California Building Standards Commission, Department of Housing and Community Development. We note, however, that the proposed 2022 State SIP Strategy released August 12, 2022, anticipates implementation starting in 2030, pending rule development and CARB Board hearing in 2025.[146]

The Bay Area AQMD hosted public meetings in 2021 and developed draft amendments to certain rules that would reduce NO_X emissions from residential and commercial furnaces and water heaters.[147] Specifically, Bay Area AQMD has developed draft amendments to two rules: (1) Regulation 9, Rule 4 (''Nitrogen Oxides from Fan Type Residential Central Furnaces''), which applies to furnaces with a heat input rate of less than 175,000 Btu/hr and combination heating and cooling units with a rated cooling capacity of less than 65,000 Btu/hr (like SJVUAPCD Rule 4905); and (2) Regulation 9, Rule 6 (''Nitrogen Oxides Emissions from

[139] Public Justice Comment Letter, 19, and Exhibits 41 through 44. Commenters also state that studies suggest these measures may provide particularly notable benefits to winter $PM_{2.5}$ peaks in the SJV. Id. at 19.

[147] A summary of the Bay Area AQMD's rule development is available at: *https://www.baaqmd.gov/rules-and-compliance/rule-development/building-appliances.*

Natural Gas-Fired Boilers and Water Heaters''), which applies to water heaters with a rated heat input capacity of 75,000 Btu/hr or less (like SJVUAPCD Rule 4902), as well as additional source types and sizes.[148]

For Rule 4, Bay Area AQMD staff have developed draft amendments to lower the current NO_X emission limit for applicable furnaces from 40 nanograms of NO_X per joule of useful heat (ng/j) to 14 ng/j (which would match the limit in SJVUAPCD Rule 4905) in the short term (with a compliance date of January 1, 2023); followed by a zero-NO_X emission requirement (with a compliance date of January 1, 2029); and expand the applicability beyond fan-type central furnaces to other types of equipment (*e.g.,* wall furnaces and direct vent units).[149] For Rule 6, which contains NO_X limits for small boilers and water heaters, Bay Area AQMD staff proposes a zero-NO_X emission requirement. However, staff also note that while technologies achieving zero-NO_X emissions exist, ''they are limited in availability and can be expensive,'' that such standards would be ''technology and market-forcing,'' and, therefore, staff proposes compliance dates of January 1, 2027, and January 1, 2031, depending on equipment heat rate (*i.e.,* the size of the boiler or water heater).[150]

CARB and Bay Area AQMD efforts in this area underscore the importance of building heating emission sources, such as water heaters and space heaters (*e.g.,* furnaces), throughout California and the continued effort to implement available control measures for these sources for criteria pollutant attainment planning requirements. At the same time, while SJVUAPCD, CARB, and Bay Area AQMD each acknowledge that zero-NO_X emission technology for small residential and commercial space and water heating is available, it is unclear what a feasible implementation horizon might be in light of CARB's strategy and the Bay Area AQMD's draft amendments. The plan as submitted did not address how such implementation considerations may or may not affect the feasibility of setting such zero-NO_X emission standards for space and water heating in small residential and commercial buildings in the SJV.

Given the factors discussed above, we now propose that the State has not adequately identified potential control measures, evaluated for BACM/BACT, nor demonstrated the implementation of BACM/BACT for controlling NO_X and direct $PM_{2.5}$ emissions from building emission heating sources in the SJV.

C. Attainment Demonstration

1. Summary of 2021 Proposed Rule

In sections IV.C (air quality modeling) and IV.F (attainment demonstration) of our 2021 Proposed Rule, the EPA summarized the CAA and regulatory requirements for air quality modeling and attainment demonstrations, the State's submission in the SJV $PM_{2.5}$ Plan, and our evaluation thereof.[151] We briefly summarize those components herein.

Sections 188(c)(2) and 189(b)(1)(A) of the CAA require that Serious area plans must include a demonstration (including air quality modeling) that provides for attainment of the $PM_{2.5}$ NAAQS as expeditiously as practicable, but no later than the end of the tenth calendar year after the area's designation as nonattainment. The $PM_{2.5}$ SIP Requirements Rule also specifies that the control strategy in a Serious area attainment plan must provide for attainment as expeditiously as practicable.[152] The outermost statutory Serious area attainment date for the 2012 annual $PM_{2.5}$ NAAQS in the SJV is December 31, 2025 (absent an EPA-approved attainment date extension request under CAA section 188(e)). For purposes of determining the attainment date that is as expeditious as practicable, the State must conduct future year modeling that takes into account emissions growth, known emissions controls (including any controls that were previously determined to be RACM/RACT or BACM/BACT), any other emissions controls required to meet BACM/BACT, and additional measures as needed for expeditious attainment of the NAAQS. The regulatory requirements for Serious area plans are codified at 40 CFR 51.1010 (control strategy requirements) and 40 CFR 51.1011(b) (attainment demonstration and modeling requirements). We also described the EPA's $PM_{2.5}$ modeling guidance (''Modeling Guidance''),[153] including our recommendations therein for photochemical modeling, inputs, procedures, performance evaluation, emissions simulation, and calculating relative response factors (RRFs).

With respect to air quality modeling, the 2018 $PM_{2.5}$ Plan included the State's modeled attainment demonstration projecting that the SJV will attain the 2012 annual $PM_{2.5}$ NAAQS by December 31, 2025; the State's primary discussion of the photochemical modeling appears in Appendix K (''Modeling Attainment Demonstration''). The State provides a conceptual model of $PM_{2.5}$ formation in the SJV as part of the modeling protocol in Appendix L (''Modeling Protocol'') and describes emission input preparation procedures. The State presents additional relevant information in Appendix C (''Weight of Evidence Analysis'') of CARB's staff report for the 2018 $PM_{2.5}$ Plan,[154] which includes ambient trends and other data in support of the demonstration of attainment by 2025.

In the 2021 Proposed Rule, the EPA presented its review of the State's modeling approach and its many interconnected facets, including model input preparation, model performance evaluation, use of the model output for the numerical NAAQS attainment test, and modeling documentation, and found it to be generally consistent with the EPA's recommendations in the Modeling Guidance. We incorporated our evaluation of the Plan's modeling for the 2006 24-hour $PM_{2.5}$ NAAQS portion of the SJV $PM_{2.5}$ Plan[155] and extended that evaluation with information specific to the 2012 annual $PM_{2.5}$ NAAQS. Overall, in the 2021 Proposed Rule, we considered the State's analyses consistent with the EPA's guidance on modeling for $PM_{2.5}$ attainment planning purposes and proposed to find that the modeling in the 2018 $PM_{2.5}$ Plan was adequate for the purposes of supporting the State's RFP demonstration and the attainment demonstration.

With respect to the attainment demonstration, the SJV $PM_{2.5}$ Plan includes a modeled demonstration projecting attainment of the 2012 annual $PM_{2.5}$ NAAQS in the SJV by December 31, 2025, based on emission reductions

[148] As in the San Joaquin Valley, larger boilers and similar equipment used in industrial, institutional, and large commercial settings are subject to other rules of the Bay Area AQMD, and therefore not subject to Rule 4 or Rule 6.

[149] Bay Area AQMD, ''Workshop Report, Draft Amendments to Building Appliance Rules—Regulation 9, Rule 4: Nitrogen Oxides from Fan Type Residential Central Furnaces and Rule 6: Nitrogen Oxide Emissions from Natural Gas-Fired Boilers and Water Heaters,'' September 2021, 1.

[154] CARB, ''Staff Report, Review of the San Joaquin Valley 2018 Plan for the 1997, 2006, and 2012 $PM_{2.5}$ Standards,'' release date December 21, 2018 (''CARB Staff Report'').

[155] EPA Region IX, ''Technical Support Document, EPA Evaluation of Air Quality Modeling, San Joaquin Valley $PM_{2.5}$ Plan for the 2006 $PM_{2.5}$ NAAQS,'' February 2020 (''EPA's 2006 NAAQS Modeling TSD'').

from implementation of baseline control measures and the development, adoption, and implementation of additional control measures to meet specific enforceable commitments. In the EPA's 2021 Proposed Rule, we described how the Plan's control strategy was to reduce emissions from sources of NO_X and direct $PM_{2.5}$ and that most of the projected emission reductions are achieved by baseline measures—*i.e.,* the combination of State and District measures adopted prior to the State's and District's adoption of the Plan—that will achieve ongoing emission reductions from the 2013 base year to the 2025 projected attainment year.

The remainder of the Plan's emission reductions are to be achieved by additional measures to meet enforceable commitments, including potential regulatory and incentive-based measures and, as necessary, substitute measures.[156] In the Valley State SIP Strategy and the 2018 $PM_{2.5}$ Plan, CARB and the District, respectively, included commitments to take action on specific measures by specific years or to develop substitute measures (referred to as ''control measure commitments'') and to achieve specified amounts of NO_X and direct $PM_{2.5}$ emission reductions by certain dates (referred to as ''aggregate tonnage commitments'').[157] We refer to these complementary commitments herein as ''aggregate commitments.''

In the 2021 Proposed Rule, the EPA described several findings relating to our evaluation of the SJV $PM_{2.5}$ Plan's attainment demonstration. First, we proposed to approve the Plan's emissions inventories and to find the Plan's air quality modeling adequate.[158] Second, we proposed to find that the Plan provides for expeditious attainment through the timely implementation of the control strategy to reduce emissions from sources of NO_X and direct $PM_{2.5}$, including RACM, BACM, and any other emission controls necessary for expeditious attainment.

Third, the EPA proposed to find that the emissions reductions that are relied on for attainment in the SIP submission are creditable. We noted that the SJV $PM_{2.5}$ Plan relies principally on already adopted and approved rules to achieve the emissions reductions needed to attain the 2012 annual $PM_{2.5}$ NAAQS in the SJV by December 31, 2025, and that the balance of the reductions that the State has modeled to achieve attainment by this date is currently represented by enforceable commitments that account for 13.8% of the NO_X and 8.0% of the direct $PM_{2.5}$ emissions reductions needed for attainment. In terms of our evaluation of CARB and the District's enforceable commitments, we proposed to find that circumstances in the SJV for the 2012 annual $PM_{2.5}$ NAAQS warrant the consideration of enforceable commitments and that the EPA's three criteria for such commitments had been met: (1) the commitments constitute a limited portion of the required emissions reductions; (2) both CARB and the District have demonstrated their capability to meet their commitments; and (3) the commitments are for an appropriate timeframe. We therefore proposed to approve the State's reliance on these enforceable commitments in its attainment demonstration.

Overall, in the 2021 Proposed Rule, we proposed to approve the SJV $PM_{2.5}$ Plan's demonstration of attainment of the 2012 annual $PM_{2.5}$ NAAQS by December 31, 2025, consistent with the requirements of CAA section 189(b)(1)(A). We presented the basis for our proposed determination in sections IV.F.3.a through IV.F.3.e of the 2021 Proposed Rule and provided further detail of our evaluation of baseline measures and the additional measures and aggregate commitments in sections II and IV, respectively, of the EPA's 2012 Annual $PM_{2.5}$ TSD.

2. Summary of Ninth Circuit Order and Adverse Comments

As introduced in section I.D of this proposed rule, in response to a petition for review of the EPA's approval of the 2006 24-hour $PM_{2.5}$ NAAQS portion of the SJV $PM_{2.5}$ Plan, the Ninth Circuit Court of Appeals issued a Memorandum Opinion that, in part, vacated the final action with respect the EPA's second factor for evaluating the validity of the State's enforceable commitments (*i.e.,* whether the State is capable of fulfilling its commitment). The Ninth Circuit's order is very relevant to this proposed rule because the State relied on the same common control strategy, including the same set of enforceable commitments (*i.e.,* the same set of control measure commitments and aggregate tonnage commitments) for both the 2006 24-hour $PM_{2.5}$ NAAQS Serious area plan and the 2012 annual $PM_{2.5}$ NAAQS Serious area plan.

The Ninth Circuit found that the EPA ''fail[ed] to provide evidence or a reasoned explanation for its conclusion that California will be able to fulfill its commitment'' in the face of a potential multi-billion dollar funding shortfall for incentive-based control measure commitments, ''which could result in emission reduction shortfalls of approximately 7% of the total NO_X reductions and 8% of the total $PM_{2.5}$ reductions necessary for attainment.'' [159] In response to the EPA's arguments that: (1) the funding shortfall may be smaller than projected; (2) emission reductions may be less expensive than the strategy predicts; (3) certain yet-to-be-quantified sources of reductions in the Plan may make up for shortfalls; and (4) California and the District may identify other measures to fulfill their commitments, the Court wrote that, ''[b]ecause these speculative assertions are unsupported by the evidence, they fail to ensure that California and the District have a plausible strategy for achieving this portion of the attainment strategy, and therefore do not collectively satisfy the second factor of the EPA's three-factor test.'' [160] It is important to emphasize that the State relied heavily on the projected emission reductions that it hopes to achieve through new control measures and emissions reductions reflected in the aggregate commitments. These reductions are crucial to the State meeting the modeled attainment demonstration and RFP requirements. If it is not credible that the State can meet the commitments, then the EPA cannot approve other nonattainment plan elements that rely upon them.

Separately, in comments on the EPA's 2021 Proposed Rule, Public Justice states that CARB and the District's aggregate tonnage commitments are to ''achieve a specific amount of reductions at the last possible moment prior to the attainment deadline with no concrete strategies for how that will be achieved.'' [161] They assert that prior plans with aggregate tonnage commitments for the 1997 annual $PM_{2.5}$ NAAQS by 2015 (*i.e.,* the 2008 $PM_{2.5}$ Plan) and then by 2020 (*i.e.,* the SJV $PM_{2.5}$ Plan) failed to attain those standards and that such past failures implies that the commitments failed to

[156] In this proposed rule, the term ''substitute measures'' means additional control measures that were not identified in CARB and the District's original control measure commitments in adopting the Valley State SIP Strategy and the 2018 $PM_{2.5}$ Plan, respectively. The ''substitute'' aspect primarily relates to emission reductions (*i.e.,* providing emission reductions where any adopted measure achieves less emission reductions than originally estimated, and/or providing emission reductions in lieu of any originally planned measure that is not adopted). They are also sometimes referred to as ''alternative measures'' in the SJV $PM_{2.5}$ Plan and adopting resolutions.

[157] CARB Resolution 18–49 and SJVUAPCD Governing Board Resolution 18–11–16, paragraph 6.

[158] Sections IV.A (emissions inventory) and IV.C (air quality modeling) of the 2021 Proposed Rule.

[159] *Medical Advocates for Healthy Air* v. *EPA,* Case No. 20–72780, Dkt. #58–1 (9th Cir., April 13, 2022), 6.

[160] Id. at 7.

[161] Public Justice Comment Letter, 20.

deliver the promised clean air.[162] The commenters further state that ''deferred, unspecified, and last-minute promises to achieve reductions (*i.e.,* aggregate commitments), inflicts disparate impacts in violation of Title VI,'' irrespective of whether the commitments comply with the CAA.

3. The EPA's Reconsidered Proposal

As a result of the Ninth Circuit Memorandum Opinion with respect to the SJV $PM_{2.5}$ Plan's enforceable commitments, the EPA has reconsidered its proposed approval of the Plan's demonstration of attainment for the 2012 annual $PM_{2.5}$ NAAQS in the SJV by December 31, 2025, and now proposes to disapprove the Plan's attainment demonstration. The Ninth Circuit Memorandum Opinion raised concerns about the ability of CARB and the District to fulfill the commitments.

We present our reconsideration in the following sections of this proposed rule: (1) our reconsideration of CARB and the District's enforceable commitments and proposal that the commitments do not meet the second factor of the EPA's three-factor test (in section II.C.3.a); and (2) the effect of our proposed disapproval of the State's enforceable commitments and specific portions of the State's BACM demonstration on the modeled attainment demonstration (in section II.C.3.b).

a. Additional Measures and Enforceable Commitments

In this subsection we re-examine CARB and the District's enforceable commitments. We describe CARB and the District's progress in adopting specific measures that they committed to present for governing board adoption, and evaluate whether CARB and the District have demonstrated the capability to achieve specific tonnages of reductions that they committed to achieve by the 2025 attainment year. We first enumerate the measures that have already been approved into the SIP and quantify the amount of the tonnage commitment that these account for. We then calculate CARB and the District's remaining commitments as of the time of this notice, describe the strategy that CARB and the District have provided for achieving the remaining reductions (consisting of submitted measures that have not yet been approved into the SIP, adopted measures that have not yet been submitted to the EPA, measures under development, and other potential future measures), and calculate the reductions that may be associated with these measures. We conclude that although CARB and the District have made substantial progress toward achieving the committed-to reductions, CARB and the District have not presented a plausible strategy demonstrating that they are capable of achieving the *entirety* of the aggregate commitment.

In our 2021 Proposed Rule, the EPA described the SJV $PM_{2.5}$ Plan's series of CARB and District commitments to achieve emission reductions through additional control measures, beyond baseline measures, that are intended to contribute to expeditious attainment of the 2012 annual $PM_{2.5}$ NAAQS. For mobile sources, CARB identified a list of 12 State regulatory measures and 3 incentive-based measures that CARB has committed to propose to its Board for consideration by specific years.[163] For stationary sources, the District identified a list of nine regulatory measures and three incentive-based measures that the District has committed to propose to its Board for consideration by specific years.[164]

The Plan contains CARB's and the District's estimates of the emission reductions that could be achieved by each of these additional measures, if adopted as planned.[165] As we described in our 2021 Proposed Rule, CARB's commitments are contained in CARB Resolution 18–49 (October 25, 2018) and the Valley State SIP Strategy and consist of two parts: a control measure commitment and a tonnage commitment.

First, CARB has committed to ''begin the measure's public process and bring to the Board for consideration the list of proposed SIP measures outlined in the *Valley State SIP Strategy* and included in Attachment A, according to the schedule set forth.'' [166] By email dated November 12, 2019, CARB confirmed that it intended to begin the public process on each measure by discussing the proposed regulation or program at a public meeting (workshop, working group, or Board hearing) or in a publicly-released document, and to then propose the regulation or program to its Board.[167] Second, CARB has committed ''to achieve the aggregate emissions reductions outlined in the Valley State SIP Strategy of 32 tpd of NO_X and 0.9 tpd of $PM_{2.5}$ emissions reductions in the San Joaquin Valley by 2024 and 2025.'' [168] The Valley State SIP Strategy explains that CARB's overall commitment is to ''achieve the total emission reductions necessary to attain the Federal air quality standards, reflecting the combined reductions from the existing control strategy and new measures'' and that ''if a particular measure does not get its expected emissions reductions, the State is still committed to achieving the total aggregate emission reductions.'' [169]

Similarly, in our 2021 Proposed Rule, we explained that the District's commitments are contained in SJVUAPCD Governing Board Resolution 18–11–16 (November 15, 2018) and Chapter 4 of the 2018 $PM_{2.5}$ Plan and also consist of two parts: a control measure commitment and a tonnage commitment. First, the District has committed to ''take action on the rules and measures committed to in Chapter 4 of the Plan by the dates specified therein, and to submit these rules and measures, as appropriate, to CARB within 30 days of adoption for transmittal to EPA as a revision to the [SIP].'' [170] By email dated November 12, 2019, the District confirmed that it intended to take action on the listed rules and measures by beginning the public process on each measure, *i.e.,* discussing the proposed regulation or program at a public meeting, including a workshop, working group, or Board hearing, or in a publicly-released document, and then proposing the rule or measure to the SJVUAPCD Governing Board.[171] Second, the District has

[162] Public Justice refers specifically to the EPA's November 2016 finding of failure to attain and the EPA's November 2021 final disapproval of the 1997 annual $PM_{2.5}$ NAAQS portion of the SJV $PM_{2.5}$ Plan. 81 FR 84481 (November 23, 2016) and 86 FR 67329 (November 26, 2021), respectively.

[163] CARB Resolution 18–49, Attachment A and Valley State SIP Strategy, Table 7 (''State Measures and Schedule for the San Joaquin Valley''). The schedule of proposed SIP measures in Table 7 includes two additional CARB measures: the second phase of the Advanced Clean Cars Program (''ACC 2'') and the ''Cleaner In-Use Agricultural Equipment'' measures. However, these measures are not scheduled for implementation until 2026 and 2030, respectively, which is after the January 1, 2025 implementation deadline under 40 CFR 51.1011(b)(5) for control measures necessary for attainment by December 31, 2025. Therefore, we are not reviewing these measures as part of the control strategy to attain the 2012 annual $PM_{2.5}$ NAAQS in the SJV.

[170] SJVUAPCD Governing Board Resolution 18–11–16, 10–11.

[171] Email dated November 12, 2019, from Jon Klassen, SJVUAPCD, to Wienke Tax, EPA Region IX, ''RE: follow up on aggregate commitments in SJV $PM_{2.5}$ Plan'' (attaching ''District Progress in

committed to ''achieve the aggregate emissions reductions of 1.88 tpd of NO_X and 1.3 tpd of $PM_{2.5}$ by 2024/2025'' through adoption and implementation of these measures or, if the total emission reductions from these rules or measures are less than these amounts, ''to adopt, submit, and implement substitute rules and measures that achieve equivalent reductions in emissions of direct $PM_{2.5}$ or $PM_{2.5}$ precursors'' in the same implementation timeframes.[172]

In sections IV.F.3.c and IV.F.3.d of our 2021 Proposed Rule, the EPA described CARB's and the District's progress as of that point in time on their control measure commitments and progress towards fulfilling their respective aggregate commitments, respectively. Based on our reconsideration of the State's enforceable commitments in light of the Ninth Circuit Memorandum Opinion, while we propose to retain certain findings with respect to the State's progress, we now propose that the State has not adequately demonstrated that it can fulfill the remaining portions of its enforceable commitments (*i.e.,* the second factor of the EPA's three-factor test). We present our reconsidered evaluation of the status of CARB's and the District's control strategy and our three-factor test for enforceable commitments, as follows.

With respect to progress on the control measure commitments, CARB and the District together have adopted 18 measures of the 27 control measure commitments in the SJV $PM_{2.5}$ Plan and have begun the public process on 5 of the remaining control measure commitments, which is unchanged since the time of our 2021 Proposed Rule. This progress is described in further detail in CARB and the District's ''Progress Report and Technical Submittal for the 2012 $PM_{2.5}$ Standard San Joaquin Valley'' (2021 Progress Report).[173] For CARB's portion, CARB has adopted 10 of the 15 measures identified in its commitment (including one incentive-based measure) and begun the public process on 3 of the remaining 5 measures. For the District's portion of the control measure commitments, the District has adopted 8 of the 12 measures identified in its commitment (including one incentive-based measure) and begun the public process on 2 of the remaining 4 measures.

Although CARB and the District have made substantial progress in developing and adopting the regulatory measures listed in their respective control measure commitments, they have not yet fulfilled the commitments for several measures in accordance with the timeframes established in the SJV $PM_{2.5}$ Plan. We provide further detail on CARB and the District's control measure commitments in section IV.A of the EPA's 2012 Annual $PM_{2.5}$ TSD (including tables IV–A and IV–B regarding CARB and the District's control measure commitments, respectively).[174]

Regarding the remaining nine measures not yet proposed for board consideration, we continue to note that one measure, Rule 4550 (''Conservation Management Practices''), has an action year of 2022 in the 2018 $PM_{2.5}$ Plan (*i.e.,* the District has the remainder of 2022 to present a proposed measure for board consideration) and that four regulatory measures and four incentive-based measures are overdue. For the four regulatory measures, while CARB and the District have not proposed these measures to their respective boards, they began the public process on each of the four measures on time with respect to the schedule of their respective public process commitments. To our knowledge, CARB anticipates board consideration of the diesel fuel measures in 2022 and the forklift measure in 2022 or 2023 [175] and continues to develop the airport ground support equipment measure; the District continues to evaluate potential amendments to Rule 4692 in the near future.[176]

For the four incentive-based measures, CARB and the District continue to invest in reducing emissions from heavy-duty trucks and buses, off-road equipment, agricultural operation internal combustion engines, and commercial under-fired charbroiling.[177] However, while CARB and the District have discussed the proposed programs at board hearings,[178] to our knowledge, CARB and the District have not started the public process for the four incentive-based control measure commitments as enforceable measures to be submitted to the EPA for approval and inclusion as control measures in the California SIP. Furthermore, as discussed in section IV.F.3.c of our 2021 Proposed Rule, for heavy-duty trucks and off-road equipment, CARB acknowledges that many of the project lives do not span the attainment year [179] and, thus, while these projects may accelerate emission reductions and benefit communities in the SJV, the projects that qualify for SIP credit may be limited for the purposes of the 2012 annual $PM_{2.5}$ NAAQS Serious area attainment demonstration.

Overall, while CARB and the District have made substantial progress in developing and adopting the regulatory measures listed in their respective control measure commitments that were submitted in the SJV $PM_{2.5}$ Plan, in light of the Ninth Circuit Memorandum Opinion, we have reconsidered the effect of the eight overdue measures of the original commitments and in particular the overdue incentive-based measures, on our evaluation of CARB and the District's aggregate tonnage commitments and our three-factor test. Under the second factor of the EPA's test for enforceable commitments, the

Implementing Commitments with 2018 $PM_{2.5}$ Plan'').

[172] SJVUAPCD Governing Board Resolution 18–11–16, 10–11.

[173] ''Progress Report and Technical Submittal for the 2012 $PM_{2.5}$ Standard San Joaquin Valley,'' October 19, 2021. Transmitted to the EPA by letter dated October 20, 2021, from Richard W. Corey, Executive Officer, CARB, to Deborah Jordan, Acting Regional Administrator, EPA Region IX. See sections of 2021 Progress Report entitled ''Progress in Implementing District Measures'' and ''Progress in Implementing CARB Measures.''

[174] We note that Table IV–A of the EPA's 2012 Annual $PM_{2.5}$ TSD contained an error with respect to the adoption date of CARB's measure for Transportation Refrigeration Units Used for Cold Storage. While CARB had heard proposed amendments to the measure on September 23, 2021, the measure was not actually adopted until February 24, 2022, following further process and rule adjustments required by the Board. CARB Resolution 22–5, February 24, 2022.

[175] In the 2021 Progress Report (dated October 19, 2021), page 20, CARB indicates that the Zero-Emission Off-Road Forklift Regulation Phase 1 would be presented for Board consideration ''as early as 2022,'' while CARB's updated ''SJV $PM_{2.5}$ SIP Measure Tracking'' (dated December 2021) anticipates presenting the measure to the Board in Summer 2023.

[176] 2021 Progress Report, 8–9, 20–22, and tables 2 and 3.

[177] CARB, ''Long-Term Heavy-Duty Investment Strategy, Including Fiscal Year 2020–21 Three-Year Recommendations for Low Carbon Transportation Investments,'' (App. D to CARB's ''Proposed Fiscal Year 2021–22 Funding Plan for Clean Transportation Incentives''), release date October 8, 2021; and SJVUAPCD, ''Comprehensive Annual Financial Report, Fiscal Year Ended June 30, 2020,'' release date December 23, 2020. See also, 2021 Progress Report, 3 and 15.

[178] For example, CARB staff discussed the Accelerated Turnover of Trucks and Buses Incentive Measure at its annual 2020 update to the CARB Board. CARB presentation, ''Update on the 2018 $PM_{2.5}$ SIP for the San Joaquin Valley,'' October 22, 2020. District staff discussed and adopted an emission reductions strategy for commercial under-fired charbroiling, including incentives, in December 2020. SJVUAPCD, ''Item Number 11: Adopt Proposed Commercial Under-Fired Charbroiling Emission Reduction Strategy,'' December 17, 2020.

[179] Id. at 24 and 32. Generally, mobile source incentive projects implemented under the Carl Moyer program are under contract only during the ''project life'' and may not be credited with SIP emission reductions after the project life ends. EPA Region IX, ''Technical Support Document for EPA's Rulemaking for the California State Implementation Plan California Air Resources Board Resolution 19–26 San Joaquin Valley Agricultural Equipment Incentive Measure,'' February 2020, 12–13.

Agency must evaluate whether a State is capable of fulfilling such commitments. The tardiness of presenting these control measures for board consideration renders the reductions from these measures more speculative under the second factor.

With respect to the aggregate tonnage commitments to attain the 2012 annual $PM_{2.5}$ NAAQS in the SJV, we reiterate that CARB committed to achieve 32 tpd of NO_X and 0.9 tpd of $PM_{2.5}$ emissions reductions, and the District committed to achieve 1.88 tpd of NO_X and 1.3 tpd of $PM_{2.5}$ emissions reductions by 2025. These aggregate tonnage commitments sum to 33.88 tpd NO_X and 2.2 tpd direct $PM_{2.5}$. CARB and the District have committed to achieve these reductions via the 27 control measure commitments, or such other substitute measures as may be necessary, to achieve the aggregate tonnage commitments for NO_X and direct $PM_{2.5}$.

For the purpose of our analysis of the State's progress toward achieving its aggregate tonnage commitments, of the 18 measures adopted by December 2021, as well as the adoption of an important substitute measure (the Agricultural Burning Phase-out Measure [180]), the State has submitted 12 measures as revisions to the California SIP (*i.e.,* more than the 9 measures submitted to EPA as of the time of the 2021 Proposed Rule). Since December 2021, the EPA finalized or proposed approval of three control measure SIP submissions that were control measure commitments in the SJV $PM_{2.5}$ Plan.

First, the EPA finalized approval of the Heavy-Duty Vehicle Inspection Program (HDVIP) and Periodic Smoke Inspection Program (PSIP).[181] However, as in our 2021 Proposed Rule, CARB has not yet provided its analysis of the basis for this emission reduction estimate (of 0.02 tpd direct $PM_{2.5}$, per the State's 2021 Progress Report). Therefore, the EPA is not proposing at this time to credit this measure with any particular amount of emission reductions towards attainment of the 2012 annual $PM_{2.5}$ NAAQS in the SJV.

Second, the EPA finalized approval of the Agricultural Burning Phase-out Measure,[182] which includes a schedule to phase-out (*i.e.,* introduce prohibitions of) agricultural burning for additional crop categories or materials accounting for a vast majority of the tonnage of agricultural waste in phases that started January 1, 2022, and become fully implemented by January 1, 2025.[183] The EPA received comments from the District that supported approval of the Agricultural Burning Phase-out Measure into the SIP while also advocating for a higher rule effectiveness rate (*i.e.,* 95% instead of EPA's proposed 80%),[184] which in turn would increase the amount of emission reductions that the EPA would credit towards fulfilling the District's aggregate tonnage commitment. We continue to evaluate these comments and for now have retained our proposal to credit the measure for emission reductions of 0.83 tpd NO_X and 1.23 tpd direct $PM_{2.5}$, consistent with the 80% rule effectiveness rate used by the EPA in the 2021 Proposed Rule.

Third, the EPA has proposed approval of Rule 4311 (''Flares''), as amended December 17, 2020.[185] The District's staff report for Rule 4311 estimates that the emission reductions from these amendments would be 0.19 tpd NO_X and 0.03 tpd direct $PM_{2.5}$ in 2025.[186] The EPA continues to evaluate the District's estimate with respect to SIP-creditable emission reductions, though we note that they are relatively small when compared to the overall 207.38 tpd NO_X and 6.4 tpd direct $PM_{2.5}$ modeled to attain the 2012 $PM_{2.5}$ NAAQS and to the combined aggregate tonnage commitments of 33.88 tpd NO_X and 2.2 tpd direct $PM_{2.5}$.

Similar to our 2021 Proposed Rule, we propose to credit reductions from three measures, all of which are now approved into the SIP and have large associated emission reductions of direct $PM_{2.5}$ and/or NO_X in the SJV.[187] The three measures are: Rule 4901 (''Wood Burning Fireplaces and Wood Burning Heaters''); two of three parts of the Agricultural Equipment Incentive Measure (for which we described our proposed SIP credit in the 2021 Proposed Rule); and the Agricultural Burning Phase-out Measure (for which we described our proposed SIP credit in this proposed rule).[188]

Based on these SIP-approved measures, our estimate of the remaining aggregate tonnage commitments remains the same as in our 2021 Proposed Rule. Specifically, in Table 1 herein we summarize the total NO_X and direct $PM_{2.5}$ emission reductions that the State models as sufficient to attain the 2012 annual $PM_{2.5}$ NAAQS in the SJV by December 31, 2025, the emission reductions attributed to baseline measures and new control strategy measures (including only measures currently approved into the California SIP), and the emission reductions remaining as aggregate tonnage commitments.

TABLE 1—REDUCTIONS FOR ATTAINMENT IN 2025 AND AGGREGATE TONNAGE COMMITMENTS

		NO_X (tpd)	Direct $PM_{2.5}$ (tpd)
A	Total reductions from baseline and control strategy measures modeled to achieve attainment	207.38	6.4
B	Reductions from baseline measures	173.5	4.2
C	Reductions from additional measures *approved* into the California SIP	5.29	1.69
D	Total reductions remaining as commitments (A–B–C)	28.59	0.51
E	Percent of total reductions needed remaining as commitments (D/A)	13.8%	8.0%

[184] Letter dated January 25, 2022, from Jonathan Klassen, Director of Air Quality Science and Planning, SJVUPACD, to Michael Regan, Administrator, U.S. EPA.

[185] 87 FR 3736 (January 25, 2022).

[186] SJVUAPCD, ''Item Number 12: Adopt Proposed Amendments to Rule 4311 (Flares),'' December 17, 2020, Attachment C (''Final Draft Staff Report with Appendices for Proposed Amendments to Rule 4311''), 21–22.

[187] The seven additional measures submitted as SIP revisions for which the EPA has not proposed action as of August 2022 include: the Innovative Clean Transit measure (submitted February 13, 2020); Rules 4306 and 4320 (submitted March 12, 2021); Rule 4702 (submitted October 15, 2021); Rules 4352 and 4354 (submitted March 9, 2022), and the Residential Wood Burning Incentive Measure (submitted March 17, 2022).

[188] Final actions on these measures are as follows: 85 FR 44206 (July 22, 2020) (Rule 4901), 86 FR 73106 (December 27, 2021) (Agricultural Equipment Incentive Measure), and 87 FR 36222 (June 16, 2022) (Agricultural Burning Phase-out Measure).

As shown in Table 1, 13.8% of the NO_X reductions necessary for attainment and 8.0% of the direct $PM_{2.5}$ reductions necessary for attainment remain as aggregate tonnage commitments (*i.e.,* combining CARB and the District's remaining commitments).[189] Based on the direct $PM_{2.5}$ emission reductions that the EPA has credited to Rule 4901 (0.2 tpd) and the Agricultural Burning Phase-out Measure (1.23 tpd), which add up to 1.43 tpd, we conclude that the District has exceeded its 1.3 tpd direct $PM_{2.5}$ commitment by 0.13 tpd.

Beyond the measures that the EPA has taken final action to approve into the California SIP and proposed to credit herein, CARB has provided updated emission reduction estimates for 10 additional measures, including 9 that have been adopted, as well as one substitute measure in development, as described in the 2021 Progress Report. The CARB measure with the largest updated emission reduction estimates is the Heavy-Duty Vehicle Inspection and Maintenance Program (''Heavy-Duty I/M'').

The District has similarly provided updated emission reduction estimates for seven additional measures, including six that have been adopted. The District measures with the largest updated emission reduction estimates include amendments to Rule 4702 (''Internal Combustion Engines'') (0.61 tpd NO_X), the Residential Wood Burning Devices Incentive Projects measure (0.33 tpd direct $PM_{2.5}$), and Rule 4354 (''Glass Melting Furnaces'') (0.5 tpd NO_X and 0.04 tpd direct $PM_{2.5}$), as well as amendments planned in 2022 to Rule 4550 (''Conservation Management Practices'') (0.32 tpd direct $PM_{2.5}$).

The EPA is not proposing to credit towards the aggregate tonnage commitments the updated emission reduction estimates from these additional District measures. We will review and act on the CARB and District measures submitted to date (Innovative Clean Transit, Rule 4306, Rule 4320, Rule 4702, Rule 4352, Rule 4354, and the Residential Wood Burning Incentive Measure), as well as future measure submissions, in separate rulemakings, during which time the public will have an opportunity to review and provide comment.

Although we are not proposing to credit reductions from these measures at this time, in order to determine whether CARB and District have the capability to meet their aggregate tonnage commitments, we have re-evaluated the updated emission reduction estimates to assess whether they could meet the NO_X and/or direct $PM_{2.5}$ emission reduction commitments with these measures or, if not, how much would remain of CARB and the District's unfulfilled aggregate tonnage commitments.

TABLE 2—HYPOTHETICAL EMISSION REDUCTIONS FROM ESTIMATED, ADOPTED, AND/OR SUBMITTED ADDITIONAL MEASURES AND EFFECT ON REMAINING AGGREGATE TONNAGE COMMITMENTS FOR 2025

		NO_X (tpd)	Direct $PM_{2.5}$ (tpd)
A	Total reductions needed from baseline and control strategy measures (see Table 1, row A of this proposed rule).	207.38	6.4
B	Total reductions remaining as commitments after SIP credit (see Table 1, row D of this proposed rule).	28.59	0.51
	CARB:		
	Submitted Measures:		
	HDVIP and PSIP [a]	0	0.02
	Innovative Clean Transit	0.017	<<0.01
C	Sub-Total	0.017	0.02
	Additional Adopted Measures:		
	Heavy-Duty I/M	14.7	0.03
	Amended Warranty Requirements for Heavy-Duty Vehicles	0.34	<<0.01
	Heavy-Duty Low-NO_X Engine Standard—California Action	0	0
	Advanced Clean Local Trucks (Last Mile Delivery)	0.08	<<0.01
	Zero-Emission Airport Shuttle Buses	<<0.01	<<0.01
	Small Off-Road Engines	0.155	0.007
	Transport Refrigeration Units Used for Cold Storage	0.04	0.01
	Agricultural Equipment Incentive Measure-Phase 1 (NRCS portion)	0.64	0.04
	Agricultural Equipment Incentive Measure Phase 2	4.9	0.5
D	Sub-Total	15.955	0.087
	Measures Not Yet Presented for Board Consideration: [b]		
	Zero-Emission Off-Road Forklift Regulation Phase 1	0.02	<<0.01
E	Sub-Total	4.92	0.5
F	*Grand Total for CARB (C+D+E)*	20.892	0.607
	SJVUAPCD:		
	Submitted Measures:		
	Rule 4311 (''Flares'')	0.19	0.03
	Rule 4306 (''Boilers, Steam Generators, and Process Heaters—Phase 3'')	0.19	0
	Rule 4320 (''Advanced Emission Reduction Option for Boilers, Steam Generators, and Process Heaters greater than 5 MMBtu/hr'') [c].	0	0
	Rule 4352 (''Solid Fuel Fired Boilers, Steam Generators, and Process Heaters'')	0.5	0.04
	Rule 4354 (''Glass Melting Furnaces'')	0.2	0.04

[189] However, we note that if the EPA were to grant maximum credit for the emission reductions calculated by the District for Rule 4311 (0.19 tpd NO_X and 0.03 tpd direct $PM_{2.5}$), the remaining aggregate tonnage commitments would be 28.4 tpd NO_X (13.7% of total reductions needed to attain in 2025) and 0.48 tpd direct $PM_{2.5}$ (7.5% of total reductions needed to attain in 2025).

TABLE 2—HYPOTHETICAL EMISSION REDUCTIONS FROM ESTIMATED, ADOPTED, AND/OR SUBMITTED ADDITIONAL MEASURES AND EFFECT ON REMAINING AGGREGATE TONNAGE COMMITMENTS FOR 2025—Continued

		NO_X (tpd)	Direct $PM_{2.5}$ (tpd)

K	Assuming maximum SIP credit, total reductions remaining as commitments (B–J)	6.01	−0.86

Sources: 2021 Progress Report, Table 2 and Table 3.

[a] As discussed herein, the EPA has taken final action to approve CARB's HDVIP and PSIP measure into the California SIP but we are not yet proposing SIP credit for these two measures.

[b] Given the complexities involved in regulating locomotive emissions, we have conservatively excluded from our analysis the emission reduction estimates in the 2021 Progress Report for CARB's In-Use Locomotive Measure.

[c] The District's draft staff report for Rule 4306 and Rule 4320 estimate emission reductions of 0.19 tpd NO_X and 0.45 tpd NO_X, respectively, in 2024. However, the District notes that it is not proposing the emission reductions from Rule 4320 for SIP credit at this time. SJVUAPCD, ''Draft Staff Report, Proposed Amendments to Rule 4306 (Boilers, Steam Generators, and Process Heaters—Phase 3), Proposed Amendments to Rule 4320 (Advanced Emission Reduction Options for Boilers, Steam Generators, and Process Heaters Greater Than 5.0 MMBtu/hr),'' November 25, 2020, 4.

Assuming the EPA were to agree with the maximum credit for the emission reductions estimated by CARB and the District in the 2021 Progress Report, these additional measures could achieve emission reductions of 22.58 tpd NO_X and 1.37 tpd direct $PM_{2.5}$. Combined with the reductions from additional measures already approved by EPA into the California SIP (5.29 tpd NO_X and 1.69 tpd direct $PM_{2.5}$, per Row C of Table 1 of this proposed rule), the State would achieve emission reductions of 27.87 tpd NO_X and 3.06 tpd direct $PM_{2.5}$. Compared to the combined aggregate tonnage commitments, the State would have remaining aggregate tonnage commitments of 6.01 tpd NO_X and would have exceeded the aggregate tonnage commitments by 0.86 tpd direct $PM_{2.5}$. More specifically, CARB would have remaining commitments of 6.65 tpd NO_X and 0.03 tpd direct $PM_{2.5}$, and the District would have exceeded its commitments by 0.64 tpd NO_X and 0.89 tpd direct $PM_{2.5}$.

However, given the remaining NO_X commitments for CARB, which are approximately 3% of the NO_X emission reductions modeled to attain the 2012 annual $PM_{2.5}$ NAAQS in the SJV by 2025, we have given additional consideration to the evidence of emission reductions for two source categories that have large emission reduction estimates: Heavy-Duty I/M and the Agricultural Equipment Incentive Measures, including the NRCS portion of the Phase 1 measure adopted by CARB in 2019 and the Phase 2 measure slated for 2024 consideration, per the 2021 Progress Report.

With respect to Heavy-Duty I/M, in the Valley State SIP Strategy, CARB originally estimated that it would achieve 6.8 tpd NO_X and <0.1 tpd direct $PM_{2.5}$ in 2025 and described the regulatory concepts that would reflect the current (as of 2018) ''advanced engine and exhaust control technologies, including on-board diagnostics (OBD).'' [190] Since that time, as described in the State's 2021 Progress Report and the EPA's 2021 Proposed Rule, California has developed additional provisions related to Heavy-Duty I/M that the State estimates would achieve emission reductions of 14.7 tpd NO_X and 0.03 tpd direct $PM_{2.5}$ in 2025.[191]

While the EPA would still not propose to approve a specific amount of SIP-creditable reductions until after the State submits such measure in final form to the EPA as a revision to the SIP, we have re-examined the role of the potential additional emission reductions from Heavy-Duty I/M presented by CARB. As a qualitative matter, we agree that the requirements under California Senate Bill 210 (2019) that heavy-duty vehicles comply with Heavy-Duty I/M in order to register annually with the California Department of Motor Vehicles, as well as the implementation of roadside emissions monitoring (*i.e.,* the Portable Emissions AcQuisition System, ''PEAQS'') in the SJV to detect high emitting vehicles between periodic test cycles, are tangible additions that would increase the emission reductions relative to what was contemplated at the time of Plan adoption in November 2018 (by the District) and January 2019 (by CARB).

As a quantitative matter, however, the scale of the estimated 14.7 tpd NO_X emission reductions is roughly half the remaining aggregate commitment of 28.59 tpd NO_X and represents 7.1% of the 207.38 tpd NO_X modeled for attainment and a substantial increase from CARB's original estimate of 6.8 tpd NO_X (3.3% of the 207.38 tpd NO_X). This 14.7 tpd NO_X represents a substantial quantity that, pursuant to the Ninth Circuit Memorandum Opinion, must be supported by evidence to ''ensure that California and the District have a plausible strategy for achieving this portion of the attainment strategy'' in order to satisfy the second factor of the three-factor aggregate commitment test.[192] While CARB documented its extensive regulatory and technical

[190] Valley State SIP Strategy, 19–20 and Table 8.

[191] 2021 Progress Report, 19. CARB notes that further detail on emission reduction calculations can be found in the CARB staff report on Heavy-Duty I/M, released October 15, 2021. See, CARB, ''Staff Report: Initial Statement of Reasons, Public Hearing to Consider the Proposed Heavy-Duty Inspection and Maintenance Regulation,'' October 8, 2021, (''Heavy-Duty I/M ISOR'') and App. H (''Proposed Heavy-Duty Inspection and Maintenance Regulation, Standardized Regulatory Impact Assessment'').

analyses in the measure's Initial Statement of Reasons and associated appendices,[193] CARB has not provided the detailed basis of its calculations of 14.7 tpd NO_X and 0.03 tpd direct $PM_{2.5}$ emission reductions to the EPA. Given that CARB may do so in a future control measure SIP submission, and we lack the record evidence to do so here, we do not suggest an alternative amount of emission reduction from Heavy-Duty I/M in this proposed rule. Rather, we note that the more detailed calculations and technical report necessary to support such an estimate, specific to the SJV and to annual average emission reductions in 2025, are not available, and therefore we do not have sufficient support in the record at this time to rely on the State's estimated reductions, in line with the Ninth Circuit Memorandum Opinion.

With respect to mobile agricultural equipment, the EPA has taken final action to approve the Funding Agricultural Replacement Measures for Emission Reductions (FARMER) program and the Carl Moyer Memorial Air Quality Standards Attainment Program (''Carl Moyer'') portions of CARB's first incentive measure on agricultural equipment in the SJV (''Agricultural Equipment Incentive Measure-Phase 1'') and proposed in our 2021 Proposed Rule to credit emission reductions of 4.46 tpd NO_X and 0.26 tpd direct $PM_{2.5}$ towards CARB's aggregate tonnage commitments.[194] CARB has estimated that it will achieve 4.9 tpd additional NO_X reductions, and 0.5 tpd additional direct $PM_{2.5}$ reductions through a second agricultural equipment incentive measure. In light of the Ninth Circuit Memorandum Opinion, and its finding that the EPA had not ensured that CARB and the District had a ''plausible strategy'' for achieving parts of the attainment strategy that relied on incentive-based reductions in the face of a budget shortfall for funding these measures, we must evaluate whether there is sufficient evidence in the record to establish a reasonable basis for concluding that any ''Phase 2'' agricultural equipment incentive measure will have sufficient funding to achieve the reductions ascribed to it.

As we noted in the EPA's 2021 Proposed Rule, fewer incentive-based emission reductions are needed to demonstrate attainment of the 2012 annual $PM_{2.5}$ NAAQS than were required in the portion of the SJV $PM_{2.5}$ Plan addressing the 2006 24-hour $PM_{2.5}$ NAAQS that was at issue in the *Medical Advocates* case.[195] In the Ninth Circuit Memorandum Opinion, the court pointed to a $2.6 billion shortfall between what the EPA calculated to be a need for $5 billion in funding and the more than $2 billion in funding that the State had ''identified or anticipated.''[196] Notably, funding for the Carl Moyer, California Assembly Bill 617, and FARMER programs were included in the ''identified or anticipated'' portion of the State's funding analysis, and not the ''incentive funding gap'' for which the Court found EPA's explanations justifying approval to be overly speculative.[197] Accordingly, we do not consider reliance on reductions from a Phase 2 agricultural equipment incentive measure to be prohibited by the Ninth Circuit Memorandum Opinion, to the extent that a Phase 2 rule would rely on the same, existing programs, and provided that evidence of sufficient identified or reasonably anticipated funding exists in the record.

As described in the EPA's analysis of the cost-effectiveness of the Agricultural Equipment Incentive Measure-Phase 1, based on information provided by CARB, the total project costs resulting in these emission reductions were $155 million for FARMER and $125 million for Carl Moyer, or $280 million combined.[198] As described in the EPA's 2021 Proposed Rule,[199] the SJV portion of the FARMER funding has typically been 80% of the State-wide allocation and the first three years of FARMER funding for the SJV were $108 million (fiscal year 2017–2018), $104.3 million (fiscal year 2018–2019), and $43.84 million (fiscal year 2019–2020).[200] For the current fiscal year (2021–2022), the District accepted $168.43 million in FARMER funds to replace agricultural equipment in the SJV.[201] Similarly, we noted that CARB expects Carl Moyer funding to increase in future years, following the enactment of California Assembly Bill 1274.[202]

Thus, while future funding allocations are subject to annual State and local funding cycles, given the renewed, large investment in the fiscal year 2021–2022 FARMER program, potential for increases in funding for the Carl Moyer program, and the success of these programs in meeting enforceability criteria for purposes of crediting emission reductions, the EPA anticipates that CARB will be able to develop an additional agricultural equipment incentive measure (''Agricultural Equipment Incentive measure-Phase 2'') that has funding levels comparable or larger than those for Phase 1 (*i.e.,* including the $168 million accepted by the District in March 2022) and that CARB's emission reduction estimates of 4.9 tpd NO_X and 0.5 tpd direct $PM_{2.5}$ by 2025, per the 2021 Progress Report, are reasonable and supported by identified or reasonably anticipated funding.

However, we have not yet taken final action on the NRCS portion of the Agricultural Equipment Incentive Measure-Phase 1 and, for this proposed rule, do not rely on the estimated emission reductions for that portion of the Agricultural Equipment Incentive Measure-Phase 1 (*i.e.,* 0.64 tpd NO_X and 0.04 tpd direct $PM_{2.5}$). Looking forward in time, this suggests some uncertainty regarding creditability of emission reductions from any portion of a Phase 2 agricultural equipment incentive measure that may be implemented through the NRCS program.

Furthermore, for any measure, to the extent that CARB or the District assumed a 100% rule effectiveness rate where the EPA is not able to confirm and approve such a rate, further discounts to the emission reductions estimated may be warranted in certain cases.[203] Accordingly, the overall remaining NO_X commitment could be larger than 6.01 tpd and the anticipated

[202] 2021 Progress Report, 22.

[203] For example, the District originally sought SIP credit of 0.26 tpd direct $PM_{2.5}$ emission reductions from Rule 4901 and the EPA is proposing 0.2 tpd direct $PM_{2.5}$ based on a 75% rule effectiveness rate. Similarly, CARB and the District sought SIP credit of 1.04 tpd NO_X and 1.54 tpd direct $PM_{2.5}$ emission reductions from the Agricultural Burning Phase-out Measure and the EPA is proposing 0.83 tpd NO_X and 1.23 tpd direct $PM_{2.5}$ based on an 80% rule effectiveness rate.

excess emission reductions for direct $PM_{2.5}$ could be smaller than 0.86 tpd.

Notwithstanding some uncertainty as to the scale of emission reductions from the Heavy-Duty I/M and the Agricultural Equipment Incentive Measures (*i.e.,* assuming that the additional measures with discrete emission reduction estimates in the 2021 Progress Report achieve their respective emission reductions), there remains at least 6.65 tpd NO_X and 0.03 tpd direct $PM_{2.5}$ in CARB's commitment for which the record does not contain a specific and plausible strategy to achieve. In our 2021 Proposed Rule we discussed two possible ways that CARB could fill this gap: (1) additional reductions from committed or substitute measures named by CARB, and (2) a hypothetical inter-pollutant trading of excess direct $PM_{2.5}$ emission reductions by the District for any shortfall in NO_X emission reductions by CARB. The Ninth Circuit Memorandum Opinion has established that these concepts in the absence of a specific SIP revision are too speculative and do not constitute a ''plausible strategy'' for achieving this portion of the commitment.

With respect to additional reductions from committed measures, in the 2021 Proposed Rule, we explored potential reductions from two incentive-based measures: Accelerated Turnover of Trucks and Buses Incentive Projects, and Accelerated Turnover of Off-road Equipment Incentive Projects.[204] CARB initially estimated that they would achieve 8 tpd NO_X reductions from Accelerated Turnover of Trucks and Buses Incentive Projects, and 1.5 tpd NO_X reductions from Accelerated Turnover of Off-road Equipment Incentive Projects.[205] However, CARB did not propose a measure to its board for either measure by 2021, as it had committed to do, nor to our knowledge has CARB started the public process for enforceable measures to be submitted to the EPA for inclusion as control measures in the California SIP.

In the 2021 Progress Report, CARB acknowledged that many of the project lives do not span the attainment year[206] and, thus, while these projects accelerate emission reductions and benefit communities in the SJV, the projects that qualify for SIP credit may be limited for the purposes of the 2012 annual $PM_{2.5}$ NAAQS Serious area attainment demonstration. In our 2021 Proposed Rule, we acknowledged these weaknesses in these incentive programs, but we nonetheless assumed that these measures may ultimately result in SIP-creditable emission reductions for a portion of the combined 9.5 tpd NO_X.[207] In light of the Ninth Circuit Memorandum Opinion, the EPA does not consider it appropriate to rely on reductions that have been rendered substantially less likely to occur by the State's update indicating that few emissions from these projects may be creditable.

Furthermore, while the State continues to invest heavily in the replacement of older, dirty heavy-duty vehicles and equipment on a State-wide basis,[208] we are not aware of a document that identifies specific funding amounts applied to the replacement of such equipment in the SJV within the specific timeline of the Plan's demonstration of attainment of the 2012 annual $PM_{2.5}$ NAAQS by December 31, 2025. In brief, the amount of funding that is specific to the SJV for these two measures for purposes of attainment of the 2012 annual $PM_{2.5}$ NAAQS is unclear, and this renders more speculative at least a portion of the large scale of NO_X emission reductions originally anticipated.[209]

With respect to substitute measures under development, CARB points to the In-Use Locomotive Rule (and estimates emission reductions of 1.14 tpd NO_X and 0.03 tpd direct $PM_{2.5}$ by 2025 in the SJV), which is slated for 2022 Board consideration.[210] However, as noted in our 2021 Proposed Rule,[211] given the complexities involved in regulating locomotive emissions, we have conservatively excluded from our analysis the emission reduction estimates in the 2021 Progress Report for CARB's In-Use Locomotive Measure.

In addition, CARB has identified further measures that were not included in the original control measure commitments that may provide emission reductions toward CARB's aggregate tonnage commitments.[212] These measures include Cargo Handling Equipment Registration, Construction and Mining Equipment Measure, and Co-Benefits from the Climate Program. However, we do not have information as to what these measures might entail, when the State may adopt or implement them, and what scale of emission reductions they could potentially achieve.

Based on the lack of information on funding and process for heavy-duty and off-road equipment incentive-based measures and the lack of information on other potential substitute measures, such as a Construction and Mining Equipment Measure, and in light of the Ninth Circuit Memorandum Opinion, we have reconsidered our evaluation of this prospect and now propose that there is not sufficient evidence to show that the Valley State SIP Strategy contains a ''plausible strategy'' to achieve the remaining NO_X and direct $PM_{2.5}$ emission reductions needed for attainment.

The other approach that the 2021 Proposed Rule discusses for filling the gap in CARB's strategy for achieving its commitment is based on a hypothetical future SIP revision. In the 2021 Progress Report, CARB and the District provided additional emissions analysis to assess how excess direct $PM_{2.5}$ emission reductions could be converted to equivalent NO_X emission reductions using an inter-pollutant trading ratio rooted in the sensitivity analyses of the 2018 $PM_{2.5}$ Plan.[213] CARB and the District have not formally submitted this analysis as a SIP revision to the EPA or requested that the EPA apply such inter-pollutant trading for purposes of fulfilling the aggregate tonnage commitments through an equivalent amount of emission reductions.

Consistent with past EPA action on $PM_{2.5}$ planning SIP submissions for the SJV,[214] where the State submits a SIP

[209] The EPA also notes that, for regulatory measures that have large estimated emission reductions, rather than incentive-based measures, CARB estimated that its Low-Emission Diesel Fuel Requirement would achieve an additional 1 tpd NO_X and 0.1 tpd direct $PM_{2.5}$ reductions. However, without near-term adoption and submission, its associated emission reductions may not be creditable towards the aggregate tonnage commitment for 2025.

[210] 2021 Progress Report, 20–21. Additional information on CARB's regulatory concepts for the In-Use Locomotive Measure are available at: *https://ww2.arb.ca.gov/our-work/programs/reducing-rail-emissions-california/locomotives-and-railyards-meetings-workshops.*

[213] 2021 Progress Report, Table 4 and 33–37.

[214] For example, the EPA has approved an inter-pollutant trading mechanism for use in transportation conformity analyses for the 2006 24-hour $PM_{2.5}$ NAAQS. 85 FR 44192, 44204. In that same final rule, the EPA approved the State's demonstration that it had fulfilled prior aggregate tonnage commitments, in part, by using an inter-pollutant trading approach that the EPA found

revision that would substitute reductions in one pollutant to achieve a tonnage commitment concerning a different pollutant (*e.g.,* substituting excess direct $PM_{2.5}$ reductions to satisfy a NO_X reduction commitment), it must include an appropriate inter-pollutant trading (IPT) ratio and the technical basis for such ratio in the plan submission itself, along with the requisite public process. The EPA will review any such IPT ratio and its bases before approving or disapproving any such SIP revision. The possibility of a future SIP submission discussing IPT does not constitute a ''plausible strategy'' for achieving reductions that are modeled to result in attainment. Thus, at this time, we are not proposing to approve any particular inter-pollutant trading approach for purposes of meeting the aggregate tonnage commitments, nor applying any excess reductions of one pollutant towards fulfilling a portion of committed reductions of the other pollutant.

The additional evaluation we have discussed herein as part of our reconsideration of the State's enforceable commitments requires us to re-evaluate the EPA's three-factor test for enforceable commitments. Based on our reconsideration, and consistent with the Ninth Circuit Memorandum Opinion, we retain our proposed findings that the State's commitments meet the first factor (the commitment represents a limited portion of the required reductions, *i.e.,* 13.8% of the NO_X and 8.0% of the direct $PM_{2.5}$ emission reductions necessary to attain) and the third factor (the commitment is for a reasonable and appropriate timeframe) of the three-factor test. However, we now propose that the State's commitments do not meet the second factor (regarding the State's capability to fulfill its commitments). Our analysis and findings for the first and third factors are presented in section IV.F.3.e of the 2021 Proposed Rule. We provide our reconsidered evaluation of the second factor as follows in this proposed rule.

As the EPA noted in our 2021 Proposed Rule, CARB and the District have been capable of developing and adopting many of the regulatory measures listed in their respective control measure commitments. However, the question before us more precisely is whether such substantial progress, coupled with the strategy submitted by the State for achieving the remaining reductions which the State has modeled as leading to attainment, is sufficient to show that the State is capable of fulfilling its *entire* aggregate tonnage commitments by 2025. Several components of our reconsideration suggest that the State may not be capable of fulfilling the entire aggregate tonnage commitment, particularly with respect to NO_X emission reductions from additional CARB measures.

First, in terms of additional measures for which CARB and the District provided updated emission reduction estimates, we have given additional consideration to the evidence of emission reductions for two source categories that have large emission reduction estimates: Heavy-Duty I/M and the Agricultural Equipment Incentive Measures. For Heavy-Duty I/M, CARB has not provided to the EPA a sufficient basis for its increase in estimated emission reductions from 6.8 tpd NO_X to 14.7 tpd NO_X, where the 14.7 tpd reduction amounts to 7.1% of the total emission reductions modeled for attainment of the 2012 annual $PM_{2.5}$ NAAQS. Although the EPA is confident, based on its review, that emission reductions are available in this category, and that the State is capable of achieving some amount of reductions, the State has not sufficiently supported its assertion that it is capable of achieving 14.7 tpd of NO_X and 0.03 tpd of direct $PM_{2.5}$. As discussed above, due to uncertainty surrounding the NRCS portion of the Agricultural Equipment Incentive Measure-Phase 1, we are not relying on reductions from that portion of the rule, and the creditability of any NRCS portion of a potential future Phase 2 has not been established.

Furthermore, for any measure, to the extent that CARB or the District assumed a 100% rule effectiveness rate where the EPA is not able to confirm and approve such a rate, further discounts to the emission reduction estimates may be warranted in certain cases.

Accordingly, the overall remaining NO_X commitment could be larger than 6.01 tpd and the anticipated excess emission reductions for direct $PM_{2.5}$ could be smaller than 0.86 tpd.

Second, even if the EPA were to assume maximum credit for the additional measures for which CARB and the District provided updated emission reduction estimates, CARB, in combination with the District, would still need emission reductions of at least 6 tpd NO_X to fulfill its commitments.[215] Moreover, the reductions from CARB's remaining incentive measures for Heavy-Duty vehicles and off-road equipment appear to be limited relative to the combined emission reduction estimate of 9.5 tpd NO_X in the Plan. Without documentation supporting the funding amounts to be applied in the SJV within the timeline of the 2012 annual $PM_{2.5}$ NAAQS portion of the SJV $PM_{2.5}$ Plan, it is not clear that the full amount of these estimated reductions is supported by a ''plausible strategy'' to achieve them, as required in the Ninth Circuit Memorandum Opinion. In addition, the identified substitute measures lack sufficient detail to provide support for making up for NO_X emission reduction shortfalls from CARB's control measure commitments.

Given the gap between the reductions needed and the reductions for which CARB and the District have presented a non-speculative plan for achieving, we now propose that the State has not demonstrated that it is capable of fulfilling the remaining aggregate tonnage commitments necessary to attain the 2012 annual $PM_{2.5}$ NAAQS in the SJV by December 31, 2025, and therefore find that the SJV $PM_{2.5}$ Plan does not meet the second factor of our three-factor test for enforceable commitments.

b. Attainment Demonstration

Based on our reconsideration of the Plan's enforceable commitments described in section II.C.3.a of this proposed rule, and our reconsideration of the Plan's BACM demonstration for described in section II.B, we now propose to disapprove the SJV $PM_{2.5}$ Plan's modeled attainment demonstration for the 2012 annual $PM_{2.5}$ NAAQS in the SJV by December 31, 2025. We discuss the interrelationship of these nonattainment plan elements as follows.

Regarding enforceable commitments, CAA section 110(a)(2)(A) provides that each SIP ''shall include enforceable emission limitations and other control measures, means or techniques . . . as well as schedules and timetables for compliance, as may be necessary or appropriate to meet the applicable requirements of [the Act].'' Section 172(c)(6) of the Act, which applies to nonattainment SIPs, is virtually identical to section 110(a)(2)(A). The EPA interprets the CAA to allow for approval of enforceable commitments that are limited in scope, where circumstances exist that warrant the use of such commitments in place of

adequate. 85 FR 44192, 44205; see also proposed rule at 85 FR 17382, 17406–17407 and associated EPA's General Evaluation TSD, Table III–C and section IV.

[215] As noted in this proposed rule, if the EPA were to assume credit for emission reductions from the additional District measures, the District would have exceeded its aggregate tonnage commitments by 0.64 tpd NO_X and 0.89 tpd direct $PM_{2.5}$.

adopted and submitted measures, and considers three factors in determining whether to approve the enforceable commitment.

Given our proposed finding above that the State has not met the second factor of the EPA's three-factor test (*i.e.,* whether the State is capable of fulfilling its commitment), the State is left with a gap between the reductions that it has modeled as necessary for attainment, and the reductions that the EPA may count as constituting the State's control plan. Therefore, the EPA proposes that the State's control strategy does not include sufficient enforceable measures, pursuant to CAA sections 110(a)(2)(A) and 172(c)(6), to achieve the necessary emission reductions to attain the 2012 annual $PM_{2.5}$ NAAQS in the SJV by December 31, 2025.

The lack of an approved control plan to achieve the reductions necessary to attain by 2025 is sufficient on its own to compel disapproval of the attainment demonstration. However, even if the State's control plan was sufficient to lead to attainment in 2025, the Public Justice Comment Letter and our reconsidered BACM analysis in section II.B of this notice raise additional issues regarding the sufficiency of the modeled attainment demonstration.

The State's attainment demonstration identifies the Bakersfield-Planz monitor as the design value monitor, and models this monitor as achieving the 12.0 µg/m³ concentration necessary for attainment in 2025.[216] The State's submission also indicates that the Bakersfield-Planz monitor is modeled to read 12.1 µg/m³ in 2024.[217] This represents a very narrow margin between modeled attainment in 2024 and 2025. In light of the Act's requirement to demonstrate attainment by the most expeditious date practicable, in order for the EPA to approve the Plan's demonstration that the area will attain by 2025, the State must also demonstrate that attainment by an earlier date is not practicable.

As explained in section II.B of this notice, the EPA now proposes to find that the State has not sufficiently demonstrated that it has implemented BACM for all necessary categories of sources. Most notably, the State has not sufficiently evaluated the amount of ammonia reductions that may be available. In light of the very small (0.1 µg/m³) gap between attaining in 2024 and 2025, and the State's sensitivity modeling in its precursor demonstration indicating that a 30% reduction in ammonia would reduce annual $PM_{2.5}$ concentrations at the Bakersfield-Planz monitor by 0.12 µg/m³ and a 70% reduction would reduce annual $PM_{2.5}$ concentrations at the Bakersfield-Planz monitor by 0.36 µg/m³, the State has not demonstrated that reductions from sources identified in section II.B could not expedite attainment.[218] As a result, even if the State's control plan was sufficiently concrete that the EPA could credit all reductions of NO_X and direct $PM_{2.5}$ that the State indicated that it intended to use to fulfill its aggregate commitments, the State is still required to demonstrate that the selected attainment year (*e.g.,* 2025) is as expeditious as practicable considering potential emission reductions from all plan precursors, including ammonia.

The EPA emphasizes that it is stating both that the Plan does not demonstrate that the SJV will attain by 2025 and that the State has not demonstrated that it could not attain sooner than 2025. These findings are not in tension with one another. Under the Act, the State must demonstrate that its control plan will be sufficient to attain the NAAQS, and to attain the NAAQS by the most expeditious date practicable. The State's failure to demonstrate that it could not attain sooner than 2025 is not inconsistent with the State also having other analytical or substantive flaws in its control plan to attain by 2025. The EPA is not proposing to find that the SJV can practicably attain by 2024, nor is the EPA proposing to find that the SJV could not possibly attain by 2025. Instead, the EPA is proposing, in light of the uncertainty regarding ammonia controls, to find that the State has failed to demonstrate that it could not practicably attain before 2025, and in light of identified deficiencies in the control plan, that the State's control strategy for attaining by 2025 is flawed.

Furthermore, for the 1997 annual $PM_{2.5}$ NAAQS, on November 8, 2021, the State submitted the ''Attainment Plan Revision for the 1997 Annual $PM_{2.5}$ Standard,'' which was adopted by the District on August 19, 2021, and by CARB on September 23, 2021 (''15 µg/m³ SIP Revision''). In that submission, the State updated its prior air quality modeling to account for more recent monitored air quality data. Specifically, the State estimated 2023 annual average concentrations starting from a 2018 monitored base year (*i.e.,* rather than a 2013 base year, in order to reflect updated monitored air quality data), and applied updated, scaled relative response factors (RRFs) to reflect emissions changes between 2018 and 2023.[219] Because this scaling indicated a significant change in the modeling results for the 1997 annual $PM_{2.5}$ NAAQS, and the modeling for the 2012 annual $PM_{2.5}$ NAAQS relies on many of the same models and assumptions, the result of the scaling analysis introduces additional uncertainty to the modeled attainment demonstration for the 2012 $PM_{2.5}$ NAAQS. Accordingly, we recommend updated modeling analysis for the 2012 annual $PM_{2.5}$ NAAQS.

As a result of our proposed disapproval of the control plan and the uncertainty regarding additional reductions that could be achieved by further BACM/BACT level controls for all appropriate plan precursors (particularly for ammonia), we now propose to disapprove the attainment demonstration for the 2012 annual $PM_{2.5}$ NAAQS.

D. Reasonable Further Progress Demonstration and Quantitative Milestones

1. Summary of 2021 Proposed Rule

In section IV.G of our 2021 Proposed Rule, the EPA described the requirements for RFP and quantitative milestones for a Serious $PM_{2.5}$ nonattainment area, summarized the State's submission in the 2018 $PM_{2.5}$ Plan for the SJV, and presented our evaluation thereof.[220] We briefly summarize those components here and rely on the more complete exposition in that proposed rule, except as described in section II.D.2 of this proposed rule (*i.e.,* the EPA's reconsidered proposal for RFP and quantitative milestones).

Regarding requirements, CAA section 172(c)(2) provides that all nonattainment area plans shall require RFP toward attainment. In addition, CAA section 189(c) requires that all $PM_{2.5}$ nonattainment area plans contain quantitative milestones for purposes of measuring RFP, as defined in CAA section 171(1), every three years until the EPA redesignates the area to attainment. Section 171(1) of the Act defines RFP as the annual incremental reductions in emissions of the relevant air pollutant as are required by part D, title I of the Act, or as may reasonably be required by the Administrator for the purpose of ensuring attainment of the

[216] 2018 $PM_{2.5}$ Plan, App. K, Table 39.

[217] Id. at Table 33.

[218] See 2018 $PM_{2.5}$ Plan, App. G, tables 4 through 7.

[219] 15 µg/m³ SIP Revision, Ch. 5, 5–9 to 5–12. See also 15 µg/m³ SIP Revision, App. K, 64–65. In the 15 µg/m³ SIP Revision, the State used existing modeling runs for 2020 and 2024 to compute RRFs for each $PM_{2.5}$ component using the standard approach recommended in the EPA's Modeling Guidance. Those RRFs were then scaled to reflect emissions changes between 2018 and 2023 to arrive at updated RRFs.

[220] 86 FR 74310, 74338–74345.

NAAQS by the applicable attainment date.

In addition to the EPA's longstanding guidance on the RFP requirements for PM, the Agency has established specific regulatory requirements for the $PM_{2.5}$ NAAQS in the $PM_{2.5}$ SIP Requirements Rule for purposes of satisfying the Act's RFP requirements and provided related guidance in the preamble to the rule. Specifically, under the $PM_{2.5}$ SIP Requirements Rule, for a $PM_{2.5}$ attainment plan a State must include an RFP analysis that includes, at minimum, the following four components: (1) an implementation schedule for control measures; (2) RFP projected emissions for direct $PM_{2.5}$ and all $PM_{2.5}$ plan precursors for each applicable milestone year, based on the anticipated control measure implementation schedule; (3) a demonstration that the control strategy and implementation schedule will achieve reasonable progress toward attainment between the base year and the attainment year; and (4) a demonstration that by the end of the calendar year for each triennial milestone date for the area, pollutant emissions will be at levels that reflect either generally linear progress or stepwise progress in reducing emissions on an annual basis between the base year and the attainment year.[221] Additionally, states should estimate the RFP projected emissions for each quantitative milestone year by sector on a pollutant-by-pollutant basis.[222]

Section 189(c) of the Act requires that $PM_{2.5}$ attainment plans include quantitative milestones that demonstrate RFP. The purpose of the quantitative milestones is to allow periodic evaluation of the State's progress towards attainment of the $PM_{2.5}$ NAAQS in the area consistent with RFP requirements. Because RFP is an annual emission reduction requirement and the quantitative milestones are to be achieved every three years, when a State demonstrates compliance with the quantitative milestone requirement, it should also demonstrate that RFP has been achieved during each of the relevant three years. Quantitative milestones should provide an objective means to evaluate progress toward attainment meaningfully, *e.g.,* through imposition of emissions controls in the attainment plan and the requirement to quantify those required emissions reductions on the schedule approved by the EPA and thus required to meet RFP.

As we noted in the 2021 Proposed Rule, the CAA does not specify the starting point for counting the three-year periods for quantitative milestones under CAA section 189(c). In the General Preamble and General Preamble Addendum, the EPA interpreted the CAA to require that the starting point for the first three-year period be the due date for the Moderate area plan submission.[223] Consistent with this longstanding interpretation of the Act, the $PM_{2.5}$ SIP Requirements Rule requires that each plan for a Serious $PM_{2.5}$ nonattainment area that demonstrates attainment by the end of the 10th calendar year following the date of designation contain quantitative milestones to be achieved no later than milestone dates 7.5 years and 10.5 years from the date of designation of the area.[224] The 2018 $PM_{2.5}$ Plan includes a demonstration designed to show attainment by the end of the 10th calendar year following designations (*i.e.,* December 31, 2025). Because the EPA designated the SJV nonattainment for the 2012 annual $PM_{2.5}$ NAAQS effective April 15, 2015,[225] the applicable quantitative milestone dates for purposes of the submitted Serious area plan for this NAAQS in the SJV are October 15, 2022, and October 15, 2025.

Quantitative milestones must provide for objective evaluation of reasonable further progress toward timely attainment of the $PM_{2.5}$ NAAQS in the area and include, at minimum, a metric for tracking progress achieved in implementing SIP control measures, including BACM and BACT, by each milestone date.[226]

The State presents its RFP demonstration and quantitative milestones for the 2012 annual $PM_{2.5}$ NAAQS in Appendix H of the 2018 $PM_{2.5}$ Plan. Following the identification of a transcription error in the RFP tables of Appendix H, the State submitted a revised version of Appendix H that corrects the transcription error and provides additional information on the RFP demonstration.[227] Given the State's conclusions that ammonia, SO_X, and VOC emissions do not contribute significantly to $PM_{2.5}$ levels that exceed the 2012 annual $PM_{2.5}$ NAAQS in the SJV, the RFP demonstration provided by the State only addresses emissions of direct $PM_{2.5}$ and NO_X.[228] Similarly, the State developed quantitative milestones based upon the Plan's control measure strategy to achieve emission reductions of direct $PM_{2.5}$ and NO_X.[229]

For the 2012 annual $PM_{2.5}$ NAAQS, the RFP demonstration in the Plan follows a stepwise approach due to the time required for CARB and the District ''to amend rules, develop programs, and implement the emission reduction measures.'' [230] The revised Appendix H provides clarifying information on the RFP demonstration, including additional information to justify the Plan's stepwise approach to demonstrating RFP. This clarifying information did not affect the Plan's quantitative milestones. It is important to note that the State evaluated what would be necessary for purposes of meeting RFP premised upon its approach to regulating only direct $PM_{2.5}$ and NO_X emissions, and upon a December 31, 2025 attainment date that itself depended upon the State achieving certain additional emission reductions though the enforceable commitments.

In our 2021 Proposed Rule we further described the State's RFP demonstration and quantitative milestones in the SJV $PM_{2.5}$ Plan, including, for example, the anticipated implementation schedule for CARB and District control measures, projected emissions for each RFP year and attainment year, and percent reductions to be achieved in each milestone year, which would be consistent with a stepwise approach. We noted that the reductions between the 2013 base year and 2019 milestone year are consistent with generally linear progress toward the targeted attainment date, while the reductions by the 2022 milestone year would fall short of the rate of reductions to show generally linear RFP. We also noted that the State relies on more substantial direct $PM_{2.5}$ and NO_X emission reductions by January 1, 2025, due in large part to CARB and the District's reliance on enforceable commitments to achieve additional $PM_{2.5}$ and NO_X emission reductions from new measures implemented by 2024. Lastly, we noted the State's overall conclusion that the adopted control strategy and additional commitments for reductions from new control programs by this time are adequate to meet the RFP requirement for the 2012 annual $PM_{2.5}$ NAAQS with

[230] Id. at App. H, H–4.

the projected attainment date of December 31, 2025.

Regarding quantitative milestones, Appendix H of the 2018 $PM_{2.5}$ Plan identifies October 15 milestone dates for the 2019 and 2022 RFP milestone years, the 2025 attainment year, and a post-attainment milestone year of 2028.[231] Appendix H also identifies target emissions levels to meet the RFP requirement for direct $PM_{2.5}$ and NO_X emissions for each of these milestone years,[232] as shown in Table 6 of our 2021 Proposed Rule, and control measures that CARB and the District already have in place or plan to implement by each of these years, in accordance with the control strategy in the Plan.[233]

We noted, however, that while quantitative milestones are required for 2019 in the context of the Moderate area plan for the 2012 annual $PM_{2.5}$ NAAQS in the SJV (corresponding to the 4.5 years after the date of designation), we have already evaluated and approved the State's quantitative milestones for 2019, as supplemented by the 2018 $PM_{2.5}$ Plan.[234] Therefore, the EPA is not evaluating the 2019 milestones for purposes of the State's Serious area plan for the 2012 annual $PM_{2.5}$ NAAQS in the SJV.

Although the State's attainment demonstration for the 2012 annual $PM_{2.5}$ NAAQS does not rely on CARB's and the District's control measure commitments for emission reductions until 2024,[235] the RFP and quantitative milestone elements of the 2018 $PM_{2.5}$ Plan rely on these control measure commitments to demonstrate that the plan requires RFP toward attainment.[236] In our 2021 Proposed Rule we summarized the specific milestones identified by the State for each milestone year and with respect to the control measure commitments in each three-year period.

The EPA presented its evaluation of the State's RFP demonstration and quantitative milestones in section IV.G.3 of the 2021 Proposed Rule, with additional information in section V of the EPA's 2012 Annual $PM_{2.5}$ TSD. We previously proposed to approve the State's RFP demonstration and quantitative milestones.

2. The EPA's Reconsidered Proposal

As discussed in section II.C.3, we are now proposing to disapprove the attainment demonstration for the Serious area plan portion of the 2018 $PM_{2.5}$ Plan for the 2012 annual $PM_{2.5}$ NAAQS because we are proposing to not approve the State's control plan to achieve the reductions modeled for 2025 and the attainment demonstration does not demonstrate that the SJV could not practicably attain before 2025. The RFP demonstration in the Plan is deficient because it sets out a timeline for implementing the deficient control plan, which is not sufficient to ''ensure attainment'' under CAA section 171(l). The quantitative milestones do not ''demonstrate [RFP] toward attainment by the applicable date'' under CAA section 189(c), both because the Plan does not sufficiently demonstrate that the control plan will result in attainment, and because the plan does not sufficiently establish what the applicable date should be.[237] As a result, the EPA proposes to disapprove the Plan's Serious area RFP demonstration and quantitative milestones for the 2012 annual $PM_{2.5}$ NAAQS.

E. Motor Vehicle Emission Budgets

1. Summary of 2021 Proposed Rule

In section IV.I of our 2021 Proposed Rule, the EPA described the requirements for motor vehicle emission budgets (''budgets'') for a Serious $PM_{2.5}$ nonattainment area, summarized the State's submission in the 2018 $PM_{2.5}$ Plan for the SJV, and presented our evaluation thereof.[238] We briefly summarize those components here and rely on the more complete exposition in that proposed rule, except as described in section II.E.2 of this proposed rule (*i.e.,* the EPA's reconsidered proposal for budgets).

Section 176(c) of the CAA requires federally funded or approved actions in nonattainment and maintenance areas to conform to the SIP's goals of eliminating or reducing the severity and number of violations of the NAAQS and achieving expeditious attainment of the NAAQS. Conformity to the SIP's goals means that such actions will not: (1) cause or contribute to new violations of a NAAQS; (2) increase the frequency or severity of an existing violation; or (3) delay timely attainment of any NAAQS or any interim milestone.

Actions involving Federal Highway Administration (FHWA) or Federal Transit Administration (FTA) funding or approval are subject to the EPA's transportation conformity rule, codified at 40 CFR part 93, subpart A (''Transportation Conformity Rule''). Under this rule, metropolitan planning organizations (MPOs) in nonattainment and maintenance areas coordinate with State and local air quality and transportation agencies, the EPA, FHWA, and FTA to demonstrate that an area's regional transportation plan (RTP) and transportation improvement programs (TIP) conform to the applicable SIP. The MPO's demonstration is typically done by showing that estimated emissions from existing and planned highway and transit systems are less than or equal to the applicable budgets contained in adequate or approved control strategy implementation plans. An attainment plan for the $PM_{2.5}$ NAAQS should include budgets for the attainment year and each required RFP milestone year for direct $PM_{2.5}$ and $PM_{2.5}$ precursors subject to transportation conformity analyses. Budgets are generally established for specific years and specific pollutants or precursors and must reflect all of the motor vehicle control measures contained in the attainment and RFP demonstrations.[239]

In our 2021 Proposed Rule, we described how states should identify budgets for direct $PM_{2.5}$, NO_X, and all other $PM_{2.5}$ precursors for which the State and/or the EPA has determined that on-road emissions significantly contribute to $PM_{2.5}$ levels in the area for each RFP milestone year and the attainment year if the plan demonstrates attainment.[240] All direct $PM_{2.5}$ SIP budgets should include direct $PM_{2.5}$ motor vehicle emissions from tailpipes, brake wear, and tire wear.

We described the process by which the State and the EPA should determine

[231] 2018 $PM_{2.5}$ Plan, App. H, Table H–12.

[232] Id. at Table H–5.

[233] Id. at H–23 to H–24 (for CARB milestones) and H–20 to H–22 (for District milestones).

[234] 86 FR 67343, 67346.

[235] 2018 $PM_{2.5}$ Plan, Ch. 4, Table 4–3 (''Emission Reductions from District Measures'') and Table 4–9 (''San Joaquin Valley Expected Emission Reductions from State Measures'').

[236] 2018 $PM_{2.5}$ Plan, App. H, H–4 to H–10 (describing commitments by CARB and SJVUAPCD to adopt additional measures to fulfill tonnage commitments for 2024 and 2025, including ''action'' and ''implementation'' dates occurring before 2024 to ensure expeditious progress toward attainment).

[237] In addition, as discussed in section II.C.3.a of this proposed rule, the EPA notes that of the State's 27 control measure commitments, four regulatory measures and four incentive-based measures are overdue (*i.e.,* were due for board consideration in 2020 or 2021). It is not clear, based on the evidence before the EPA, that such measures will be presented to the CARB and District boards in the 2022 calendar year. Furthermore, to the extent the State relies on substitute measures to ultimately fulfill its aggregate tonnage commitments in 2025 (*e.g.,* the Agricultural Burning Phase-out Measure), the State has not provided quantitative milestones as part of a SIP revision that would provide for periodic evaluation of the State's progress in implementing such substitute measures. In addition, the State has not provided quantitative milestones for ammonia.

[238] 86 FR 74310, 74347–74351.

[239] 40 CFR 93.118(e)(4)(v).

[240] 40 CFR 93.102(b)(2)(iv) and (v).

whether other pollutant emissions (*i.e.,* for re-entrained road dust, VOC, SO_2, and ammonia) contribute significantly to the $PM_{2.5}$ nonattainment problem, either with respect to the whole plan or with respect to on-road mobile emissions, and therefore be subject to the transportation conformity requirements (*i.e.,* budgets for such pollutant(s) must be included in the plan). We further noted that transportation conformity trading mechanisms are allowed under 40 CFR 93.124 where a State establishes appropriate mechanisms for such trades and where the basis for the trading mechanism is the SIP attainment modeling that establishes the relative contribution of each $PM_{2.5}$ precursor pollutant.

The EPA's process for determining the adequacy of a budget consists of three basic steps: (1) notifying the public of a SIP submittal; (2) providing the public the opportunity to comment on the budgets during a public comment period; and (3) making a finding of adequacy or inadequacy.[241] The EPA can notify the public by either posting an announcement on the EPA's adequacy website notifying the public that the EPA has received a SIP submission that will be reviewed to determine if the budgets in that submission are adequate for transportation conformity purposes (40 CFR 93.118(f)(1)), or through a **Federal Register** notice of proposed rulemaking when the EPA reviews the adequacy of submitted motor vehicle emission budgets simultaneously with its review and action on the SIP itself (40 CFR 93.118(f)(2)).

The State includes budgets for direct $PM_{2.5}$ and NO_X emissions for the 2019 and 2022 RFP milestone years, the projected attainment year (2025), and one post-attainment year quantitative milestone (2028) in the 2018 $PM_{2.5}$ Plan.[242] The State establishes separate direct $PM_{2.5}$ and NO_X subarea budgets for each county, or partial county (for Kern County), in the SJV.[243] CARB calculated the budgets using EMFAC2014,[244] which was, at the time, CARB's latest version of the EMFAC model for estimating emissions from on-road vehicles operating in California that had been approved by EPA at the time of Plan development, and the latest modeled vehicle miles traveled and speed distributions from the SJV MPOs from the Final 2017 Federal Transportation Improvement Programs, adopted in September 2016. The budgets reflect annual average emissions consistent with the annual averaging period of the 2012 annual $PM_{2.5}$ NAAQS and the 2018 $PM_{2.5}$ Plan's RFP demonstration.

In our 2021 Proposed Rule, the EPA noted the following: (1) 2022 and 2025 are the required budget years applicable to the Serious area plan portion of the 2018 $PM_{2.5}$ Plan for the 2012 annual $PM_{2.5}$ NAAQS in the SJV (and that the attainment year of 2025 coincided with the latter milestone year based on timing of designations); (2) the EPA had approved the budgets for the 2022 RFP milestone year in acting on the Moderate area plan and, therefore, will not be acting on them again in acting on the Serious area plan;[245] (3) the EPA is not evaluating the 2019 budgets, which would neither be used in any future conformity determinations (as the plan contains budgets for 2022 and other future years), nor required for the submitted Serious area plan; and (4) the EPA would begin the motor vehicle emissions budget adequacy and approval review processes for the 2028 post-attainment milestone year budgets only if the area were to fail to attain the standard by December 31, 2025 (the applicable Serious area attainment date if the EPA were to finalize approval of the 2018 $PM_{2.5}$ Plan's attainment demonstration).

The Plan's direct $PM_{2.5}$ budgets include tailpipe, brake wear, and tire wear emissions but do not include paved road dust, unpaved road dust, and road construction dust emissions.[246] The State did not include budgets for VOC, SO_2, or ammonia, consistent with its precursor demonstration that control of these precursors would not significantly contribute to attainment of the 2012 annual $PM_{2.5}$ NAAQS. The State also included a discussion of the significance/insignificance factors for motor vehicle emissions of ammonia, SO_2, and VOC to support a finding of insignificance under the transportation conformity rule.[247] The State is not required to include re-entrained road dust in the $PM_{2.5}$ budgets under section 93.103(b)(3) unless the EPA or the State has made a finding that these emissions are significant, and neither the State nor the EPA has made such a finding. Nevertheless, the Plan includes a discussion of the significance/insignificance factors for re-entrained road dust and concludes that such emissions are insignificant.[248] The budgets included in the 2018 $PM_{2.5}$ Plan are shown in Table 3 of this proposed rule, which is identical to Table 9 of our 2021 Proposed Rule.

TABLE 3—MOTOR VEHICLE EMISSION BUDGETS FOR THE SAN JOAQUIN VALLEY FOR THE 2012 $PM_{2.5}$ STANDARD

[Annual average, tpd]

County	2022 (RFP year) [a]		2025 (attainment year)

[248] 2018 $PM_{2.5}$ Plan, App. D, D–121.

[a] The EPA has already approved the 2022 RFP budgets in our final rule on the State's Moderate area plan for the 2012 annual $PM_{2.5}$ NAAQS in the SJV.

In our 2021 Proposed Rule, we also described the State's proposed trading mechanism in the 2018 $PM_{2.5}$ Plan for transportation conformity analyses that would allow future decreases in NO_X emissions from on-road mobile sources to offset any on-road increases in direct $PM_{2.5}$ emissions.

We presented our evaluation of the State's Serious area budgets for the 2012 annual $PM_{2.5}$ NAAQS in the SJV and proposed to approve the 2025 budgets. We noted our preliminary review of the budgets submitted for adequacy, which preceded our proposed approval of the budgets, consistent with the EPA's general process. Based on information in the Plan, we proposed that budgets were not required for SO_2, VOC, and ammonia.

Based on our proposed approval of the State's RFP and attainment demonstrations, and our review of the budgets in the Plan, we proposed that the 2025 budgets for RFP and attainment were consistent with those demonstrations, were clearly identified and precisely quantified, and met all other applicable statutory and regulatory requirements including the adequacy criteria in 40 CFR 93.118(e)(4) and (5). We provided a more detailed discussion of the budgets in section VI of the EPA's 2012 Annual $PM_{2.5}$ TSD. We noted that our proposed approval of the budgets for the 2012 annual $PM_{2.5}$ NAAQS did not affect the status of the previously approved budgets for the 1997 $PM_{2.5}$ NAAQS and related trading mechanism, which remain in effect for that $PM_{2.5}$ NAAQS, nor the 2006 24-hour $PM_{2.5}$ NAAQS and related trading mechanism, which remain in effect for that $PM_{2.5}$ NAAQS.[249]

Based on our review of the State's trading mechanism for transportation conformity analyses for the 2012 annual $PM_{2.5}$ NAAQS, the EPA previously proposed to approve the trading mechanism, which would allow future decreases in NO_X emissions from on-road mobile sources to offset any on-road increases in $PM_{2.5}$, using a 6.5:1 NO_X:$PM_{2.5}$ ratio.[250] To ensure that the trading mechanism does not affect the ability to meet the NO_X budget, we noted the following: (1) the Plan provides that the NO_X emission reductions available to supplement the $PM_{2.5}$ budget would only be those remaining after the NO_X budget has been met; (2) the SJV MPOs would have to document clearly the calculations used in the trading when demonstrating conformity, along with any additional reductions of NO_X and $PM_{2.5}$ emissions in the conformity analysis; and (3) the trading calculations must be performed prior to the final rounding to demonstrate conformity with the budgets. We summarized the technical bases for our proposed approval of the trading mechanism in the 2021 Proposed Rule and in section VI of the EPA's 2012 Annual $PM_{2.5}$ TSD.

Regarding the duration of budgets for the 2012 annual $PM_{2.5}$ NAAQS, the EPA noted that once budgets are approved, they cannot be superseded by revised budgets submitted for the same CAA purpose and the same year(s) addressed by the previously approved SIP until the EPA approves the revised budgets as a SIP revision. While CARB had requested in its letter submitting the 2018 $PM_{2.5}$ Plan that the EPA limit the duration of the budgets (*i.e.,* to allow an adequacy finding, rather than approval, of future SIP revision of budgets to replace the initial budgets),[251] CARB later clarified that since they have submitted EMFAC2021 for EPA review, they no longer request that we limit the duration of our approval.[252]

Lastly, in our 2021 Proposed Rule, the EPA proposed to disapprove the contingency measure element of the 2018 $PM_{2.5}$ Plan with respect to the Serious area requirements for the 2012 annual $PM_{2.5}$ NAAQS, and we are not modifying our proposed action on contingency measures in this proposed rule. Accordingly, we noted that if the EPA were to finalize the proposed disapproval of the 2012 annual $PM_{2.5}$ NAAQS Serious area contingency measure element, the area would be eligible for a protective finding under the transportation conformity rule because the 2018 $PM_{2.5}$ Plan reflects adopted control measures that fully satisfy the emissions reductions requirements for the RFP and attainment year of 2025.[253]

2. The EPA's Reconsidered Proposal

Based on the EPA's reconsideration and proposed disapprovals of the attainment and RFP demonstrations discussed herein, we have reconsidered our proposed approval of the Serious area budgets for the 2012 annual $PM_{2.5}$ NAAQS in the SJV. As discussed below, the EPA now proposes to disapprove the 2025 RFP and attainment year budgets.

As noted in section I.B of this proposed rule, we are not re-proposing any action on the Plan's precursor demonstrations for SO_X and VOC (*i.e.,* we retain our proposed approval that SO_X and VOC are not plan precursors for the 2012 annual $PM_{2.5}$ NAAQS in the SJV, and therefore SO_2 and VOC budgets would not be required, consistent with the transportation conformity regulation (40 CFR 93.102(b)(2)(v))). However, as discussed in section II.A.3 of this proposed rule, the EPA now proposes to disapprove the State's precursor demonstration that ammonia does not significantly contribute to exceedances of the 2012 annual $PM_{2.5}$ NAAQS in the SJV, and therefore the Plan's precursor demonstration would not address the State's obligation to consider whether ammonia budgets are necessary in the Serious area plan.

In the Plan, the State provides a discussion of the significance/insignificance factors for motor vehicle emissions of ammonia (and SO_2 and VOC), which would demonstrate a finding of insignificance under the transportation conformity rule.[254] The factors typically addressed for significance include an examination of the on-road contribution of ammonia to the total emissions, and the likelihood of future motor vehicle emission controls. We note that annual average ammonia emissions from on-road mobile sources are an estimated 3.4 tpd of a total of 324.3 tpd from all sources in 2025, or about 1% of the total ammonia emissions.[255] Based on our

[249] 76 FR 69896, 69923–69924 (November 9, 2011) (final rule approving direct $PM_{2.5}$ and NO_X budgets for 2012 and 2014 for the 1997 annual and 24-hour $PM_{2.5}$ NAAQS); and 85 FR 44192, 44204 (final rule approving direct $PM_{2.5}$ and NO_X budgets for 2020, 2023, and 2024 for the 2006 24-hour $PM_{2.5}$ NAAQS); and 86 FR 53150, 53176–53179 (September 24, 2021) (proposed rule to approve budgets from the 2018 $PM_{2.5}$ Plan for direct $PM_{2.5}$ and NO_X for 2017 and 2020 for the 1997 24-hour $PM_{2.5}$ NAAQS). We note that, following our 2021 Proposed Rule on the 2012 annual $PM_{2.5}$ NAAQS portion of the Plan, the EPA finalized approval of the 2017 and 2020 budgets for the 1997 24-hour $PM_{2.5}$ NAAQS portion of the Plan. 87 FR 4503.

[250] For example, a 1 tpd excess of direct $PM_{2.5}$ emissions from on-road mobile sources in 2025 could be offset by a 6.5 tpd reduction in NO_X emissions below the NO_X budget for on-road mobile sources in 2025.

[251] Letter dated May 9, 2019, from Richard W. Corey, Executive Officer, CARB, to Mike Stoker, Regional Administrator, EPA Region IX, 3.

[252] Email dated November 30, 2021, from Nesamani Kalandiyur, Manager, Transportation Analysis Section, Sustainable Transportation and Communities Division, CARB, to Karina O'Connor, EPA Region IX.

[253] 40 CFR 93.120(a)(3).

[254] For the criteria and procedures for demonstrating a finding of insignificance under the transportation conformity rule, see 40 CFR 93.109(f).

[255] 2018 $PM_{2.5}$ Plan, App. B, Table B–5.

review, and the small contribution of ammonia emissions from on-road mobile sources, the EPA agrees with the State's finding that on-road mobile source emissions of ammonia are insignificant and therefore the State is not required to include budgets for ammonia in its Serious area plan for the 2012 annual $PM_{2.5}$ NAAQS in the SJV.

With respect to the 2025 RFP and attainment year, the EPA proposes to disapprove the direct $PM_{2.5}$ and NO_X budgets for 2025, as follows. While the 2025 budgets for RFP and attainment were clearly identified and precisely quantified, in this proposed rule the EPA proposes to disapprove the State's Serious area RFP and attainment demonstrations for the 2012 annual $PM_{2.5}$ NAAQS.[256] The EPA cannot approve budgets where the underlying CAA requirements (*i.e.,* RFP and attainment) are disapproved and therefore proposes to disapprove the 2025 budgets. The budgets, when considered together with all other emission sources, cannot be consistent with the applicable requirements for RFP and attainment of the 2012 annual $PM_{2.5}$ NAAQS given the proposed disapprovals of the RFP and attainment demonstrations. Therefore, we are proposing to disapprove the motor vehicle emissions budgets because they do not meet applicable statutory and regulatory requirements, including the adequacy criteria specified in the transportation conformity rule.[257] If the EPA finalizes the disapproval, the EPA would concurrently withdraw the adequacy finding for the 2025 RFP and attainment year motor vehicle emission budgets.[258]

Lastly, given that we now propose to disapprove the Plan's RFP and attainment demonstrations for the 2012 annual $PM_{2.5}$ NAAQS, rather than just the Serious area contingency measure element alone (as described in our 2021 Proposed Rule), the SJV would not be eligible for a protective finding under the transportation conformity rule because the 2018 $PM_{2.5}$ Plan's control measures do not fully satisfy the emissions reductions requirements for the RFP and attainment year of 2025.[259]

As a result, if the EPA finalizes our proposed disapproval of the budgets, upon the effective date of our final rule the area would be subject to a conformity freeze under 40 CFR 93.120 of the transportation conformity rule. No new transportation plan, TIP, or project may be found to conform until the State submits another control strategy implementation plan revision fulfilling the same CAA requirements, the EPA finds the budgets in the revised plan adequate or approves the budgets, the MPO makes a conformity determination for the new budgets, and the U.S. Department of Transportation makes a conformity determination.[260] In addition, only transportation projects outside of the first four years of the current conforming transportation plan and TIP or that meet the requirements of 40 CFR 93.104(f) during the resulting conformity freeze may be found to conform until California submits a new attainment and RFP plan for the 2012 annual $PM_{2.5}$ NAAQS and (1) the EPA finds the submitted budgets adequate per 40 CFR 93.118 or (2) the EPA approves the new attainment plan and conformity to the new plan is determined.[261] Furthermore, if, as a result of our final disapproval action, the EPA imposes highway sanctions under section 179(b)(1) of the Act two years from the effective date of our final rule, then the conformity status of the transportation plan and TIP will lapse on that date and no new transportation plan, TIP, or project may be found to conform until California submits a new plan for the 2012 annual $PM_{2.5}$ NAAQS, and conformity to the plan is determined.[262]

III. Environmental Justice Considerations

Executive Order 12898 (59 FR 7629, February 16, 1994) requires that Federal agencies, to the greatest extent practicable and permitted by law, identify and address disproportionately high and adverse human health or environmental effects of their actions on minority and low-income populations. Additionally, Executive Order 13985 (86 FR 7009, January 25, 2021) directs Federal Government agencies to assess whether, and to what extent, their programs and policies perpetuate systemic barriers to opportunities and benefits for people of color and other underserved groups, and Executive Order 14008 (86 FR 7619, February 1, 2021) directs Federal agencies to develop programs, policies, and activities to address the disproportionate health, environmental, economic, and climate impacts on disadvantaged communities.

To identify environmental burdens and susceptible populations in underserved communities in the SJV nonattainment area and to better understand the context of our proposed action on the 2012 annual $PM_{2.5}$ NAAQS portion of the SJV $PM_{2.5}$ Plan on these communities, we conducted a screening-level analysis using the EPA's environmental justice (EJ) screening and mapping tool (''EJSCREEN'').[263] Our screening-level analysis indicates that all eight counties in the SJV score above the national average for the EJSCREEN ''Demographic Index'' (*i.e.,* ranging from 48% in Stanislaus County to 61% in Tulare County, compared to 36% nationally).[264] The Demographic Index is the average of an area's percent minority and percent low income populations, *i.e.,* the two populations explicitly named in Executive Order 12898.[265] All eight counties also score above the national average for demographic indices of ''linguistically isolated population'' and ''population with less than high school education.''

With respect to pollution, all eight counties score at or above the 97th percentile nationally for the $PM_{2.5}$ index and seven of the eight counties in the SJV score at or above the 90th percentile nationally for the $PM_{2.5}$ EJ index, which is a combination of the Demographic Index and the $PM_{2.5}$ index. Most counties also scored above the 80th percentile for each of 11 additional EJ indices included in the EPA's EJSCREEN analysis. In addition, several

[256] See 40 CFR 93.118(e)(4)(iii).

[257] 40 CFR 93.118(e)(4).

[258] The EPA found the 2025 budgets adequate in our 2021 Proposed Rule. See also, the EPA's 2012 Annual $PM_{2.5}$ TSD, 41.

[259] 40 CFR 93.120(a)(3).

[260] 40 CFR 93.120(a)(2).

[261] Id.

[262] 40 CFR 93.120(a)(1).

[263] EJSCREEN provides a nationally consistent dataset and approach for combining environmental and demographic indicators. EJSCREEN is available at *https://www.epa.gov/ejscreen/what-ejscreen.* The EPA used EJSCREEN to obtain environmental and demographic indicators representing each of the eight counties in the San Joaquin Valley. We note that the indicators for Kern County are for the entire county. While the indicators might have slightly different numbers for the SJV portion of the county, most of the county's population is in the SJV portion, and thus the differences would be small. These indicators are included in EJSCREEN reports that are available in the rulemaking docket for this action.

[264] EPA Region IX, ''EJSCREEN Analysis for the Eight Counties of the San Joaquin Valley Nonattainment Area,'' August 2022.

[265] EJSCREEN reports environmental indicators (*e.g.,* air toxics cancer risk, Pb paint exposure, and traffic proximity and volume) and demographic indicators (*e.g.,* people of color, low income, and linguistically isolated populations). The score for a particular indicator measures how the community of interest compares with the State, the EPA region, or the national average. For example, if a given location is at the 95th percentile nationwide, this means that only 5% of the US population has a higher value than the average person in the location being analyzed. EJSCREEN also reports EJ indexes, which are combinations of a single environmental indicator with the EJSCREEN Demographic Index. For additional information about environmental and demographic indicators and EJ indexes reported by EJSCREEN, see EPA, ''EJSCREEN Environmental Justice Mapping and Screening Tool—EJSCREEN Technical Documentation,'' section 2 (September 2019).

counties scored above the 90th percentile for certain EJ indices, including, for example, the Ozone EJ Index (Fresno, Kern, Madera, Merced, and Tulare counties), the National Air Toxics Assessment (NATA) Respiratory Hazard EJ Index (Madera and Tulare counties), and the Wastewater Discharge Indicator EJ Index (Merced, San Joaquin, Stanislaus, and Tulare counties).[266]

As discussed in the EPA's EJ technical guidance, people of color and low-income populations, such as those in the SJV, often experience greater exposure and disease burdens than the general population, which can increase their susceptibility to adverse health effects from environmental stressors.[267] Underserved communities may have a compromised ability to cope with or recover from such exposures due to a range of physical, chemical, biological, social, and cultural factors.[268] The EPA is committed to environmental justice for all people, and we acknowledge that the SJV nonattainment area includes minority and low income populations that are subject to higher levels of $PM_{2.5}$ and other pollution relative to State and national averages, and that such concerns could be affected by this action.

If the EPA were to finalize the proposed disapprovals described in section II of this proposed rule, California would be required to submit a plan revision for the SJV for the 2012 annual $PM_{2.5}$ NAAQS to address the identified deficiencies. In addition, as summarized in section V of this proposed rule, such final action would trigger clocks for the SJV for offset sanctions 18 months after the final rule effective date, highway funding sanctions six months after the offset sanctions, and the obligation for the EPA to promulgate a Federal implementation plan (FIP) within two years of the final rule effective date. These obligations ensure that the identified deficiencies are resolved in an expeditious manner, consistent with the principles of environmental justice.

We note that, in developing and proposing draft regulations for governing board consideration, both CARB and the District consider the potential benefits of proposed measures for reducing health hazards to disadvantaged communities, such as diesel PM exposure near Heavy-Duty truck corridors and indoor smoke exposure from residential wood burning. There may be further opportunities to address EJ concerns through such control development and implementation.

More broadly, California law has established additional requirements for community-focused action to reduce air pollution in the State. For example, in response to California Assembly Bill 617 (2017), CARB and the District have engaged communities in the SJV, performed technical evaluations, and ultimately selected four communities (South Central Fresno, Shafter, Stockton, and Arvin/Lamont) that are in varying stages of developing and implementing community air monitoring programs and community emission reduction programs.[269] Furthermore, grant programs implemented by the local, State, and Federal authorities may serve to smooth and accelerate emission reductions of $PM_{2.5}$ and its precursor pollutants in the SJV, thereby relieving some of the cumulative burden on disadvantaged communities in the SJV nonattainment area.[270]

IV. Title VI of the Civil Rights Act

As noted in section I.C of this proposed rule, the EPA received a comment letter dated January 28, 2022 (the Public Justice Comment Letter), on the 2021 Proposed Rule from a coalition of 13 organizations.

The commenters urge the EPA to disapprove the Serious area plan ''because EPA has failed to require CARB/SJV to provide necessary assurances that the State implementation plan complies with Title VI of the Civil Rights Act of 1964. The on-going environmental justice and air pollution crisis demand EPA reverse course and disapprove the 2012 plan.'' [271] To support this argument, the commenters provide information regarding the racial demographics of the SJV, the potential for disparate impacts from exposure to $PM_{2.5}$, and specific aspects of the SJV $PM_{2.5}$ Plan that the commenters believe result in disparate impacts. The commenters point to past precedent in which the EPA has considered compliance with Title VI of the Civil Rights Act (Title VI) in the SIP context through CAA section 110(a)(2)(E). The commenters also note that thus far California has provided no ''demonstration'' that the Serious area plan does not cause or exacerbate disparate impacts on affected communities in the SJV. Thus, the commenters assert that the EPA must disapprove the Serious area plan because the State did not provide ''required assurances'' of compliance with Title VI.

At this time, the EPA has not issued any guidance or regulations concerning what might be required for purposes of CAA section 110(a)(2)(E) as it regards Title VI. The EPA has addressed other aspects of section 110(a)(2)(E) in the context of infrastructure SIP submissions in its September 2013 ''Guidance on Infrastructure State Implementation Plan (SIP) Elements under Clean Air Act Sections 110(a)(1) and 110(a)(2).'' Similarly, EPA regulations only address other aspects of section 110(a)(2)(E) in 40 CFR Sections 51.230–232.

A. Background on CAA Section 110(a)(2)(E)

For purposes of background, section 110(a)(2)(E) of the CAA, in relevant part and with emphasis added, reads as follows:

> (2) Each implementation plan submitted by a State under this chapter shall be adopted by the State after reasonable notice and public hearing. Each such plan shall—. . .
>
> (E) provide (i) *necessary assurances* that the State (or, except where the Administrator deems inappropriate, the general purpose local government or governments, or a regional agency designated by the State or general purpose local governments for such purpose) will have adequate personnel, funding, and authority under State (and, as appropriate, local) law to carry out such implementation plan *(and is not prohibited by any provision of Federal or State law from carrying out such implementation plan or portion thereof),* (ii) requirements that the State comply with the requirements respecting State boards under section 7428 of this title, and (iii) necessary assurances that, where the State has relied on a local or regional government, agency, or instrumentality for the implementation of any plan provision, the State has responsibility for ensuring adequate implementation of such plan provision.[272]

[266] Notably, Tulare County scores above the 90th percentile on six of the 12 EJ indices in the EPA's EJSCREEN analysis, including the $PM_{2.5}$ EJ Index, which is the highest count among all SJV counties.

[267] EPA, ''Technical Guidance for Assessing Environmental Justice in Regulatory Analysis,'' section 4 (June 2016).

[268] Id. at section 4.1.

[269] For further information, see, *e.g.,* SJVUAPCD, ''Item Number 9: Receive Progress Reports on AB617 Community Emission Reduction Program Implementation,'' November 18, 2021.

[270] For example, through the EPA's Targeted Airshed Grant program, the District has competed for, and the EPA has granted 13 awards to the District from 2015 through 2021, totaling $77.4 million, to replace older, dirtier woodstoves, agricultural equipment, heavy-duty trucks and yard trucks, and agricultural nut harvesters with cleaner equipment. A list of the Targeted Airshed Grants the EPA awarded in fiscal years 2015–2020 is accessible online at *https://www.epa.gov/air-quality-implementation-plans/targeted-airshed-grant-recipients.* These EPA grants support projects to reduce emissions in areas facing the highest levels of ground-level ozone and $PM_{2.5}$.

[271] Public Justice Comment Letter, 2.

[272] 42 U.S.C. Section 7410(a)(2)(E) (emphasis added).

The EPA has previously addressed CAA section 110(a)(2)(E)(i), Title VI, and necessary assurances in a 2012 action on a nonattainment plan SIP submission from California for purposes of the ozone NAAQS.[273] Comments submitted on the EPA's April 24, 2012 proposed action contended that the SIP submission was not in compliance with CAA section 110(a)(2)(E) because of alleged violations of Title VI related to the regulation of pesticides as precursors to ozone (as volatile organic compounds). To evaluate the commenter's concerns, the EPA sought additional necessary assurances from the State concerning its regulation of pesticides. California submitted additional information to the EPA concerning the State's activities that were part of the resolution of a Title VI complaint, and additional information concerning the State's regulation of pesticides. California submitted this information to provide ''necessary assurances'' to the EPA that implementation of the requirements of the SIP submission would not violate Title VI. The EPA accepted this information as providing adequate necessary assurances for purposes of section 110(a)(2)(E) and did not require the State to make any substantive changes to support approval of the SIP revision.

Commenters in the 2012 action asserted that California had not provided sufficient necessary assurances. In the response to comments in the 2012 action, the EPA explained that ''Section 110(a)(2)(E), however, does not require a State to 'demonstrate' it is not prohibited by Federal or State law from implementing its proposed SIP revision. Rather, this section requires a State to provide 'necessary assurances' of this.'' [274] The EPA further explained,

> Courts have given EPA ample discretion in deciding what assurances are ''necessary'' and have held that a general assurance or certification is sufficient. (''EPA is entitled to rely on a state's certification unless it is clear that the SIP violates state law and proof thereof * * * is presented to EPA.'' *BCCA Appeal Group* v. *EPA,* 355 F.3d 817, 830 fn 11 (5th Cir. 2003)).[275]

The EPA received a petition for review (from groups overlapping with the groups that sent the Public Justice Comment Letter) of the EPA's October 26, 2012 final action which was reviewed and ultimately decided in EPA's favor by the Ninth Circuit Court of Appeals.[276] The Court used an arbitrary and capricious standard of review to evaluate the EPA's conclusion that the State had provided adequate ''necessary assurances'' that implementation of the SIP is not prohibited by Federal law—specifically, Title VI of the Federal Civil Rights Act of 1964—per the language of section 110(a)(2)(E). The Ninth Circuit found that the EPA fulfilled its duty to provide a reasoned judgment because its determination was cogently explained and supported by the record. In dismissing the petition, the Court explained that ''[t]he EPA has a duty to provide a reasoned judgment as to whether the State has provided 'necessary assurances,' but what assurances are 'necessary' is left to the EPA's discretion.'' [277]

B. Background on Title VI of the Civil Rights Act of 1964

For purposes of background context, Title VI prohibits recipients of Federal financial assistance from discriminating on the basis of race, color, or national origin. Under the EPA's nondiscrimination regulations, which implement Title VI and other civil rights laws,[278] recipients of EPA financial assistance are prohibited from taking actions in their programs or activities that are intentionally discriminatory and/or have an unjustified disparate impact.[279] This includes policies, criteria or methods of administering programs that are neutral on their face but have the effect of discriminating.[280] Under the EPA's regulation, recipients of EPA financial assistance are also required to have in place certain procedural safeguards, including grievance procedures that assure the prompt and fair resolution of external discrimination complaints.[281]

The EPA carries out its mandate to ensure that recipients of EPA financial assistance comply with their nondiscrimination obligations by investigating administrative complaints filed with the EPA alleging discrimination prohibited by Title VI and the other civil rights laws; [282] initiating affirmative compliance reviews; [283] and providing technical assistance to recipients to assist them in meeting their Title VI obligations. In the current matter being addressed in this action, no Title VI complaint was filed regarding CARB or the District.[284] Also, the EPA (through the External Civil Rights Compliance Office or ECRCO) has not initiated and is not currently conducting a compliance review of either CARB or SJVUAPCD.

C. Comments Received on 2021 Proposed Rule

The commenters raise the issue of compliance with section 110(a)(2)(E) with respect to Title VI. The commenters contend that the SIP submission for the SJV is not in compliance with CAA section 110(a)(2)(E) because California has not provided necessary assurances to ensure that implementation of the SIP is in compliance with Title VI. The commenters did not submit these specific comments to CARB or the SJVUAPCD during the State's development and adoption process of the proposed SIP revisions that are currently at issue. The commenters are not required to have done so to raise this issue with the EPA now, but as a result, the SIP submission to the EPA does not include any CARB or District response concerning this specific issue. In addition, the SIP submission does not include specifically identified necessary assurances per section 110(a)(2)(E) provided by the State.

At the outset, the EPA acknowledges the statements in the comment letter that the SJV area has historically been designated as nonattainment for the $PM_{2.5}$ NAAQS and that the SJV area includes higher representation of persons of color compared to the State average. Although in this action the EPA is not proposing to disapprove on the basis of CAA section 110(a)(2)(E), if the EPA disapproves the Serious area plan as proposed today, California would need to submit a revised Serious area plan for the SJV. The EPA expects that any such revision would comply with the requirements of section 110(a)(2)(E) and that CARB and the District will engage with the community through notice and comment during the SIP

[283] 40 CFR Section 7.115.

[284] The EPA's External Civil Rights Compliance Office (ECRCO) contacted Mr. Brent Newell, signatory to the Public Justice Comment Letter, to see whether the commenters intended to file a Title VI administrative complaint with the EPA. In response, the commenters stated, ''[t]he comments submitted were neither intended nor styled as a Title VI complaint. The comments raise significant issues with respect to EPA's proposed approval, including the section 110(a)(2)(E) issues and EPA's authority and duty to enforce Title VI, and we expect EPA to respond to all of the issues in the final action/response to comments.'' Email exchange dated February 8, 2022, between Brent Newell, Public Justice and Lilian Dorka, Director, External Civil Rights Compliance Office, EPA Office of General Counsel.

development process for its revised Serious area plan prior to submitting a revised SIP to the EPA, and specifically with respect to necessary assurances relative to Title VI. The new SIP development process provides an important opportunity for CARB and the District to identify potential adverse disparate impacts on the basis of race, color, or national origin from its revised Serious area plan for the 2012 annual $PM_{2.5}$ NAAQS and address them as appropriate.

The EPA acknowledges that it has not issued national guidance or regulations concerning implementation of section 110(a)(2)(E) as it pertains to consideration of Title VI and disparate impacts on the basis of race, color, or national origin in the context of the SIP program. Such guidance is forthcoming and will address CAA section 110(a)(2)(E)'s necessary assurance requirements as they relate to Title VI. In the interim, CARB and the District may find existing EPA and DOJ Title VI and environmental justice resources useful, even though these documents do not relate specifically to CAA section 110(a)(2)(E).[285] Additionally, the EPA's ECRCO is available to provide technical assistance regarding Title VI compliance to CARB and/or the District as they develop the revised Serious area plan for the 2012 annual $PM_{2.5}$ NAAQS.

V. Summary of Proposed Actions and Request for Public Comment

For the reasons discussed in this proposed rule, under CAA section 110(k)(3), the EPA proposes to disapprove, as a revision to the California SIP, the following portions of the SJV $PM_{2.5}$ Plan for the 2012 annual $PM_{2.5}$ NAAQS to address the CAA's Serious area planning requirements in the SJV nonattainment area:

(1) the demonstration that BACM, including BACT, for the control of ammonia emission sources and for the control of NO_X and direct $PM_{2.5}$ building heating emission sources will be implemented no later than 4 years after the area was reclassified (CAA section 189(b)(1)(B) and 40 CFR 51.1010(a));

(2) the demonstration that the Plan provides for attainment as expeditiously as practicable but no later than December 31, 2025 (CAA sections 188(c)(2) and 189(b)(1)(A) and 40 CFR 51.1011(b));

(3) plan provisions that require RFP toward attainment by the applicable date (CAA section 172(c)(2) and 40 CFR 51.1012(a));

(4) quantitative milestones that are to be achieved every three years until the area is redesignated attainment and that demonstrate RFP toward attainment by the applicable attainment date (CAA section 189(c) and 40 CFR 51.1013(a)(2)(i)); and

(5) motor vehicle emissions budgets for 2025 as shown in Table 3 of this proposed rule (CAA section 176(c) and 40 CFR part 93, subpart A).

We are also proposing to disapprove the State's precursor demonstration for ammonia. Our proposed action on the emissions inventory and contingency measure elements remains unchanged from our 2021 Proposed Rule.

If we finalize the proposed disapprovals for BACM, the attainment demonstration, RFP, quantitative milestones, or motor vehicle emission budgets, the offset sanction in CAA section 179(b)(2) would apply in the SJV 18 months after the effective date of a final disapproval, and the highway funding sanctions in CAA section 179(b)(1) would apply in the area six months after the offset sanction is imposed.[286] Neither sanction will be imposed under the CAA if the State submits and we approve, prior to the implementation of the sanctions, a SIP revision that corrects the deficiencies that we identify in our final action. The EPA intends to work with CARB and the SJVUAPCD to correct the deficiencies in a timely manner.

In addition to the sanctions, CAA section 110(c)(1) provides that the EPA must promulgate a Federal implementation plan (FIP) addressing any disapproved elements of an attainment plan two years after the effective date of disapproval unless the State submits, and the EPA approves, a SIP submission that cures the disapproved elements.

Furthermore, if we take final action disapproving the 2012 annual $PM_{2.5}$ NAAQS portion of the SJV $PM_{2.5}$ Plan, a conformity freeze will take effect upon the effective date of any final disapproval (usually 30 days after publication of the final action in the **Federal Register**). A conformity freeze means that only projects in the first four years of the most recent RTP and TIP can proceed. During a freeze, no new RTPs, TIPs, or RTP/TIP amendments can be found to conform.[287]

We will accept comments from the public on these proposals for the next 45 days. The deadline and instructions for submission of comments are provided in the **DATES** and **ADDRESSES** sections at the beginning of this proposed rule.

VI. Statutory and Executive Order Reviews

Additional information about these statutes and Executive Orders can be found at *https://www.epa.gov/laws-regulations/laws-and-executive-orders.*

A. Executive Order 12866: Regulatory Planning and Review and Executive Order 13563: Improving Regulation and Regulatory Review

This action is not a significant regulatory action and was therefore not submitted to the Office of Management and Budget (OMB) for review.

B. Paperwork Reduction Act (PRA)

This action does not impose an information collection burden under the PRA, because this proposed SIP disapproval, if finalized, will not in-and-of itself create any new information collection burdens, but will simply disapprove certain State requirements for inclusion in the SIP.

C. Regulatory Flexibility Act (RFA)

I certify that this action will not have a significant economic impact on a substantial number of small entities under the RFA. This action will not impose any requirements on small entities. This proposed SIP partial disapproval, if finalized, will not in-and-of itself create any new requirements but will simply disapprove certain State requirements for inclusion in the SIP.

D. Unfunded Mandates Reform Act (UMRA)

This action does not contain any unfunded mandate as described in UMRA, 2 U.S.C. 1531–1538, and does not significantly or uniquely affect small governments. This action proposes to disapprove certain pre-existing requirements under State or local law, and imposes no new requirements. Accordingly, no additional costs to State, local, or tribal governments, or to the private sector, result from this action.

E. Executive Order 13132: Federalism

This action does not have federalism implications. It will not have substantial

[285] See ECRCO's Toolkit Chapter I at: *https://www.epa.gov/sites/default/files/2017-01/documents/toolkit-chapter1-transmittal_letter-faqs.pdf,* January 18, 2017, and Department of Justice "Title VI Legal Manual (Updated)" at: *https://www.justice.gov/crt/fcs/T6Manual6.* See also, *e.g.,* EPA, "Guidance on Considering Environmental Justice During the Development of Regulatory Actions," (May 2015), and EPA, "Technical Guidance for Assessing Environmental Justice in Regulatory Analysis," (June 2016).

[286] 40 CFR 52.31.

[287] See 40 CFR 93.120(a).

direct effects on the states, on the relationship between the national government and the states, or on the distribution of power and responsibilities among the various levels of government.

F. Executive Order 13175: Coordination With Indian Tribal Governments

This action does not have tribal implications, as specified in Executive Order 13175, because the SIP revision that the EPA is proposing to partially disapprove would not apply on any Indian reservation land or in any other area where the EPA or an Indian tribe has demonstrated that a tribe has jurisdiction, and will not impose substantial direct costs on tribal governments or preempt tribal law. Thus, Executive Order 13175 does not apply to this action.

G. Executive Order 13045: Protection of Children From Environmental Health Risks and Safety Risks

The EPA interprets Executive Order 13045 as applying only to those regulatory actions that concern environmental health or safety risks that the EPA has reason to believe may disproportionately affect children, per the definition of ''covered regulatory action'' in section 2–202 of the Executive Order. This action is not subject to Executive Order 13045 because this proposed SIP partial disapproval, if finalized, will not in-and-of itself create any new regulations, but will simply disapprove certain State requirements for inclusion in the SIP.

H. Executive Order 13211: Actions That Significantly Affect Energy Supply, Distribution, or Use

This action is not subject to Executive Order 13211, because it is not a significant regulatory action under Executive Order 12866.

I. National Technology Transfer and Advancement Act (NTTAA)

Section 12(d) of the NTTAA directs the EPA to use voluntary consensus standards in its regulatory activities unless to do so would be inconsistent with applicable law or otherwise impractical. The EPA believes that this action is not subject to the requirements of section 12(d) of the NTTAA because application of those requirements would be inconsistent with the CAA.

J. Executive Order 12898: Federal Actions To Address Environmental Justice in Minority Populations and Low-Income Population

Executive Order 12898 (59 FR 7629 (February 16, 1994)) establishes Federal executive policy on environmental justice. Its main provision directs Federal agencies, to the greatest extent practicable and permitted by law, to make environmental justice part of their mission by identifying and addressing, as appropriate, disproportionately high and adverse human health or environmental effects of their programs, policies, and activities on minority populations and low-income populations in the United States. The EPA's evaluation of this issue is contained in the section of the preamble titled ''Environmental Justice Considerations.''

Particulate Matter (PM) Pollution

CONTACT US <https://epa.gov/pm-pollution/forms/contact-us-about-particulate-matter-pm-pollution>

Health and Environmental Effects of Particulate Matter (PM)

Health Effects

The size of particles is directly linked to their potential for causing health problems. Small particles less than 10 micrometers in diameter pose the greatest problems, because they can get deep into your lungs, and some may even get into your bloodstream.

Exposure to such particles can affect both your lungs and your heart. Numerous scientific studies have linked particle pollution exposure to a variety of problems, including:

- premature death in people with heart or lung disease
- nonfatal heart attacks
- irregular heartbeat
- aggravated asthma <https://epa.gov/asthma>
- decreased lung function
- increased respiratory symptoms, such as irritation of the airways, coughing or difficulty breathing.

People with heart or lung diseases, children, and older adults are the most likely to be affected by particle pollution exposure.

- AirNow <https://airnow.gov/> can help you monitor air quality near you, and protect yourself and your family from elevated PM levels.

Environmental Effects

Visibility impairment

Fine particles ($PM_{2.5}$) are the main cause of reduced visibility (haze) in parts of the United States, including many of our treasured national parks and wilderness areas. Learn more about visibility and haze <https://epa.gov/visibility>

Environmental damage

Particles can be carried over long distances by wind and then settle on ground or water. Depending on their chemical composition, the effects of this settling may include:

- making lakes and streams acidic
- changing the nutrient balance in coastal waters and large river basins
- depleting the nutrients in soil
- damaging sensitive forests and farm crops
- affecting the diversity of ecosystems
- contributing to acid rain effects <https://epa.gov/acidrain/effects-acid-rain>.

Materials damage

PM can stain and damage stone and other materials, including culturally important objects such as statues and monuments. Some of these effects are related to acid rain effects on materials <https://epa.gov/acidrain/effects-acid-rain#materials>.

Understanding Global Warming Potentials

Greenhouse gases (GHGs) warm the Earth by absorbing energy and slowing the rate at which the energy escapes to space; they act like a blanket insulating the Earth. Different GHGs can have different effects on the Earth's warming. Two key ways in which these gases differ from each other are their ability to absorb energy (their "radiative efficiency"), and how long they stay in the atmosphere (also known as their "lifetime").

The Global Warming Potential (GWP) was developed to allow comparisons of the global warming impacts of different gases. Specifically, it is a measure of how much energy the emissions of 1 ton of a gas will absorb over a given period of time, relative to the emissions of 1 ton of carbon dioxide (CO_2). The larger the GWP, the more that a given gas warms the Earth compared to CO_2 over that time period. The time period usually used for GWPs is 100 years. GWPs provide a common unit of measure, which allows analysts to add up emissions estimates of different gases (e.g., to compile a national GHG inventory), and allows policymakers to compare emissions reduction opportunities across sectors and gases.

- CO_2, by definition, has a GWP of 1 regardless of the time period used, because it is the gas being used as the reference. CO_2 remains in the climate system for a very long time: CO_2 emissions cause increases in atmospheric concentrations of CO_2 that will last thousands of years.
- Methane (CH_4) is estimated to have a GWP of 27-30 over 100 years. CH_4 emitted today lasts about a decade on average, which is much less time than CO_2. But CH_4 also absorbs much more energy than CO_2. The net effect of the shorter lifetime and higher energy absorption is reflected in the GWP. The CH_4 GWP also accounts for some indirect effects, such as the fact that CH_4 is a precursor to ozone, and ozone is itself a GHG.
- Nitrous Oxide (N_2O) has a GWP 273 times that of CO_2 for a 100-year timescale. N_2O emitted today remains in the atmosphere for more than 100 years, on average. (Learn why EPA's U.S. Inventory of Greenhouse Gas Emissions and Sinks uses a different value.)

- Chlorofluorocarbons (CFCs), hydrofluorocarbons (HFCs), hydrochlorofluorocarbons (HCFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6) are sometimes called high-GWP gases because, for a given amount of mass, they trap substantially more heat than CO_2. (The GWPs for these gases can be in the thousands or tens of thousands.)

Frequently Asked Questions

Why do GWPs change over time?

> EPA and other organizations will update the GWP values they use occasionally. This change can be due to updated scientific estimates of the energy absorption or lifetime of the gases or to changing atmospheric concentrations of GHGs that result in a change in the energy absorption of 1 additional ton of a gas relative to another.

Why are GWPs presented as ranges?

> In the most recent report by the Intergovernmental Panel on Climate Change (IPCC), multiple methods of calculating GWPs were presented based on how to account for the influence of future warming on the carbon cycle. For this Web page, we are presenting the range of the lowest to the highest values listed by the IPCC.

What GWP estimates does EPA use for GHG emissions accounting, such as the *Inventory of U.S. Greenhouse Gas Emissions and Sinks* (Inventory) and the Greenhouse Gas Reporting Program?

The EPA considers the GWP estimates presented in the most recent IPCC scientific assessment to reflect the state of the science. In science communications, the EPA will refer to the most recent GWPs. The GWPs listed above are from the IPCC's Sixth Assessment Report, published in 2021.

The EPA's *Inventory of U.S. Greenhouse Gas Emissions and Sinks* (Inventory) complies with international GHG reporting standards under the United Nations Framework Convention on Climate Change (UNFCCC). UNFCCC guidelines now require the use of the GWP values from the IPCC's Fifth Assessment Report (AR5), published in 2013. The Inventory also presents emissions by mass, so that CO_2 equivalents can be calculated using any GWPs, and emission totals using more recent IPCC values are presented in the annexes of the Inventory report for informational purposes.

The data collected by EPA's Greenhouse Gas Reporting Program is generally reported in mass units of greenhouse gas and is used in the Inventory. The Reporting Program, generally uses GWP values from the AR4 to determine whether facilities exceed reporting thresholds and to publish data in CO_2 equivalent values. The Reporting Program collects data about some industrial gases that do not have GWPs listed in the AR4; for these gases, the Reporting Program uses GWP values from other sources, such as the AR5.

EPA's CH_4 reduction voluntary programs also use CH_4 GWPs from the AR5 report for calculating CH_4 emissions reductions through energy recovery projects, for consistency with the national emissions presented in the Inventory.

Are there alternatives to the 100-year GWP for comparing GHGs?

The United States primarily uses the 100-year GWP as a measure of the relative impact of different GHGs. However, the scientific community has developed a number of other metrics that could be used for comparing one GHG to another. These metrics may differ based on timeframe, the climate endpoint measured, or the method of calculation.

For example, the 20-year GWP is sometimes used as an alternative to the 100-year GWP. Just like the 100-year GWP is based on the energy absorbed by a gas over 100 years, the 20-year GWP is based on the energy absorbed over 20 years. This 20-year GWP prioritizes gases with shorter lifetimes, because it does not consider impacts that happen more than 20 years after the emissions occur. Because all GWPs are calculated relative to CO_2, GWPs based on a shorter timeframe will be larger for gases with lifetimes shorter than that of CO_2, and smaller for gases with lifetimes longer than CO_2. For example, for CH_4, which has a short lifetime, the 100-year GWP of 27–30 is much less than the 20-year GWP of 81–83. For CF_4, with a lifetime of 50,000 years, the 100-year GWP of 7380 is larger than the 20-year GWP of 5300.

Another alternate metric is the Global Temperature Potential (GTP). While the GWP is a measure of the heat absorbed over a given time period due to emissions of a gas, the GTP is a measure of the temperature change at the end of that time period (again, relative to CO_2).The calculation of the GTP is more complicated than that for the GWP, as it requires modeling how much the climate system responds to increased concentrations of GHGs (the climate sensitivity) and how quickly the system responds (based in part on how the ocean absorbs heat).

The greenhouse effect of tropospheric ozone

Tropospheric ozone (O_3) is the third most important anthropogenic greenhouse gas after carbon dioxide (CO_2) and methane (CH_4). Ozone absorbs infrared radiation (heat) from the Earth's surface, reducing the amount of radiation that escapes to space.

This map shows the longwave radiative effect (LWRE) of infrared radiation absorbed by tropospheric ozone in Watts/meter^2 as estimated from Aura's Tropospheric Emission Spectrometer (TES) top-of- atmosphere (TOA) observations. Data are averaged for August 2006 and include both clear-sky and cloudy scenes. Areas with no data are indicated in white over oceans and grey over land.

Higher values of trapped infrared radiation are caused by lofted ozone pollution in the northern mid-latitudes and from sources of biomass burning in the southern hemisphere.

This map shows the longwave radiative effect of infrared radiation absorbed by tropospheric ozone as estimated from TES top-of-atmosphere observations.
