Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
George,Munoz,rockyvangogh@yahoo.com,95207,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon

Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
Kay,Pearsall,kayakfc@gmail.com,93555,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
Daniel,Ezso,dan.kathy@twc.com,91607,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Ann,Ekberg,edscookie@sbcglobal.net,94558,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."

There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
Adam,Glick,asglick@yahoo.com,90292,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon

Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
Belinda,Poropudas,belinda.poropudas@gmail.com,94901,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
Diane,Racine,shrill.bond05@icloud.com,90024,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Suzie,Holland,suzanneholland@sbcglobal.net,94565,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Skip,Conley,22atsea@gmail.com,96003,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon

Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
Edith,Davis,edithdavis111@gmail.com,90803,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Christy,Lester,clester33@gmail.com,92056,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
Gilbert,Souza,tonysouza27@comcast.net,95301,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."

There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Betsy,Kramer,kramerbetsy@ymail.com,95610,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon

Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Keith,vonborstel,keith@keithvb.com,95616,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Laurie,KASPARIAN,loddyg@gmail.com,92691,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Juliann,Berman,jeffr46858@aol.com,94061,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
Rebecca,Erickson,raeonthebay@hotmail.com,94010,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon

Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Lynne,Schae,lynneschae@gmail.com,92627,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
Kurt,Abney,eggson6th@gmail.com,92264,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."

The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Pec,Indman,works-peri0k@icloud.com,95129,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Lawrence,Mallach,lmallach@roadrunner.com,91360,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon

Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
Allen,Yarowsky,ayarowsky@icloud.com,92103,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. Mike,Bonar,mikenb@sbcglobal.net,94044,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."

Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
Raffaella,Pippa,peanut_laddies.0y@icloud.com,92130,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Rosalie,Salvato,rsalvato2012@gmail.com,91506,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon

Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Doug,Perske,3perskes@gmail.com,95973,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."

There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Steve,McClure,smcclure@earthlink.net,94117,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Shani,Searcy,tariffs.strain_0w@icloud.com,91932,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
Elisabeth,Garst,elisabethg77@gmail.com,94705,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for

public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."

RE: Proposed 2024 Low Carbon Fuel Standard Amendments

Dear Chair Randolph and Members of the Board:

California Resources Corporation ("CRC") appreciates the opportunity to comment on the California Air Resources Board's ("CARB" or "the Board") proposed 2024 amendments to the Low Carbon Fuel Standard ("LCFS") published December 19, 2023 (the "Proposed Rules").[1] As explained below, in addition to other aspects of the proposal, CRC believes that the Proposed Rules approach to LCFS credit generation for hydrogen projects is not consistent with CARB's December 2022 Scoping Plan (the "2022 Scoping Plan"), and, unless CARB takes steps to revise its proposal, California's nascent low carbon hydrogen production industry will lack vital incentives necessary for the development of California's low carbon economy.

About CRC and Carbon TerraVault Holdings, LLC

California Resources Corporation is an independent energy and carbon management company committed to the energy transition. CRC has some of the lowest carbon intensity production in the US and we are focused on maximizing the value of our land, mineral and technical resources for decarbonization by developing carbon capture and storage ("CCS") and other emissions reducing projects.

Our core activities involve exploration, production, gathering, processing, and marketing of crude oil, natural gas, and natural gas liquids. We leverage advanced technologies extensively to enhance safety and boost production efficiency across our expansive mineral acreage and diverse portfolio. These cutting-edge technologies allow us to increase production while minimizing the environmental footprint of our oil and gas development operations. For more information about CRC, please visit www.crc.com.

Carbon TerraVault Holdings, LLC ("CTV"), a subsidiary of CRC, is developing services that include the capture, transport and storage of carbon dioxide for its customers. CTV is engaged in a series of CCS projects that inject CO_2 captured from industrial sources into depleted

[1] California Air Resources Board, Proposed LCFS Amendments, https://ww2.arb.ca.gov/rulemaking/2024/lcfs2024.

underground reservoirs and permanently store CO_2 deep underground. For more information about CTV, please visit www.carbonterravault.com.

CTV is involved in several green energy initiatives. These include the Grannus Ammonia and Hydrogen Project, which will sequester 370,000 metric tons ("MT") of CO_2 annually and produce clean ammonia and hydrogen in Northern California. The project aims to be California's first clean ammonia and hydrogen facility producing 150,000 MT per annum of clean ammonia and 10,000 MT per annum of clean hydrogen. The Elk Hills Hydrogen Project, in collaboration with Lone Cypress Energy Services, will sequester 205,000 MT of CO_2 per year and produce 65 tons per day of hydrogen from a new hydrogen plant.[2,3] CTV has an agreement to sequester 150,000 MT per annum with NLC Energy, who plans to build a new facility expected to produce up to 7,000 MMBtu per day of RNG from biomass and other agricultural waste feedstock. The Verde Clean Fuels renewable gasoline production facility plans to partner with CTV to sequester 100,000 MT per annum and will utilize an innovative and proprietary liquid fuels technology to produce renewable and lower-carbon gasoline and other liquid fuels from feedstocks such as biomass and agricultural waste. Inentec plans to build a new renewable dimethyl ether (rDME) production facility, with CTV sequestering 100,000 MT per annum and Inentec producing 80-100 tons per day of rDME from biomass and other wastes materials. Lastly, the Yosemite Hydrogen Facility, in partnership with Yosemite Clean Energy, will sequester 40,000 MT of CO_2 per year from a new hydrogen plant expected to produce 24,000 kilograms per day of hydrogen with forest biomass feedstock. These projects contribute to our sustainability goals to reduce carbon emissions and promote clean energy.

About Carbon TerraVault Joint Venture

Carbon TerraVault Joint Venture ("CTV JV") is a carbon management partnership focused on carbon capture and sequestration development, and was formed between Carbon TerraVault, a subsidiary of CRC, and Brookfield Renewable. The CTV JV develops both infrastructure and storage assets required for CCS development in California. CRC owns 51% of the CTV JV with Brookfield Renewable owning the remaining 49% interest.

Proposed Recommendations

As a California-based company committed to the energy transition, CRC supports CARB's overall goal of achieving carbon neutrality by 2045 and reducing greenhouse gas emissions by 2045 to a level that is 85% below 1990 levels. In its Statement of Reasons for the Proposed Rules, CARB stated that "[m]eeting this goal will require the deployment of greenhouse gas emission reduction strategies ***at an unprecedented scale and pace***."[4] However, we are concerned that many aspects of the Proposed Rules unnecessarily restrict or prohibit established and proven strategies for reducing GHG emissions in connection with the production of low carbon intensity ("CI")

---

[2] Second Quarter 2023 Update, California Resources Corporation (July. 31, 2023).

[3] CRC expects that the Lone Cypress Hydrogen Project will utilize a blended feedstock consisting of natural gas and RNG, subject to the availability of RNG.

[4] 2024 LCFS Amendments Staff Report: Initial Statement of Reasons at 4 (Dec. 2023) [hereinafter "Initial Statement of Reasons"] (emphasis added).

hydrogen from generating LCFS credits. In particular, the Proposed Rules as written would exclude low-CI hydrogen with CCS (production of hydrogen utilizing CCS to capture GHG emissions) from generating LCFS credits. The Proposed Rules seemingly only provide for LCFS credits to be generated from hydrogen produced using (1) electricity generated from renewable power sources and (2) renewable natural gas ("RNG") as a feedstock. This proposal is inconsistent with the CARB 2022 Scoping Plan and will ultimately frustrate the deployment of low carbon hydrogen projects in California.

As discussed in greater length below, we respectfully request that prior to finalization of the Proposed Rules, CARB:

365.1 — Revise the definition of the term "renewable hydrogen" in the proposed LCFS amendments to allow for the use of CCS to be consistent with the 2022 Scoping Plan;

365.2 — Expand the LCFS crediting requirements for hydrogen fueling infrastructure to explicitly acknowledge that low-CI hydrogen with CCS can be used to meet the carbon intensity targets;

365.3 — Revise and broaden the refinery crediting program to allow for the use of CCS;

365.4 — Clarify that book-and-claim accounting can be used to support LCFS credit generation when RNG is used to generate electricity utilized for hydrogen production and direct air capture projects; and

365.5 — Reverse the proposed crediting changes for solar innovative crude projects.

These four requests largely stem from regulatory inconsistencies and counterproductive consequences associated with the Proposed Rules, including 1) conflicts between the amendments and CARB's 2022 Scoping Plan, 2) negative impacts to California's climate goals, and 3) harmful financial effects, including risk of stranding assets.

California Resource Corporation's Concerns with the Proposed LCFS Amendments

1. The Proposal is Not Consistent with CARB's 2022 Scoping Plan and Will Frustrate Deployment of Low Carbon Hydrogen

Assembly Bill ("AB") 32 requires CARB to develop a Scoping Plan which lays out California's strategy for meeting the state's climate goals and update the Scoping Plan every five years.[5] The 2022 Scoping Plan provides a detailed pathway to achieve targets for carbon neutrality and reduce anthropogenic GHG emissions by 85% below 1990 levels no later than 2045.

Hydrogen production plays a critical role in meeting these goals per the 2022 Scoping Plan. In order to achieve these ambitious climate targets, the 2022 Scoping Plan recognized that ***1,700 times*** the current hydrogen supply will be required by 2045.[6] AB 32 requires that any CARB

[5] Cal. Code Regs. Title 17, § 38561.(a)-(h) (2023).

[6] California Air Resources Board, *2022 Scoping Plan for Achieving Carbon Neutrality*, at 8 (Dec. 2022) [hereinafter "CARB 2022 Scoping Plan"].

scoping plan embrace "technologically feasible and cost-effective reductions in GHG emissions."[7] The 2022 Scoping Plan follows that statutory directive, but the Proposed Rules do not.

365.6 The massive scaling of low carbon hydrogen projects necessary to meet the goals of the 2022 Scoping Plan requires an "all of the above" approach to low carbon hydrogen production and ensuring that sufficient supportive financial incentives are in place. LCFS credits represent a potentially critical financial incentive for low or zero carbon hydrogen projects. However, based on how CARB proposes to define "renewable electricity," hydrogen production would generally only be eligible to generate LCFS credits if it involves: (1) the electrolysis of water or aqueous solutions using renewable electricity; (2) catalytic cracking, oxidation or steam methane reforming of biomethane or other renewable hydrocarbons; or (3) thermochemical conversion of biomass.[8] This narrow definition ignores, and if adopted as proposed will only serve to disincentivize, the entire low-CI hydrogen industry—a nascent but proven technology being implemented at scale in California by CRC. In light of the 1,700-fold expansion in the state's hydrogen supply called for by the 2022 Scoping Plan, CRC believes that CARB should be encouraging *all forms* of low carbon hydrogen production.

As highlighted above, the 2022 Scoping Plan calls for a flexible approach to supporting the development of low carbon hydrogen.[9] Specifically, the Plan makes the following key references to hydrogen and CCS:

> "For the purposes of this Scoping Plan, 'renewable hydrogen' and 'green hydrogen' are interchangeable and are not limited to only electrolytic hydrogen produced from renewables." (page 26)
>
> "CCS can support hydrogen production until such time as there is sufficient renewable power for electrolysis and an abundant water source." (page 86)
>
> "If steam methane reformation is paired with CCS, the hydrogen produced could potentially be low carbon." (page 88)

These references were included in the final adopted version of the 2022 Scoping Plan despite multiple commenters calling on CARB to explicitly exclude CCS from its definition of hydrogen production eligible to generate LCFS credits. Adhering to the 2022 Scoping Plan requirements outlined in AB 32, CARB refused to take such a narrow approach and built flexibility into the final 2022 Scoping Plan. But merely a year later, in December 2023, CARB published the draft LCFS amendments that seem to take the opposite approach in contrast to that of the 2022 Scoping Plan. This change in the Board's direction seems arbitrary and capricious in light of the rulemaking record.

---

[7] AB 32 § 38561.(a) "[CARB] shall prepare and approve a scoping plan, as that term is understood by the state board, for achieving the **maximum technologically feasible and cost-effective reductions** in greenhouse gas emissions [emphasis added]."
[8] 2024 LCFS Amendments, Proposed Regulation Order, 17 C.C.R. § 95481.(a).
[9] CARB 2022 Scoping Plan at 6.

This abrupt change in CARB's stance towards low-CI hydrogen with CCS is further evidenced in the Board's responses to public comments on the draft 2022 Scoping Plan. When a public commenter called for CARB to only support electrolytic hydrogen generation via renewable electricity, the Board responded by stating that:

> [t]he 2022 Scoping Plan does not prescribe the energy source to produce hydrogen, and therefore, steam methane reformation paired with CCS could be considered in the near term to ensure a rapid transition to hydrogen and increase hydrogen availability until such time as electrolysis with renewables and biomass-based hydrogen can meet the ongoing need.[10]

CARB further acknowledged that because "the build-out [of renewable power generation] takes time and is additive to the growth in demand growth associated with electrification across the economy, the state needs to keep options open for other methods to produce zero carbon hydrogen at the scale needed to meet the projected demand."[11] The Proposed Rules, however, do not embrace the approach called for in the 2022 Scoping Plan and seemingly only contemplate a role for CCS in hydrogen production when RNG is used as a feedstock.[12] Restricting LCFS crediting to hydrogen produced from CCS only when RNG is also used does not keep California's "options open."

The Proposed Rules ignore the technical realities associated with the time to scale the deployment of hydrogen solely produced from renewable electricity and other factors discussed below that may limit the availability of RNG as a feedstock. In this interim period, low-CI hydrogen with CCS is the only proven and scalable technology capable of meeting the demands of California's expanding low carbon economy.[13] Even CARB itself has acknowledged, in its 2022 Scoping Plan, that "[t]here is a high degree of uncertainty around the availability of solar to support both electrification of existing sectors and the production of hydrogen through electrolysis."[14] Given this uncertainty, we are concerned that CARB is playing a zero-sum game by directly linking hydrogen generation LCFS credits largely to renewable power generation. Instead of devoting renewable power supplies to meet other grid demands, these LCFS amendments would incentivize more of this zero-carbon electricity to be devoted to hydrogen generation via electrolysis. This unnecessary competition over scarce renewable energy supplies can be avoided by revising the LCFS amendments to incentivize low-CI hydrogen with CCS as an interim solution while these other hydrogen generation technologies develop.

---

[10] CARB 2022 Scoping Plan Response to Comments, Appendix B at 57.
[11] *Id.*
[12] While the 2022 Scoping Plan used the example of CCS with hydrogen production using RNG as a feedstock as an example of low carbon hydrogen production, *see id.*, nothing in the 2022 Scoping Plan suggested that CARB viewed this as the only pathway for CCS to support low carbon hydrogen production and LCFS credit generation.
[13] Bracci, J., et al., *Fueling the California Mobility Market with Hydrogen from Natural Gas plus Carbon Capture and Storage, Stanford Natural Gas Initiative and Stanford Center for Carbon Storage*, May 2022, at 41 ("near-term techno-economic models still point to SMR-CCS being the cheaper hydrogen generation pathway to kickstart a clean hydrogen economy in California") [hereinafter "SCCS Study"].
[14] CARB 2022 Scoping Plan at 88.

Moreover, CARB may be overestimating the availability of RNG for use in hydrogen production within California. Separate from the provisions related to hydrogen, the Proposed Rules would also effectively end LCFS crediting for biomethane projects after 2040. Given that the biomethane crediting pathway is widely used to support the development of RNG projects, this change will remove the primary financial incentive for new RNG projects in California and for producers to send RNG to California. This is because LCFS credits are critical to making RNG projects competitive with fossil gas given the comparatively low value of environmental credits available under the federal Renewable Fuel Standard ("RFS") and other state low carbon fuel programs. The Proposed Rule's inclusion of a limited pathway for crediting projects using RNG as a feedstock to produce hydrogen until only 2045 is unlikely to be enough to support the volumes of RNG needed meet the 2022 Scoping Plan's goals for low-CI hydrogen. Removing biomethane crediting from the LCFS may result in producers sending RNG to Oregon and Washington to capture more value under those state low carbon fuel programs. In addition, demand for RNG outside of California is only expected to grow over the next several years, with New Mexico recently enacting a low carbon fuel standard and the U.S. Environmental Protection Agency's expected eventual finalization of rules allowing RNG used in electricity generation to generate credits under the RFS. This will inevitably increase demand for RNG for non-hydrogen uses outside of California and could accordingly result in RNG supply shortfalls within the state. CARB's assumption that sufficient RNG may be available as a feedstock for low carbon hydrogen production does not appear to consider this factor.

The LCFS can play a critical support role in the development of California's low carbon hydrogen economy. For example, strong market signals from the LCFS have supported increased production and use of biodiesel and other low carbon fuels.[15] Even regarding CCS, a recent May 2022 study from the Stanford Center for Carbon Storage found that "LCFS is the single largest financial incentive for eligible CCS projects in California."[16] But rather than send strong market signals or incentives in support of California's growing low carbon hydrogen industry, the Proposed Rules send the opposite signal, likely harming both the low carbon hydrogen and CCS industries. By picking winners and losers at such an early stage in the energy transition, CARB is abandoning the technology-neutral approach outlined in its own 2022 Scoping Plan where it stated that "[t]he challenge before us requires us to keep all tools on the table."[17] We believe that CARB should adopt this latter approach and reverse the restrictive course proposed in the LCFS amendments. In particular, as part of this reversal, CARB needs to revise its proposal so that blue
365.7 hydrogen projects are eligible to receive additional LCFS credit generating opportunities.

2. Impact to State Climate Goals

The California Climate Crisis Act (AB 1279) sets an ambitious goal, requiring the state to achieve net zero GHG emissions as soon as possible, but no later than 2045, and thereafter achieve and maintain net negative GHG emissions. CCS is critical to this endeavor; it is, importantly, a *viable* option to reduce emissions from sectors that are key contributors to California's total

---

[15] CARB 2022 Scoping Plan at 191.
[16] SCCS Study at 32.
[17] CARB 2022 Scoping Plan at 11.

emissions.[18] It is also a "critical enabler" of various carbon dioxide removal pathways and a "strong complement" to other decarbonization strategies.[19] In California specifically, CCS has the potential to play "a key role" in the removal of unabated carbon emissions, with potential geologic sequestration capacity in the state estimated to be between 35 to 425 gigatons of CO_2e in saline aquifers and 5 gigatons of CO_2e in the largest oil and gas basins.[20] This could provide storage capacity for up to 1,000 years.[21]

CARB itself has acknowledged the essential role that CCS must play in achieving California's ambitious climate goals. In fact, CARB has stated that "there is no path to carbon neutrality without carbon removal and sequestration," as indicated not just by the 2022 Scoping Plan Update but also by the IPCC's Climate Change 2022: Mitigation of Climate Change report.[22] The 2022 Scoping Plan is the main regulatory document governing how CARB will approach progress toward, and the meeting of, the state's ambitious climate aims. Integral to such progress is the development of, and support of, CCS projects—without this tool, carbon neutrality will remain an illusory hope.
365.8 CARB's LCFS Proposed Rules, then, are entirely inconsistent with the state's 2022 Scoping Plan, completely disregarding prior acknowledgement of the absolute necessity of CCS. CARB must return to embracing CCS as an integral part of its strategy to achieve the state's targets.

CCS represents a both foundational building block for meeting California's climate goals and acting as a bridge to support low carbon hydrogen production until sufficient renewable power generation capacity exists to actually allow for large-scale hydrogen production using only renewable electricity. Even if, as CARB has recognized, the transportation sector is headed toward electrification, low carbon hydrogen and CCS will be a key component in any strategy to decarbonize hard-to-abate industries, such as heavy manufacturing (*e.g.*, steel and cement).[23] The role of low-CI hydrogen with CCS as a necessary bridge to 100% renewable-derived hydrogen will be thwarted without the right support under the LCFS.

3. Financial Impacts

Notwithstanding the critical role of low-CI hydrogen with CCS in meeting the state's ambitious climate goals, the Proposed Rules fail to account for the significant financial benefits CCS can provide. For example, it is estimated that the community benefits from direct air capture CCS projects *alone* in Kern County, California, could produce $68 million a year in county property tax revenue, $25 million to surrounding cities, and a total of 23,000 jobs.[24] And, in a study

[24] *See* Ferrell, Jake, *Carbon Removal in California: Striving Toward Environmental Justice in the Central Valley*, American University Research Center (Dec. 2023).

365.9 from Louisiana State University, the development of a CCS hub in the region was estimated to result in thousands of jobs and several hundred million dollars in potential earnings for workers in the Gulf Coast region over a five-year construction period.[25] However, such financial benefits for state and local governments can only be realized if the right incentives are in place. To that end, CARB should ensure that any final amendments to the LCFS properly incentivize the development of CCS.

365.10 For California to be a leader in the CCS industry, and to capitalize on the substantial financial benefits that CCS can bring, CARB should use the LCFS to incentivize additional low carbon hydrogen production. LCFS credits are critical here.[26] To mitigate against the expenses of production, low carbon hydrogen developers have come to rely on stacking multiple incentives, particularly following the passing of the Inflation Reduction Act in August 2022.[27] For CCS projects, the stacking of incentives relies not only on tax credits but also the LCFS credit.[28] However, by adopting the restrictive approach proposed in the LCFS amendments, CCS projects face undue capital and economic uncertainty, stymying development and, ultimately, the achievement of energy decarbonization goals. Moreover, this unnecessary barrier to market and develop CCS projects will likely result in stranded assets, the very idea of which CARB has strongly rejected in the 2022 Scoping Plan[29] and acknowledged it must avoid in the LCFS Proposed Rules themselves.[30] It is critical that CARB revise its approach to ensure that low carbon hydrogen production is economical and financially viable.

4. Book-and-Claim Accounting and Crediting Opportunities for Low-Carbon Electricity and Hydrogen Production and Direct Air Capture ("DAC")

365.11 CRC also requests that CARB clarify the book-and-claim accounting provisions in the Proposed Rules to allow for LCFS credit generation when low-CI electricity produced from biomethane is then used to support DAC or hydrogen production. As an operator, we would like the ability to receive credits for any quantities of low-CI electricity produced onsite using biomethane feedstocks, but we anticipate these initial projects to be small in scale. As a result, our

[29] *Id*. at 9 "We must avoid making choices that will lead to stranded assets and incorporate new technologies that emerge over time."

[30] With respect to biomethane, CARB acknowledges that, for the fuel to transition to more sectors in the long term, "the existing market signals will need to transition accordingly to avoid stranded assets and the closure of methane capture projects." Initial Statement of Reasons at 30. The same idea is applicable to CCS projects if projects are forced to cease mid-development due to the lack of financial incentives, support and access to capital.

low carbon operations would benefit from the ability to directly offset purchased quantities of biomethane used onsite with the corresponding electricity generation credits. If CARB believes that the Proposed Rules already allow for such a crediting scheme, we request CARB issue a statement confirming that this is a valid approach.

5. Innovative Crude LCFS Credit Proposed Changes

$$Credits_{Innov}(MT) = \cancel{511}314 \times \frac{E_{electricity} \times f_{renew}}{V_{crudeproduced}} \times V_{Innov} \times C$$

Figure 1: Proposed LCFS Credits Equation for Innovative Crude Projects.

The Proposed Rules include a substantial reduction in the credits awarded to innovative crude oil produced or transported using solar or wind-based electricity. As highlighted in **Figure 1**, this reduction stems from a change in the coefficient (*i.e.*, the displacement emission factor) in the equation listed above (replacing "511" with "314") which will reduce awarded credits by approximately 40%. CRC notes that this crediting pathway has resulted in at least seventeen innovative crude oil projects to date across the state. Furthermore, our operating experience has shown that solar electricity production provides one of the best ways as an operator to directly reduce our Scope 2 GHG emissions. Despite these successful emission reductions, CARB's proposed changes to this crediting equation will impact funding investment decisions for projects currently in development. Worse still, operating projects that were financially justified based on the previous crediting equation risk becoming stranded assets if their LCFS credits are taken away.

365.12 We request CARB reverse this proposed change and keep the current displacement emission factor of 511 gCO_2e/kWh. In the alternative, we request that the Proposed Rules be revised to more explicitly state that projects that have already been approved to generate LCFS credits in this manner be allowed to keep using the existing crediting equation with a potential grace period for projects currently under development. Absent these requested revisions, the arbitrary changes to the innovative crude pathway crediting scheme sets a precedent that LCFS credits cannot be relied upon when justifying long-term project investment decisions. In turn, this could impact other LCFS crediting programs—beyond just the innovative crude pathway—by creating hesitation among investors instead of incentivizing new projects and developments to reduce emissions.

Conclusion

As more fully explained above, CRC recommends CARB revisit various of its proposed amendments to the LCFS program with respect to low-CI hydrogen with CCS, in particular. Revisions to the Proposed Rules are necessary to ensure consistency with the 2022 Scoping Plan and, importantly, to recognize the importance of blue hydrogen in meeting the state's ambitious climate goals. To that end, revisions to the definition of the term "renewable hydrogen" are required, alongside the expansion and broadening of LCFS crediting programs and requirements, among others, as detailed above.

CRC appreciates the opportunity to comment on the proposed 2024 LCFS amendments. We thank the Chair and CARB for its consideration and look forward to continued dialogue.

Respectfully submitted,

Chris Gould

Regarding

Proposed Amendments to the California Low Carbon Fuel Standard Regulation

February 20, 2024

Introduction

We write to provide comments on the amendments to the California Low Carbon Fuel Standard (LCFS) regulation proposed by the California Air Resources Board (ARB) in its Initial Statement of Reasons[1] (ISOR). We are research scientists, research scholars, legal fellows, and doctoral students from Stanford University with special expertise in the development of climate and energy policy. Between us, we have more than 75 years of experience in the evaluation and development of energy and climate policy. Some of us have been active participants in ARB processes since the advent of the LCFS as an early action measure in the early days of AB32 implementation.

We write in our personal capacity. None of the views expressed below can or should be attributed in any way to the Climate and Energy Policy Program, the Woods Institute for the Environment, the Doerr School of Sustainability, or Stanford University.

While these comments provide some critiques and suggested changes to the proposed amendments to the LCFS and of the ISOR, we share what we believe to be ARB staffs' core objective of a safe, affordable, equitable, and most of all rapid transition to a zero emission California. We submit these comments as Californians who heartily endorse the ambition of that shared enterprise. We also commend and respect the tremendous time and effort, particularly with stakeholders, that ARB staff has made to generate the ISOR. We hope that our comments will be viewed as constructive and substantive, in alignment with our intent of assisting ARB in achieving that crucial mission.

[1] California Air Resources Board, Public Hearing to Consider the Proposed Amendments to the Low Carbon Fuel Standard, Staff Report: Initial Statement of Reasons, December 19, 2023. *Hereafter, "ISOR".*

Executive Summary

We actively participated in the hearing processes leading up to the release of the ISOR as well as in the Environmental Justice Advisory Committee (EJAC) discussions of the rule. Our work included conducting modeling using earlier versions of the ARB California Transportation Supply (CATS) model, used in the development of the proposed amendments evaluated in the ISOR. Our earlier comments and presentations led directly to improvements in the model to better reflect ongoing trends in the transportation sector as well as new regulations implemented by ARB since its last model update.

Our main comments are as follows, and are described in greater detail in subsequent sections:

366.1

(1) The rulemaking to date suffers from a lack of transparency because ARB staff has declined to release the CATS model input files upon which many of its conclusions are based. While ARB did release GREET modeling, which explains its views of life cycle accounting issues related to the rule amendments, the failure to release input and output files for CATS related to all alternatives considered for the ISOR fundamentally limits stakeholder opportunity to understand, let alone comment on, the proposals under consideration. **We ask that before ARB staff brings the proposal before the Board, that staff release these files and allow an additional round of public comment.**

366.2

(2) As recently stated by Jim Bushnell with respect to the ARB administered cap-and-trade program, the LCFS is entering its "teenage years."[2] This has several important implications – including a greater need to consider distributional impacts as the program matures, as well as the interaction between the cap-and-trade and LCFS programs and lastly, that combination's cumulative impacts. The ISOR does not evaluate this interaction, even though there is a parallel rulemaking in its early phases to significantly strengthen the cap-and-trade targets to 2030. **The impacts of these programs cannot be understood in isolation and ARB needs to evaluate them together to understand both environmental and socioeconomic impacts before the Board should consider votes on proposals to amend either program.**

(3) The transportation sector, in significant part due to ARB's own successful efforts over the past quarter century to facilitate entry of Zero Emission Vehicles (ZEVs) into the California vehicle fleet and to clean up diesel trucks, is in the middle of a rapid transformation. This rulemaking, relying on a relatively simple and deterministic model, proposes to create regulatory targets that will subsidize aspects of the transportation fuels sector, the refining sector, and the agricultural sector for the next 21 years. That process assumes greater certainty about the future than currently, exists, despite the rapidly and unpredictably evolving present context. It

[2] James Bushnell, California's Cap-and-Trade Market Enters its Teen-Age Years, Energy Institute Blog, Energy Institute at Haas, 2023, *at* https://energyathaas.wordpress.com/2023/11/27/californias-cap-and-trade-market-enters-its-teen-age-years/.

evaluates alternatives without any consideration of uncertainty even though ARB's other transportation policies are likely driving and will in the future continue to drive—along with technological innovation—transformative change. We believe that given rates of change in the sector, a more cautious and short-term policy is more
366.3 prudent. **We recommend that ARB adopt a policy that sets incentives until 2035 and then reconsider the regulation in the early 2030s or thereabouts based on the facts at that point.**

366.4 **(4)** There are real questions about the greenhouse gas emissions reductions claimed in the ISOR. Notably:

(a) The interaction with the federal Renewable Fuels Standard (RFS) is critical to understanding the actual impacts (and induced leakage) from this rule, but ARB does not articulate a clear approach for considering them or do so in a transparent manner.

366.5 (b) The failure of the ISOR to cap lipid biofuels and its reliance on outdated indirect land use (ILUC) calculations raises real questions regarding the actual reductions achievable by the ISOR given unprecedented renewable diesel supply growth.

366.6 **We recommend that ARB reevaluate GHG emission reductions and adopt a cap on lipid biofuels at a level that is consistent with the assumptions underlying its current ILUC estimate.**

(5) Criteria pollutant emission reductions associated with the proposed amendments
366.7 are likely overstated, both because (1) ARB relies on an incorrect assumption about the relationship between in-state oil production and in-state fossil diesel consumption and because (2) ARB relies on outdated assumptions about the California medium and heavy-duty fleets. Over the past fifteen years, ARB has moved aggressively to force diesel retrofits with strong emission controls as well as the advent of advanced technology diesel engines that incorporate stringent emission controls. ARB's own science shows that new and retrofit diesel engines fueled by RD and BD as opposed to fossil diesel do not have lower emissions. Yet the rule, relying on older science that focused on older un-retrofitted diesel engines, makes claims that the rule will provide significant criteria pollutant benefits. **ARB staff should correct these assumptions and then recalculate an estimate of the potential criteria pollutant benefits of the different alternatives it has considered.**

(6) Although ARB included a relatively robust distributional analysis in the SRIA, it was
366.8 largely omitted from the ISOR. We believe that, particularly for the proposed amendments to the LCFS—that will increase the degree that gasoline prices are impacted by the LCFS, —a distributional analysis is essential to fully understanding the consequences of the rule for low and moderate-income Californians. The proposed LCFS amendments, through simultaneous increases in credit prices and elevated carbon intensity reductions for fuel suppliers, necessitate a detailed examination of their combined impact. **We recommend that ARB staff revise the ISOR to incorporate a thorough and robust analysis of the effects arising from deeper CI reductions, higher credit prices and the newly proposed Automatic Acceleration Mechanism before presentation to the Board.**

We recognize and appreciate the significant outreach and staff time that has gone into the development of the ISOR. Simultaneously, we believe that the concerns we describe above regarding the current proposal are serious enough to warrant substantial reconsideration of the proposal. A right-sized LCFS amendment is called for: one that reflects the role of the LCFS as an important tool to force innovation in the liquid fuels sector, but also reflects the ability – or lack thereof – to accurately predict the transportation sector's future. We urge staff to recall that the founding idea of the LCFS, as articulated by Alex Farrell of UC Berkeley, was that the program would be an important supplement to cap-and-trade because of the unique and additional barriers to innovation in the fuels sector. We also urge staff and the Board to allocate sufficient time for the consideration of potential impacts and interactions between the LCFS and cap-and-trade programs. Additionally, we recommend conducting a comprehensive analysis of the distributional impacts of both programs as they mature, are updated for scoping plan consistency, and as their ambition deepens over the next decade.

366.1 **I. To Enable Fulsome Review of the Proposed Amendments, CARB Should Provide the Inputs to its CATS Modeling, Consider Extending the Comment Period, and Hold Additional Community Meetings.**

We appreciate CARB's early disclosure of its CATS model for public evaluation of the LCFS. To realize the full benefit of public engagement associated with a public-facing CATS model, we encourage CARB to make the input and output files it relied on in analyzing alternatives for this proposed rule (CATS model data) publicly available. To do so would be particularly useful because much of CARB's analysis of the proposal's impacts in the ISOR relies on CATS model data.[3]

Publicly available CATS model data is essential for the public and commenting experts to fully assess the potential benefits and drawbacks of the preferred alternative and other alternatives. If the input files were publicly available, commenters could also evaluate how different alternatives might shift those benefits and drawbacks and make suggestions for how to optimize the program for public benefit, consistent with ARBs assumptions regarding the baseline evolution of the liquid fuels market in California.

While we recognize that the CATS modeling results do not fully determine the ARB staff proposal as described in the ISOR, they are utilized both to justify the preferred alternative and to rule out other alternatives. These inputs are therefore key to understanding CARB's rationale for its proposal. We emphasize that our earlier analysis of ARB staff CATS modeling led to improvements in the model that contribute to the ISOR.

[3] *See, e.g.,* SRIA at B-1 (table chronicling predicted percentage of future alternative fuels production, within which 3 rows cite CATS model outputs or results under "Notes"). *See also,* discussion of the EJ alternative in the ISOR.

Written communication with ARB staff[4] has indicated that they intend to release nothing more than the V0 sample input file published as a part of the public meeting to describe ARBs improvements to the CATS model (V0.2). The publicly-available CATS input file released on August 16th, 2023, is an example baseline that requires further modifications, such as current producers, market behavior and actual feedstock trends to resolve the model accurately. Without that information, stakeholders will not have a meaningful opportunity to comment on the proposed amendments to the LCFS or the discussion of alternatives in the ISOR.

If ARB were to release these files, all parties to the rulemaking would also require additional time to evaluate and provide comment on the CATS model data – both the input assumptions and the output files for different alternatives. We therefore recommend that ARB release the CATS model data as soon as possible and then provide additional time for parties to comment prior to moving forward with the proposals contained in the ISOR.

II. The LCFS amendment in the ISOR cannot be evaluated without considering its interaction with the Cap-and-Trade Program and likely amendments.

(a) The Waterbed effect needs to be considered.

Notably absent from the list of policies accounted for in the SRIA and ISOR baseline is the California cap-and-trade program. In principle, the California cap-and-trade program acts as a limit on total GHG emissions from regulated sectors in the state, including transportation. When the stringency of the LCFS is increased, any additional emissions reductions from the
366.2 transportation create additional room under the emissions cap that may be filled by other sectors, if the emissions cap level is unchanged. In this way, increasing the stringency of the LCFS will further reduce emissions from transportation within California, but at the same time allow other sectors to emit more under the cap. The net will be unchanged emissions unless leakage occurs (see below).

Accordingly, a more stringent LCFS depresses cap-and-trade program allowance prices and allows emissions in other sectors to replace some of the reductions from the LCFS—reducing the effectiveness of the policy and altering the true emissions reductions it achieves. This has been referred to as the '*waterbed effect*'.[5] Additionally, depressing cap-and-trade program allowance prices contribute to reduced revenue from the cap-and-trade program available for funding California's climate programs through the Greenhouse Gas Reduction Fund. We recommend that ARB staff reevaluate the estimated GHG emission reductions of the proposed amendments to the LCFS, taking into account the interaction with cap-and-trade.

[4] Email communication between Michael Wara and Matt Botill.
[5] Knut Einar Rosendahl, 2019. "**EU ETS and the waterbed effect**," Nature Climate Change, Nature, vol. 9(10), pages 734-735, October.

(b) Leakage caused by the interaction of LCFS and cap-and-trade could be significant.

Further, there is another issue that may cause the increased stringency of the amended LCFS program to contribute to a *net increase in emissions*. Because the cap-and-trade program does not evaluate all upstream emissions associated with biofuel production (such as agriculture emissions from feedstock production or biorefining outside of California), to the extent that the LCFS increases production of biofuels, it will also increase emissions outside of the cap-and-trade program. At the same time, any emissions reductions from gasoline and diesel fuels in California achieved by the LCFS may be offset by increases in other sectors based
366.4 on the waterbed effect (see above).[6] We recommend that ARB staff reevaluate the estimated GHG emission reductions of the proposed amendments to the LCFS, taking into account the potential for leakage effects.

(c) Prices in both emissions programs create impacts that need to be considered jointly.

All this context becomes even more important given the stated objective in the recent scoping plan update of amending the cap-and-trade program to tighten the cap prior to 2030.[7] There have been a number of preliminary workshops in 2023 to evaluate this idea.[8] At the same time, Bushnell et al. were funded by ARB staff to conduct modeling to assess the potential emissions and allowance price impacts of alternatives.[9] Notably, all four scenarios evaluated (other than an end to the program) show that prices will be at the price ceiling of $110 per allowance by 2030. In combination with strengthened 2030 LCFS ambition and the potential for
366.2 multiple triggers of the proposed LCFS Automatic Acceleration Mechanism due to the growth of RD supply,[10] a scenario is likely in which cumulative consumer price impacts could be quite substantial by the late 2020s – amounting to significantly more than $1.50 per gallon of gasoline.

We note that despite considerable efforts by ARB and other state agencies, uptake of EVs has primarily been via high-income Californians to date. This trend is not expected to change radically over the next several years. This means that the burden from combined pass-through of both cap-and-trade allowance prices and LCFS credit prices – both of which will be required inputs to each gallon of liquid fuel – could be substantially higher for low income Californians than evaluated in either program in isolation (see below re distributional effects).

(d) Cap-and-trade prices will likely be high enough in the next few years to incentivize methane reductions at dairies.

One particularly controversial aspect of the proposed amendments to the LCFS presented in the ISOR is the continued reliance on book-and-claim crediting of both in-state and out-of-state dairies until as late as 2040. This has been described by staff and stakeholders as needed to ensure that statutory methane reduction objectives are achieved at a major source of California's methane emissions: large dairies (also termed Confined Animal Feeding Operations, or CAFOs). ARB staff has also stated that they are concerned that eliminating book-and-claim might "strand" investments made at dairies to capture methane from liquid manure holding tanks.

366.8 Estimates of the cost of installing and operating dairy manure methane digesters vary and range from as little as $30/ton to as high as $90/ton. Today, LCFS prices are in the middle of this range – as of this writing, $65/credit. ARB staff has stated concerns that additional digesters will not come online consistent with their goals for the sector if book-and-claim, which critics point out does not consider additionality, is eliminated.

But ARB has also created a second pathway for digesters to access revenue from carbon markets in California – via a compliance grade offset in the cap-and-trade program.[11] Uptake of this opportunity has been limited: both because until very recently, allowance prices in cap-and-trade were below $30, and also because during the same time, credit prices in the LCFS were close to $200. However, ARB's own modelling[12] indicates that by 2030, the most likely outcome for all scenarios considered in cap-and-trade, so long as the program is extended, is that allowance prices will be at the price ceiling – in 2030 equal to $110/ton. If LCFS credits have been sufficient to incentivize methane digester installation, it stands to reason that the much higher allowance and offset price would as well.

The interaction between the LCFS and the CAT is therefore critical in evaluating the emissions impact and affordability of the two programs. Because the current ISOR does not evaluate this crucial policy interaction between California's flagship climate policies, ARB cannot yet fully understand even near-term impacts from the ISOR. We recommend that ARB conduct an analysis of the joint impacts of proposed amendments to the LCFS and cap-and-trade and revise the ISOR to reflect these results.

366.3 **III. ARB should limit the duration of proposed amendments and the incentives they create to balance the need for project certainty with the deep uncertainties regarding the future of the liquid fuels sector—10 years is long enough.**

---

[11] *See*, Air Resources Board, Livestock Projects, *at* https://ww2.arb.ca.gov/our-work/programs/compliance-offset-program/compliance-offset-protocols/livestock-projects

[12] *See*, Bushnell, James. "California's Cap-and-Trade Market Enters its Teen-Age Years" *Energy Institute Blog*, UC Berkeley, November 27, 2023, https://energyathaas.wordpress.com/2023/11/27/californias-cap-and-trade-market-enters-its-teen-age-years/

Amendments to the LCFS proposed in this rulemaking would set a trajectory to the year 2045 for subsidies directed towards CAFOs, refineries, and other low-carbon fuel producers. In public meetings related to the scoping plan, ARB staff have repeatedly articulated concerns about the need to create long-term certainty so that investments in lipid biofuel, hydrogen, and methane digesters can secure finance based on the LCFS. This is a valid concern.

However, that concern needs to be balanced in the present rulemaking against the real uncertainty associated with the ongoing transition in the transportation sector – in significant part due to ARBs ambitious rulemakings related to light, medium, and heavy-duty vehicles. Last year, in the light duty segment, ZEVs accounted for more than 25% of new vehicle sales, up almost 6% from 2022.[13] While there will no doubt be challenges in a full transition to ZEVs in all three weight classes, the transition is rapidly picking up steam. This is even more true in light of the fact that since the pandemic, essentially all the growth in global light duty vehicle sales has come from ZEVs. California, and in particular ARB, deserves tremendous credit for this success.

366.3 The future for medium and heavy-duty ZEV technology is much less certain, however. It may be that the challenges of electrifying these fleets are overcome through a combination of innovation and smart policy support. It may also be that some or even a large fraction of these vehicles continues to rely on either liquid (RD and BD) or gaseous fuels (for example green or blue hydrogen). Despite what ARB staff CATS modelling in the ISOR and the recent 2022 Scoping Plan Update seems to indicate, how this transition will play out is fundamentally uncertain at this point – even for the early 2030s.

The idea that we know enough now to accurately predict its trajectory all the way to 2045 is simply not credible at this time. Yet the rulemaking under consideration today would lock in a variety of large subsidies for particular technologies that, given what it knows now, ARB thinks may be important for the transition to zero emissions fleets or for its agricultural methane reduction goals. And these subsidies are being offered to extremely powerful industries in California. Once offered, they will be exceedingly difficult—both from a practical and a political perspective—to pull them back as circumstances evolve.

In the past, most recently in 2018, ARB has not tried to regulate decarbonization of the liquid fuels sector using the LCFS for much longer than a decade. We recommend that ARB stay consistent with this precedent here, and limit amendments it makes today to the next decade – through 2035. A ten-year time horizon recognizes ARB's concerns today in creating sufficient certainty to allow for project finance, but also balances that concern against the tremendous uncertainty that rapid technological innovation and adoption creates for the LCFS.

That does not mean that in a future rulemaking – conducted in the early 2030s, perhaps – ARB would not act to extend incentives that they see as essential to their policy goals at that

[13] *See,* California Energy Commission, New ZEV Sales in California, *at* https://www.energy.ca.gov/data-reports/energy-almanac/zero-emission-vehicle-and-infrastructure-statistics/new-zev-sales.

time. It means only that by acting today, the agency will preserve its freedom of movement and future responsiveness to the uncertain but rapid evolution in transportation technologies.

IV. ARB's assessment of the GHG emissions impacts of the rule are almost certainly overstated and need to be reevaluated.

We perceive several issues with ARB's calculation of GHG emission reduction benefits of the proposed LCFS amendments against which costs must be judged. Quantification of GHG emission benefits is especially important for the LCFS since that is the basic justification for the policy's existence.

Below, we discuss two issues that merit substantial reanalysis or correction in the GHG emission benefits:

366.4

(1) Transparency regarding the interaction of the LCFS proposed amendments with the federal Renewable Fuels Standard (RFS);
(2) the implications of the massive growth in RD supply for indirect land use change (ILUC) emissions.

366.4

(a) Contrary to ARB's prior practice, the ISOR is unclear on how the RFS is accounted for and appears to claim credit for emission reductions caused by the RFS. It also does not account for resource shuffling caused by the RFS and LCFS interaction. ARB should be transparent about how it accounts for this interaction if in fact that has changed since the 2018 LCFS amendments.

In prior amendments to the LCFS (again, most recently in 2018) ARB acknowledged that the RFS had significant impacts on RD and BD consumption in California. It also assumed that the best approach for estimating the benefits of the LCFS was to develop a baseline volume and carbon intensity that the RFS would produce, and then assume that the additional stringency of the LCFS would produce GHG benefits incremental to that RFS baseline. In the present rulemaking, ARB is not transparent regarding its approach and may have abandoned this approach in favor of neglecting impacts of the RFS and claiming all GHG benefits for the LCFS.

The SRIA indicates that impacts of the amendments to the LCFS account for the role of the RFS in the baseline[14] However, no additional detail is provided to indicate how this is reflected in ARB's estimates, and how contributions from the RFS change under the proposed alterations to the LCFS. The SRIA states that GHG emissions are derived from "CATS outputs of the fuel quantities and average annual CI associated with each fuel."[15] Importantly, the impacts of the RFS are not static and change in response to alterations to California's LCFS. It is not clear if and how exactly these dynamics are accounted for in the present rulemaking.

[14] SRIA at 12.
[15] *Id.* at 25.

The federal RFS sets a nation-wide volumetric mandate for biofuels and allows flexibility for where those biofuels are produced and consumed. An additional unit of biofuel consumed in California counts equally toward compliance with the federal RFS as one consumed elsewhere in the country. Therefore, when the stringency of the LCFS is increased, greater biofuel consumption in California reduces the amount required to be consumed by other states, effectively offsetting some of the emissions benefit. This dynamic is critical to incorporate into the design and evaluation of the LCFS.

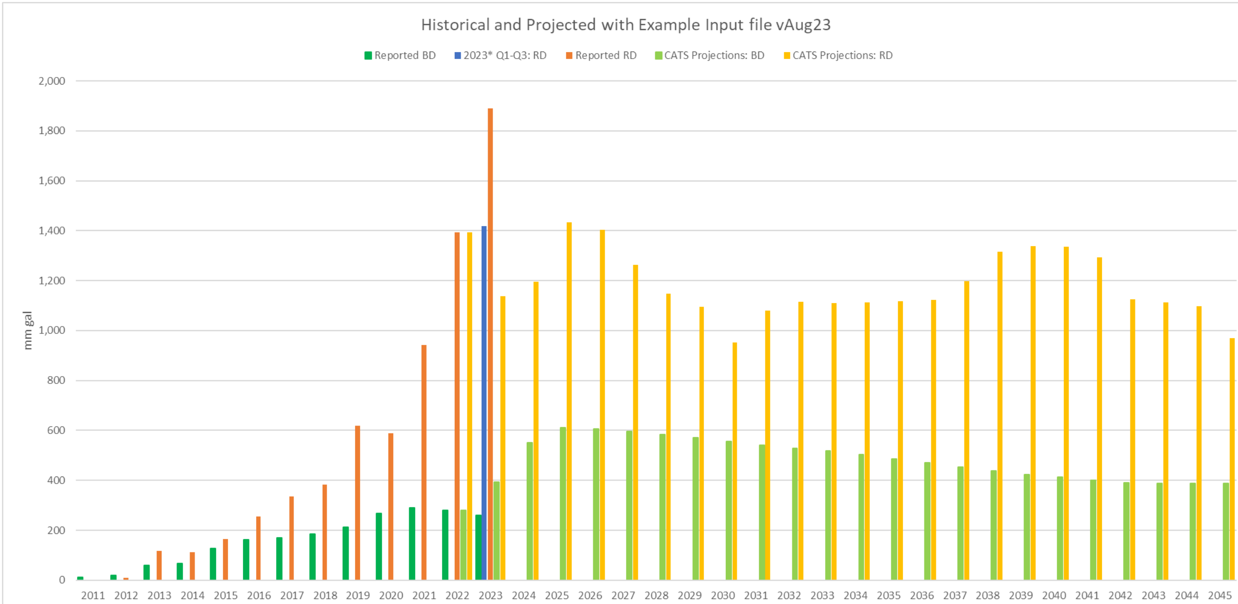
366.4 The attribution approach, from the 2018 rulemaking in Appendix F Table F-12 at page 12, suggests that only emissions reductions below the thresholds set by the federal RFS should be attributed to the LCFS. For instance, all emissions reductions from bio-based diesel fuels down to a carbon intensity of 50g/MJ are attributed to the RFS, while only emissions reductions below the 50g/MJ threshold are attributed to the LCFS. For example, an additional gallon of bio-based diesel at 40g/MJ could be said to contribute an additional 10g/MJ of emissions reduction from what would have occurred under the RFS alone.

This provides a simplistic but defensible approach that should be taken and explicitly outlined in this rulemaking. However, attributing all emissions reductions from the diesel standard to the carbon intensity of BD or RD overstates the role of the LCFS, and would contribute to misleading conclusions in evaluating the impact and cost-effectiveness of the policy.

In sum, more transparent discussion of ARBs approach to accounting for the interactions between the LCFS and RFS is required to assess how ARB accounts for emission reductions. Otherwise, the possibility cannot be ruled out that ARB has overstated the emissions contribution of the revisions to the LCFS program.

366.5 **(b) The ISOR does not consider the rapid increase in RD supply that has already occurred and which is projected to occur in the next few years. This rapid growth in supply throws into question the relatively low estimates of ILUC emissions that were developed a decade ago for the LCFS.**

In early workshops associated with the development of this amendment package, ARB staff indicated concern about the growth of crop-based biofuels in the RD supply. This growth has continued to far outstrip expectations. Shown below are comparisons of actual BD and RD supply to LCFS markets as compared to CATS estimates of their supply. Evidently, the data model fit is strong for 2022, but 2023 data significantly exceeds model projections for any time to 2045. Meanwhile, two biofuel conversions underway in Martinez, with refineries set to come online in 2024, have the potential to add 1.7 billion gallons of RD to the LCFS supply, roughly doubling supplies of liquid biofuels in the near term.



Historically, RD has been predominantly sourced from used cooking oil and other byproducts that do not impact global crop markets. Corn ethanol has long been known to interact with global commodity markets and through that, land use decisions. For that reason, in 2015, ARB incorporated Indirect Land Use Change (ILUC) emissions into its CI life cycle accounting. The ILUC estimates that were included for crop-based biofuels were based on a perturbation scaled to US biofuel consumption at that time.

Today's RD growth has far outstripped that assumption and calls into question the
validity of the ILUC calculation that relies upon it. Recently, US EPA surveyed ILUC estimates
from a variety of sources – finding a range of 11 to 260 CO2e/MJ.[16] ARB's current ILUC value, 29
CO2e/MJ, is in the very low range of these estimates. This fact, combined with the age and
366.5 outdated assumptions that underpin this value, suggests that the ILUC estimate used to
calculate CI for crop-based biofuels is too low – and perhaps significantly too low. This in turn
will lead to overestimation of emissions reductions associated with the massive growth of RD in
the fuel mix in California, by claiming benefits while causing harm elsewhere as forests are cut
and peatlands are converted to support oil seed agriculture. We recommend that either ARB
366.9 pause this rulemaking until ILUC values that reflect the possible scope and scale of RD supply
coming to market can be developed, or incorporate a lipid-based biofuels cap consistent with
its current ILUC calculation into the proposed LCFS amendments.

366.7 **V. Criteria pollutant emissions benefits of the proposed LCFS amendments are likely overestimated by the ISOR in two different ways.**

[16] US EPA, "Model Comparison Exercise Technical Document" (EPA-420-R-23-017, 2023); https://nepis.epa.gov/Exe/ZyPDF.cgi?Dockey=P1017P9B.pdf.

The ISOR provides a detailed assessment of the criteria pollutant benefits of the proposed LCFS amendments. We have concluded that the analysis is flawed in at least two ways. Both lead to substantial overestimation of criteria pollutant benefits.

(a) The ISOR assumes criteria pollutant benefits from older diesel trucks, but ARB's own science shows that those benefits do not exist for newer diesel trucks which now predominate in the sector.

The SRIA's analysis of particulate matter benefits includes the following explanation:

366.7

> PM emissions changes for biodiesel relative to conventional diesel were based on testing using pre- 2007 engines without diesel filters. CARB (2015) indicates that, for 2007 and later engines equipped with PM filters, there were no meaningful differences in PM emissions between conventional diesel and biodiesel. However, Durbin et al. (2011) indicates that PM emissions for these engines were essentially at the limit of detection, and the level of efficiency of the diesel particulate factor would have masked any fuel differences. *For these reasons, staff believes that PM emissions changes for biodiesel use in pre-2007 engines without diesel particulate filters relative to conventional diesel use was also applicable to 2007 and later engines with diesel filters*.[17]

As we understand this language, ARB's analysis assumed that as post-2007 engines with diesel filters shifted to biodiesel from the reference fuel, $PM_{2.5}$ emissions would decline to a similar extent as they did when pre-2007 engines switched fuels. However, more recent work – prepared by the same author for ARB in 2021 – found no statistical difference between $PM_{2.5}$ emissions from biodiesel and ARB's reference fuel for post-2007 engines.[18]

We recommend that ARB integrate the best currently available science on the impact of newer diesel engines into its analysis of criteria pollutant benefits of the proposed LCFS amendments. In doing so, ARB should rely on its own pre-existing quantification of the fraction of the on-road diesel fleet today that lack emission controls relative to the fraction that has both selective catalytic reduction and diesel particulate filters.[19] ARB should then ascribe benefits for older diesel engines consistent with the analysis in the ISOR while ascribing a much lower or negligible criteria pollutant benefit to newer advanced diesel engines or retrofitted engines. On net, we believe that this change will significantly reduce the benefit of RD and so reduce the loss of benefits from RD associated with a cap on liquid biofuels.

[17] SRIA at B-10 n.119 (emphasis added).
[18] Thomas D. Durbin *et al.*, Final Report: Low Emission Diesel (LED) Study: Biodiesel and Renewable Diesel Emissions in Legacy and New Technology Diesel Engines, xviii-xix (Nov. 2021), https://ww2.arb.ca.gov/sites/default/files/2021-12/Low_Emission_Diesel_Study_Final_Report_12-29-21.pdf.
[19] *See*, Air Resources Board, Sunset Estimation for Biodiesel In-Use Requirements, *at* https://ww2.arb.ca.gov/resources/documents/sunset-estimation-biodiesel-in-use-requirements#footnote1_1yzdw61.

(b) The ISOR assumes that reductions in fossil fuel demand caused by the LCFS will result in equal reductions in oil production in California. This is incorrect.

366.7 In its SRIA, ARB makes an assumption that incorrectly inflates the air pollution benefits associated with the proposed rule from the upstream oil and gas sector. ARB's "Assumption 1" is that "[o]il extraction operations in California decline at the same rate that demand for petroleum products declines."[20] While such a relationship is theoretically possible, there is also substantial evidence that suggests that these dynamics may be more complex than assumed in the SRIA.

California's production of crude oil has been declining for several decades, whereas diesel demand in California has stayed relatively stable over the last 40 years.[21] And even if the two figures are related, the rate of decline may be different for crude oil production than for diesel demand, particularly in light of the many other factors that may influence both oil extraction and demand – including out of state activities and actors.[22] In particular, the most important factors influencing oil demand in California are the cost to extract California's remaining crude oil resources and the global oil price. Given favorable market conditions, there is no reason to think that crudes from California will not be exported. Given the prevailing conditions, extraction is likely to continue its seemingly inexorable decline, whatever the design of the LCFS. We recommend that ARB eliminate its reliance on this assumption in evaluating the benefits of the proposed LCFS amendments and reduce the criteria pollutant benefits accordingly.[23]

---

[20] SRIA at B-1; *see also id.* ("It is reasonable to expect that the crude oil extracted in California may ramp down in tandem with declining demand for finished petroleum products.").

[21] *Contrast* Figure 1 *with* Figure 2 *infra*.

[22] *See, e.g.,* Figure 3, *infra* (portraying California imports of diesel over time, including an increasing proportion of foreign imports).

[23] Moreover, while the ISOR states that the reduction in demand associated with the COVID-19 pandemic appears to have reduced emissions associated with oil and gas extraction, there are several reasons that such a relationship may not carry over to this context. ISOR at 56. First, the pandemic constituted a comparatively limited window of time; the longer trends of state diesel consumption and California oil extraction displayed in Figures 1 and 2 below suggest the opposite (or no) relationship between those two numbers. Second, because the COVID19 pandemic was a global phenomenon, out-of-state actors may have been acting in parallel with California actors. Because the LCFS applies to diesel use in California rather than diesel use in other states, that coordination would not apply here.

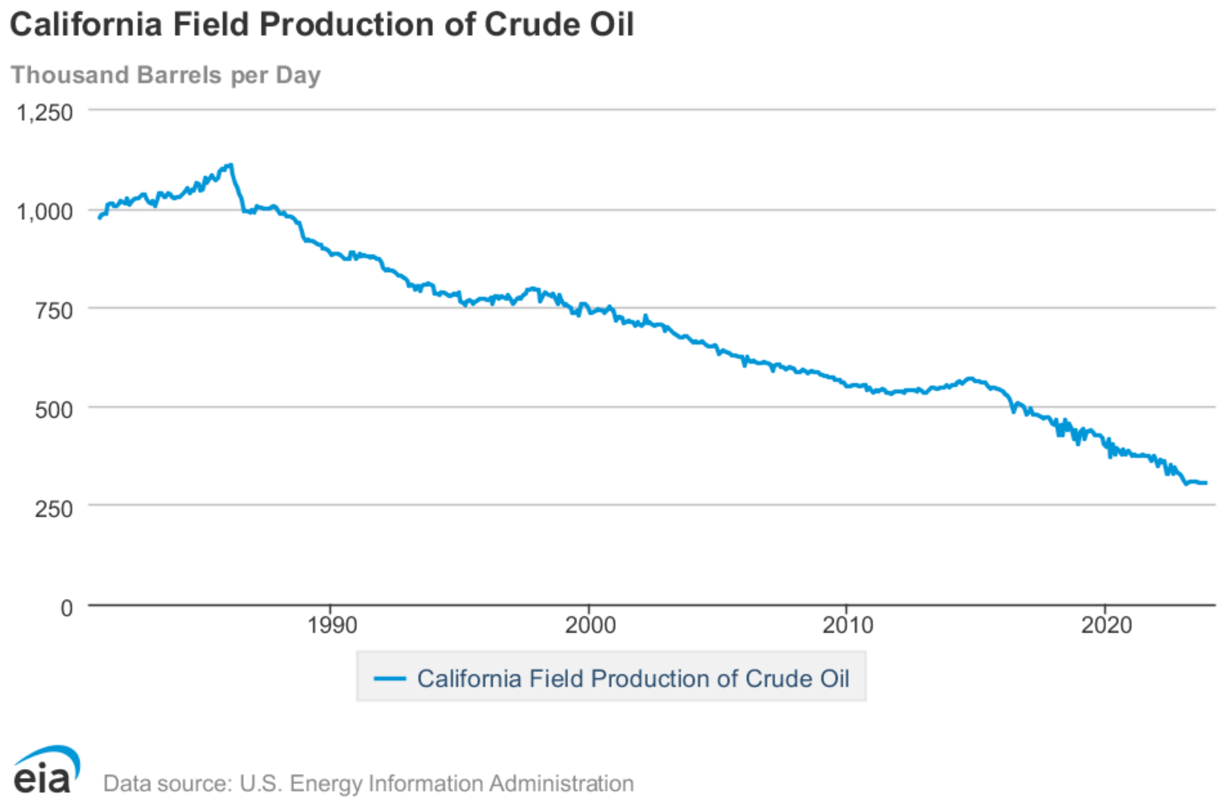


Figure 1. California's production of crude oil over time.[24]

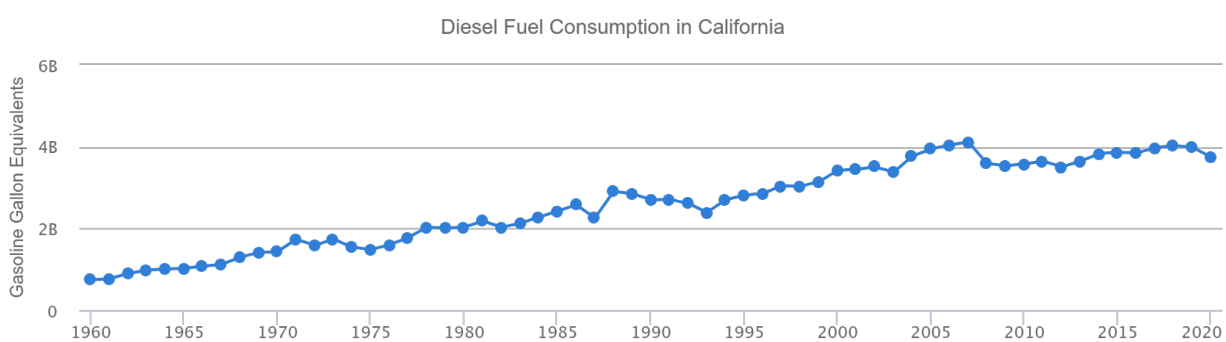

Figure 2. Diesel fuel consumption in California over time.[25]

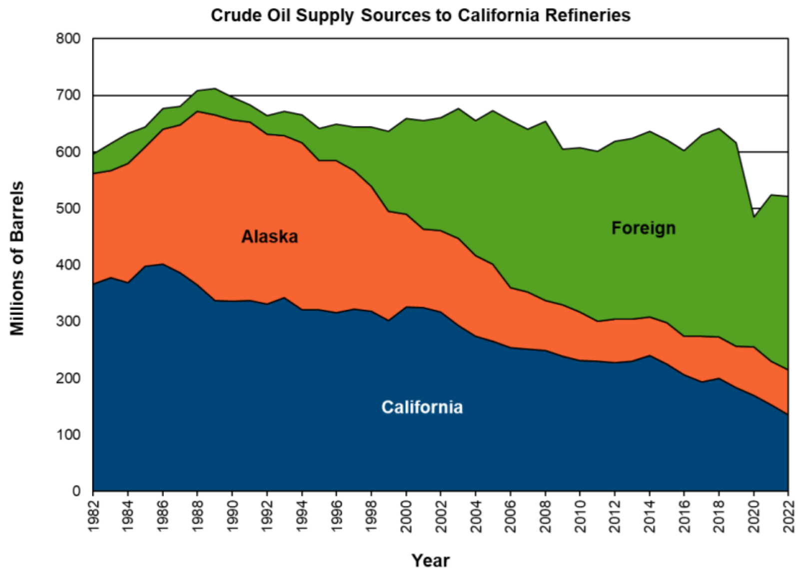

Figure 3. Crude oil supply sources to California refineries over time.[26]

VI. ARB needs to develop a thorough distributional analysis of the likely impacts of the proposed amendments because they are particularly likely to have disproportionate impacts on low-income Californians.

366.8 Though ARB staff included a discussion of expected distributional effects in the Supplementary Regulatory Impact Analysis (SRIA) for the proposed amendments to the LCFS, it omitted the qualitative distributional analysis from the ISOR – a widely-circulated and relied-upon document for decisionmakers. The ISOR should, at a minimum, contain a robust discussion of expected distributional effects. To do so is essential, and aligns with the purpose of ISOR documents—to provide comprehensive and accessible information about proposed regulations. Moreover, clarity about distributional consequences improves the regulatory process for decisionmakers and the public. An improved and transparent understanding of these consequences will support CARB in its pursuit of environmental justice.

At minimum, the ISOR should incorporate a qualitative distributional analysis because a key function of the ISOR is to provide comprehensive and accessible information about proposed regulations – including explanations and justifications – to the public and decisionmakers. For the ISOR to be accessible and comprehensive, it must transparently discuss relevant information. Information about the distribution of effects is particularly relevant for the proposed amendments to the LCFS because, as discussed in the SRIA, low-income, disadvantaged, and rural communities may bear a disproportionate share of the costs of the

[26] Cal. Energy Comm'n, *Annual Oil Supply Sources to California Refineries* (last accessed Feb. 19, 2024), https://www.energy.ca.gov/data-reports/energy-almanac/californias-petroleum-market/annual-oil-supply-sources-california.

amendments.[27]

Information about distributional effects of the proposed amendments is also relevant because any social welfare analysis – which is commonly used to justify proposed regulation – should, at a minimum, contain a discussion of likely distributional effects.[28] Social welfare analysis without distributional analysis clouds the understanding of the possible consequences of proposed and alternative regulations for the public and decisionmakers. For example, if a report only contains information about aggregate effects, it could obscure that a historically marginalized group will be uniquely burdened by the costs of a rule. A clear discussion about this in the ISOR makes essential information accessible to the public and decisionmakers.

Moreover, the ISOR should include a distributional analysis because clarity about the possible distribution of effects is beneficial to the regulatory process. To begin, clarity about the full distributional consequences of a proposal allows regulators to evaluate their normative choices. For example, a clear distributional analysis that discusses a likelihood that the proposed amendments will increase the financial burden for low-income, disadvantaged, and rural communities while alleviating their pollution exposure reveals a regulatory choice to prioritize alleviating environmental burdens. (A normative statement that aligns with this choice could be "ARB should prioritize ameliorating pollution exposure").

This transparency about expected consequences also allows regulators to more precisely identify action needed to alleviate inequitable social outcomes. For example, if the expected financial cost to low-income, disadvantaged, and rural communities is estimated to be overly burdensome, then decisionmakers can better prepare to provide material support to these communities.

Moreover, including a clear distributional analysis in the ISOR can provide an accountability mechanism for regulators with the public. For example, if ARB clearly communicates to the public that low-income, disadvantaged, and rural communities may be financially burdened, then the public can advocate for alternatives that avoid this consequence or for remedies to address it.

Finally, the clarity and additional benefits for the regulatory process associated with including a distributional analysis in the ISOR also support the pursuit of environmental justice – a core aspiration of ARB.[29] Environmental justice is defined in state law, which identifies meaningful engagement with the public as central to the pursuit of environmental justice.[30]

---

[27] SRIA at 60.
[28] *See* Office of Management and Budget, 2023, Circular A-4, Part 10, *at* https://www.whitehouse.gov/wp-content/uploads/2023/11/CircularA-4.pdf
[29] ISOR at 64.
[30] *See id.* (citing Gov. Code § 65040.12, subd. (e)(1), which states that "[a]t a minimum, [environmental justice includes] the meaningful consideration of recommendations from populations and communities most impacted by pollution into land use decisions.")

Clear communication of the consequences of regulation is necessary for achieving that meaningful engagement.

This inclusive approach also ensures transparency about the full spectrum of expected consequences, facilitates informed decisionmaking and fosters meaningful public engagement. By incorporating distributional analysis into the ISOR, ARB can demonstrate its commitment to equitable regulatory practices and contribute to a more informed and participatory rulemaking process.

In summary, we recommend that ARB staff revise the ISOR to include distributional analysis because distributional analysis aligns with the goals of providing comprehensive and accessible information, improving the regulatory process for decisionmakers and the public, and pursuing environmental justice.

Board Comments Home

February 20, 2024

The Honorable Liane M. Randolph, Chair
California Air Resources Board
1001 I Street
Sacramento, CA 95814

RE: 2024 Low Carbon Fuel Standard Amendments

Dear Chair Randolph:

The signatories of this letter appreciate the opportunity to provide comments regarding the 2024 amendments to the Low Carbon Fuel Standard (LCFS). We strongly support the increased focus by the California Air Resources Board (CARB) on ensuring that the fuels used in the LCFS program are produced in the most sustainable manner. We are strong advocates for rigorous lifecycle accounting (LCA) methods that precisely quantify the lifecycle emissions from biofuels and that recognize and incentivize lower carbon feedstocks. From a LCA perspective, "corn is not just corn." To the contrary, corn and other crops can be grown on soil using a wide variety of techniques and inputs that substantially impact real-world carbon intensity (CI). We encourage the Board to direct staff to dedicate time and resources to analyze the lifecycle issues pertaining to crop-based feedstocks and report back to the Governing Board. This focused research, analysis, and reporting by CARB staff will enable and inform potential expansions to the LCFS regulations to include field-based practices, the recognition of soil organic carbon, and the harnessing of other CI-reducing techniques and technologies with the next update to the LCFS regulations.

The supporters of this letter represent a range of fuels, feedstocks, and technologies including agriculture trade associations, crop input companies, developers of LCFS credits, and other low-carbon fuel industry participants. This diverse group is united in its interest to provide high-quality fuels to the California transportation market with the lowest environmental footprint. This includes practices that encourage producers to reduce nitrous oxide and methane emissions and increase the carbon sequestered in the soil.

In 2018, the Intergovernmental Panel on Climate Change (IPCC) published a Special Report on the impacts of a 1.5°C global warming above pre-industrial levels. This report found that achieving global carbon neutrality by mid-century is critical to avoiding the most catastrophic impacts of climate change.[1] Moreover, the IPCC Sixth Assessment identified land-based emissions mitigation as "the only [sector] in

[1] IPCC, 2018: Summary for Policymakers. In: Global Warming of 1.5°C. An IPCC Special Report on the impacts of global warming of 1.5°C above pre-industrial levels and related global greenhouse gas emission pathways, in the context of strengthening the global response to the threat of climate change, sustainable development, and efforts to eradicate poverty [Masson-Delmotte, V., P. Zhai, H.-O. Pörtner, D. Roberts, J. Skea, P.R. Shukla, A. Pirani, W. Moufouma-Okia, C. Péan, R. Pidcock, S. Connors, J.B.R. Matthews, Y. Chen, X. Zhou, M.I. Gomis, E. Lonnoy, T. Maycock, M. Tignor, and T. Waterfield (eds.)]. Cambridge University Press, Cambridge, UK and New York, NY, USA, pp. 3-24, doi:10.1017/9781009157940.001.

which large-scale carbon dioxide removal may currently and short term be possible" and that it is "crucial to limit climate change and its impacts."[2] The latest science finds that it is increasingly likely that the 1.5°C target will be exceeded[3] and that large-scale greenhouse gas (GHG) reductions are critical to meeting the target.[4]

Already a leader in the response to climate change, CARB's 2022 Scoping Plan Update details sector-by-sector roadmaps for California to achieve carbon neutrality by 2045 or earlier. One critical roadmap is for the aviation sector, where the scenario includes a transition of 20% of aviation fuel demand to zero-emission technologies by 2045 and sustainable aviation fuel (SAF) for the rest.[5]

The agriculture sector can play a significant role in helping California meet the goal of generating SAF. Practices including optimizing fertilizer application, reducing tillage, using enhanced-efficiency fertilizers, double-cropping and planting cover crops have the potential to reduce the CI of fuels by more than 40 g CO_2e/MJ.[6] These practices are not limited to their GHG benefits; they provide "additional ecosystem service benefits, including watershed protection, increased biodiversity, and improved soil health and fertility."[7]

There is significant opportunity to increase the adoption of these practices on U.S. farmland. A recent study found that no-till or strip-till is practiced on only 30% of cropland.[8] Furthermore, these practices are not always maintained by farmers. While no-till practices were adopted on almost 8 million acres between 2012 and 2017, farmers on more than 5 million acres discontinued no-till during the same period for a net gain of only 3 million acres.[9] Another practice that can reduce GHG emissions, the planting and cultivation of cover crops, has an even lower adoption rate than no-till. Unfortunately, only 5.1% of the approximately 300 million cropland acres planted cover crops in 2017.[10] The LCFS program has the potential to provide a strong and long-term incentive for farmers to implement no-till, cover crops, double-cropping and other similar practices.

367.1 CARB is also proposing that all crop-based feedstock used for LCFS fuel pathways must obtain third-party sustainability certification by January 1, 2028, under an approved certification system. These certification systems "must consider environmental, social, and economic criteria," an expansive list that is likely to place a significant financial burden and obligations on farmers that elect to continue to supply feedstocks for biofuels production. Given the broadness of these requirements and the significant additional administrative burden this will impose on farmers and the producers who buy from them, we urge CARB staff to clarify the specific environment, social and governance ("ESG") criteria that these certifications are meant to address in the context of crop-based feedstocks and to seek further stakeholder feedback on development of these criteria after this rulemaking. This requirement is consistent with the verification of land use under the EU Renewable Energy Directive (RED). Under international polices such as RED, CORSIA, and RenovaBio, fuel producers are required to collect farm level data and are thus able to benefit from improved farming practices.

367.2 CARB should also provide a 3-year grace period for any certification system that it plans to suspend or remove, to give stakeholders sufficient time to get certified under a different certification system.

367.3 Additionally, sustainability certifications that address these ESG criteria will often also include a rigorous GHG accounting for feedstock CI calculation. For example, both the Roundtable for Sustainable Biomaterials (RSB) and the International Sustainability & Carbon Certification (ISCC) are existing sustainability certification systems that may meet the requirements outlined in Section 95488.9(g); both systems have already developed GHG methodologies for feedstock CI calculation.[11,12] If CARB requires farms to go through the rigorous process of third-party sustainability certification, then we respectfully request that CARB also consider accepting a feedstock CI score that is calculated and verified in accordance with certification system standards. This would provide a mechanism to compensate farmers adopting climate smart practices for the additional work of certification. Specifically, we ask the Board to direct staff to evaluate existing GHG calculation methodologies and develop guidance around feedstock CI calculation.

367.4 We are asking the Board to direct staff to investigate how the agriculture sector can be optimized to produce low-carbon biofuels to meet the state's SAF goal. Specifically, we are requesting the Board to prioritize policy discussions and the associated technical analysis related to low-carbon feedstocks for the production of SAF. This technical analysis should include a thorough lifecycle analysis to determine the extent to which supplies of sustainable biofuels produced from various feedstocks can be expanded while not converting additional land to agricultural uses. This technical analysis should be informed by the other primary LCA methodologies including Argonne GREET. To ensure the timely analysis of this information, we request that the Board direct staff to report back to the Board by the end of 2025 on the results of lifecycle analysis and progress toward developing policies to encourage the production of SAF.

For the foreseeable future, liquid fuels will be required to power the majority of airflight thus necessitating a rapid expansion in the supply of SAF. In order to create demand for the fuels with the lowest actual CI possible, ARB needs to account for and incentivize field-based practices. Fortunately, the

[11] RSB GHG Calculation Methodology v2.3 (2017). https://rsb.org/wp-content/uploads/2020/06/RSB-STD-01-003-01-RSB-GHG-Calculation-Methodology-v2.3.pdf
[12] ISCC EU 205 Greenhouse Gas Emissions (2021). https://www.iscc-system.org/wp-content/uploads/2022/05/ISCC_EU_205_Greenhouse-Gas-Emissions-v4.0.pdf

benefits of these sustainable agricultural practices go beyond their GHG savings, positively impacting our water, ecosystems, and soils.

CARB has been an international leader in developing and implementing programs to reduce GHG emissions across the California economy and the inclusion of climate smart agricultural practices will continue the State's leadership throughout the country. We thank CARB for this opportunity to offer these comments and look forward to continued collaboration to implement policies and strategies that further reduce emissions from the transportation sector.

Sincerely,
