Karen,Hoffman,karenhoffm@gmail.com,94702,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."

Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
Meghan,Nunez,meghanlnunez@gmail.com,95405,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon

Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Robert,Casillas,rcasillas3@yahoo.com,94066,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
Michael,Ireland,michael-ireland@att.net,95321-1048,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."

The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Martha,Szondy,periwinkle32@gmail.com,91607,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
Laura ,Zahm ,puffin@sonic.net,95327,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon

Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Lori,Carlson,carlsonlj@yahoo.com,95139,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Cynthia,Thomsen,cetathomsen@gmail.com,92104,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Lynnea,Hagen,lynnea317@gmail.com,95112,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
Jorgina,Freese,ginapiano@gmail.com,95687,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon

Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Esmeralda,Ramirez,eramirez726@gmail.com,90002,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."

The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
BROOKE,TRAUT,traut.brooke@gmail.com,93657,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Alejandro,de Avila,adeavilab@gmail.com,94025,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Jennifer,Slattery,3fungirls@gmail.com,95130,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for

public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Joanne,Boster,jeboster@gmail.com,92115,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
William,Obermayer,billyober@gmail.com,94020,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Susan,Montgomery ,susanmontgomery5@icloud.com,91362,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
Jamie,M,jmarantz@efcps.net,94601,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for

public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon

Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
Dawn,Wade,bskart@astound.net,95648,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."

There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
Gloria,Alpern,gloriaalpern@gmail.com,91607,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
James,Ferguson,fergs111@gmail.com,92028,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
Michael,Lanham,jmz@vom.com,94952,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for

public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."

Sue,Colbert,sassiesuz@gmail.com,94522,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."

Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
V L,Berg,vlberg1@aol.com,92203,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel

Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Mara,Veneman,msveneman@gmail.com,94019,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
Stephen,Parsons,dwarkforg7@gmail.com,95407,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for

public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."

The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Erin,McMahon,26lexi@gmail.com,94110,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
Eve,Navarro,eve.political.mail@gmail.com,95441,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel

Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
AJ,Ackleson,aj.ackleson@gmail.com,95476,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. Diana,Clark,dithebrit@gmail.com,94595,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for

public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."

Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Romy,Campagna,xvalleygrl@icloud.com,92627,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Jim,scott,naughtyboyvineyards@yahoo.com,96469,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel

Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
Amity,Buxton,amitypb@gmail.com,94612,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for

public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Stephanie,Murphy ,seerymur@gmail.com,95820,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Shirley,Koch,shirleykoch12@gmail.com,95650,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Josephine,Riordan,quasars_focused_0k@icloud.com,95135,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel

Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
Teresa,Yrastorza,dragnet.trilby_0c@icloud.com,94702,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
Kate,Considine,dragonstorm7998@duck.com,93030,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for

public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."

The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Franceia,McCord,famccord@yahoo.com,92563,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Pearly,Masters,pearly.masters@gmail.com,94402,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel

Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Christina,Duclos,ducloschristina9@gmail.com,93313,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Matthew,O,mph_64@hotmail.com,90210,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for

public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Corwyn,Kalenda,ckalenda@gmail.com,95112,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Mary,Bjerke,marybjerke7@gmail.com,95066,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel

Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
Nishanga,Bliss,nishangabliss@gmail.com,94702,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Robert,Erickson,erickson.wade@gmail.com,94706,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for

public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."

There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Joe,Madrigal,banner.grackle0e@icloud.com,91702,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Phyliss,Vincent,philly54@hotmail.co.uk,92111,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel

Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Mike.,Skeen,joeblow3021@gmail.com,94702,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
G P,Suddeth,jeepsuds@gmail.com,90278,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for

public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."

There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Michele,Massey,michelemassey73@gmail.com,92582,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals."
Andy,Lee,andylee2@aol.com,90020,CA,"Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel

Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California’s air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state’s ambitious goals."
Cynthia,Olival,c_olival049@yahoo.com,93514,CA,"Your proposed amendments to California’s Low Carbon Fuel Standard are a climate policy failure that backslides on the state’s role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Your budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's $3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year.
