Subject Proposed Low Carbon Fuel Standard Amendments

Comment

001.1

As a retired Bio-science Researcher who has been a pro environment person reading and researching what needs to be done to stop Climate Change I am 100% in favor of any Reduced Carbon rules that can be enacted.
Also if California puts the new Rules in place We set the standard and create new clean energy jobs.
This is only good for the California Public.

Subject	Lower Carbon in our atmosphere

Comment

003.1

Capturing carbon and reducing the release of carbon into our atmosphere is incredibly urgent and important for the survival of life on earth and for the air quality for all of us, but especially for those most at risk of developing lung cancers, such as infants, children and those with compromised immunity. The toxins released by climate-caused wildfires and loose carbon regulations pose a constant threat to the health of the public, our food and water sources. The new carbon regulations should place public health before private profits.

Subject	Exemption of Jet Fuel

Comment

005.1

I strongly protest to the continued exemption of jet fuel from LCFS obligation. Airlines have shown themselves time and time again to not act in any meaningful way to lower their carbon emissions. They speak out of both sides of their mouth, praising SAF and continually asking for more and more incentives, while quietly lobbying behind closed doors against any kind of obligation, whether at federal or state level. California has the opportunity to once again be a pioneer and leader in this area, and finally hold airlines to account through a minimum of equal treatment to all other fossil fuels. Airlines will only ever commit when all feel equal levels of responsibility of emissions reductions. We are not asking for a mandate, though that would be the more effective path as proven in Europe. We are simply asking for aviation to shoulder its fair share of obligation under LCFS, as gasoline and diesel have since the beginning. Anything short risks compromising the integrity of both California's climate leadership as well as the airlines' stated GHG reduction targets. The time for talking and cheap press releases is long past. The time for action is now and CARB can spark this into motion with a simple change to this exemption, ending the free carbon handout to the airline industry and catalyzing the sustainable aviation fuels industry anew

Subject	Volume standards for soy or canola oil

Comment

006.1

Hello, while I understand the goal of reducing emissions, the draconian edict of "arbitrarily" saying you must be producing in 2023 to have the ability to "wait" until 2028 to adjust your supply chain is illogical and very damaging to companies who have invested near billions to provide California with renewable fuels. Your decision to allow those who were producing in 2023 the ability to "wait" until January 2028 is a nod to common sense, but the deadline of "you have to have been producing in 2023 to get this accommodation is quite harmful to many not only producers of renewable fuels but of their suppliers who have contracts to furnish them with feedstocks. The goal of CARB (end result at least) is to incentivize foreign feedstocks, and punish North American companies.

006.2

The 2023 stipulation is harmful and should be removed to allow companies who did not produce in 2023 but are producing now, to be able to adjust in a timely, not harmful manner. Many plants were constructed to supply California with better fuels, yet encountered delays in being built during a very difficult supply chain situation over the last 4-5 years. I ask that you not punish them for an arbitrary deadline and treat them the same as those who have been producing in 2023 and prior it would be extremely harmful if you kept the proposal, but hardly damaging to the goals of CARB.

Thank you,
Danny Tonasio

Subject	CARB

Comment

Dear California Air Resources Board,

Your proposed amendments to California's Low Carbon Fuel Standard are a climate policy failure that backslides on the state's role as a climate leader. The program subsidizes combustion fuels to the tune of billions of dollars per year and has no place in our toolkit of climate policies for the 2020s. There is too much on the line for our climate to get this critical program so wrong.

Governor Newsom's budget proposes significant delays and cuts of hundreds of millions of dollars to vital zero-emission transportation programs, which makes it all the more urgent to use the Low Carbon Fuel Standard to more fully support zero-emissions transportation. Historically, California has thrown good money after bad, and devoted 80% of the LCFS's \$3 to 4 billion each and every year to combustion technology. It would be wild to allow these funds to continue to languish on the climate sidelines, instead of anchoring our transition to a zero-emissions future.

The world has changed a lot since the implementation of the LCFS in 2009. Unlike the 2000s, we have a north star goal for our climate and the air we breathe: zero emissions transportation. Continuing to invest the billions in revenue from the LCFS into harmful and polluting biofuels that end up combusted, instead of electric vehicles powered by clean energy, hampers our efforts to fight the climate crisis while enriching oil companies and industrial agriculture.

007.3

I urge you to correct your course and modernize the program by reflecting your consensus that the only way to meet air quality standards is through eliminating combustion altogether, not piling on billions of dollars in lavish incentives for combustion each and every year. By focusing on real air pollution solutions, you could add a clean air multiplier to the credits system, especially for public fleets that transport many people at once, would deliver major benefits for California's air quality and throw a lifeline to cash-strapped transit agencies that low-income Californians depend on for mobility.

California cannot meet our clean air and climate goals without harnessing the power of the Low Carbon Fuel Standard and overhauling this multibillion-dollar program for our zero emissions future. Please act expeditiously to reform the program to achieve our state's ambitious goals.

Sincerely,
Andrea Carcovich

[Board Comments Home](#)

To start I will disclose I am in the business of consulting farmers on cash grain sales, commodity brokerage and crop insurance sales. Obviously I have a bias to support agriculture and any policies that encourage demand of agricultural products.

I read recently the California Air Resources Board wants to limit virgin soybean oil as a feedstock for renewable diesel production to 20%, I assume by volume. I don't know how that level was decided on or if the volume of renewable diesel to be refined and the amount feedstocks available make that possible. That's a problem I have with any mandate as many times the mandate doesn't always work in reality. I assume the 20% threshold can be adjusted to fit actual conditions.

009.1 Used Cooking Oil started as virgin oil, so I am curious about the rationale to limit virgin soybean oil volume to 20%. The requirement of proof any soybeans or canola used in oil production were grown before 2008 is puzzling. I would be interested to know why that restriction is being sought. It appears to be a subtle way to say CARB wants no domestically produced oil used in renewable diesel in California. We just don't store oilseeds for 15 years.

009.2 I am not opposed to refining used cooking oil for renewable diesel, it is better than dumping it down a drain or ending up in a landfill. It is an issue with Congress (namely the Inflation Reduction Act) allowing Used Cooking Oil to be IMPORTED from other countries, refined and issuing a \$1.00 to \$1.75 per gallon tax credit (depending on use) to the refiner and or the blender. However I do think CARB can be proactive and discourage importation of UCO that ultimately generates a tax credit. That is a job for Congress and I will let my representatives know my thoughts on the situation.

009.3 Importing UCO but not allowing the tax credit to the blender and or refiner is an acceptable compromise in my opinion. But I understand that is the job of Congress, not CARB. I just don't see why we are allowing any FOREIGN waste product to take precedence over home grown feedstocks for a great fuel source like renewable diesel. I believe UCO imports in 2022 in to the US were around 200 million pounds and last year were around 3 billion pounds. UCO could contain palm oil which is a major issue.

Thank you for your time and I hope I was able to convey my thoughts on this subject in a good manner. I just would like to see CARB take actions that put domestic energy production at the top of the list.

Sincerely,

Stewart Hughes

Conrad, IA

Subject	"Low" carbon?? Seriously? Gotta be lower than that, now!

Comment

010.1

* The proposal to remove credits for hydrogen produced from fossil fuels is a positive step. But delaying implementation of this measure until 2030 means production of hydrogen from fossil fuels will continue to receive financial rewards for another five-plus years, thus incentivizing the harm we should be preventing.

010.2

* Biofuels produced from virgin soy or canola oil have major negative consequences, including deforestation, and incentivizing industrial agriculture that generates large amounts of greenhouse gas and other pollution, and drives up food prices. The proposed revision acknowledges such problems, but continues to provide credits for the production of biofuels that include up to 20 percent from these destructive sources. And even this weak restraint will not take effect until 2028. Environmental justice advocates have repeatedly called instead for caps on vegetable-oil based biofuels.

010.3

* The proposed draft continues to provide credits for industrial dairy "biogas." This financial support continues to incentivize the expansion of large-scale factory dairy farms, causing serious harm to the health of surrounding communities, increasing the greenhouse gases and pollution generated by the production of feed for cows confined to barns; concentrated methane emitted by pools of waste; the inevitable leakage of methane during storage and transportation; and greenhouse gas emissions produced by combustion of the product. We urge CARB to phase out support for biomethane as rapidly as possible.

010.4

* Unlike previous versions of the LCFS, the new proposal does not require airlines to take any responsibility for the combustion of

fossil jet fuel, even for intrastate travel. This is a step backward, excluding a major source of greenhouse gases and pollution from fossil fuel combustion.

Fix it. Now.

Subject	Reform the Low Carbon Fuel Standard

Comment

The California Air Resources Board's proposed update to the Low Carbon Fuel Standard doesn't go far enough. Despite persistent opposition from the environmental justice community, it continues those parts of the program that provide financial support for harmful practices, such as biofuel produced from virgin soy and canola oil, and factory farm production of "biomethane."

010b.1

* The proposal to remove credits for hydrogen produced from fossil fuels is a positive step. But delaying implementation of this measure until 2030 means production of hydrogen from fossil fuels will continue to receive financial rewards for another five-plus years, thus incentivizing the harm we should be preventing.

010b.2

* Biofuels produced from virgin soy or canola oil have major negative consequences, including deforestation, and incentivizing industrial agriculture that generates large amounts of greenhouse gas and other pollution, and drives up food prices. Subject	Strengthen climate protections to fix LCFS

Comment

011.1

011.2

011.3

011.4

The latest proposed LCFS revision does not go far enough to reform the program. CARB should phase out support for vegetable-oil-based biofuels produced from virgin oil, since the expansion of agricultural lands for biofuel production has large negative climate impacts. CARB must phase out support for biomethane, which is propping up the expansion of polluting factory farms. And the latest proposal leaves airlines off the hook for combustion of jet fuel.

Accounting tricks aside, the lowest-carbon fuel is clean zero-emission electricity. Ultimately, CARB should phase out subsidies for fuels that do not meet this high standard.

Comment

Airplanes should be responsible for their emissions and air pollution even if they use low carbon fuels because there are several disadvantaged communities near airports including in Sacramento. Low carbon fuels produced from some crops are energy intensive to grow and/or transport. Then, less land to grow food would cause Californians to import more food on diesel ships and planes.

From: Dennis Albiani <DALbiani@caladvocates.com>

Sent: Friday, August 16, 2024 3:18 PM

To: [REDACTED]

Subject: Board Member Eisenhut

[REDACTED] I was able to connect with Member Eisenhut this morning on the LCFS regulation. Since the regulation is out and in a 15 day comment period, he wanted to make sure the ex parte rules were followed. Below is what I shared with him:

I shared this section of the regulation:

4. With the proposed addition of subsection 95482(i), staff is proposing to provide credits for biomass-based diesel produced from virgin soybean oil and canola oil for up to 20 percent of annual biomass-based diesel reported on a company-wide basis. Biomassbased diesel from virgin soybean and canola oil in excess of 20 percent will be assessed the carbon intensity of the applicable diesel pool benchmark for that year, or the certified carbon intensity of the applicable fuel pathway; whichever is higher. California currently leads the nation in ZEV sales and stocks. As auto manufacturers comply with increasing ZEV sales requirements and as California prioritizes waste feedstocks and advanced decarbonization technologies, the State must ensure that other regions are able to also access increasing volumes of low-carbon alternative fuels. California expects that overall diesel demand will decline in the State over the coming decades due to the State's portfolio of ZEV and clean fuel policies. This proposed addition allows for California to displace up to 100% of the

State's current fossil diesel demand with cleaner alternative diesel. The proposed addition also avoids sending a long-term signal for virgin soy or canola oil to serve California demand. **For companies that already have a certified fuel pathway prior to the effective date of the amendments and for which the percentage of biomass-based diesel produced from virgin soybean oil or canola oil was greater than 20 percent of combined reported biodiesel and renewable diesel quantities for that company's 2023 LCFS reporting, this provision would take effect starting January 1, 2028, to provide time to adjust feedstock supply contracts as needed. All other companies would be subject to this requirement upon the effective date of the amended regulation.**

013.1

With the concerns on the last sentence that the date and requiring a "certified fuel pathway" essentially meant that businesses had to be in production no later than mid 2022, cuts out many entities that have initiated production since 2022.

I welcome the opportunity to complete a form or whatever other formalities need to be completed. Please let me know. Thanks.

August 21st, 2024

To the California Air Resources Board (CARB):

We write in strong support of CARB's Low Carbon Fuel Standard (LCFS) and appreciate the opportunity to participate in the rulemaking process for this groundbreaking program.

By way of background, Carbon Solutions Group (CSG) is a developer of EV charging infrastructure and an aggregator of environmental attributes. In California, CSG has developed ~230 DCFC and L2 charging ports, which represent roughly 3,000 kW. CSG is developing another 220 charging ports over the next two years in California, which will, in total, represent 10,000 kW.

CSG previously commented upon CARB's proposed LCFS amendments in February and May 2024. In this letter, CSG offers comment on an aspect of the "15-Day Changes"—the topic of widening the scope of base credit participation. Specifically, CSG stresses the critical need for EV charging infrastructure owner-operators (EVSPs) to participate in LCFS base credit generation for multi-unit developments (MUDs).

MUDs are an important sub-section of the residential market due to the relative driver-density per square-foot and the socio-economic plurality of its residents. For example, 38.9% of all residential units in California qualify as "attached units," which amounts to over 4,750,000 attached units in total.¹ More so, over 50% of new builds in California are MUDs, with the overwhelming majority of that figure being composed of structures of five units or more. As such, MUDs represent both a substantial portion of largely unaddressed EV demand, as well as a scalable means of reaching California's climate goals, such as the Advanced Clean Cars II (ACC II) rule. Indeed, ACC II is unachievable without incentivizing the MUD-residing portion of the population.

Furthermore, as noted in CSG's previous public comment letters, single-family homeownership has become cost-prohibitive for many Californians. A communal charging option at MUDs can offer an opportunity for low-to-middle income drivers to adopt EVs with greater ease, thereby addressing important social equity objectives.

However, MUDs—especially retrofit scenarios—present a series of unique challenges that are largely unsupported by any state-level incentive program or subsidy. Furthermore, it should be noted that retrofits make up a substantial part of overall demand. Of the total number of residential structures in California, older structures (44 years or older) comprise 70%.

¹ "California Housing Statistics." June 5, 2020. Accessed via:
<<https://www.infoplease.com/us/census/california/housing-statistics>>

Demand for an on-site MUD charging option is abundant among prospective EV drivers. As various studies have shown, EV drivers prefer to charge at home. For example, December 2023 AutoPacific data reports:

70% of surveyed respondents who currently reside in a condo complex, and 67% of those who live in an apartment building, either intend to purchase, or will consider purchasing an EV in the near future, compared to 63% of those who own a single-family home. At the current time, however, relatively few apartments and condos offer onsite charging for residents, meaning most of these EV considerers will have to be reliant on public charging, which is less convenient and generally much more expensive than charging at home.

42% of all EV rejectors cite lack of a place to charge at home or work is a reason why they don't want an EV, ranking 3rd in their list of rejection reasons. [...] AutoPacific's data also show that the vast majority, 79%, of EV owners who live in an apartment or condo actually do have EV charging available to them where they live. This strongly suggests that most EV considerers who live in an apartment or condo won't make the switch to electric unless their property managers install EV charging on site.²

015.1 Cont

When it comes to a potential EV charging retrofit, oftentimes, the process starts with residents themselves: would-be EV drivers residing at an MUD express desire for on-site charging. In response, an MUD owner will reach out to CSG, or another EVSP, in order to execute an installation.

Yet, while there is demand from residents and will from the property owner, a series of logistical and financial challenges quickly emerge that often sink any hopes of the installation of EV charging infrastructure at the MUD.

Firstly, most older MUDs have implicit electrical capacity constraints. Increasing capacity alone sometimes requires significant financial investment. Cascading costs usually follow as well. The location of parking spaces is not necessarily close to an electrical room, for example. In turn, structural alterations are often required, driving up costs further. These construction and electric costs obviously precede the actual cost of installation itself. Thus, the financial outlay for an MUD usually ends up being too burdensome to pursue. CSG's experience and analysis indicate that the total cost to install charging infrastructure in an MUD can range from \$5,000 to \$25,000 *per L2 charger*.

While HOAs do have budgets for upgrades, older buildings rarely, if ever, have "EV charging" as a line item in that budget. Therefore, there is no "in-house" capital to allocate for an EV charging retrofit. Likewise, there is often times no utility incentive program or rebate program to facilitate the installation of EV charging in MUDs. And while an MUD could feasibly participate in incremental LCFS credits, these fractional credits are insufficient to reduce costs to a level that will result in the execution of an installation, particularly in a retrofit scenario.

² AutoPacific, "EVs Have Greater Appeal to Apartment and Condo Residents than Homeowners." December 12, 2023. Accessed via: <<https://www.autopacific.com/autopacific-insights/2023/12/12/evs-have-greater-appeal-to-apartment-and-condo-residents-than-homeowners>>

These challenges are manifest before even considering the costs of the EVSP, such as the need to cover the capital costs of installation and the operational costs of running the charging stations. Part of this cost recovery process involves a markup on electricity, which of course has its ceiling, beyond which no resident-driver is willing to pay.

015.1 Cont In short, MUD residents are not buying EVs because there is no on-site EV charging option at home. Conversely, MUD owners presently lack the financial incentive to take the risk to install EV charging optionality on-site. As such, a substantial portion of California's transportation pool remains unconverted to EVs, resulting in a massive obstacle towards reaching California's climate goals. This supply-demand disparity is another example of the chicken-or-the-egg dilemma that has beleaguered EV adoption overall. However, with groundbreaking programs like LCFS, that dilemma has been minimized in certain sectors of the overall transportation pool. It is CSG's hope that the MUD sector can likewise be incentivized successfully.

Therefore, CSG respectfully asks CARB to consider allowing EVSPs / property owners to participate in base credits *and* incremental credits for residences qualifying as MUDs. Materially, these credits would be generated from communal L2 chargers that are accessible to any resident or guest of the MUD. This base credit participation would help balance the financial risk that EVSPs and property owners undertake each time an MUD decides to install EV charging infrastructure.

The above comments are offered in light of CARB's ongoing expertise, diligence, and efforts to optimize California's LCFS. We thank you for your vision and ethic, and remain, as ever, proud participants of this historic program.

Best Regards,

Michael Daley

Re: Support for California Air Resources Board Proposal to Retain Jet Fuel Exemption in Low Carbon Fuel Standard Program

In response to the revised Proposed Low Carbon Fuel Standard Amendments posted August 12th, 2024, we are writing to share our support for the recent California Air Resources Board (CARB) proposal to retain the jet fuel exemption under its Low Carb Fuel Standard (LCFS) Program. American Airlines supports the withdrawal of the proposal to eliminate the jet fuel exemption and retain the existing opt-in approach for SAF under the CARB LCFS Program.

016.1

American Airlines is committed to reducing its climate impact and achieving net zero carbon emissions by 2050, and transitioning to SAF is core to this commitment. We have long recognized that scaling up the supply of SAF and achieving net-zero carbon emissions by 2050 can only happen by working collaboratively with governments and other stakeholders across sectors. Achieving this ambition for SAF will require new and additional policy incentives, streamlined permitting processes, and close collaboration among governments, the aviation industry, the fuels industry, environmental organizations and others.

Aviation accounts for 2.6% of the U.S. greenhouse gas emissions but 5% of U.S. Gross Domestic Product (GDP) and 4.1% of California's GDP, thus exerting outsize economic impact relative to its share of emissions. U.S. civil aviation firms employ more than 380,000 California-based employees, with an overall economic impact of \$194 billion.¹ Aviation is critical to driving California's economy and its rank as the 5th largest economy in the world, enabling \$114 billion in annual trade flows and underpinning many of California's other significant economic drivers such as agriculture, tourism, manufacturing, banking, technology, and small business.

California has established itself as an early leader in attracting investment, production, and use of SAF through the existing LCFS Program, which provides an opt-in credit for SAF that helps reduce the price difference between SAF and conventional jet fuel. Ensuring a healthy and vibrant aviation industry is essential to California's future, and leveraging CARB's early leadership on SAF can enable California leadership in the emerging SAF production industry, creating new jobs and economic development opportunities.

The primary impediment to increased SAF production and availability in California remains the higher cost of SAF for producers and buyers relative to conventional jet fuel and renewable diesel. Whether or not jet fuel becomes a deficit generating fuel has no direct impact on whether SAF is produced or used.

¹ [The Economic Impact of Civil Aviation on the U.S. Economy, State Supplement, US Department of Transportation, November 2020](#)

Our mutual interest is to increase SAF production, availability, and use, and the most effective way to accomplish this is to continue the positive, collaborative approach represented by the existing “opt-in” mechanism developed by CARB and the aviation community. We support CARB’s decision to withdraw the proposal to remove the exemption for jet fuel for intrastate flights, preserve the existing opt-in approach for SAF. We look forward to the opportunity to work with CARB and other stakeholders across the SAF ecosystem to explore solutions which build on the existing opt-in model of the LCFS Program. We recommend that CARB establish a joint CARB-industry working group with stakeholders across the emerging SAF ecosystem to explore alternative policy and voluntary proposals to rapidly increase SAF production, availability and use in California. We look forward to working with CARB on such measures to accelerate SAF deployment.

Yours truly,

Eduardo A. Angeles

VIA ELECTRONIC SUBMISSION

August 23, 2024

The Honorable Liane Randolph

Chair, California Air Resources Board

P.O. Box 2815 Sacramento, CA 95812

Via electronic submission

Re: Comments on Proposed Amendments to the Low Carbon Fuel Standard Regulation

Dear Chair Randolph:

I am a California dairy farmer.

Based in large part on the new market for dairy biogas that was created by the CARB LCFS program, I agreed to build a digester on my dairy. We have been online since 2018, and our pathway application was approved in 2020, with the understanding that our digester could participate in the market for up to 30 years.

Now, after I made this commitment and the digester investment is irrevocable, CARB is changing the LCFS rules so that my dairy can claim avoided methane benefits for no more than 20 years, meaning that I have only 16 years left to operate this digester. So CARB is taking 10 years of profitability away after I have already made the investment.

Unless CARB restores the 30-year eligibility, I expect we and our industry partners will immediately freeze or cancel all future investments in the digester, including additional manure collection, biogas capacity upgrades, solar power supply, CO2 sequestration, additional manure treatment to reduce methane slip - or any other improvements - whose return is now at risk.

Please act immediately to restore our faith that it is safe to invest in renewable energy in California.

Sincerely,

Joey Airoso

Circle A Dairy

Subject	15-Day LCFS Comment by FS, Fueling Sustainability

Comment

Dear Clerk of the Board,

The following is a summary of the comment. The full comment is attached. Please contact me if there are any questions or issues with the filing.

FS Indústria de Biocombustíveis Ltda (FS, Fueling Sustainability) appreciates the opportunity to provide comments regarding the recent modifications proposed by the California Air Resources Board (CARB) to the Low Carbon Fuel Standard (LCFS) regulations (the "15-Day Changes"). We appreciate the California Air Resources Board's (CARB) role in developing and implementing the vitally important LCFS program. Aligned with CARB's LCFS and climate policy objectives, FS produces extremely low carbon intensity (Low-CI) ethanol and works to develop and implement technical innovations that can contribute to and be recognized in the LCFS and other carbon reduction programs. We are submitting these comments to share our perspective with CARB regarding proposals of particular importance to FS, and to share our direct experience in participating and complying with certification schemes.

Best Regards,

Liane Randolph
Chair

Steve Cliff
Executive Officer

California Air Resources Board
1001 I ST Sacramento, CA 95814
RE: FS Comments Relating to Proposed 15-Day Changes to Low Carbon Fuel Standard

(Comment submitted electronically)

Dear Chair Randolph and Executive Officer Cliff:

FS Indústria de Biocombustíveis Ltda (FS, Fueling Sustainability) appreciates the opportunity to provide comments regarding the recent modifications proposed by the California Air Resources Board (CARB) to the Low Carbon Fuel Standard (LCFS) regulations (the “15-Day Changes”). We appreciate the California Air Resources Board’s (CARB) role in developing and implementing the vitally important LCFS program. Aligned with CARB’s LCFS and climate policy objectives, FS produces extremely low carbon intensity (Low-CI) ethanol and works to develop and implement technical innovations that can contribute to and be recognized in the LCFS and other carbon reduction programs. We are submitting these comments to share our perspective with CARB regarding proposals of particular importance to FS, and to share our direct experience in participating and complying with certification schemes.

FS would like to emphasize at the outset that while this comment letter does provide strong suggestions and some criticism regarding two areas covered by the 15-day changes, there is a great deal in the LCFS rule package that we heartily support. We commend CARB for the establishment of the LCFS and view it as a model program for the decarbonization of the transportation sector. It is because the LCFS program is so critical to the development of low carbon fuels and technologies that we are heavily invested in providing constructive input such that CARB and the LCFS can continue to be world leaders in transportation decarbonization and climate policy design and execution.

FS, Fueling Sustainability

FS is the first Brazilian company to produce ethanol, animal nutrition products, and corn oil exclusively from second-crop corn. FS uses energy cogeneration from biomass to meet its own energy needs and to generate surplus electricity that is sold to the Brazilian electrical grid. We have developed a new low-carbon value chain that encompasses Low-CI second-crop corn, incentivizes sustainable forest cultivation, enables the production and sale of high-quality animal nutrition and ethanol products, and generates bioenergy and steam. FS has an integrated food and energy production system, a business model that uses second-crop corn as raw material. This strategy results in better use of available agricultural resources, increased yield per acre, reduced need for expansion of cultivated land, better sustainability and greater reduction of greenhouse gas (GHG) emissions.

CARB Should Implement a Notice and Comment Period Focused on Technical Input Prior to Making Indirect Land Use Change Determinations and Recognize Fuel Combinations that Achieve Lower iLUC Scores

018.1

In the 15-Day Change proposed by the establishment of §95488.3(d)(2), CARB has proposed to undertake an unspecified process to potentially assign a more conservative land use change (iLUC) value when CARB determines that “no value in Table 6 is conservatively representative of a particular region/feedstock/fuel combination.” The complete proposed subsection contains the following language:

(2) The Executive Officer may determine that no value in Table 6 is conservatively representative of a particular region/feedstock/fuel combination and assign a more conservative LUC value. Such determination must be based on the best available empirical data, including but not limited to satellite-based remote sensing data for land cover monitoring, crop yields, and emission factors from the AEZ-EF model or carbon stock datasets. For feedstocks not listed in Table 6, the Executive Officer may determine and assign an appropriate LUC value based on empirical land cover data, crop yields, and emission factors.

018.1 Cont

To ensure transparency in determining carbon intensities under the LCFS, the Executive Officer should establish a clear process for determining and adjusting iLUC values. As CARB is well-aware, life cycle analysis (LCA) issues are complex and controversial and iLUC determinations can make or break a particular fuel’s opportunity to participate in the California LCFS marketplace. In addition, CARB’s initial determination for a particular region/feedstock/fuel combination will likely establish an iLUC value that will be applied to subsequent pathways that utilize this particular region/feedstock/fuel combination. Thus it is important that CARB establish a robust and public process prior to reaching these determinations.

This process should begin with preliminary communication and notification, with CARB committing to inform stakeholders in advance of any proposed iLUC value adjustments. Additionally, CARB should provide transparency in the methodologies and assumptions used. Before finalizing any changes to iLUC values, CARB should engage in a public consultation process, allowing for technical discussions where industry experts, stakeholders, and the public can contribute input on the proposed values and methodologies.

In addition to establishing a public process, CARB should also be open to the possibility of lowering an iLUC value rather than only adjusting iLUC values in a manner that is unfavorable to feedstock and fuels that are reviewed. We recognize that CARB will be consistently taking a conservative approach to iLUC values but cannot discern a sufficient rationale for CARB to only move iLUC values in one direction. To the extent that other regions of the world can provide feedstocks and fuels that are found to cause less land use change than regions already represented in Table 6, the resulting fuels should receive CI scores that reflect that better performance.

018.2

Brazilian second-crop corn provides an excellent example of why sufficient process and technical input is essential to LCFS policy design. This particular region/feedstock/fuel combination faces a significant challenge under the LCFS program due to the absence of a Table 6 value grounded on regional performance. The available global default value for corn

does not reflect the specific low-risk and Low-CI characteristics of Brazil's second-crop corn. We take this opportunity to request CARB's attention to the study and recognition of Brazilian farming practices, yields of double-cropped soy and corn per acre, the role of renewable biomass, the nature of second-crop corn and other factors that establish second crop Brazilian corn as a low-CI and low-ILUC feedstock and support Low-CI values for Brazilian Second Crop Ethanol. The main factors are highlighted below and warrant a robust review.

- 1) Improved agricultural practices and soybean-corn multi-cropping systems reduce the risk of iLUC.
- 2) Brazil has soybean land available that can be used to expand the production of second-crop corn, without requiring additional land.
- 3) A negative ILUC for Brazilian corn ethanol is documented in scientific literature.

Due to these factors, other jurisdictions with rigorous oversight programs have determined zero ILUC value for other multi-crops under specific conditions including the following.

- 1) The Carbon Offsetting and Reduction Scheme for International Aviation (CORSIA) has determined zero or negative ILUC values for secondary (oilseed) crops.
- 2) CORSIA has determined a zero ILUC value for sequential cropping in general which includes 2nd crop corn.
- 3) Brazilian corn ethanol is classified as a Low LUC risk by the ISCC/CORSIA.

018.3

**CARB Should Bifurcate Issues
Pertaining to Forest Biomass from this LCFS Rulemaking to
Receive Stakeholder Input Prior to Establishing a
New and Highly Complex Woody Biomass Scheme**

Regrettably, during the course of this rulemaking, CARB did not hold a workshop to discuss and examine the many complexities presented by forest biomass. CARB also did not share with stakeholders the extensive new language pertaining to forest biomass contained in the 15-Day Changes in §95488.8(g)(1)(A)(3) and the approximately six pages of new language proposed to be added to §95488.9(g).

FS respectfully submits that this LCFS proposal would have benefitted from a stricter reading of the California Administrative Procedure Act particularly given the tremendous wildfire risk in California that is fueled by such massive and dangerous quantities of forest biomass that the State has established a million-acre fire treatment strategy as further discussed by the comment letter of the California Forestry Association.

018.3 Cont

From the perspective of FS, the forest biomass scheme proposed in the 15-Day Changes is as completely unworkable in Brazil as it is in California. We do not think it feasible to propose simple fixes to make the scheme workable and would recommend that it be completely redesigned. However, we think this redesign is a process that will require many months if not a year. We also think it imperative that the many positive changes that CARB has made to the LCFS program should not be further delayed in terms of implementation. Therefore, we would recommend that CARB delete all of the new language pertaining to woody biomass from the LCFS rulemaking package and initiate a separate focused rulemaking that involves stakeholders and California agencies with forestry expertise in the process.

In terms of preliminary comments from FS to inform this forest biomass process, we would submit the following. To ensure a comprehensive and accurate assessment of the life cycle analysis (LCA) for renewable biomass used in combustion — whether it is a forest/agricultural/industrial residue or a purpose-grown forest biomass — CARB should establish the following clear and detailed minimum requirements:

- a. **Inclusion of Clear Definitions for Each Supply Chain Element:** This includes defining the Point of Origin, First Gathering Point, Processing Unit, and other critical links in the biomass supply chain. Clear definitions will ensure consistency and transparency in the assessment process.
- b. **Specify Emission Factors for Biomass Combustion:** We request specific definitions regarding where the LCA for biomass combustion begins and ends. This clarity is essential for accurately calculating the carbon footprint and understanding the environmental impact of biomass used for energy generation.
- c. **Definition of Waste/Residue:** To avoid ambiguity, it is essential for CARB to provide a precise definition of what qualifies as waste or residue, particularly in the context of energy generation. This clarity will be key in determining whether or not to account for upstream emissions of biomass in Tier 2 submissions.

Conclusion

We appreciate the opportunity to participate in this proceeding. Please count on FS for providing data and evidence, or any other support that CARB may need to pursue the listed topics.

Respectfully,

DocuSigned by:

CD36C38E34B34B9...

Executive VP Sustainability & Businesses Development

Email Address	graham@noyeslawcorp.com
Affiliation	Noyes Law Corporation for Raizen
Subject	Raizen's Comments on Proposed 15-Day Changes

Comment

Dear Clerk of the Board,

Attached please find Raizen's comments regarding the proposed 15-Day Changes to the Low Carbon Fuel Standard. Below is a brief summary of these comments. Please contact me regarding any questions or issues regarding the filing. Thank you for your assistance.

The recent modifications proposed by the California Air Resources Board (CARB) to the Low Carbon Fuel Standard (LCFS) regulations (the "15-Day Changes") present significant implications for biofuel producers globally. As one of the leading ethanol producers in Brazil, Raízen is deeply invested in the LCFS and broadly supports these changes, which will accelerate carbon intensity (CI) and petroleum reduction, phase in sustainability requirements, and promote advanced biofuels. From Raízen's standpoint, these changes resonate with our commitment to sustainability and innovation. These changes also have the potential to expand the global sustainable fuels market but to execute the revised LCFS effectively, it will be critical for CARB to work with stakeholders as CARB interprets and implements the sustainability and certification requirements.

RE: Raízen's Comments on Proposed 15-Day Changes

Dear Chair Randolph and Executive Officer Cliff:

The recent modifications proposed by the California Air Resources Board (CARB) to the Low Carbon Fuel Standard (LCFS) regulations (the "15-Day Changes") present significant implications for biofuel producers globally. As one of the leading ethanol producers in Brazil, Raízen is deeply invested in the LCFS and broadly supports these changes, which will accelerate carbon intensity (CI) and petroleum reduction, phase in sustainability requirements, and promote advanced biofuels. From Raízen's standpoint, these changes resonate with our commitment to sustainability and innovation. These changes also have the potential to expand the global sustainable fuels market but to execute the revised LCFS effectively, it will be critical for CARB to work with stakeholders as CARB interprets and implements the sustainability and certification requirements.

Based upon our review, the proposed LCFS regulations provide an overall framework to advance to a more sustainable and rigorous program but do not explicitly establish precisely how the program will be administered. Raízen appreciates that CARB has deliberately built flexibility into the revised LCFS so that CARB can supplement program details through experience gained via implementation and interaction with stakeholders. Raízen encourages CARB to work closely with stakeholders to align the revised LCFS program with international standards, and to welcome global feedstocks and fuels that meet LCFS sustainability requirements. Already a global policy leader, CARB will need to further expand its international engagement to evolve the LCFS program to align with the dynamic and complex international policy environment.

Emphasizing Certification and Sustainable Practices

Raízen's sourcing of feedstocks and energy is already aligned with CARB's increasing emphasis on sustainability certification. Raízen's sugarcane production is certified by several internationally recognized sustainability schemes (e.g., ISCC, Bonsucro, Renovabio) ensuring compliance with global standards for

environmental and social responsibility.

- 019.1 Notably, Raízen's sugarcane plantations are located in regions where there has been a documented increase in native forests, contrary to the common narrative that biofuel production necessarily leads to deforestation. Raízen's experience and practices demonstrate that it is possible to expand biofuel production while contributing positively to the environment. This proactive approach positions Raízen favorably under CARB's proposed regulations, which will require full third-party certification by 2031. We would encourage CARB to scrutinize existing certifications schemes for full alignment with existing programs and thereby avoid doubling of efforts and conflicting standards. This will allow Raízen and other international market participants to seamlessly comply with these requirements and send a global market signal that will support sustainable biofuel production and not incentivize negative activities or outcomes.

E2G Technology

- 019.2 One of the most significant aspects of CARB's proposed changes is the tightening of CI benchmarks for fuels. Raízen is particularly well-prepared to meet these challenges, thanks to our proprietary technology known as E2G, which converts sugarcane waste bagasse into ethanol. This second-generation ethanol technology utilizes agricultural waste as a feedstock and significantly lowers the carbon intensity of the resulting biofuel. The use of bagasse for biofuel production is not only scalable but the feedstock is also recognized as a residue according to the European Renewable Energy Directive (EU RED). This recognition means that bagasse is considered to have zero life-cycle GHG emissions up to the point of collection, giving it a significant advantage over feedstocks like soy, canola, and palm oil. Raízen is confident these advantages can drive further decarbonization under these regulatory changes. Furthermore, E2G (just like normal sugar cane ethanol) can be utilized in hard to abate sectors such as aviation, maritime shipping, and other sectors where electrification has significant limitations.

- 019.3 We anticipate that once Raízen's E2G technology is certified by CARB, it will achieve a CI score that is significantly lower than most other fuels currently in the market. The reduction in carbon intensity aligns with CARB's goals and provides California with the opportunity to achieve greater overall greenhouse gas emissions (GHG) reductions with the same volume of ethanol fuel which is critical given the regulatory blend level of E10 that currently exists. Brazil has deep and positive experience with higher ethanol blends. To facilitate more rapid achievement of California's petroleum and GHG reduction goals, Raízen encourages CARB to complete its review of E15 as quickly as possible and to continue its work to maximize E85 use in flex fuel vehicles (FFVs) and expand its fleet of FFVs via the Advanced Clean Cars rule.

Support for Sustainable Aviation Fuels

- 019.4 Raízen also appreciates CARB's specific recognition of sustainable aviation fuel

(SAF) within the LCFS framework. As one of the few companies currently furnishing feedstock to the US SAF supply chain, we see this as a critical area of growth. CARB's support of bio-based SAF not only provides a clear market signal but also encourages continued investment and innovation in this sector.

The aviation industry is one of the most challenging sectors to decarbonize, and bio-based SAF represents a viable pathway to achieving significant carbon reductions. Raízen's involvement in this market demonstrates our long-term commitment to providing sustainable solutions across the full range of transportation fuels. The proposed LCFS changes by CARB will likely accelerate the adoption of SAF, accelerating GHG and petroleum reduction in this critical area.

Indirect Land Use Change Calculations

We think it important to consider that via Section 95488.3(d) and associated Table 6, CARB has given itself the authority to assign a "more conservative" indirect land use change (iLUC) value when CARB determines that Table 6 "does not accurately reflect" the iLUC of a region/feedstock/fuel. CARB may also add new feedstocks/fuels to Table 6. Consistent with other LCFS provisions, we would recommend that CARB's process for changing iLUC values provides notice to stakeholders and the opportunity for public comment and particularly technical input. As CARB is well-aware, life cycle analysis (LCA) issues are complex and controversial and iLUC determinations can make or break a particular fuel's opportunity to participate in the California LCFS marketplace.

In addition to establishing a notice and comment process, CARB should also be open to the possibility of lowering an iLUC value rather than only adjusting iLUC values in a manner that is unfavorable to non-US sources of feedstock and fuels. We recognize that CARB will be consistently taking a conservative approach to iLUC values but cannot discern a sufficient rationale for CARB to only move iLUC values for non-US fuels in one direction. To the extent that other regions of the world can provide feedstocks and fuels that are found to cause less land use change than US fuels, the resulting fuels should receive CI scores that reflect that performance.

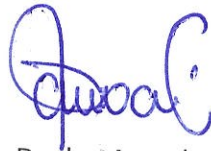

Conclusion

The proposed modifications to the LCFS regulations by CARB reflect a forward-thinking approach to reducing GHG emissions and promoting sustainable biofuels. From Raízen's perspective, these changes align with our long-standing commitment to sustainability and innovation. Our certified supply chain, development of low-CI fuels through E2G technology, and leadership in the SAF market position us to meet new standards set by CARB.

Raízen supports CARB's proactive efforts to drive the adoption of low-carbon fuels. We are eager to collaborate with CARB both now and in the future, leveraging our expertise, certified supply chain, and innovative technologies to

meet and exceed the new standards. Raízen is committed to working closely with CARB to ensure that the transition to a low-carbon economy is both efficient and sustainable.

Sincerely,

Paulo Macedo

International Relations Director

Raízen

Subject	H Cycle's Comments RE: 15-Day Changes to LCFS Proposal

Comment

Dear Clerk of the Board,

Attached please find the comments of H Cycle regarding the 15-day proposed changes to the Low Carbon Fuel Standard. A summary of the comments is included here. Please contact me if there are any questions or issues relating to the filing. Thank you for your assistance.

H Cycle, LLC ("H Cycle") is pleased to submit comments pertaining to the California Air Resources Board's ("CARB") proposed 15-day changes ("15-Day Changes") to the Low Carbon Fuel Standard ("LCFS"). We support CARB's LCFS program as it sends a powerful market signal to decarbonize the transportation sector, is performance based, and provides long-term policy stability that supports investment. However, we respectfully encourage CARB not to bias the LCFS program structure to favor more energy intensive electrolytic hydrogen over H Cycle's non-electrolytic process that leverages waste streams from organics diversion to reduce emissions of the short-lived climate pollutant ("SLCP") methane, create a distributed hydrogen production network, and attract federal dollars to California to accelerate hydrogen production expansion.

August 22, 2024

The Honorable Liane M. Randolph
Chair
California Air Resources Board
1001 I Street
Sacramento, CA 95814

(Comment submitted electronically)

RE: H Cycle’s 15-Day Changes Comment Requesting that CARB Level the Playing Field by Giving all Hydrogen Producers Access to Book-and-Claim Accounting as was Originally Proposed

Dear Chair Randolph,

H Cycle, LLC (“H Cycle”) is pleased to submit comments pertaining to the California Air Resources Board’s (“CARB”) proposed 15-day changes (“15-Day Changes”) to the Low Carbon Fuel Standard (“LCFS”). We support CARB’s LCFS program as it sends a powerful market signal to decarbonize the transportation sector, is performance based, and provides long-term policy stability that supports investment. However, we respectfully encourage CARB not to bias the LCFS program structure to favor more energy intensive electrolytic hydrogen over H Cycle’s non-electrolytic process that leverages waste streams from organics diversion to reduce emissions of the short-lived climate pollutant (“SLCP”) methane, create a distributed hydrogen production network, and attract federal dollars to California to accelerate hydrogen production expansion.

15-Day Change

020.1 Cont

CARB’s Notice of Public Availability of Modified Text (“15-Day Notice”) states that regarding §95488.8(i)(1)(C), “staff proposes to add the word “electrolytic” to clarify the type of hydrogen production to which this subsection applies.” There is no further explanation given for the change. The lack of explanation is unfortunate given that the original LCFS regulatory proposal posted on December 19, 2023 (“Original LCFS Proposal”), affirmatively struck the word “electrolytic” from §95488.8(i)(1)(C). The Original LCFS Proposal was responsive to strong industry support for a technology neutral and consistent approach to carbon accounting for hydrogen production.

The reinsertion of “electrolytic” into §95488.8(i)(1)(C) would perpetuate the current regulatory structure which establishes two distinct LCFS carbon accounting approaches for hydrogen production. Electrolytic hydrogen is authorized to use book-and-claim accounting to access low carbon intensity (“Low-CI”) power. Non-electrolytic hydrogen production can only access Low-CI power through the establishment of a behind the meter direct connection to a renewable power generating facility and must meet the other requirements of §95488.8(h)(1).

**California's LCFS Program was Authorized by Executive Order to
Reduce the Carbon Intensity of California's Transportation Fuels and
Designed to be Technology Neutral**

In January 2007, California Governor Arnold Schwarzenegger issued Executive Order S-01-07 which ordered as its first two operative provisions:

1. *That a statewide goal be established to reduce the carbon intensity of California's transportation fuels by at least 10 percent by 2020 ("2020 Target").*
2. *That a Low Carbon Fuel Standard ("LCFS") for transportation fuels be established for California. (...) ¹*

As former Board Member Professor Dan Sperling explained to the Carnegie Endowment for International Peace:

A low carbon fuel standard is a carbon intensity standard applied to a fuel's life cycle. This makes the low carbon fuel standard a technology neutral policy that harnesses market forces to stimulate innovation by allowing industry and consumers, instead of government, to choose winners among competing fuel technologies and products. ²

020.1 Cont Despite the centrality of technology-neutral carbon intensity within the LCFS program structure, CARB is proposing with this 15-Day Change that hydrogen should be subject to two distinct carbon accounting schemes depending on whether the hydrogen is produced through the electrolytic method which utilizes electricity and water, or through any other method.

**LCFS Policy Design Should
Incentivize Hydrogen Production that Uses Less Electricity**

020.1 Cont While there may be sound policy reasons to favor some production process over others, CARB has not provided any justification in the 15-Day Notice and none is readily apparent. In discussions with CARB on book-and-claim issues, one key issue of concern that has been emphasized is an insufficient supply of Low-CI power. This has been discussed as a reason to prioritize the use of Low-CI power for fuels for zero emission vehicles including battery electric vehicles and fuel cell electric vehicles.

However, an electricity consumption comparison of electrolytic hydrogen production versus hydrogen produced through H Cycle's process demonstrates that favoring electrolytic hydrogen via biased carbon accounting will waste rather than conserve power for zero emission vehicles. The H Cycle process is distinct from electrolytic pathways as it uses municipal solid waste ("MSW") from material recovery facilities ("MRFs") residuals as its feedstock and primary energy source to produce hydrogen. The H Cycle process is capable of taking what may be described as the "waste of the waste"- organic waste that is not suitable for anaerobic digestion or composting. One of H Cycle's primary uses of electricity in the process is to power plasma torches in the thermal conversion unit that enables the processing and conversion of organic waste in an environmentally friendly manner.

¹ California State Library, "Executive Order S-01-07," (January 22, 2007) at <https://www.library.ca.gov/wp-content/uploads/GovernmentPublications/executive-order-proclamation/5107-5108.pdf>

² Carnegie Endowment for International Peace, "A National Low-Carbon Fuel Standard," (July 19, 2012), at <https://carnegieendowment.org/events/2012/07/a-national-low-carbon-fuel-standard?lang=en>.

In the case of electrolytic hydrogen, the energy value of the hydrogen is derived solely from the electricity input with some of the energy value of the electricity lost due to energy inefficiency. The U.S. Department of Energy has set the technical targets for high temperature electrolyzer stacks and systems at 76% energy efficiency for 2026.³

020.1 Cont As a result of the inherent inefficiencies of electrolytic hydrogen production and H Cycle’s ability to capture the energy value of the waste in hydrogen, H Cycle can produce a kilogram of hydrogen using only one-third of the electrical power required by an electrolytic hydrogen facility. Thus, returning to CARB’s goal of strategically utilizing California’s Low-CI power sources to generate the maximum quantity of fuel for zero emission vehicles, the deployment of H Cycle facilities will yield 3x the amount of hydrogen than electrolytic facilities for the same electricity. Yet, the 15-Day Change proposal creates a carbon accounting disparity such that the electrolytic hydrogen producers will receive more favorable CI scores under the LCFS due to their ability to access Low-CI power via book-and-claim accounting. In the words of Professor Sperling, *this approach places the government in the position of choosing winners among competing fuel technologies and products.*

In addition to its ability to produce more hydrogen from less electricity, the environmental services that H Cycle provides further underscore the importance of providing H Cycle with equal access to Low-CI power via book-and-claim.

H Cycle is the Leading Company in Organic/Biogenic Waste-to-Hydrogen

H Cycle is a California company based in Concord that was founded in 2021. H Cycle is a developer of low-cost, low-carbon hydrogen production facilities that deploy an advanced waste-to-hydrogen thermal conversion technology. H Cycle is currently developing multiple projects in California. H Cycle facilities will be capable of utilizing a diverse composition of waste feedstocks including post-separated organic fractions of municipal solid waste, agricultural residues, and woody biomass from wildfire risk reduction projects to produce Low-CI hydrogen. The successful development of these projects will reduce methane emissions from landfill disposal and other waste streams and facilitate achievement of California’s waste diversion targets under Senate Bill 1383 (“SB 1383”). The H Cycle process delivers Low-CI hydrogen that can be used as a fuel for decarbonizing hard-to-abate sectors such as low-carbon fuel production, heavy-duty trucking, and sustainable aviation. H Cycle is excited to work with CARB and local communities to deploy our solution and support the State in meeting its climate, sustainability and air quality goals. H Cycle is the first company to have received a favorable Article 2 determination from CalRecycle.

Conclusion

Non-electrolytic hydrogen technologies have the potential to be a meaningful contributor to the State’s and CARB’s goals. Supporting waste-to-hydrogen as a technology and commercial pathway brings many benefits including achieving organics diversion targets and SB 1383 short-lived climate pollutant reductions; and job growth and investment tax base from new facilities.

³ Office of Energy Efficiency and Renewable Energy, “Technical Targets for High Temperature Electrolysis,” at <https://www.energy.gov/eere/fuelcells/technical-targets-high-temperature-electrolysis>.

For the reasons discussed in this comment, we respectfully request that CARB revert to the Original Proposal that utilizes consistent carbon accounting for hydrogen production technologies.

We appreciate the opportunity to submit these comments, and are available for further discussions on these important issues.

Sincerely,

Re: Proposed 15-Day Changes to the Proposed Regulation Order

Dear Chair Randolph and Members of the California Air Resources Board,

On behalf of the Georgia/Florida Soybean Association, thank you for the opportunity to comment on the proposed 15-day changes (15-Day Changes) to the Low Carbon Fuel Standard (LCFS) program. Georgia/Florida Soybean Association represents soybean farmers across Georgia and Florida on public policy issues important to the soybean industry. Growers across Georgia and Florida have long been committed to producing the world's food, feed, fuel, fiber, and thousands of bioproducts in an environmentally and economically sustainable way.

CARB's 15-Day Changes to revise the LCFS was quite surprising, as the final package diverged significantly from what was included in the Initial Statement of Reasons (ISOR) and the April 10 public workshop. Of top concern for farmers across our state and the rest of the nation is a proposal that would cap the use of soybean oil and canola oil as feedstocks for biofuels at 20 percent by company.

Placing an artificial limit on the market, combined with the inclusion of sustainability guardrails, as proposed will fail to reduce emissions and will only increase costs. Georgia and Florida farmers remain frustrated that CARB insists on using data and methods that are over two decades old to set carbon intensity (CI) scores for soy, while refusing to consider new economic data and failing to consider the potential indirect emission impacts their expanding preference for waste is having.

Georgia/Florida Soybean Association opposes the proposed discretionary authority provided to the Executive Officer to stop accepting new pathways for biomass-based diesel. In addition to discriminating against the lipid-based fuel platform, we are concerned this could have unintended impacts for non-lipid pathways which could produce biomass-based diesel as a co-product. We are also concerned that the aggressive step-down of CI benchmarks, which partially result from the removal the proposed regulation of fossil jet fuel, combined with other changes, will reward importers of waste feedstocks while penalizing farmers across Georgia, Florida and the broader United States.

As CARB seeks to finalize updates to the LCFS program in the coming months, we strongly encourage the agency to ensure these updates are based on science as required by AB-32. The determination to make such drastic changes to previous CARB proposals so late in the game was shocking to the soybean and biofuels industries. For CARB to move from arguing that, based on the modeling, a vegetable oil feedstock cap was detrimental to the goals of the LCFS at the April public workshop, to now recommending a wildly stringent cap on those feedstocks without data or science, is quite difficult to comprehend. CARB's own April 10th analysis showed that a feedstock cap would increase greenhouse gas (GHG) emissions in California, which is contrary to requirements in AB-32.

Vegetable Oil Feedstock Cap

The inclusion of a virgin vegetable oil feedstock cap in the 15-Day Changes was alarming to farmers and the entire biofuels value chain, as reflected in market activity. You may understand our surprise based on the April 10 workshop in which CARB noted that liquid fuels would continue to be needed in the transportation sector in California for at least the next decade. In that same workshop, CARB also argued that the imposition of a virgin vegetable oil feedstock cap would increase the utilization of petroleum diesel in the transportation sector. In the staff's own presentation on April 10, staff noted that nearly eighty percent of vehicles on the road in California to still use combustion engines by 2030. Further, they noted that such a stringent cap on virgin vegetable oils may result in 2.8 billion gallons of fossil diesel utilization in 2030, versus 1.9 billion gallons using a scenario that does not impose the cap proposed by the Environmental Justice Advisory Committee.

In a full reversal of staff's prior analysis, which is only four months ago, staff is now essentially recommending to the board that more fossil diesel be sold into the market in 2030. This recommendation appears to not only go against the goals of AB-32, but also science. This recommendation seems to flatly disagree with the Intergovernmental Panel on Climate Change, which notes in its sixth assessment report that using existing low carbon technologies is a crucial component to avoiding catastrophic temperature increases, stating that "biodiesel and renewable diesel fuels...could offer important near-term reductions" for several technologies, including buses, rail, and long-haul trucking.¹

In our current interpretation, the cap may lock out of the market producers of the lowest cost, lowest carbon intensity soybean oil-based biofuel (soy methyl esters). Most soy methyl esters are produced at biodiesel plants adjacent to soybean processing plants. Often, the companies which own operate these soybean processing are not involved in the procurement and processing of non-crop-based oils, such as UCO and tallow. They exclusively make biofuels out of soy oil or canola oil. The current language limits crediting

¹ Jaramillo, P., S. Kahn Ribeiro, P. Newman, S. Dhar, O.E. Diemuodeke, T. Kajino, D.S. Lee, S.B. Nugroho, X. Ou, A. Hammer Strømman, J. Whitehead, 2022: Transport. In IPCC, 2022: Climate Change 2022: Mitigation of Climate Change. Contribution of Working Group III to the Sixth Assessment Report of the Intergovernmental Panel on Climate Change. https://report.ipcc.ch/ar6wg3/pdf/IPCC_AR6_WGIII_FinalDraft_Chapter10.pdf

of soy and canola to 20 percent of reported gallons. This leaves integrated agriprocessing/biofuel producers two choices: 1) exit the market entirely, or 2) be denied a government benefit on 80 percent of their fuel. If this is the current interpretation of the proposed provision, it would significantly and arbitrarily disadvantage the sustainable oilseed biodiesel community.

We echo the concern of the American Soybean Association that new requirement appears to contradict the statutory guidance laid out in AB-32 to minimize costs.

Sustainability Guardrails

020.5

Georgia/Florida Soybean Association was surprised to find that not only was a feedstock cap in the 15-Day Changes, but the sustainability guardrails were also retained. The cap, sustainability guardrails and Indirect Land Use Change score all additively, and redundantly, address land use change. This has the equivalent effect of giving soy and canola a much higher CI score increasing the compliance cost associated with delivering the product, despite the lack of direct evidence.

Broadly we are concerned that the requirement proposed by CARB is unneeded given the longstanding, excessively high ILUC figure (relative to more recent modeling efforts). Furthermore, we are extremely disheartened that CARB has not followed the example of governments across North America, where farmers who submit data for compliance are also given the opportunity to be incentivized for conservation efforts. This additional cost without benefit contradicts language authorizing the LCFS. Section 38562 (b)(7) of AB-32 directs CARB to, "Minimize the administrative burden of implementing and complying with these regulations." Adding supply chain traceability to a bulk delivery system adds significant administrative burden without changing the GHG emissions of the pathway.

CARB's efforts could be improved and enhanced by outreach to U.S. Department of Agriculture (USDA) personnel who have engaged in activity regarding climate-smart farming practices. USDA recently closed a comment period on its Request for Information on Procedures for Quantification, Reporting, and Verification of Greenhouse Gas Emissions Associated with the Production of Domestic Agricultural Commodities Used as Biofuel Feedstocks. With the information received, USDA seeks to quantify and qualify the benefits of climate smart agriculture practices for biofuel programs at the state, national, and international level. Communication between CARB and USDA could be enlightening regarding ongoing agricultural sustainability practices.

Through the current sustainable aviation fuel (SAF) federal tax credit (40B), the CI of soy-based biofuels can improve through no-till and cover cropping on the field that the soybeans were produced. Other farming practices like low-till, nutrient management, enhanced efficiency fertilizers, buffers, wetland and grassland management, tree planting on working lands, planting for higher carbon sequestration, and soil amendments all can and should be accounted to assign a lower CI score to an agricultural feedstock. USDA

already tracks all these practices through several of their managed conservation programs. In addition, there are a variety of other practices that scientifically lower the CI score of soybean feedstocks for biofuels, and USDA is actively working to develop mechanisms to account for those.

Given the work being undertaken by USDA and EPA as part of the implementation of the Inflation Reduction Act, Georgia/Florida Soybean Association urges CARB to reconsider its proposed sustainability requirements to allow soybean growers the opportunity to participate in the California biofuels market through innovative and climate smart agriculture practices.

Outdated Scoring

020.2 Cont For the last several years, state soybean associations, national associations, and biofuel producers have urged CARB to consider updating its scoring methodology for crop-based biofuels. CARB has refused to even consider the request.

We remain deeply concerned that without a comprehensive update to the Global Trade Analysis Project model for biofuels (GTAP-BIO) that CARB utilizes, soy-based feedstocks will be phased out of the LCFS even without the additional limitations being proposed in the 15-Day Changes. Current data indicates a much lower CI score for soybeans, as growers continue to improve soil practices, limit water use, lower on-farm emissions and more. On the one hand, CARB is recommending stringent sustainability guardrails for U.S. soy, but on the other hand is still on track to likely phase-out soy-based biofuels from credit generation by approximately 2035 or sooner.

CARB has indicated plans to update all major models for lifecycle emissions calculations except for GTAP-BIO in the updated LCFS rulemaking. The soy industry has made vast improvements in sustainability and efficiency over the past two decades, with even greater improvement goals ahead. At the same time, CARB continues to rely on a 2014 model that uses data from 2004. The ILUC score accounts for half or more of the CI score for soy-based biofuels. CARB's current modeling assigns soy biomass-based diesel with an ILUC impact of 29.1g CO₂e/MJ whereas updated results from the model used to calculate ILUC scores indicate a value of between 9 and 10 gCO₂e/MJ for soybeans². The recently released 40BSAF-GREET 2024 model has an ILUC score of 12.2 for soy-based sustainable aviation fuel in federal programs.

The benefits of the LCFS can only be achieved if CI values are accurately captured. If land use change concerns are large enough to justify sustainability guardrails and capping virgin vegetable oil feedstocks, then the modeling should also be updated to reflect current land use change data.

² Taheripour, F., Karmai, O., and Sajedinia, E. (2023). *Biodiesel Induced Land Use Changes: An Assessment Using GTAP-BIO 2014 Data Base*. Purdue University

Entities Eligible to Apply for Fuel Pathways

021.3 Cont We are concerned about CARB's 15-Day Changes to give the Executive Officer discretion to stop accepting new pathways for biomass-based diesel starting in 2031. We do not understand what provision of AB-32 statute is served, or justifies, this arbitrary and highly selective change. CARB must under statute minimize costs and maximize GHG reductions. It is unclear how this is served by rejecting new pathways. In fact, the requirements of current law are met by allowing the most available pathways. If these pathways cannot achieve cost-effective GHG savings, they will not be utilized by the market in the LCFS. In essence, an increase in pathways can only serve to improve GHG benefits in California. Singling out a single fuel for prejudicial treatment is baffling given the goals of the LCFS and the authority that establishes it. Executive Order S-01-07 establishing the LCFS specifically cites diversity of fuels as a motivation for the program, and this proposal contradicts one of the stated purposes of the program. In addition, this provision if implemented could also significantly disadvantage other biofuel production processes which may produce biomass-based diesel as a co-product, for example in system where SAF is a main product.

Conclusion

Georgia/Florida Soybean Association is encouraged by the continued successes of programs that support the development of cleaner, low-carbon fuels. However, it is critical that CARB finalizes updates in a way that does not arbitrarily exclude agricultural feedstocks through policies that are not science-based and run afoul of CARB's mandate, including capping vegetable oil feedstocks and applying onerous sustainability guardrails that add cost without rewarding farming practices that lower CI.

CARB's 15-Day Changes, released in August 2024, is deeply concerning. CARB has singled out soybean and canola oil for adverse, prejudicial treatment. No scientific evidence is ever given for this treatment. In fact, CARB has refused to update the science as required by law for these feedstocks. This alone calls into question the integrity of a performance-based LCFS. On top of this, CARB is now proposing feedstock caps, traceability requirements and authority to reject applications for these fuels produced from them. Again, CARB has not shown any scientific justification. In fact, the LCFS is already over penalizing soy for any land use change requirements.

Farmers across Georgia and Florida remain eager to continue working with CARB to support the role of agriculture in diversifying the fuel supply while reducing GHGs and increasing clean air in California and beyond. On behalf of Georgia and Florida soybean farmers, we appreciate the opportunity to comment and look forward to collaborating with CARB and other relevant stakeholders

on implementation of policies that expand the use of soy-based biofuels and market opportunities for soybean farmers.

Sincerely,

California Air Resources Board (CARB)
California Low Carbon Fuel Standard (LCFS) | Stakeholder Feedback

022.1

This comment is intended to recommend the use of the carbon-14 testing method to determine the share of biogenic carbon content of feedstocks, fuels and emissions under California’s Low Carbon Fuel Standard (LCFS). Biogenic content measurements following methods such as ASTM D6866 Method B currently provide critical value to prominent clean fuel standard programs including California’s LCFS.

Included here you will find:

Recommendations for California’s Low Carbon Fuel Standard	1
What is Biogenic Testing (Carbon-14)?	5
ASTM D6866 Method B - The Most Reliable Method	6
About Beta Analytic	7
ISO/IEC 17025:2017 laboratory	8
Required tracer-free facility for Carbon-14	8
References	9

Recommendations for California’s Low Carbon Fuel Standard

Our recommendation is that California’s Low Carbon Fuel Standard (LCFS) should include direct biogenic content testing requirements following the ASTM D6866 Method B standard for any fuels or feedstocks seeking recognition of renewable (biogenic) content. Routine direct biogenic testing requirements are the only reliable method of incentivizing the use of biomass derived content and guaranteeing compliance. Routine biogenic testing requirements currently play a critical role in California’s LCFS and prominent similar programs.

California’s LCFS currently requires testing following ASTM D6866 for any fuels produced from co-processing and recommends testing for fuels produced from municipal solid waste (MSW). Several of the updates being considered by the program could benefit from the introduction of similar testing requirements and offer opportunities to strengthen the existing requirements.

022.2

Require Routine Biogenic Testing for Fuels Produced from MSW

Beta's first recommendation for this update to this LCFS is to introduce routine biogenic testing requirements for fuels produced from MSW in line with the program's requirements for co-processing. Given the heterogeneous nature of MSW, it is critical that routine testing requirements be maintained to make sure the program only rewards the renewable portion of those fuels.

Implementing routine testing for these fuels would be in line with the requirements of the US Renewable Fuel Standard (RFS), Canada's Clean Fuel Regulations (CFR), Oregon's Clean Fuels Program (CFP) and other leading programs.¹ As CARB updates the program, it is important to improve this policy from a recommendation to a requirement.

Update the Certification Framework for Biogas, Biomethane & RNG

022.3

Beta also recommends that CARB introduce routine biogenic testing requirements for fuels produced from biogas, biomethane and RNG. As CARB considers the best way to move forward with biogas, biomethane and RNG in the program, we recommend reviewing the [Biogas Regulatory Reform Rule \(BRRR\)](#), which the EPA included in the RFS Set Rule, the EU's updated methodology for biogas under the Renewable Energy Directive (RED), and Canada's Clean Fuel Regulations (CFR) Quantification Method (QM) for Co-Processing.² These recent policies reflect the leading best practices for regulating this sector under clean fuel programs.

The US introduced biogenic testing requirements for fuels produced from biogas in the 2023 Set Rule update to the US Renewable Fuel Standard (RFS), in a section called the [Biogas Regulatory Reform Rule](#).³ This update requires routine biogenic testing for any biogas or RNG fuels seeking to generate RINs under the RFS. Starting on July 1st, 2024 for new facilities and January 1st, 2025 for existing facilities, fuels produced from biogas will need to submit biogenic test results of the biogas at the point of production from the digester/landfill, at the point of upgrading, and after upgrading prior to pipeline injection.

The EU introduced biogenic testing requirements for fuels produced from biogas in a June 2023 update to the EU Renewable Energy Directive (RED) titled, ["Renewable energy- method for calculating the share of renewables in the case of co-processing."](#)⁴ This update was specifically issued in response to the discovery of a major case of fraud within the RED program stemming from biodiesel submissions from China which were approved by mass balance calculations.⁵ The EU investigation into this issue is still

2023. "Renewable energy- method for calculating the share of renewables in the case of co-processing." *European Commission*

2022. "Clean Fuel Regulations: Quantification Method for Co-Processing in Refineries." *Environment and Climate Change Canada*

² 2023. "40 CFR Parts 80 and 1090– Renewable Fuel Standard (RFS) Program: Standards for 2023–2025 and Other Changes." *EPA*

³ 2023. "40 CFR Parts 80 and 1090– Renewable Fuel Standard (RFS) Program: Standards for 2023–2025 and Other Changes." *EPA*

⁴ 2023. "Renewable energy- method for calculating the share of renewables in the case of co-processing." *European Commission*

⁵ 2023. "ISCC Press Release July 27, 2023." *International Sustainability & Carbon Certification*

ongoing, and the full extent of the damage is not yet known, but this was a significant setback for the program and quickly plummeted biodiesel prices in the EU.

The EU tied biogas, biomethane and RNG into the update in order to address these concerns for any fuels containing a mixture of biogenic and fossil content. The advantage of this framework is that the EU was able to continue to accept calculation based methodologies like mass and energy balance by requiring routine direct biogenic testing to validate the data. However, calculation based approaches are much more common for co-processing, where all inputs and outputs are concentrated in a single facility, as opposed to biomethane and RNG which are often produced, upgraded and blended at multiple facilities.

Canada's CFR introduced routine biogenic testing requirements for hydrocarbon gas fuels alongside co-processing in July 2022.⁶ The program's QM for co-processing requires routine direct testing following ASTM D6866 for, "each co-processed fuel, product and hydrocarbon co-product produced in the project," including gasses beyond biogas, biomethane and RNG, such as renewable propane. Introducing these requirements for biogas, biomethane and RNG alongside co-processing in 2022 when the RFS, RED and LCFS only required testing for co-processing has allowed the CFR to avoid many of the sustainability and verification concerns currently impacting the market for these fuels in California, the US and the EU. We recommend that CARB use this update to apply the same requirements in place for co-processing under the LCFS to biogas, biomethane and RNG.

Require Biogenic Testing as Sustainability Criteria for Waste Feedstocks

We recommend that CARB also consider the BRRR Set Rule update when updating the program's sustainability criteria for waste feedstocks. The BRRR requires testing at the point of biogas production, at the point of upgrading to a fuel and at the point of blending with any non-renewable components prior to pipeline injection.⁷ This approach provides a simple but comprehensive framework to apply for waste feedstocks. By testing the initial feedstock, the fuel at the point of upgrading and the final blended fuel, there is a clear demonstration of biogenic content from the waste feedstock to the final product. Given that these feedstocks need initial verification and that biogenic content ends up in various co-products during production, this approach provides a holistic way to incentivize only the renewable portion of fuels produced from these feedstocks.

It is critically important that this program require direct testing rather than allow calculation based approaches such as mass balance, which make claims based on material inputs in production. These calculations allow producers to assume that all of their biomass inputs end up in their facilities' outputs, despite it being well understood in the industry that the input of renewable feedstocks is not the same

⁶ 2022. "Clean Fuel Regulations: Quantification Method for Co-Processing in Refineries." *Environment and Climate Change Canada*

⁷ 2023. "40 CFR Parts 80 and 1090– Renewable Fuel Standard (RFS) Program: Standards for 2023–2025 and Other Changes." *EPA*

as the output. Renewable feedstocks will often have different activity than their fossil counterparts and won't necessarily produce the same quantity of outputs.⁸ By basing their calculations solely on production inputs rather than outputs these methods systematically over-report the renewable share of fuels.

We encourage CARB to review the recent mass balance fraud challenges faced by the EU Renewable Energy Directive (RED) program as an example of this risk, particularly pertaining to waste feedstock attestation.⁹ In July 2023 the program discovered rampant fraudulent biodiesel submissions from China, which had been certified by ISCC mass balance. The discovery quickly "caused a dramatic fall in biodiesel prices in European markets."¹⁰ In response to this situation the EU quickly updated the RED's rules to uniformly require routine direct testing, including for producers choosing calculation based approaches to verify their calculations.¹¹

Implement Biogenic Testing Requirements for Intrastate Jet Fuels

022.5

As CARB looks to introduce intrastate fossil jet fuel to the program, we recommend that routine biogenic testing requirements be applied to these fuels as well. Routine biogenic testing requirements are the only way to reliably verify the renewable content included in mixed fuels, and therefore encourage the displacement of fossil content. Especially given the importance co-processing currently plays in the SAF industry's early development, requiring routine testing is the best way to incentivize renewable content and penalize fossil content.

Demand Legitimate Vetting From Certification Programs Leveraged by LCFS

022.6

In the workshop on these updates CARB specifically mentioned its intention to rely on existing certification programs such as "ISCC, RBS, REDcert, Bonsucro, etc." Beta would like to emphasize that not all of these certification programs are equally stringent or reliable, and encourage CARB not to rely on any certifications which would invite risk to the LCFS. It is critical that only certifications relying on internationally recognized testing standards be relied on by the program.

Beta would again urge CARB to review the recent case of fraudulent biodiesel fuels which were certified in the EU RED using ISCC mass balance. These calculations are preferred by the industry because they enable producers to systematically over-report their renewable content, allowing them to receive more government incentives and greenwash their products. We re-iterate with emphasis that these calculations ignore the fact that renewable feedstocks will often have different activity than their fossil counterparts and won't necessarily produce the same quantity of outputs.¹² By basing their calculations

⁸ 2006. "Determining the modern carbon content of biobased products using radiocarbon analysis." *Bioresource Technology*, 97(16), 2084-2090.

⁹ 2023. "ISCC Press Release July 27, 2023." *International Sustainability & Carbon Certification*

¹⁰ 2023. "ISCC Press Release July 27, 2023." *International Sustainability & Carbon Certification*

¹¹ 2023. "Renewable energy- method for calculating the share of renewables in the case of co-processing." *European Commission*

¹² 2006. "Determining the modern carbon content of biobased products using radiocarbon analysis." *Bioresource Technology*, 97(16), 2084-2090.

solely on production inputs rather than outputs these methods systematically over-report the renewable share of fuels. As a result relying on any certification based on these calculations would leave the program susceptible to embellished claims and potentially duplicated counting.

022.4 Cont Certifications relying on mass balance such as the ISCC also allow producers to use book and claim, or free allocation, meaning they do not have to guarantee that there is any renewable content in a given fuel. Producers prefer this because if 10% of their feedstocks are biogenic they can claim that 10% of their products are biogenic, even if that's not the case because biobased can go in different amounts to different products in the co-process. Even further, book and claim also allows them to claim that 10% of their products are 100% biogenic and the rest are 0%, even if all of the products should be 10% biogenic based on calculations (and would likely C14 test below that).¹³

This system is designed to allow producers to maximize the incentives they can receive from programs such as the LCFS, without guaranteeing that they are actually providing the sustainability benefits those incentives are meant to produce. Facilities certified using these calculations are also extremely difficult to audit as a result. There are multiple facilities across the globe using successfully Carbon-14 analysis of the actual output and it is the easiest and most trustworthy method.

022.6 Cont Certifications which rely on direct testing following internationally recognized standards, such as the Roundtable on Sustainable Biomaterials (RSB) must be prioritized to protect the integrity of the LCFS.¹⁴ As CARB considers which certifications to rely on, it is imperative that only programs which have demonstrated a commitment to creating stringent, scientifically proven frameworks be admitted.

Conclusion

022.7 California's LCFS is a critical tool for the state's decarbonization journey and an example relied on by other programs around the US and the entire world. By implementing best practices for verification established by a wide range of fuel decarbonization programs led by the LCFS, CARB can protect and strengthen its ability to successfully achieve and measure the goals of this program. Routine direct testing following ASTM D6866 Method B is the most effective way to incentivize and validate biogenic content under this program.

What is Biogenic Testing (Carbon-14)?

Carbon-14 analysis is a reliable method used to distinguish the percentage of biobased carbon content in a given material. The radioactive isotope carbon-14 is present in all living organisms and recently expired material, whereas any fossil-based material that is more than 50,000 years old does not contain any

¹³ 2024. "The Mass Balance Approach." *International Sustainability & Carbon Certification*

¹⁴ 2023. "RSB Standard for Advanced Fuels." *Roundtable on Sustainable Biomaterials (RSB)*

ISO/IEC 17025:2017-Accredited Testing Laboratory

carbon-14 content. Since Carbon-14 is radioactive, the amount of carbon-14 present in a given sample begins to gradually decay after the death of an organism until there is no carbon-14 left. Therefore, a radiocarbon dating laboratory can use carbon-14 analysis to quantify the carbon-14 content present in a sample, determining whether the sample is biomass-based, fossil fuel-derived, or a combination.

The analysis is based on standards such as ASTM D6866 and its international equivalents developed for specific end uses, such as ISO 13833. ASTM D6866 is an international standard developed for measuring the biobased carbon content of solid, liquid, and gaseous samples using radiocarbon dating.¹⁵ There are also many international standards based on the specific use of direct Carbon-14 testing, such as ISO 13833, which is an international standard developed for measuring the biogenic carbon content of stationary sources emissions.¹⁶

Carbon-14 analysis yields a result reported as % biobased carbon content. If the result is 100% biobased carbon, this indicates that the sample tested is completely sourced from biomass material such as plant or animal byproducts. A result of 0% biobased carbon means a sample is only fossil fuel-derived. A sample that is a mix of both biomass sources and fossil fuel sources will yield a result that ranges between 0% and 100% biobased carbon content. Carbon-14 testing has been incorporated into several regulations as the recommended or required method to quantify the biobased content of a given material.

ASTM D6866 Method B - The Most Reliable Method

Carbon-14 is a very well-established method which has been in use by many industries (including the fossil fuel industry) and academic researchers for several decades.

Carbon-14 measurements done by commercial third party testing is robust, consistent, and with quantifiable accuracy/precision of the carbon-14 amount under **ASTM D6866 method B**. The EN 16785 is the only standard that allows a variant of the Mass Balance (MB) method of 'carbon counting' under EN 16785-2. The EN 16785-1 requires that the biocarbon fraction be determined by the carbon-14 method. However, when incorporating this EN 16785 method, certification schemes like the "Single European Bio-based Content Certification" **only** allow the use of EN 16785-1 due to its reliability and the value of a third-party certification. <http://www.biobasedcontent.eu/en/about-us/>

In ASTM D6866 method B, the carbon-14 result is provided as a single numerical result of carbon-14 activity, with graphical representation that is easily understood by regulators, policy

¹⁵ 2021. "Standard Test Methods for Determining the Biobased Content of Solid, Liquid, and Gaseous Samples Using Radiocarbon Analysis." *ASTM International (D6866-21)*

¹⁶ 2013. "ISO 13833:2013 Stationary source emissions: Determination of the ratio of biomass (biogenic) and fossil-derived carbon dioxide." *International Organization for Standardization*

makers, corporate officers, and more importantly, the public. The overwhelming advantage of carbon-14 is that it is an independent and standardized laboratory measurement of any carbon containing substance that produces highly accurate and precise values. In that regard, it can stand alone as a quantitative indicator of the presence of biobased vs. petroleum feedstocks. When carbon-14 test results are challenged, samples can be rapidly remeasured to verify the original reported values (unlike mass balance).

The quantification of the biobased content of a given product can be as low as 0.1% to 0.5% (1 relative standard deviation – RSD) based on Instrumental error for Method B (AMS). This error is exclusive of indeterminate sources of error in the origin of the biobased content, and manufacturing processes. As such a total error of +/-3% (absolute) has been assigned to the reported Biobased Content to account for determinate and indeterminate factors.¹⁷

It is also important that the program should always require ASTM D6866 Method B, rather than allow Method C for any use. Where ASTM D6866 Method B uses the AMS Instrument to measure ¹⁴C, Method C uses Liquid Scintillation Counting (LSC). In Method B, the AMS Instrument directly measures the ¹⁴C isotopes. However, in Method C, scintillation molecules indirectly absorb the beta molecules that release with the decay of ¹⁴C and convert the energy into photons which are measured proportionally to the amount of ¹⁴C in the sample. Since Method B directly measures the ¹⁴C isotopes and Method C measures them indirectly, Method B is significantly more precise and should be prioritized in regulations.¹⁸ LSC measurements, like those used in Method C, are commonly used as an internal testing tool when samples are limited and accuracy does not need to be extremely high.

About Beta Analytic

Beta Analytic was among the originators of the use of Accelerator Mass Spectrometry (AMS) for the ASTM D6866 biobased / biogenic testing standard using Carbon-14 to distinguish renewable carbon sources from petroleum sources. Beta began testing renewable content in 2003 at the request of United States Department of Agriculture (USDA) representatives who were interested in Beta's Carbon-14 capabilities for their BioPreferred[®] Program (www.biopreferred.gov). At their request, Beta joined ASTM under subcommittee D20.96. Beta's previous president, Darden Hood, was positioned as a technical contact for the USDA and within 3 months completed the ASTM D6866-04 standard. The Carbon-14 technique is now standardized in a host of international standards including ASTM D6866, CEN 16137, EN 16640, ISO 16620, ISO 19984, BS EN ISO 21644:2021, ISO 13833 and EN 16785. Carbon-14 analysis can be used on various types of samples (gas, liquids and solids). Beta Analytic continues to be a

ISO/IEC 17025:2017-Accredited Testing Laboratory

technical contact for ASTM D6866 with current president Ron Hatfield and is involved with all their latest ASTM D6866 versions.

The Carbon-14 standardized method is also incorporated in a variety of regulatory programs including the California AB32 program, US EPA GHG Protocol, US EPA Renewable Fuels Standard, United Nations Carbon Development Mechanism, Western Climate Initiative, Climate Registry's Greenhouse Gas Reporting Protocol and EU Emissions Trading Scheme.

We are currently technical experts on Carbon-14 in the following committees:

ASTM D6866 (D20.96) Plastics and Biobased Products (Technical Advisor)
ASTM (D02.04) Petroleum Products, Liquid Fuels and Lubricants (Technical Advisor)
ASTM (061) US TAG to ISO/TC 61 Plastics (Technical Expert)
USDA BioPreferred Program TAC (Technical Advisor)
ISO/TC 61/SC14/WG1 Terminology, classifications, and general guidance (Technical Expert)
CEN/TC 411 Biobased Products
CEN/TC 411/WG 3 Biobased content
CEN/TC 61/SC 14/WG 1 Terminology, classifications, and general guidance (Technical Expert)

ISO/IEC 17025:2017 Accredited Laboratory

To ensure the highest level of quality, laboratories performing ASTM D6866 testing should be ISO/IEC 17025:2017 accredited or higher. This accreditation is unbiased, third party awarded and supervised. It is unique to laboratories that not only have a quality management program conformant to the ISO 9001:2008 standard, but more importantly, have demonstrated to an outside third-party laboratory accreditation body that Beta Analytic has the technical competency necessary to consistently deliver technically valid test results. The ISO 17025 accreditation is specifically for natural level radiocarbon activity measurements including biobased analysis of consumer products and fuels, and for radiocarbon dating.

Required tracer-free facility for Carbon-14

For carbon-14 measurement to work, be accurate, and repeatable, the facility needs to be a tracer-free facility, which means artificial/labeled carbon-14 is not and has never been handled in that lab. Facilities that handle artificial carbon-14 use enormous levels relative to natural levels and it becomes ubiquitous in the facility and cross contamination within the facility, equipment and chemistry lines is unavoidable. Results from a facility that handles artificial carbon-14 would show elevated renewable contents (higher pMC, % Biobased / Biogenic values), making those results invalid. Because of this, Federal contracts and agency programs (such as the USDA BioPreferred Program) require that AMS laboratories must be 14C tracer-free facilities in order to be considered for participation in solicitations.

To learn more about the risks associated with testing natural levels Carbon-14 samples in a facility handling artificially enhanced isotopes please see the additional information provided after this comment.

Demand a Tracer-Free Laboratory for Radiocarbon Dating

As part of its commitment to provide high-quality results to its clients, ISO/IEC 17025-accredited Beta Analytic does not accept pharmaceutical samples with “tracer Carbon-14” or any other material containing artificial Carbon-14 (^{14}C) to eliminate the risk of cross-contamination. Moreover, the lab does not engage in “satellite dating” – the practice of preparing individual sample graphite in a remote chemistry lab and then subcontracting an AMS facility for the result.

High Risk of Cross-Contamination

Pharmaceutical companies evaluate drug metabolism by using a radiolabeled version of the drug under investigation. AMS biomedical laboratories use ^{14}C as a tracer because it can easily substitute ^{12}C atoms in the drug molecule, and it is relatively safe to handle. Tracer ^{14}C is a well-known transmittable contaminant to radiocarbon samples, both within the AMS equipment and within the chemistry lab.

Since the artificial ^{14}C used in these studies is phenomenally high (enormous) relative to natural levels, once used in an AMS laboratory it becomes ubiquitous. Cross-contamination within the AMS and the chemistry lines cannot be avoided. Although the levels of contamination are acceptable in a biomedical AMS facility, it is not acceptable in a radiocarbon dating facility.

Biomedical AMS facilities routinely measure tracer-level, labeled (Hot) ^{14}C samples that are hundreds to tens of thousands of times above the natural ^{14}C levels found in archaeological, geological, and hydrological samples. Because the ^{14}C content from the biomedical samples is so high, even sharing personnel will pose a contamination risk; “Persons from hot labs should not enter the natural labs and vice versa” (Zermeño et al. 2004, pg. 294). These two operations should be absolutely separate. Sharing personnel, machines, or chemistry lines run the risk of contaminating natural level ^{14}C archaeological, geological, and hydrological samples.

Avoid the Risks

Find out from the lab that you are planning to use that they have never in the past and will never in the future:

- accept, handle, graphitize or AMS count samples containing Tracer or Labeled (Hot) ^{14}C .
- share any laboratory space, equipment, or personnel with anyone preparing (pretreating, combusting, acidifying, or graphitizing) samples that contain Tracer or Labeled (Hot) ^{14}C .
- use AMS Counting Systems (including any and all beam-line components) for the measurement of samples that contain Tracer or Labeled (Hot) ^{14}C .

Tracer-Free Lab Required

Recently, federal contracts are beginning to specify that AMS laboratories must be ^{14}C tracer-free facilities in order to be considered for participation in solicitations.

A solicitation for the National Oceanic and Atmospheric Administration (NOAA) has indicated that “the AMS Facility utilized by the Contractor for the analysis of the micro-samples specified must be a ^{14}C tracer-level-free facility.” (Solicitation Number: WE-133F-14-RQ-0827 - Agency: Department of Commerce)

As a natural level radiocarbon laboratory, we highly recommend that researchers require the AMS lab processing their samples to be Tracer-free.

No Exposure to Artificial Carbon-14

According to ASTM International, the ASTM D6866 standard is applicable to laboratories working without exposure to artificial carbon-14 routinely used in biomedical studies. Artificial carbon-14 can exist within the laboratory at levels 1,000 times or more than 100 % biobased materials and 100,000 times more than 1% biobased materials. Once in the laboratory, artificial ^{14}C can become undetectably ubiquitous on materials and other surfaces but which may randomly contaminate an unknown sample producing inaccurately high biobased results. Despite vigorous attempts to clean up contaminating artificial ^{14}C from a laboratory, isolation has proven to be the only successful method of avoidance. Completely separate chemical laboratories and extreme measures for detection validation are required from laboratories exposed to artificial ^{14}C . Accepted requirements are:

- (1) disclosure to clients that the laboratory working with their products and materials also works with artificial ^{14}C
- (2) chemical laboratories in separate buildings for the handling of artificial ^{14}C and biobased samples
- (3) separate personnel who do not enter the buildings of the other
- (4) no sharing of common areas such as lunch rooms and offices
- (5) no sharing of supplies or chemicals between the two
- (6) quasi-simultaneous quality assurance measurements within the detector validating the absence of contamination within the detector itself.

Re: **Proposed Updates to the Low Carbon Fuel Standard**

Dear Members of the Board:

We at Sunflower Alliance appreciate the Board's acknowledgement that the LCFS is in need of significant revision. However, we are also disappointed that the proposed revisions continue many of the harmful measures of the current program.

The Low Carbon Fuel Standard Program has provided much-needed support for zero-emission transportation, especially the rapid conversion to electric transportation. We urge you to further revise

the LCFS program to focus on incentivizing these approaches, rather than continuing support for biomethane and combustion fuels.

Specifically:

- 023.1
- Removing credits for hydrogen produced from fossil fuel is a positive step forward. But delaying implementation of this measure until 2030 means another five-plus years of financial rewards for its production. This serves to further the harm we should be preventing. We would like to encourage far more immediate implementation to prevent any further reliance on dirty, greenhouse gas-intensive hydrogen.
- 023.2
- The proposed draft continues to provide credits for the production of industrial dairy “biogas” despite the many harmful effects of this financial support. It incentivizes the expansion of large-scale factory dairy farms¹, causing harmful effects on the health of surrounding communities, including increased release of ammonia, water pollution, and increased truck traffic²; encourages the inevitable leakage of methane during storage and transportation³; and generates greenhouse gas emissions created by combustion of the product. We urge you to phase out support for biomethane as rapidly as possible^{4,5}.

- 023.3
- Unlike previous versions of the LCFS, the new proposal does not require the aviation industry to take any responsibility for the combustion of fossil fuel–based jet fuel, even for intrastate travel. This is a step backward, excluding a major source of greenhouse gases and pollution from fossil fuel combustion.
- 023.4
- It can't be said enough that biorefining is still a species of refining, and, as such, releases dangerous emissions with dire impacts on frontline communities. The production of renewable diesel is *at best* an interim solution, whose necessity we hope will be short-lived.
- 023.5
- Biofuels manufactured from virgin soy or canola oil are particularly problematic, with major negative consequences that include increased food prices, global deforestation, and the incentivization of industrial agriculture, which generates high quantities of greenhouse gas and toxic pollution. We are truly appreciative that the proposed revision acknowledges the seriousness of these problems. But we are dismayed that the LCFS revision continues to provide credits for the production of biofuel that includes up to 20 percent of this destructive feedstock.
- 023.6
- We are entirely unclear about the basis for this 20 percent “cap.” What likely quantifiable impact will this have on the rapidly

increasing utilization of soy and canola oils as renewable diesel feedstock? (In the first quarter of this year, biofuel from soybean and canola oil accounted for about 30 percent of the renewable diesel qualifying for LCFS credits.⁶ By all accounts, that percentage is expected to rise even further.) And what impact will the proposed 20 percent standard likely have on GHG reduction? We would like to see a more rigorous and science-based approach employed here—one that more effectively discourages, and not just somewhat reduces, the use of virgin oils in renewable diesel production.

Thank you very much for this opportunity to comment.

Very sincerely yours,

Jean Tepperman

RE: Modified Text and Availability of Additional Documents and/or Information for the Proposed Low Carbon Fuel Standard Amendments

The California Fuels and Convenience Alliance (CFCA) represents about 300 members, including nearly 90% of all the independent petroleum marketers in the state and more than one half of the state's 12,000 convenience retailers. Our members are small, family- and minority-owned businesses that provide services to nearly every family in California. Additionally, CFCA members fuel local governments, law enforcement, city and county fire departments, ambulances/emergency vehicles, school district bus fleets, construction firms, marinas, public and private transit companies, hospital emergency generators, trucking fleets, independent fuel retailers (small chains and mom-and-pop gas stations) and California agriculture, among many others.

We must respectfully oppose the proposed amendments to the Low Carbon Fuel Standard (LCFS) program. Our analysis of the proposed changes reveals significant concerns about their potential impacts on fuel supply, consumer prices, and the overall effectiveness of the state's energy transition strategy. We specifically oppose the following amendments:

024.1

1. **Modification of Average Carbon Intensity Benchmarks:** The proposed increase in the carbon intensity (CI) reduction targets for gasoline, diesel, and jet fuels to a near-term increase in stringency to a 9% CI reduction in 2025 represents an abrupt shift in the regulatory framework. This accelerated target poses several substantial challenges that could impact various aspects of the fuel market and broader economy:

A. Feasibility and Technological Constraints

- I. **Technological Readiness:** Achieving a 9% reduction in carbon intensity within such a short timeframe requires advanced technological solutions that are not yet fully developed or commercially available. Many of the technologies necessary to meet these stringent targets, such as next-generation biofuels, carbon capture and storage, and advanced engine technologies, are still in the research or early deployment stages. The rapid escalation of targets may outpace the development and deployment of these critical technologies, making it difficult for industry stakeholders to achieve compliance.
- II. **Infrastructure Limitations:** Existing infrastructure, including refineries and distribution networks, may not be adequately equipped to support the rapid shift required by the new CI benchmarks. Upgrading infrastructure to handle new

types of fuels or technologies involves substantial investment and time. The lack of readiness in infrastructure could lead to bottlenecks and inefficiencies in fuel production and distribution.

B. Supply Shortages and Market Impact

- I. **Fuel Supply Disruptions:** The short timeline for achieving a 9% CI reduction could lead to significant disruptions in fuel supply. As companies scramble to meet the new standards, there could be a shortage of compliant fuels, affecting availability and reliability. This would particularly impact sectors that depend heavily on consistent fuel supplies, such as transportation and logistics.
- II. **Increased Fuel Prices:** Meeting the accelerated CI targets may involve higher production costs, which are likely to be passed on to consumers. The additional costs associated with adopting new technologies, reformulating fuels, and upgrading infrastructure could lead to higher prices at the pump. This price increase would disproportionately affect consumers, particularly those in lower-income and disadvantaged communities who are less able to absorb such costs.

C. Impact on Consumers and Disadvantaged Communities

- I. **Economic Burden:** The increased cost of fuels resulting from the rapid escalation of CI reduction targets could impose a significant economic burden on consumers. Low-income and disadvantaged communities are often more vulnerable to fluctuations in fuel prices and may struggle to cope with higher costs, exacerbating existing inequities.
- II. **Access to Affordable Energy:** Higher fuel prices could reduce access to affordable energy, affecting the cost of goods and services that rely on transportation and fuel. This could further strain household budgets and impact the overall quality of life for individuals in vulnerable communities.

D. Market Stability and Innovation

- I. **Regulatory Uncertainty:** Abrupt changes to CI benchmarks without adequate lead time can create regulatory uncertainty. Companies may face difficulties in long-term planning and investment, leading to reduced confidence in the market. This uncertainty could discourage investment in new technologies and infrastructure, potentially stalling innovation and progress in the sector.
- II. **Hindrance to Innovation:** Rapid regulatory changes may lead to a focus on short-term compliance measures rather than long-term innovation. Companies might prioritize meeting immediate targets over investing in more sustainable and innovative solutions that could offer greater benefits in the long run.

2. **Caps on Credits for Biomass-Based Diesel from Virgin Soybean and Canola Oils:** The proposed amendment introducing a company-wide 20% cap on credits for biomass-based diesel produced from virgin soybean and canola oils raises several significant concerns:

A. Market Distortion

- I. **Artificial Barriers to Market Access:** Imposing a cap of 20% on credits for biomass-based diesel from specific feedstocks, such as virgin soybean and canola oils, creates an artificial barrier that restricts market dynamics. This cap favors particular feedstocks over others, which could skew market incentives and lead to an imbalanced biofuel market. By limiting credit eligibility for certain feedstocks, the policy risks creating a market where only a few feedstocks are economically viable, reducing competition and innovation.
- II. **Stifling Innovation:** The proposed cap on credits for biomass-based diesel produced from virgin soybean and canola oils could unintentionally stifle innovation by creating an uneven playing field within the biofuel market. While the cap does not restrict biofuels produced from other feedstocks, it may still shift focus and resources toward optimizing the production of non-capped feedstocks, potentially diverting attention away from the exploration and development of new and innovative biofuel technologies. This could result in a market that prioritizes the use of available feedstocks rather than fostering a diverse and forward-thinking approach to biofuel development. An approach that avoids such specific caps and incentivizes a wider range of biofuels would better support a competitive and innovative market, driving advancements across various technologies and more effectively contributing to California's clean energy goals.

B. Compliance Burden

024.3

- I. **Uneven Implementation Timeline:** The proposed amendment introduces additional compliance complexities by setting different timelines for companies. Those with existing certified pathways prior to the adoption of the amendment have until January 1, 2028, to adjust their feedstock contracts, while other companies must comply immediately. This uneven timeline creates a competitive disadvantage for companies that must adapt quickly without the benefit of a transition period.

024.2 Cont

- II. **Administrative and Financial Strain:** Companies will face increased administrative and financial burdens as they navigate the new compliance requirements. The need to renegotiate feedstock contracts, adapt production processes, and manage the associated costs can strain resources, particularly for smaller or less resourced companies. This added complexity could lead to operational inefficiencies and increased costs, further impacting the overall market.
- III. **Market Uncertainty:** The discrepancy in compliance timelines may lead to uncertainty in the market. Companies may be hesitant to invest in long-term projects or make strategic decisions due to the potential for regulatory changes and the associated risks. This uncertainty can undermine confidence in the biofuel market and impede progress toward clean energy objectives.

C. Price Increases

- I. **Disruption of Long-Term Contracts:** The shift in feedstock requirements imposed by the cap could disrupt existing long-term contracts for feedstocks. Companies that have invested in and committed to contracts based on the

previous regulations may face financial losses or supply chain disruptions as they adjust to the new requirements. This disruption can lead to increased production costs for biodiesel and renewable diesel.

- II. **Higher Fuel Prices:** As a result of increased production costs and potential supply shortages, fuel prices are likely to rise. Higher costs for biodiesel and renewable diesel would be passed on to consumers, directly impacting the affordability of lower-carbon alternatives. This price increase could diminish the economic benefits of transitioning to lower-carbon fuels and potentially reduce consumer adoption of these cleaner options.
- III. **Impact on Consumer Affordability:** The increased fuel prices resulting from the proposed changes will disproportionately affect consumers, particularly those in lower-income communities. The rise in fuel costs can strain household budgets and exacerbate existing financial challenges, making it harder for these communities to benefit from cleaner, lower-carbon energy options.

D. Program Integrity

- I. **Slowing the Transition from Petroleum Diesel:** The proposed cap on credits could undermine the effectiveness of the LCFS program by potentially slowing the pace at which petroleum diesel is displaced. By focusing on limiting credit eligibility for specific feedstocks, the program may divert resources and attention away from more comprehensive and innovative low-carbon solutions.
- II. **Compromising Long-Term Goals:** The potential diversion of focus and resources away from broader, more effective clean energy solutions could compromise the long-term goals of the LCFS program. Ensuring that the program remains effective requires a balanced and inclusive approach that encourages the development of various low-carbon technologies and maintains momentum toward achieving comprehensive clean energy targets.

024.4

- 3. **Exclusion of Hydrogen Produced from Fossil Fuel Gas:** The proposed amendment to exclude hydrogen produced using fossil fuel gas from LCFS credit eligibility, effective January 1, 2031, presents several issues:

A. Supply Constraints

- I. **Drastic Reduction in Supply:** Hydrogen produced from fossil fuels, specifically through methods such as steam methane reforming (SMR), currently represents a substantial portion of the hydrogen supply in the market. This production method is well-established and forms the backbone of the existing hydrogen infrastructure. Removing this source could lead to a significant reduction in available hydrogen, as renewable hydrogen production capacities are still developing and are not yet able to meet current demand levels.
- II. **Increased Costs:** With a reduced supply of hydrogen, the costs associated with hydrogen production are likely to rise. The infrastructure and economies of scale that currently support fossil-based hydrogen production are not as advanced for renewable hydrogen. Consequently, excluding fossil-based hydrogen could result in higher prices for hydrogen, which would be passed on to end-users.

- III. **Market Instability:** The sudden exclusion of a major hydrogen source could cause volatility in the hydrogen market, affecting not only supply but also pricing stability. This could create uncertainty for businesses and investors, potentially stalling further investments in hydrogen infrastructure.

B. **Transitional Challenges**

- I. **Infrastructure Development:** Building the infrastructure necessary to produce, transport, and distribute renewable hydrogen at scale requires substantial time and investment. Renewable hydrogen technologies such as electrolysis are still emerging, and their infrastructure is not yet sufficient to replace fossil-based hydrogen in the short term. Excluding fossil-based hydrogen prematurely could disrupt ongoing efforts to develop this infrastructure and slow down the transition process.
- II. **Technological Advancements:** The renewable hydrogen sector is evolving, but the pace of technological advancements and cost reductions is not uniform across all areas. Immediate exclusion of fossil-based hydrogen may outpace the development and commercialization of new technologies, impeding the smooth transition to fully renewable hydrogen solutions.
- III. **Strategic Planning:** Energy policy should provide a gradual and strategic path towards renewable alternatives. Abrupt policy shifts can create misalignment between current capabilities and future goals, making it difficult for stakeholders to plan and implement the necessary changes effectively.

C. **Consumer Impact**

- I. **Increased Costs:** As the supply of hydrogen decreases and production costs rise, the price of hydrogen will inevitably increase. This price hike will directly affect consumers and businesses that use hydrogen as a transportation fuel.
- II. **Impact on Decarbonization Efforts:** Many industries are investing in hydrogen technologies to reduce their carbon footprints. The increased cost and reduced availability of hydrogen could slow down the adoption of hydrogen technologies, hampering efforts to achieve broader decarbonization goals.
- III. **Economic Disruption:** Higher hydrogen costs could lead to increased operational expenses for companies that rely on hydrogen as a transportation fuel, potentially resulting in higher prices for goods and services. This economic impact could be particularly severe for small and medium-sized enterprises that may struggle to absorb the increased costs.

In light of these concerns, we urge the California Air Resources Board to reconsider these proposed amendments. An effective energy transition strategy should support a diverse array of lower-carbon alternatives while balancing environmental goals with practical industry realities. Implementing a more measured and inclusive approach will help ensure a reliable, accessible, and affordable energy future for all Californians.

We welcome the opportunity to engage in further discussions and provide additional insights on these critical issues. If you have any questions, please contact Alessandra Magnasco at alessandra@cfca.energy.

Sincerely,

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Dear Governor Newsom,

I'm writing to express deep concern about the current state of California's Low Carbon Fuel Standard (LCFS) and to implore you to take immediate action to address the environmental injustices embedded in the program. Staff's recent changes continue to double down on dirty factory farm gas, a false solution that has infected California's climate policies.

Originally intended as a tool to combat climate pollution in the transportation sector, the LCFS has been manipulated by powerful industries, particularly Big Ag and Big Oil. It has become the nation's largest and most lucrative pollution trading scheme for factory farm biogas, perpetuating harmful practices rather than serving its environmental objectives.

Incentivizing the buildout of dirty factory farms not only enables pollution but disproportionately harms low-income communities and communities of color. Factory farms, predominantly situated in these marginalized areas, inflict severe damage on air, water, public health, rural economies, and overall quality of life. Collecting methane from factory farm cesspits does nothing to alleviate the massive harm mega-dairies and other large factory farms do to these communities.

Instead of doubling down on dirty factory farm gas, we demand a future free from the clutches of Big Oil and Big Ag and to prioritize Californians over corporate profits.

Sincerely,
Jeffrey Pekarul

Sacramento, CA 95814

RE: Comments LCFS Amendments – 15-Day Changes

Dear California Air Resources Board,

Louis Dreyfus Company (LDC) appreciates the opportunity to comment on the California Air Resources Board's (CARB) proposed amendments to the California Low Carbon Fuel Standard (LCFS). Louis Dreyfus Company is a leading merchant and processor of agricultural goods, founded in 1851. Our activities span the entire value chain, from farm to fork, across a broad range of business lines (platforms): Carbon Solutions, Coffee, Cotton, Food & Feed Solutions, Freight, Global Markets, Grains & Oilseeds, Juice, Rice and Sugar. Louis Dreyfus Company is active in over 100 countries across six geographical regions and employs approximately 18,000 people globally. We're processors of both soy and canola in North America, producers of both biomass-based diesel and ethanol and our customer base includes all Renewable Diesel producers selling product into the California markets today.

We commend CARB's continued efforts to drive decarbonization in the liquid fuels sector through the LCFS. This program has been highly successful over the last several years in encouraging significant investment throughout the value chain, enabling industry stakeholders to support California in achieving its emission reduction goals.

026.1 However, we have concerns regarding the proposed 20% cap on soy and canola oil as feedstocks in the latest regulatory text. As outlined below, we believe the proposed changes run contrary to the program's design and goals. They could undermine the health of the broader US renewable fuels market, disrupt the synergies between California's and other US state and federal policies, and adversely affect American farmers, while increasing Californian's dependence on imported foreign feedstocks. **Given these concerns, we urge CARB to reconsider this accelerated cap on virgin oils.**

Request for Additional Review

026.2 Additionally, LDC believes this proposal warrants an additional public workshop, environmental impact analysis, and 45 day comment period. These changes are substantial and not reasonably foreseeable based on previous notices. Notably, the Initial Statement of Reasons (ISOR) there is only a single mention of a vegetable oil cap, and only within the context of the Comprehensive Environmental Justice Scenario, which was found to increase overall GHG emissions.

Misalignment with LCFS Design and Goals

The LCFS is designed to reduce the carbon intensity of California's transportation fuel pool and provide an increasing range of low-carbon and renewable alternatives.¹ The program's structure naturally phases out higher carbon intensity feedstocks through progressively stricter emissions reduction targets.

026.3

Recent data indicates that 35% of California's diesel fuel pool still comprises conventional diesel.² Capping the use of soybean and canola oils would remove viable, clean, and renewable alternatives to these fossil fuels. As shown in the figure below, the current share of soy and canola oil is well above the prescribed 20% threshold; soybean and canola oil made up 31% of reported biomass based diesel feedstock during the first quarter of 2024. Given the short timeline for implementation, the only practical replacement for the gallons currently derived from these feedstocks would be conventional diesel.

This cap works contrary to CARB's goal of increasing the range of renewable alternatives as it directly limits certain alternatives. As shown below, the existing mix of feedstocks demonstrates a healthy diversity without overreliance on any single source. The proposed cap would narrow the market's focus, increasing dependence on imported feedstocks. During the previous amendments, then transportation fuels branch chief Sam Wade was once quoted as saying, "one of the nice things about the LCFS is we don't have to have a perfect crystal ball because the program doesn't pick winners. It basically sets up this system of tradable credits and provides value to the lowest carbon fuels that can come to market. So the framework really does facilitate us to look across a wide variety of options and to hopefully drive the best option to market."³ Here CARB itself is acknowledging the program functions as intended when market economics dictate the various use of feedstocks.

Additionally, this proposed change undermines the integrity of the program's fundamental design. As reported by CARB staff in April,⁴ the compliance curve naturally causes soy and canola oil BBD to become deficit generating fuels sometime between 2030 and 2033. Up until that point, BBD produced from these two feedstocks generate ever decreasing LCFS credits. The existing program structure already incentivizes the market to gradually shift away from these feedstocks making an artificial cap unnecessary.

This change to the fundamental program design affects far more than use of soy and canola oil in BBD production; it sends a clear signal that the long-term CARB objective is to eliminate the use of all liquid fuels in the market, irrespective of any new scientific basis. This is further evidenced by potential phasing out of new BBD pathways in 2031. Whether or not this is the intent; this marked shift in program design will work to discourage any further investments in the renewable liquid fuels space.

BBD Feedstock Mix in the Previous Year⁵

Broader Market Implications

026.3 cont

In 2023, LCFS-compliant gallons accounted for 51% of total BBD consumption in the US. Despite the majority share, the feedstock slate represented in gallons reported under California's LCFS program is materially different than that of the broader US Renewable Fuels Standard program (shown below). In 2023, soybean and canola oil made up 46% of feedstocks used nationwide whereas under the LCFS, the share amounted to just 31%. This feedstock use distribution shows that the LCFS is working as designed. Low-CI fuels are being imported or produced in California at a much higher rate than for other regulatory programs.

Introducing a vegetable oil cap in the U.S.'s largest BBD market would undermine the federal government's goal of reducing dependence on foreign energy and feedstocks. It would also compromise billions of dollars invested in US agricultural processing geared towards expanded domestic use of US produced crops. This accelerated pivot away from sustainable, renewable vegetable oil feedstocks fades synergies between California's state programs, the EPA's RFS and broader national level energy independence goals.

Given that row crop prices are at 24month+ lows, this cap also comes at the worst time for the US farmer. While prices had been elevated due to COVID as well as other supply chain shocks, these factors are no longer supporting markets. US farm incomes are at multi-year lows and the bright light for many US farmers had been the outlook for expanded domestic processing of US grown crops. The proposed veg-oil cap compromises existing and planned investments alike.

To add to this, inland US BBD plants without access to water born imports will be disproportionately affected by this veg-oil cap as logistics limitations make it cost prohibitive to access waste feedstocks, much of which is sourced by vessel from outside of the US. This cap compromises the economic viability of existing land-locked BBD producers and will drive additional BBD producers out of business, hurting rural

⁵ LCFS Quarterly Summary Q2 2023 - Q1 2024; assigning "other" renewable diesel as canola oil

economies as jobs are lost. We do not believe it was the intent of CARB to pick winners and losers with this update to the LCFS program.

US vs LCFS Feedstock Mix⁶

Shift in Energy Dependence to Foreign Feedstocks

From 2022 to 2023, imports of used cooking oil for BBD production tripled, largely driven by imports from China.⁷ Over the same period, imports of tallow for fuel BBD have more than doubled.⁸ Imported waste feedstocks now constitute 16% of the total used in U.S. BBD production, up from 9% in 2022 and 5% in 2021. Data suggests the sources of US used cooking oil and tallow have been fully accessed, meaning the LCFS program update puts the onus on imports to bridge the gap between the “ineligible” soybean and canola oil feedstocks currently used.

A key concern raised in prior comments submitted to CARB is the risk of chain-of-custody issues associated with these waste feedstocks. Recently, the EPA has open investigations into UCO supply chains due to potential mixing of palm and UCO.⁹ The environmental impact of this potential palm oil BBD is particularly alarming, as CARB’s own analysis suggests that the carbon intensity of palm oil-derived BBD could surpass that of conventional diesel.

While LDC appreciates CARB’s goal of increasing utilization of waste feedstocks, CARB cannot discount or overlook the fungibility and substitutability of BBD feedstocks. For instance, in the last year, 38% of tallow imports to the U.S. were sourced from South America.¹⁰ When South American tallow is shipped to the

¹⁰ USDA Global Agricultural Trade System

026.3 cont

U.S. for BBD production, soybean oil backfills this exported tallow; both as an animal feed and a biofuel feedstock to meet Brazil and Argentina's biodiesel mandates. As a result, the intended reduction in indirect land use change is not fully realized; instead, the environmental impact is merely shifted to other jurisdictions with less stringent regulations. The proposed LCFS revisions, therefore, compromise the long term health and viability of the U.S. agricultural industry, while simultaneously benefitting agricultural sectors in other countries.

In closing, LDC appreciates the opportunity to comment on these proposed LCFS updates. We trust that CARB will carefully consider these concerns to ensure that the US farmer & the North American oilseed processing industry can continue to be a partner in California's LCFS. If CARB has any questions concerning this letter, please feel free to reach out to me at GORDON.RUSSELL@ldc.com.

Affiliation	Anaergia
Subject	Food Scraps Definition and Landfill Capture Rate

Comment

Two issues:

027.1

1. Landfill capture rate: still 75% (wrong figure according to multiple scientific studies, EPA and CA studies show 36% and Canadian Clean Fuel Program adopted the 36% figure to match science). Changing landfill capture rate of methane from 75% (1997 EPA incorrect number) to 36% (correct scientific number, EPA 2023, NASA/JPL Nature 2020, numerous other studies) properly values and appropriately incentivizes California food waste AD plants. The 75% is also dangerous because it sets incorrect standard and precedent for CI calculation in SB 1440. Canadian CFR has referenced the latest science and determined landfill capture rate of 36% (see slide 19 of presentation in this link:

https://drive.google.com/file/d/10oJXYAsApJI7MDH4PyU1lGjWMLHKfonQ/view?usp=drive_link)

027.2

2. Food scraps: definition that is considered landfill diverted includes only post consumer food waste in solid form (only what's in trash cans). If food waste is in liquid form, doesn't count (ketchup or salad dressing or soda that goes to landfill). If food waste comes from a distribution center or food manufacturing facility, doesn't count, even though this waste goes to landfill. All food waste regardless of source should be assigned the statewide average of total fraction that goes to landfill. We should not cherry pick sources that are all in or all out of landfill destiny, particularly since all food waste is regulated by SB 1383 regardless of source. The attached document has suggested redlines on the definition to conform with SB 1383 and treat all food waste the same with a suggestion to simply revise the statewide fraction of food waste landfilled that should be adjusted to account for those sources that have lower landfilling rates than

those sources that have higher landfilling rates. Now it's binary, either landfilled 97.5% or not at all and this is not reality.

[Board Comments Home](#)

From CARB

~~“Food Scraps” is the organic portion of municipal solid waste (MSW) that consists of wastes derived from plants or animals for the explicit preparation for consumption by humans or other animals that is predominantly disposed by landfilling. This includes inedible waste or post-consumer food collected from foods processed or consumed at residences, hospitality facilities (hotels, restaurants, amusement parks, stadiums, special events, etc.), institutions (hospitals, schools, prisons, etc.), and grocery stores. Food scraps Feedstocks that are not typically landfilled do not qualify as Food Scraps, which include liquid wastes, fat/oil/grease: fats, oils, or greases (FOG), liquids at the point of collection, and materials, or other by-products of from industrial food manufacturing or processing, manufacturing, and distribution facilities.~~

Current CARB Proposed Definition

“Food Scraps” is the portion of municipal solid waste (MSW) that consists of inedible or post-consumer food collected from residences, hospitality facilities, institutions, and grocery stores. Feedstocks that are not typically landfilled do not qualify as Food Scraps, which include fats, oils, or greases (FOG), liquids at the point of collection, and materials from industrial food manufacturing or processing.

Anaergia Suggested Redline

“Food Scraps” is the portion of municipal solid waste (MSW) that consists of inedible or post-consumer food collected from residences, hospitality facilities, institutions, commercial establishments, distribution centers, manufacturing facilities, and grocery stores. All food scraps are assumed to follow the State-wide average landfill disposal rate of [97.5%]. This definition excludes fats, oils, or greases (FOG)..

Note: Definition should not cherry pick which sources count as landfill destined. All food waste should be treated the same and follow the statewide fraction destined to landfill. All food waste regardless of source goes to landfill to some degree. Therefore, apply the statewide average % destined to landfill for all sources combined (Statewide total). This definitions would exclude food from manufacturing plant that does go to landfill and visa versa include post consumer food waste in a trash can that does not go to landfill (i.e. SSO going to compost).

Braya Renewable Fuels
Refinery Road, P.O. Box 40
Come by Chance, NL A0B 1N0

California Air Resources Board
1001 I Street
Sacramento, CA 95814

RE: August 12, 2024 Proposed Low Carbon Fuel Standard Amendments

Dear California Air Resources Board,

Braya Renewable Fuels (Newfoundland) LP (“Braya”) is the owner of the Come By Chance refinery in Newfoundland, Canada. In the first quarter of 2024 Braya completed the conversion of the previously idled conventional oil refinery to a world-class renewable diesel production facility. The refinery is strategically located to deliver renewable fuels to various end markets, including California, and has the ability to meet LCFS demand and California’s broader greenhouse gas initiatives. Renewable diesel helps decarbonize the heavy transport sector – a sector that is key to economic activity and has few other near-term, executable decarbonization solutions.

We appreciate the opportunity to provide feedback on the Proposed Low Carbon Fuel Standard Amendments published on August 12, 2024 (the “Proposal”).

028.1

The Proposed Method of Limitation on Soybean and Canola Oil as Feedstocks is Arbitrary and Discriminatory

Braya strongly believes that the proposed limitations on biomass-based diesel produced from virgin soybean and canola oil (the “BBD Limitation”) under subsection 95482(i) are misguided, arbitrary and should not be implemented. As a threshold matter, we note that this topic will be incredibly complicated to implement, implicates complicated supply chain logistics and contracts, will cause material unintended consequences in both the renewable fuel and agriculture markets and will negatively impact California consumer energy prices. Soybean oil and canola oil collectively represent approximately 53%¹ of the US-based biomass-based diesel feedstock mix and approximately 434 million gallons (20%) of the 2023 feedstock mix in California.² The subject matter of this proposal is of a magnitude that it demands adequate notice, planning and vigorous debate to ensure the proposed amendment is consistent with the goals and strong history of the Low Carbon Fuel Standard.

Braya’s understanding of the BBD Limitation is that it will limit the eligibility of biomass-based diesel produced from soybean oil and canola oil to produce LCFS credits to no more than twenty percent of the biomass-based diesel annual production reporting, by company. The BBD Limitation would apply as soon as the Proposal becomes effective unless a producer falls into a specific grandfathered

¹ <https://advancedbiofuelsusa.info/clean-fuels-alliance-america-clean-fuels-and-california-advanced-biofuels-alliance-caba2-comments-california-low-carbon-fuel-standard-lcfs-workshop>

² https://ww2.arb.ca.gov/sites/default/files/classic/fuels/lcfs/dashboard/Fig6_2023.xlsx

028.1 cont

exception. We read the Proposal as deferring the implementation of the soybean and canola oil LCFS credit generation limitations until 2028 (the “2028 Deferral”) for producers that (i) produced at least 20% of their 2023 annual production from soybean and canola oil, collectively, and (ii) had a “certified” pathway for biomass-based diesel prior to the effective date of the Proposal. Braya assumes for the purposes of this letter that the effective date of the Proposal will be on or around the beginning of 2025. As discussed below, Braya believes that not only is the BBD Limitation fundamentally misguided, but the 2028 Deferral mechanism in particular is arbitrary and will result in unjust and undesirable outcomes.

CARB states in the Proposal that the rationale for the 2028 Deferral is “to provide time to adjust feedstock supply contracts as needed.” However, the proposed implementation of the BBD Limitation and the 2028 Deferral is fundamentally flawed in that it does not achieve CARB’s stated goal of allowing sufficient time to adjust for feedstock contracts for producers such as Braya and also omits to consider facility specific feedstock attributes.

Braya began converting its facility to renewable diesel production in 2021 and began producing renewable diesel in February 2024. Thus far in 2024, Braya has supplied the California market with renewable diesel based on a variety of renewable feedstocks, including amounts of soybean oil well in excess of 20% of Braya’s total production, under a temporary pathway issued by CARB. Braya is also preparing a Tier 2 application package for CARB review that will be filed imminently. Nonetheless, Braya will be disqualified from eligibility for the 2028 Deferral due to (i) Braya’s February 2024 production start date as opposed to the Proposal’s 2023 production requirement, and (ii) the Proposal’s requirement that Braya hold a “certified” pathway prior to the Proposal’s effectiveness. Braya notes that whether its imminent Tier 2 Application will satisfy the timing requirements of the 2028 Deferral will largely be dependent on CARB’s review schedule for the balance of 2024- an element that will be out of Braya’s control.

Notably, Braya:

- Began a refinery conversion process in 2021 that cost hundreds of millions of dollars and was specifically designed to accommodate soybean oil feedstock in reliance on the Low Carbon Fuel Standard’s historical technology-neutral approach;
- Produced over 58 million gallons of renewable diesel for the California market in 2024 under an effective temporary pathway applicable to soybean oil;
- Will apply for a fulsome Tier 2 provisional pathway in a matter of weeks;
- Has entered into tens of millions of dollars of soybean oil feedstock contracts for 2025 production that will need to be addressed at substantial cost if the 2028 Limitation is implemented as proposed; and
- Notwithstanding the above, would not qualify for the 2028 Deferral in its current form.

028.1 cont

Braya applauds CARB’s acknowledgement that the BBD Limitation should consider producers feedstock arrangements, but also believes it is important that CARB consider facility specific implications of running various feedstocks. Renewable diesel facilities are not universal in respect of feedstocks and the geographic location of a facility has a significant impact on feedstock availability. Many facilities are designed to accommodate specific feedstocks and may require capital investment

and modifications to process additional or different feedstocks. Braya anticipates needing to launch a material capital project to modify its facility to accommodate a different slate of feedstocks should the BBD Limitation be implemented. These modifications will be capital intensive and take time to complete. The BBD Limitation also assumes all producers will be able to source adequate alternative feedstocks without considering geographically imposed logistical challenges that are location and facility specific. Braya strongly believes that these facility specific concerns should be considered in the design and timing of the 2028 Deferral.

028.2

As a reference point on overall implementation timing, Braya notes that CARB has recognized a “breaking ground” timeline for avoided methane crediting periods associated with RNG projects and similar concepts have been used in the implementation of the Renewable Fuel Standard to introduce new regulatory concepts without unfairly disadvantaging certain producers. We believe such an implementation approach is superior to the 2028 Limitation and will avoid unjust outcomes for particular producers.

In short, Braya is exactly the type of producer that CARB’s proposal purports to accommodate with the 2028 Limitation, but certain flaws in its design will instead be incredibly punishing to Braya due to a backward-looking timing component that was first announced in August 2024 for virtually immediate implementation. Specific recommendations to address these design issues are at the bottom of this letter.

The BBD Limitation is Ambiguous and Will Be Difficult and Costly to Administer

028.3

Braya also believes that the BBD Limitation, as proposed, will be difficult to implement and administer. We believe that changes of this magnitude would benefit from a more fulsome review process as the current proposal contains significant ambiguities, among other material issues.

For example, there is ambiguity with respect to the terms “production reporting” and “company.” Production reporting is not a term used anywhere else in the LCFS and has no clear applicability to volumes of fuel for which the producer is not the first fuel reporting entity. Whether or not CARB’s intent is to create tracking obligations upstream of the first fuel reporting entity or to place new restrictions on non-producers that take on the reporting obligation, it is creating a situation that will significantly disrupt existing contracts and relationships while creating different paths to potentially game the system through creative allocation of feedstocks amongst entities. Compliance with this provision will require duplicate actions by multiple entities to generate the necessary reporting and tracking data.

Organizations are structured in a variety of ways to fulfill various operational and legal needs. There are many situations in which an organization that is colloquially referred to as a single company and operates under common control is nonetheless organized into separate legal entities. Too narrow of a definition of “company” can threaten the ability of an organization to operate in a commonsense manner while too broad of a definition also increases the likelihood of gaming the system and allowing affiliates of large market players to effectively circumvent the intent of the proposed cap at the expense of smaller companies and California consumers.

Even if additional guidance were provided regarding “production reporting” and “company,” to allow parties to adequately evaluate the impact of the Proposal, there will undoubtedly be additional cost and infrastructure required by both CARB and regulated parties that runs counter to AB 32’s statutory mandate to minimize administrative burden. As described further below, none of this is necessary to achieve CARB’s environmental goals because a sophisticated and technology-neutral mechanism is already in place.

028.4

Superior Mechanisms Already Exist for Limiting Biomass-Based Diesel in California

To date, the LCFS has maintained an unbiased, technology-neutral approach. CARB already has a stringent and ongoing review process in place to address indirect land use change (“iLUC”) applicable to biofuels. Braya supports stringent reviews of this iLUC mechanism particular to the applicable feedstock in use. CARB staff noted in previous workshops that this mechanism significantly penalizes producers that utilize crop-based feedstocks by elevating CI scores well above those of non-crop-based feedstocks. We note that the Proposal goes even further by increasing the CI scores for temporary pathways applicable to crop-based feedstocks. Braya believes the newly developed specified source feedstock documentation and traceability requirements that are based on actual feedstock data, including iLUC, is a more appropriate and accurate method of achieving meaningful CI reductions without jeopardizing the much-needed renewable diesel supply in California. Finally, Braya also notes that the reducing carbon intensity requirements over time inherent in the Low Carbon Fuel Standard addresses perceived excess of vegetable oil used as feedstocks. CARB’s own modeling shows that virgin oil feedstocks will become deficit generating as early as 2030, before even considering the increased CI step-down of 9% contained in the Proposal.³

The BBD Limitation Implementation Timeline Will Expose California to Fraudulent Feedstocks and Increased GHG Emissions

028.5

Braya is supportive of the overall transition to lower carbon intensity feedstocks while moving the state forward toward electrification, but care must be taken to do so in a responsible manner—which is not implementing the BBD Limitation in less than six months. As CARB is no doubt aware, significant concerns have been raised concerning the use of material amounts of fraudulent used cooking oil and palm oil, which is difficult to track. In fact, earlier this month the U.S. Environmental Protection Agency announced that it was auditing renewable fuel producers concerning potential fraudulent use of used cooking oil. In addition, material amounts of used cooking oil may become subject to the imposition of tariffs in the near-future. The rushed nature of the BBD Limitation will force producers into the morass of an ongoing fraudulent feedstock investigation and possible enforcement actions in a part of the feedstock market where verifiable quantities of feedstock are already significantly limited, defeating the purpose of a supposed transition to lower carbon intensity feedstocks.

Counter-intuitively, implementation of the BBD Limitation may increase greenhouse gas emissions. Vegetable oils are a significant portion of the feedstock mix and a significant driver of the impressive volume growth in California’s renewable diesel pool. In particular, we express concern that CARB’s evaluation of a scenario limiting biomass-based diesel contained in the April 10, 2024 California Low Carbon Fuel Standard Workshop resulted in (i) an overall increase of nearly 1,000 MMT CO₂e in

³ California Low Carbon Fuel Standard Workshop Presentation, April 10, 2024, slide 40.

greenhouse gases, (ii) an increase in 2030 fossil diesel usage of approximately 1 billion gallons and (iii) extended the overall life of fossil fuels in California, as compared to CARB's proposed scenario.⁴ Fundamentally, a reduction of feedstocks options will almost certainly result in decreased renewable diesel production.

The BBD Limitation Will Distort the California Renewable Fuel Market

028.1 cont

As described above, the 2028 Deferral will favor a certain set of historical producers to the detriment of certain other producers based on backward-looking time thresholds. Unsurprisingly, such a design is likely to have unintended consequences on the California renewable fuels market, including the *increase* of biomass-based diesel production by a certain subset of producers advantaged by the BBD Limitation. If implemented, historical producers that are granted deferred compliance under the 2028 Deferral will continue producing biomass-based diesel unabated while other producers are significantly restricted to a 20% limitation on production. This reduction in the number of producers able to process soybean oil and canola oil as feedstocks and still access the California market should lead to distressed prices for these feedstocks as the universe of buyers shrinks. These distressed feedstock prices will encourage this subset of grandfathered companies to produce as much biomass-based diesel from these feedstocks as possible to maximize the artificial advantage granted to them via the design of the 2028 Limitation. As a result, the implementation of the 2028 Deferral as constructed is likely to *increase* the relative supply of biomass-based diesel into California while also reducing the overall amount of renewable diesel coming into California as other producers are forced into other markets or reducing production.

The BBD Limitation Will Increase California Consumer Energy Costs

028.6

Braya also believes that the BBD Limitation will result in increased fuel prices for the California consumer. The price of renewable fuels is set in the marketplace by the cost of the marginal barrel produced. The BBD Limitation will force the marginal producer to procure more expensive low CI feedstock due to the aforementioned restrictions applicable to relatively cheaper soybean oil and canola oil. In turn, this increased cost of the marginal barrel will drive up the cost of the associated renewable fuel for the California consumer.

This price increase will be exacerbated by unrelated policy changes at the federal level. The planned elimination of the existing blender tax credit and replacement with the producer tax credit under the Inflation Reduction Act will also increase demand for lower CI feedstocks. The implementation of the BBD Limitation and the producer tax credit at roughly the same time is likely to result in a multiplier effect where the cost of low CI feedstocks significantly increases which will lead to a substantial and sudden increase to the cost of production to the marginal renewable fuel producer and, ultimately, to the California consumer.

Implementation of the BBD Limitation Will Deter Industry Investment in California Renewable Fuels

⁴ California Low Carbon Fuel Standard Workshop Presentation, April 10, 2024, slides 23, 29 & 31.

Finally, Braya asks CARB to consider the message it will be delivering to the market and potential investors in the renewable energy space should the BBD Limitation be implemented as proposed. That message will be clear - upon extremely limited notice and using arbitrary deadlines set in the past that effectively pick winners and losers, your investment in the energy transition could be jeopardized. Instead, a more constructive signal should be sent to existing and potential renewable fuel producers by allowing all producers to adjust to the feedstock supply changes, facility-specific modifications and accommodations to offtake contracts on a level playing field. This message should encourage innovation and investment in the renewable energy space. We firmly believe that message can only be delivered if the BBD Limitation is abandoned entirely or significantly modified as described below to avoid arbitrarily punishing recent and new market participants.

Timing of Implementation Should Reflect Underlying Electrification Progress

Braya understands that a significant contributor to the rationale underlying the BBD Limitation is the expectation of increasing electrification in medium- and heavy-duty transport vehicles. We note that, in this respect, the Proposal also contains limitations on new biomass-based diesel pathway applications under subsection 95488(d), where no new applications may be accepted if a certain threshold of zero or near-zero emission vehicles is achieved by the end of 2029. We believe such a deferred and performance-contingent approach is also appropriate for the BBD Limitation by ensuring the availability of affordable renewable fuels in California prior to mass electrification of these particular transport modes.

Recommendation

028.2 cont Braya strongly suggests eliminating the BBD Limitation completely given that it is (i) arbitrary and unnecessary considering the well-established iLUC mechanism, CI calculations (including proposed step-downs) and stringent feedstock documentation requirements and (ii) likely harmful to CARB's decarbonization goals and to the California consumer. If implemented, the BBD Limitation should be modified as described below to provide a level-playing field for producers.

Braya recommends the following modifications if the BBD Limitation is implemented:

- Either (a) adopt a “breaking ground” concept that would qualify a producer for the 2028 Deferral if physical construction or conversion of a facility began prior to January 1, 2024 or (b) move the required production timing for a producer's eligibility for the 2028 Deferral from the proposed 2023 to 2024;
- Modify the pathway certification requirement to include parties that have applied for a provisional pathway prior to the end of 2024 or have operated under a temporary pathway prior to the end of 2024; and
- Delay the implementation of the BBD Limitation in a manner that considers achievement of electrification milestones similar to those set forth in the newly proposed restrictions on biomass-based diesel pathways as described in subsection 95488(d).

Braya is also a member of the Advanced Biofuels Association (the “ABFA”) and supports and reiterates the recommendations and conclusions set forth in the ABFA's comment letter concerning the Proposal.

Thank you in advance for taking the time to review our comments and proposed solutions concerning these very important issues. We look forward to working with CARB and welcome any opportunity to discuss these matters further and provide additional assistance and insight.

Respectfully,

A handwritten signature in black ink, appearing to read 'TOM'.

Submitted electronically via <https://ww2.arb.ca.gov/applications/public-comments>

Chair Liane Randolph and Board Members
California Air Resources Board
1001 I Street
Sacramento, CA 95814

RE: Tesla Comments on CARB's Proposed Amendments to the Low Carbon Fuel Standard (August 12, 2024)

Dear Chair Randolph and Members of the Board:

Pursuant to the California Air Resources Board's (CARB's) Proposed Low Carbon Fuel Standards (LCFS) Amendments (Aug. 12, 2024) ("15-day Amendments"), Tesla respectfully submits the following comments. Tesla incorporates by reference its written comments in response to previous 2022 Scoping Plan and LCFS workshops and presentations.^{1 2 3 4} Tesla continues to support CARB and the state of California in defending the state's authority to implement the LCFS. Tesla appreciates the work of CARB staff in putting together the 15-day Amendments and strongly supports many of the proposed amendments, which will greatly improve the LCFS program moving forward. This includes assigning base credits to electric vehicle (EV) manufacturers, and improvements to the Fast Charging Infrastructure (FCI) program. Detailed below are several additional amendments that Tesla believes will further improve the program and ensure its near- and long-term success. This includes a further increase to the step change, adjusting the time frame for the Automatic Acceleration Mechanism, harmonizing the FCI program for hydrogen and electric charging, raising the per site power rating, and updating the verification process for EV charging.

I. Background - Tesla's Mission

Tesla's mission is to accelerate the world's transition to sustainable energy. Moreover, Tesla believes the world will not be able to solve the climate change crisis without directly reducing air pollutant emissions - including carbon dioxide and other greenhouse gases - from the transportation and power sectors.⁵ To accomplish its mission, Tesla designs, develops, manufactures, and sells high-performance fully electric vehicles and energy generation and storage systems, installs, and maintains such systems, and sells solar

⁵ See, Tesla, Master Plan Part 3 (Apr. 5, 2023) available at https://www.tesla.com/ns_videos/Tesla-Master-Plan-Part-3.pdf
https://www.tesla.com/ns_videos/Tesla-Master-Plan-Part-3.pdf

electricity.⁶ Consistent with this effort, in May, 2023, Tesla was ranked as the world leader in the transition to vehicle electrification.⁷

II. The 9% Step Change Should be Increased to 12%

029.1 cont Tesla applauds CARB's long-term vision of setting a 90% reduction target by 2045. This cements California as the clear leader in the transportation decarbonization policy space, with the furthest-forward decarbonization target of any transportation decarbonization program globally. It also sets California on a path to reach Net Zero by 2045, as envisioned by Executive Order B-55-18. Currently, there are two principal factors in over-compliance that threaten the continuing stringency of the LCFS – the accelerating use of both renewable diesel and renewable natural gas. Tesla applauds the 15-day Amendments pushing for a 9% step change; however, Tesla continues to believe a higher step change is required and supports the adoption of a 12% step change.

As detailed in prior comments to the Board, the current LCFS market is not functioning in a sustainable manner. There is a glut of credits on the market that has driven down pricing, making the LCFS less supportive of electrification efforts in California. CARB's 9% step change proposal is unlikely to do enough to address this threat to the program. The clear near-term solution is implementation of a step change of at least 12%, as quickly as possible.

III. Trigger the Automatic Acceleration Mechanism (AAM) Off of 2025 Data

029.2 cont The inclusion of an Automatic Acceleration Mechanism (AAM) is an important step towards balancing the safeguards in the program which already includes multiple safeguards to help rebalance the program if it is underachieving its targets, including a Credit Clearance Market, Advanced Credits, Carryback Credits, and Accumulated Deficits. The AAM is an important counterbalance safeguard for times when the program is overachieving its targets.

However, absent a stronger step change proposed above, CARB should set up the AAM to trigger off 2025 data, allowing for the first year of AAM implementation in 2026, rather than 2027 as proposed in the draft regulations, and unchanged by the 15-day Amendments. This would ensure that credit prices rebound and the program continues to support transportation electrification in a meaningful way.

IV. Assignment of Base Credits to Original Equipment Manufacturers is Critical

029.3 cont Tesla strongly supports the 15-day Amendments allowing the Executive Officer to assign a portion of base credits to Original Equipment Manufacturers (OEMs). Tesla has long argued that OEMs should play a larger role in turning base credits for residential charging into drivers of additional adoption of electric vehicles (EV) and appreciates CARB staff's efforts to allow the Executive Officer to assign base credits to OEMs. CARB's proposal will lead to increased direct investment in EV deployment in California.

⁶ See, Tesla, Impact Report 2022 (Apr. 24, 2023) available at https://www.tesla.com/ns_videos/2022-tesla-impact-report-highlights.pdf

⁷ See, ICCT, The Global Automaker Rating 2022: Who Is Leading the Transition to Electric Vehicles? (May 31, 2023) available at <https://theicct.org/publication/the-global-automaker-rating-2022-may23/>

While the Notice of Public Availability of Modified Text and Availability of Additional Documents and/or Information is relatively clear cut in stating that the Executive Officer can act if “model year 2024 ZEV sales for vehicle classifications subject to the Advanced Clean Cars regulation are less than 30 percent of new vehicle sales,”⁸ the actual regulatory language is less clear, stating that the Executive Officer may act “if the share of new zero emission vehicle sales for model year 2024 zero emission vehicles certified under California Code of Regulations, title 13, section 1962.2 is less than 30 percent.”⁹ Tesla recommends modifying the regulatory language to add clarity: “if the share of new ~~zero emission~~ vehicle sales for model year 2024 **that are** zero emission vehicles certified under California Code of Regulations, title 13, section 1962.2 is less than 30 percent.” CARB should also clarify that this trigger for the Executive Officer to act is a one-time event and that OEMs will continue to receive base credits through the life of the program, or until there is a public amendment process.

In addition, the current language is discretionary when regulatory certainty is necessary. Instead of giving the Executive Officer the discretion (“may”) to direct base credits to OEMs for “up to 45%” of those credits, Tesla believes the regulation should affirmatively state that if zero emission vehicles do not make up 30% of Model Year 2024 sales in California, the Executive Officer *shall* direct 45% of base credits to eligible OEMs. Clarity is essential when designing a market-based program for all participants and the public and Tesla encourages CARB to create that certainty by making the above suggested amendments.

V. Existing Amendments to the Fast Charging Infrastructure Program Should be Approved

029.4 cont Tesla supports several of the amendments made to the Fast Charging Infrastructure (FCI) Program made in the 15-day Amendments. In particular, Tesla supports:

- extending the program application deadline for the Heavy-Duty (HD) FCI program to December 31, 2035;
- extending the minimum distance from an existing or pending electric vehicle Federal Highway Administration Alternative Fuel Corridor to five miles instead of one mile;
- removing the ten charger cap;
- matching the credit life of the FCI and hydrogen refueling infrastructure (HRI) programs at 10 years; and
- raising the MW cap per site.

Under these amendments, this program will accelerate deployment of charging infrastructure for HD electric trucks throughout California.

a. Proposed Additional Amendments to the FCI Program

029.6 i. Harmonize Hydrogen and EV Charging CIs for Capacity Credits

CARB should continue to focus on parity between incentives for EV charging and hydrogen fueling. As such, FCI and HRI programs should have the same formula for calculating credits. The formula for a shared HD-HRI station includes a 50% factor and a private HD-HRI station includes a 25% factor. However, a shared HD-FCI charging site has a 20% factor and an FSE at a private HD-FCI charging site has

⁸ https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2024/lcfs2024/15day_notice.pdf at 4.

⁹ https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2024/lcfs2024/15day_atta-1.pdf at 48.

a 10% factor. CARB should continue to harmonize the HRI and FCI programs by amending these factors to be the same for both programs.

Second, CARB currently gives preferential treatment to hydrogen stations – despite showing no signs of commercial success – over EV charging stations when assigning the CI for capacity credits. Hydrogen stations utilizing the HCI pathway receive a CI of the “Company-wide weighted average CI for dispensed hydrogen during the quarter or 0 g/MJ, whichever is greater” while electric vehicle charging stations utilizing the FCI receive a CI of the “California average grid electricity carbon intensity” regardless of whether the EV charging company is utilizing 0 CI RECs for the rest of their charging. CARB should treat hydrogen fueling and EV charging equally by either giving hydrogen HRI capacity credits a CI of the last reported industry average, or by allowing EV charging FCI capacity credits to be generated off of a 0 CI if the company is using REC matching for the rest of their charging.

ii. **Raise the Total FCI Power Rating at One Address to 3,000 kW**

029.7

The EV charging industry is growing rapidly but in the last few months there have been more and more reports of charging congestion, particularly during holiday travel or around specific large events. A recent article in Bloomberg aptly noted that the “US charging network is also entering its post-scarcity era” which will lead to “charging’s next challenge - redundancy.”¹⁰ As such, charging providers need to build larger and larger sites to ensure that during these high traffic events or peak travel times there is adequate charging to ensure customers are not waiting for long periods of time. Tesla anticipates that the average post count per site will continue to rise, leading to a growing number of sites with an installed capacity surpassing 2,500kW. To continue to support charging infrastructure deployments, CARB should consider amending the total FCI power rating for all LMD-FCI FSEs at one address to 3,000 kW from 2,500 kW.

VI. Update the Light Duty Battery Electric Vehicle Energy Efficiency Ratio (EER)

While not included in the 15-day Amendments, Tesla believes CARB should update the Energy Efficiency Ratio (EER) for Light Duty Battery Electric Vehicles. The current 3.4 EER was adopted by CARB in 2011 and has not been updated since then. California lags other jurisdictions which have more accurate EERs, such as The Netherlands (4.0 EER),¹¹ the European Union (4.0 EER),¹² and Canada (4.1 EER).¹³ As described in previous comments, a more thorough analysis would likely result in an EER over 4.0.¹⁴

In addition, CARB should allow an OEM to apply for an EER based upon that OEM’s real-world fleet. CARB has created a precedent for this by approving the Lime scooter Tier 2 pathway which included a

¹⁴ <https://www.arb.ca.gov/lists/com-attach/7042-lcfs2024-AjBdb1VkVjclP1Rk.pdf>

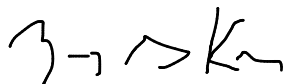

company-specific EER factor.¹⁵ Allowing OEMs to submit applications for company-specific EERs would better reflect the actual efficiency of electric vehicles in the market and allow those vehicles to be properly credited. This would also incentivize each OEM to focus on improving vehicle efficiency.

029.5 cont **VII. Remove the Unnecessary Third-Party Verification for Non-Residential EV Charging**

Proposed section 95501 of the original amendments includes a proposal to expand third-party verification for EV charging transactions. While Tesla appreciates the intent of CARB staff's proposal, it is unnecessary to create a separate third-party verification program regime for non-residential electricity transactions related to EV charging. Commercial EV charging infrastructure transactions fall under the purview of the CA Department of Agriculture, Division of Measurement Standards (DMS), under its state weights and measures program. CA DMS is responsible for verifying the accuracy of commercial EV charging infrastructure in California. This includes both a field verification process carried out by the CA counties as well as type evaluation program. While unchanged in the 15-day Amendments, it is unnecessary for CARB to add additional verification requirements for LCFS given the accuracy of commercial EV charging transaction is already regulated and verified in CA. We therefore recommend that no additional third-party verification is necessary for EV charging transactions.

Tesla appreciates the opportunity to express support for many of the 15-day Amendments to LCFS and urges CARB to incorporate the additional amendments described above to ensure continued success of the program and help meet California's transportation electrification policy goals.

Respectfully submitted,

Zachary Kahn
Senior Managing Policy Advisor
Public Policy & Business Development

August 27, 2024

Liane M. Randolph, Chair
California Air Resources Board (CARB)
1001 I Street
Sacramento, California 95814

Dear Chair Randolph,

As a stakeholder who recognizes the value that renewable diesel (RD), sustainable aviation fuel (SAF), and other liquid renewable fuels provide in reducing greenhouse gas (GHG) and air pollutant emissions, and delivering reliable, sustainable energy to California's economy, Mahoney Environmental Solutions, LLC (Mahoney) strongly urges CARB to adopt revisions to the Low Carbon Fuel Standard (LCFS) as soon as possible.

The current regulatory targets for carbon intensity (CI) reduction are outdated and must be strengthened to realize the maximum amount of GHG and pollutant emission reductions possible and send a strong signal to investors that California wants to remain a leader in generating jobs and economic development in sustainable energy.

The new draft regulatory proposal contains several elements to strengthen the program and maintain the incentives for renewable fuel producers to continue reducing the CI of their fuels and the resources used to make them. There are, however, some improvements that must be included in the final updated regulation to allow the state to reach its climate goals.

A robust and stable market for LCFS credits is critical in achieving the environmental and economic benefits for Californians. The following change is critical for the state to move forward with the best technologies needed to continue decarbonizing the transportation sector while protecting businesses, jobs, and the beautiful natural resources California has to offer.

030.1

Modifications to Section 95488(d)- Proposal to Stop Accepting RD Pathway Applications:

- Mahoney has concerns about the proposed sustainability certification requirements. CARB is requiring certifications for well-established and previously recognized waste biomass unless specifically enumerated in 95488(d).
- The proposed rules could preclude the use of used cooking oil (UCO) as a feedstock, despite the fact that UCO has been one of the cleanest and most reliable waste feedstocks for both RD and SAF supplies. SAF is produced alongside RD, and any limits on RD production inevitably will result in less SAF production. The phase out of these pathways would be detrimental to emissions reductions in the transportation sector and would potentially limit UCO for RD and SAF production in the future.

Below you will find further context regarding Mahoney and the importance of UCO collection and processing.

Background on Mahoney and UCO Collection

Since 1953, Mahoney Environmental® has helped foodservice establishments turn UCO and other waste products into useful products like renewable fuels. Mahoney manages the entire recycling process — from equipment set-up to collection, and processing. We share the benefit of UCO and pass that added value onto restaurant operators. We are a licensed EPA recycler, and all of our facilities recycle nearly 100% of the materials processed. Mahoney's goal is to be

the premier back-of-the-house service provider to foodservice operators nationwide — from national and regional chains to independent restaurants to airports throughout the United States.

Environmental & Economic Benefits

Mahoney is proud to service approximately 80,000 food service facilities nationwide, and approximately 13,400 in California. We also proudly employ over 100 employees in California, and we collect about 66,980,000 lbs. of UCO and recycle it. Our environmental impact from recycling UCO we collect in California is equivalent to:

- 73,452.10 Tons of Waste Diverted from a Landfill;
- 11,300,328 Trees Planted;
- 12,830 Cars Made Zero Emission; and
- 146,986,272 lbs. of CO₂ Prevented from Entering the Atmosphere.

Mahoney is also committed to transparency and good business practices throughout our value chain. We provide customers reports on the amount of UCO collected and the value of the product. This is extremely important, as we are then able to prove traceability records for where all of our UCO is derived and where it is delivered after our recycling process. This ensures both quality and safety for our customers and ensures UCO we collect is from a reliable and vetted source. Most importantly, this ensures that waste products are not thrown into landfills or polluting our water systems, thus protecting our most valuable natural resources. Our goal is simple: to make kitchens and the environment safer for future generations.

The potential for UCO has never been higher. This valued commodity has helped to transform the transportation sector in California and throughout the world, as it serves as a prime waste feedstock to create RD and SAF.

In closing, we urge you to adopt a strengthened proposal that includes the removal of the phase out of RD pathways as soon as possible. Thank you for your efforts to update the regulation.

Sincerely,

A handwritten signature in black ink, appearing to read "David Kimball", is written over a light blue horizontal line.

LCFS staff
California Air Resources Board
1001 I Street
Sacramento, CA 95814

Subject: Feedback on newly proposed LCFS calculators

Dear CARB staff:

First, I would like to thank you for your work in the new LCFS calculators. The new versions of the calculators will help the industry streamline the pathway applications process for low carbon energy projects. In particular, we appreciate the new hydrogen calculator, building separate calculators for biodiesel and HEFA, and increasing the number of feedstocks that can be specified in the biodiesel calculator. I would also like to thank you for incorporating some of our previous comments into the new versions of the calculators. Below are our comments on specific calculators:

Hydrogen calculator:

- It is unclear how the CI of RNG is entered in the calculator when there's a direct connection instead of B&C? Are we expected to use the B&C section with 0 as the distance from RNG injection to H2 facility (5.4). Please clarify.
- This statement is confusing:

4.7 Submetered Electricity for Liquefaction (kWh)	Enter the quantity of submetered electricity used by the hydrogen production facility for liquefaction, if available. Electrolysis submetering is used to evaluate the quantities of grid electricity attributed to GH2 and LH2 pathways.
---	---

4.7 refers to kWh demand for liquefaction, yet the description specifies that the value will be used to evaluate electricity demand for both gaseous and liquid pathways.

- Please clarify whether we can use our own energy usage values, e.g. mmBTU of NG / kg of H2 or kWh/kg H2 in CA-GREET 4.0 tab without having to submit a Tier 2 application?
- Pathway Summary Tab: A T&D loss factor is applied to calculate the mass of H2 dispensed even if the H2 is produced and dispensed on-site. This factor should be proportional to the miles traveled and transloading OR use a conditional formula to apply it only when H2 is transported.

Our Family of Brands

Chevron Products Company
A Division of Chevron U.S.A., Inc.

5001 Executive Parkway, Suite 200, San Ramon, CA 94583
925 842 8903
laurav@chevron.com

In the example below, all transportation distances are set to zero, yet the pathway gets penalized with a 0.5% T&D loss factor:

Hydrogen Production Quantities						
		Unit	Total	Gaseous Hydrogen (GH2)		Liquified Hydrogen (LH2)
Total Hydrogen Produced		kg	400,000	400,000		
		MJ, LHV	48,000,000	48,000,000		
H2 for LCFS Pathway(s)	Produced	kg	400,000	400,000		
	T&D Loss Factor	%	0.5%	0.5%		
	Dispensed (Calculated)	kg	398,000	398,000		
		MJ, LHV	47,760,000	47,760,000		
			Without B&C		With B&C RNG	Without B&C
Maximum Matchable B&C		MMBtu, HHV	100,000		100,000	
Hydrogen Reportable by Pathway		kg	400,000	80,000	320,000	
Delivered H2 for CI Calculations		MJ, LHV	47,760,000	9,552,000	38,208,000	

In the example above, 2,000 kg of H2 are subtracted from the dispensed H2 total due to T&D losses even though the H2 was produced on-site.

- CA-GREET 4.0 Tab: The following units are incorrect

Process Fuels	Natural Gas	Combusted in Boiler or CHP	75,496	MMBtu, LHV
---------------	-------------	----------------------------	--------	------------

The correct units are gCO₂e/mmBTU, LHV

- There isn't an option to input sub-metered compression or regasification or to change their emission factors, as they are lumped together. Please break out each component for transparency and to make it easier for the user to substitute default values with operational data, as needed.

Fueling Station	GH2	Compression, Precooling and Pumping	3.41	gCO ₂ e/MJ H ₂ , LHV
	LH2	Storage and Dispensing	4.22	

Biodiesel and HEFA Calculator:

- The flat tailpipe CI has changed from 0.76 to 3.497 gCO₂e/MJ for BD/RD (a delta of 2.74 gCO₂e/MJ) due to recent data from CARB's EMFAC2021 (v1.0.2), mainly N₂O increases
 - We request that CARB staff provide a clear and detailed explanation for assigning the same tailpipe score determined for ULSD to biodiesel and renewable diesel.
 - We request that staff provide details on the assumptions driving the emission changes between the prior tailpipe emission factor of 0.76 gCO₂e/MJ to the new tailpipe emission factor of 3.497. The explanation of the assumptions should be in plain language so that program participants who are not familiar with the EMFAC2021 model can understand the rationale. This explanation can be referenced in the GREET4.0 explanatory document since the relevant reference (7) is a placeholder and provides no information.

laurav@chevron.com

- The Simplified Calculators released for the 15 day comment period in August 2024 do not appear to have been updated with the feedstock emission factor information present in the updated CA-GREET4.0 model. The table below shows an example of the different values:

December 2023 Release		August 2024 Release	
Soy-Oil Based Biodiesel (per MMBTU)		Soy-Oil Based Biodiesel (per MMBTU)	
Feedstock (K451)	Fuel (L451)	Feedstock (K451)	Fuel (L451)
20,765	20,005	9,999	18,384

- We request that CARB update the simplified calculators so that participants can use simplified calculators that match the CA-GREET4.0 calculator from the start of implementation. We want to avoid any unnecessary delays from known inconsistencies.

HEFA Calculator:

- The wording in section 6 of the manual does not match the spreadsheet:

Section 6: Monthly Operational Data					
Coproducts Exported Outside Fuel Pathway			Renewable Diesel (RD)		
6.6	6.7	6.8	6.9	6.10	
Hydrogen Produced On-Site	Light Hydrocarbons Used as H2 Feedstock	Light Hydrocarbons For Alternate Use	Beginning RD Inventory	Ending RD Inventory	
kg	MMBtu, HHV	MMBtu, HHV	gallons @ 60°F	gallons @ 60°F	
1,000	300				

6.5 Alternate Fuel (MMBtu, HHV)
6.6 Imported Hydrogen (kg)
6.7 Hydrogen Produced On-Site (kg)
6.8 Light Hydrocarbons Used as H2 Feedstock (MMBtu, HHV)

We request that the manual reflects the exact section numbers in the spreadsheet to avoid confusion.

Field Name
6.9 Light Hydrocarbons with Alternate Use (MMBtu, HHV)
6.10 Beginning RD Inventory (gallons @ 60°F)
6.11 Ending RD Inventory (gallons @ 60°F)

RNG – DSM Calculator:

- L1.(1-6).14 Retention Time and Drainage – Required Annual Lagoon/Digester Cleanout
 - After production, many facilities remove excess water but do not fully cleanout the lagoon/digester to keep the microbes active. The requirement to clean out the system annually in September per the calculator is inconsistent with many baseline scenarios.

Re: Proposed 15-Day Changes to the Proposed Regulation Order

Dear Chair Randolph and Members of the California Air Resources Board,
On behalf of the South Dakota Soybean Association (SDSA), thank you for the opportunity to comment on the proposed 15-day changes (15-Day Changes) to the Low Carbon Fuel Standard (LCFS) program. SDSA represents soybean farm families across South Dakota on public policy issues important to the soybean industry. Growers across South Dakota have long been committed to producing the world's food, feed, fuel, fiber, and thousands of bioproducts in an environmentally and economically sustainable way.

CARB's 15-day changes to revise the LCFS were quite surprising, as the final package diverged significantly from what was included in the Initial Statement of Reasons (ISOR) and the April 10 public workshop. Of top concern for farmers across our state and the rest of the nation is a proposal that would cap the use of soybean oil and canola oil as feedstocks for biofuels at 20 percent by company.

- 032.1 Artificial restrictions on the market, combined with the inclusion of sustainability limits being proposed, will significantly increase costs, but will not reduce emissions. South Dakota farmers
- 032.2 remain frustrated that CARB relies on decades-old data and methods to set carbon intensity (CI) scores for soy while neglecting new economic data. CARB needs to seriously consider the potential indirect emission impacts their expanding preference for waste is having.
- 032.3 SDSA opposes the proposed discretionary authority provided to the Executive Officer to stop accepting new pathways for biomass-based diesel. In addition to discriminating against the lipid-based fuel platform, we are concerned about the unintended impacts on non-lipid pathways, which could produce biomass-based diesel as a co-product. We are also worried that the
- 032.4 aggressive step-down of CI benchmarks, which partially result from the removal of the proposed regulation of fossil jet fuel, combined with other changes, will reward importers of waste feedstocks while penalizing farm families across the United States.

As CARB seeks to finalize updates to the LCFS program in the coming months, we respectfully encourage the agency to ensure these updates are based on the most up-to-date science as required by AB-32.

032.1 cont

The determination to make such drastic changes to previous CARB proposals so late in the process was shocking to the soybean and biofuels industries. That CARB has changed from arguing that, based on the modeling, a vegetable oil feedstock cap was detrimental to the goals of the LCFS at the April public workshop, to now recommending a strict cap on those feedstocks without employing recent data or science, is confusing to grasp. CARB's own April 10th analysis showed that a feedstock cap would increase greenhouse gas (GHG) emissions in California, which conflicts with requirements in AB-32.

Vegetable Oil Feedstock Cap

The inclusion of a virgin vegetable oil feedstock cap in the 15-day changes was alarming to farm families and the entire biofuels value chain, as reflected in market activity. You may understand our surprise based on the April 10 workshop in which CARB noted that liquid fuels would continue to be needed in the transportation sector in California for at least the next decade. In that same workshop, CARB also claimed that the imposition of a virgin vegetable oil feedstock cap would increase the utilization of petroleum diesel in the transportation sector. In the staff presentation on April 10, they noted that nearly eighty percent of vehicles on the road in California will use combustion engines through 2030. Further, they noted that such a stringent cap on virgin vegetable oils may result in 2.8 billion gallons of fossil diesel utilization in 2030, versus 1.9 billion gallons using a scenario that does not impose the cap proposed by the Environmental Justice Advisory Committee.

In a complete reversal of their prior analysis only four months ago, the CARB staff is now essentially recommending to the board that more fossil diesel be sold into the market in 2030. This recommendation appears to not only go against the goals of AB-32, but it also defies the best science available today. The recommendation seems incongruent with the Intergovernmental Panel on Climate Change, which notes in its sixth assessment report that using existing low-carbon technologies is a crucial component to avoiding catastrophic temperature increases, stating that "biodiesel and renewable diesel fuels...could offer important near-term reductions" for several technologies, including buses, rail, and long-haul trucking.¹

In our current interpretation, the cap may lock the lowest cost and lowest carbon intensity soybean oil-based biofuel (soy methyl esters) producers out of the market. Most soy methyl esters are produced at biodiesel plants adjacent to soybean processing plants. Often, the companies that own and operate soybean processing facilities are not involved in the procurement and processing of non-crop-based oils, such as UCO and tallow.

¹ Jaramillo, P., S. Kahn Ribeiro, P. Newman, S. Dhar, O.E. Diemuodeke, T. Kajino, D.S. Lee, S.B. Nugroho, X. Ou, A. Hammer Strømman, J. Whitehead, 2022: Transport. In IPCC, 2022: Climate Change 2022: Mitigation of Climate Change. Contribution of Working Group III to the Sixth Assessment Report of the Intergovernmental Panel on Climate Change. https://report.ipcc.ch/ar6wg3/pdf/IPCC_AR6_WGIII_FinalDraft_Chapter10.pdf

They exclusively make biofuels out of soy oil or canola oil. The current language limits the crediting of soy and canola to 20 percent of reported gallons. This leaves integrated agriprocessing/biofuel producers two choices: 1) exit the market entirely, or 2) be denied a government benefit on 80 percent of their fuel. If this is the current interpretation of the proposed provision, it would significantly and arbitrarily disadvantage the sustainable oilseed biodiesel community.

We echo the concern of the American Soybean Association that the new requirement appears to contradict the statutory guidance laid out in AB-32 to minimize costs.

Sustainability Limits

032.5

SDSA was surprised not only to find a feedstock cap in the 15-day changes, but the sustainability limits were also retained. The cap, sustainability limits and Indirect Land Use Change score all additively, and redundantly, address land use change. This has the equivalent effect of giving soy and canola a much higher CI score, increasing the compliance cost associated with delivering the product, despite the lack of direct evidence.

South Dakota farm families are concerned that the requirement proposed by CARB is unneeded given the longstanding, excessively high ILUC figure (relative to more recent modeling efforts). Furthermore, we are extremely disheartened that CARB has not followed the example of governments across North America, where farmers who submit data for compliance are also given the opportunity to be incentivized for conservation efforts. This additional cost without benefit contradicts the language authorizing the LCFS. Section 38562 (b)(7) of AB-32 directs CARB to, "Minimize the administrative burden of implementing and complying with these regulations." Adding supply chain traceability to a bulk delivery system adds a significant administrative burden without changing the GHG emissions of the pathway.

CARB's efforts could be improved and enhanced by outreach to U.S. Department of Agriculture (USDA) personnel who have engaged in activity regarding climate-smart farming practices. USDA recently closed a comment period on its Request for Information on Procedures for Quantification, Reporting, and Verification of Greenhouse Gas Emissions Associated with the Production of Domestic Agricultural Commodities Used as Biofuel Feedstocks. USDA seeks to quantify and qualify the benefits of climate-smart agriculture practices for biofuel programs at the state, national, and international levels using the information received. Communication between CARB and USDA could be enlightening regarding ongoing agricultural sustainability practices.

Through the current sustainable aviation fuel (SAF) federal tax credit (40B), the CI of soy-based biofuels can improve through no-till and cover cropping on fields where the soybeans were produced.

Other farming practices like low-till, nutrient management, enhanced efficiency fertilizers, buffers, wetland and grassland management, tree planting on working lands, planting for higher carbon sequestration, and soil amendments all can and should be accounted to assign a lower CI score to an agricultural feedstock. USDA already tracks all these practices through several of its managed conservation programs. In addition, there are a variety of other practices that scientifically lower the CI score of soybean feedstocks for biofuels, and USDA is actively working to develop mechanisms to account for those.

Given the work being undertaken by USDA and EPA as part of the implementation of the Inflation Reduction Act, SDSA urges CARB to reconsider its proposed sustainability requirements to allow soybean growers the opportunity to participate in the California biofuels market through innovative and climate-smart agriculture practices.

Outdated Scoring

032.2 cont

For the last several years, state soybean associations, national associations, and biofuel producers have urged CARB to consider updating its scoring methodology for crop-based biofuels. CARB has refused to consider the best available science and methodology.

We remain deeply concerned that without a comprehensive update to the Global Trade Analysis Project model for biofuels (GTAP-BIO) that CARB utilizes, soy-based feedstocks will be phased out of the LCFS even without the additional limitations being proposed in the 15-day changes. Current data indicates a much lower CI score for soybeans as farm families continue to improve soil practices, limit water use, lower on-farm emissions and many of the best practices that deserve reward. On the one hand, CARB is recommending stringent sustainability guardrails for U.S. soy, but on the other hand, it is still likely to phase out soy-based biofuels from credit generation by approximately 2035 or sooner.

CARB has indicated plans to update all major models for lifecycle emissions calculations except for GTAP-BIO in the updated LCFS rulemaking. The soy industry has made vast improvements in sustainability and efficiency over the past two decades, with even greater improvement goals ahead. At the same time, CARB continues to rely on a 2014 model that uses data from 2004. The ILUC score accounts for half or more of the CI score for soy-based biofuels. CARB's current modeling assigns soy biomass-based diesel with an ILUC impact of 29.1g CO₂e/MJ, whereas updated results from the model used to calculate ILUC scores indicate a value of between 9 and 10 gCO₂e/MJ for soybeans². The recently released 40BSAF-GREET 2024 model has an ILUC score of 12.2 for soy-based sustainable aviation fuel in federal programs.

² Taheripour, F., Karmai, O., and Sajedinia, E. (2023). *Biodiesel Induced Land Use Changes: An Assessment Using GTAP-BIO 2014 Data Base*. Purdue University

The benefits of the LCFS can only be achieved if CI values are accurately captured. If land use change concerns are large enough to justify sustainability guardrails and capping virgin vegetable oil feedstocks, then the modeling should also be updated to reflect current land use change data.

Entities Eligible to Apply for Fuel Pathways

032.3 cont

We are concerned about CARB's 15-Day Changes to give the Executive Officer discretion to stop accepting new pathways for biomass-based diesel starting in 2031. We do not understand what provision of the AB-32 statute is served or justifies this arbitrary and highly selective change. CARB must, under statute, minimize costs and maximize GHG reductions. It is unclear how this is served by rejecting new pathways. In fact, the requirements of current law are met by allowing the most available pathways. If these pathways cannot achieve cost-effective GHG savings, they will not be utilized by the market in the LCFS. In essence, an increase in pathways can only serve to improve GHG benefits in California. Singling out a specific fuel for prejudicial treatment is baffling, given the goals of the LCFS and the authority that establishes it. Executive Order S-01-07 establishing the LCFS specifically cites diversity of fuels as a motivation for the program, and this proposal contradicts one of the stated purposes of the program. In addition, this provision, if implemented, could also significantly disadvantage other biofuel production processes, which may produce biomass-based diesel as a co-product, for example, in a system where SAF is a predominant product.

Conclusion

SDSA is encouraged by the continued success of programs that support the development of cleaner, low-carbon fuels. However, it is critical that CARB finalize updates in a way that does not arbitrarily exclude agricultural feedstocks through policies that are not science-based and conflict with CARB's mandate, including capping vegetable oil feedstocks and applying onerous sustainability guardrails that add cost without rewarding farming practices that lower CI.

CARB's 15-day changes, released in August 2024, are deeply concerning for farm families. CARB has singled out soybean and canola oil for adverse, prejudicial treatment. No up-to-date scientific evidence has been presented to justify the decision. In fact, CARB has refused to update the science as required by law for these feedstocks. This alone calls into question the integrity of a performance-based LCFS. Even more frustrating for farm families, CARB is now proposing feedstock caps, traceability requirements and authority to reject applications for these fuels produced from them. Again, CARB has not shown any scientific justification. In fact, the LCFS is already aggressively punishing soy farm families for land use change requirements.

Farmer families across South Dakota remain eager to continue working with CARB to support the role of agriculture in diversifying the fuel supply while reducing GHGs and increasing clean air in California and beyond. On behalf of South Dakota soybean farm families, we appreciate the opportunity to comment and look forward to collaborating with CARB and other relevant stakeholders on the implementation of policies that expand the use of soy-based biofuels and market opportunities for farm families that produce soybeans.

Sincerely,

Kevin Deinert
President
South Dakota Soybean Association

Executive Officer
California Air Resources Board
1001 I Street
Sacramento, CA 95814

Re: Comments on Proposed 15-Day Changes to Proposed LCFS Regulation

Dear Dr. Cliff:

We are writing to provide comments on the proposed 15-day change document that was published on August 12, 2024. Thank you for considering our views on this important issue.

Darling Ingredients is North America's largest purveyor of waste fats and oils and is a 50% owner of the nation's largest renewable diesel production facility through a joint venture. Most of the fats that Darling Ingredients processes from its North American factories (used cooking oil and animal fat) are used as feedstocks for domestically produced renewable diesel. We have collection, recycling, and processing operations at several locations in California¹. According to CARB, our renewable diesel reduces greenhouse gasses (GHGs) by as much as 80%, particulate matter by 30%, and NOx by 10%. Renewable diesel is compatible up to 100% in all existing vehicles, equipment, and infrastructure. Following substantial investment, one of our joint venture's renewable diesel plants will be converted to produce approximately 235 million gallons of sustainable aviation fuel (SAF) beginning later this year.

After reviewing the 15-day change document, we have several comments we wish to share.

Carbon Intensity Benchmarks

033.1

We were encouraged by the increased ambition reflected in the 2025-2029 carbon intensity (CI) benchmarks, particularly the 9% step-down set for 2025. This more aggressive implementation schedule offers the potential to restore a healthy balance to the credit market, while also better aligning with the state's capacity for meaningful carbon reductions across a broad spectrum of technologies.

As shown in the following charts, the program has been significantly outperforming the current CI benchmarks. While this overperformance is a positive development for the climate, it has inadvertently led to a decrease in credit prices and slowed investment in the clean technology sector. The proposed 9% step-down, coupled with the possibility of activating the Automatic Acceleration Mechanism (AAM), will address this fundamental issue more effectively than the original proposal, helping ensure the program continues to drive substantial carbon reductions while maintaining economic viability in the clean technology market.

¹ Fresno, Los Angeles, San Diego, San Francisco, Santa Ana, and Turlock.

Figure 1 below shows that since 2021 obligated parties have been decarbonizing at a rate well beyond the requirements of the LCFS regulation².

Figure 1

Figure 2 below highlights how overcompliance has dramatically affected the LCFS credit bank.

Figure 2

² All charts sourced from the CARB LCFS Data Dashboard.

Figure 3 below illustrates the impact of overcompliance on LCFS credit prices since 2021.

Figure 3

Sustainable Aviation Fuel

033.2

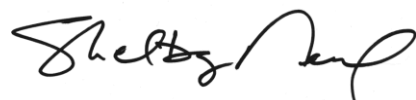

While we are pleased to see the rulemaking moving forward, we must also express our disappointment that intrastate jet fuel remains exempt from obligations under the LCFS program. We believe this decision could hinder SAF adoption in the state and prevent Californians from realizing substantial air quality benefits, including reduced emissions of PM, NOx, and SOx. If Governor Newsom's goal of 20% SAF uptake is to be achieved, we believe additional measures are necessary³. Fortunately, policy options are available, and we hope to work with CARB to explore and potentially implement those strategies.

Timeliness of Action

This regulatory process, including the informal workshop period, has been ongoing for nearly three years. While there are recommendable improvements that could be considered, time is running out under the Administrative Procedure Act (APA). Given the urgency of the situation and the severe consequences of missing the regulatory deadline, we strongly recommend proceeding without further changes to the proposed regulation and moving swiftly toward finalization. This would allow the credit market to begin recovering and enable decarbonization efforts to accelerate under the more ambitious carbon intensity benchmarks outlined in the proposal.

Once again, thank you for considering our comments. If you should have any questions, please feel free to contact me at any time at shelby.neal@darlingii.com.

Sincerely,

Shelby Neal
VP - Renewables & Energy Policy

Sacramento, California 95814

RE: August 15, 2024 Proposed 15-Day changes to the Low Carbon Fuel Standard (LCFS)

SUBMITTED VIA ELECTRONIC MAIL TO [CARB'S PUBLIC COMMENT DOCKET](#)

Mercedes-Benz Research and Development North America, Inc., and Mercedes-Benz USA, LLC, on behalf of the manufacturer of Mercedes-Benz vehicles, Mercedes-Benz AG (hereinafter collectively referred to as "Mercedes-Benz" for purposes of this submission) would like to thank the California Air Resources Board (CARB) for the opportunity to provide comments on its August 15, 2024 proposal for changes to the Low Carbon Fuel Standard (LCFS). Mercedes-Benz strongly supports giving CARB's Executive Officer (EO) the authority to direct up to 45 percent of the base credits generated by light-duty (LD) electric vehicle (EV) residential charging to the automakers producing those vehicles.

Mercedes-Benz is guided by our "Ambition 2039," which includes goals for carbon neutrality¹ by 2039 throughout our supply chain and offers a complete set of electrified product offerings to meet our customers' needs. Mercedes-Benz continues its push to increase sales of electric vehicles in the U.S. with a portfolio that spans key market segments. In fact, electric vehicle sales comprised 11% of overall passenger vehicle

¹ Net carbon-neutral means that carbon emissions that are not avoided or reduced at Mercedes-Benz are compensated for by certified offsetting projects.

sales through Q2 2024.² Additionally, the Mercedes-Benz High-Power Charging network supports Mercedes-Benz's electrification efforts through the development of a public charging network that is open to all vehicle brands. The Mercedes-Benz High-Power Charging network recently announced a partnership with Starbucks which would expand the Mercedes-Benz network by installing DC fast chargers at 100 Starbucks' stores with initial focus along the I-5 corridor.³

034.1 The LCFS program is an important complement to CARB's GHG and criteria emission and zero emission (ZEV) regulations for light-duty and medium-duty vehicles. Additionally, the LCFS program has helped incentivize the transition to electric vehicles by allowing automakers to earn eRINs. The 15-day changes would provide additional benefit by allowing CARB's Executive Officer to "*direct up to 45% of base credits to eligible OEMs, if the share of new zero emission vehicle sales for model year 2024 zero emission vehicles certified under California Code of Regulations, title 13, section 1962.2 is less than 30 percent.*" Mercedes-Benz wholly supports this addition which would give automakers the opportunity to earn up to 45 percent of the base credits and suggests that CARB also add a minimum percentage that would be guaranteed to go to automakers. Mercedes-Benz would also ask CARB to specify the criterion to which this percentage will be based, and to hold this amount fixed over time to provide certainty for OEMs.

Lastly, it would be important to understand CARB's rationale for setting 30 percent as a threshold. We agree that "continued consumer facing support for the light duty vehicle sector is important," but we believe that support is needed well beyond this threshold due to continued concerns over adequate and reliable infrastructure and the need to incentivize the mainstream market.

034.2 Mercedes-Benz also supports the requirement that funds from these credits be put towards efforts to support transportation electrification and prefers that this requirement remain broad, including but not limited to charging infrastructure, vehicle incentives, etc. As mentioned above, Mercedes-Benz is investing in our own charging network to ensure adequate and reliable charging for our customers, as well as all EV drivers. The ability to select options on how to invest LCFS base credits, i.e., into charging stations or vehicle incentives, is an important flexibility that will enhance the funds as well as benefit all EV drivers. For example, if the funds would result in only a small vehicle incentive, then the ability to use these funds towards growing our charging network would enable us to expand it even further, again providing a benefit not only to Mercedes-Benz drivers but to any driver of an EV.

Sacramento, California 95814

RE: Low Carbon Fuel Standards Amendments (15-Day Changes)

Dear California Air Resources Board Members and Staff,

Xeal Energy (Xeal) appreciates the opportunity to provide our input and support for the California Air Resources Board (CARB) rulemaking on the Low Carbon Fuel Standard (LCFS) to support increased investment in electric vehicle (EV) chargers and charging stations. Specifically, Xeal strongly supports greater EV charging investment in multifamily housing to meet California's climate goals.

Xeal has developed the next generation of EV chargers where users are provided unique and encrypted tokens that authorize, activate, and transact charging sessions without internet service directly between the charger and phone. This means chargers can operate anywhere – including multifamily housing (MFH), parking garages, and communities with limited internet connection, enabling a near 100% uptime and frictionless user experience, leading to strong consumer confidence and greater EV adoption.

Primarily focused on supporting multifamily housing and commercial real estate owners and operators, we strongly support the use of LCFS credits to incentive EV charging infrastructure investments and EV adoption. Providing reliable at-home charging in multi-family housing is critical to accelerating EV adoption and achieving the State's ZEV goals.

Xeal respectfully requests the following minor amendments to the proposed LCFS language:

1. Define all chargers located at MFH as non-residential regardless of parking arrangement

Xeal supports the continued inclusion of MFH EV charging within the LCFS program as well as removing barriers for property owners and operators to invest in EV charging infrastructure. We respectfully request all multi-family housing charging be considered "non-residential EV charging." Property owners own the chargers, regardless of whether they are on dedicated or non-dedicated parking spots and should be eligible to generate the credits. In addition, the parking spots may change from dedicated to non-dedicated, which would complicate reporting – but not change the benefits. Removing complexity and allowing credit parity will further incentivize EV charging development at multifamily housing where EV charging is critically needed.

035.2 2. **Amend verification for EV charging to include desktop review and remove requirements for site visits**

Xeal acknowledges the need to align the amount of electricity dispensed by EV charging stations with the amount reported to CARB by entities earning LCFS credits. To ensure accuracy, the most effective method is through data checks and reviews of electronic records of dispensed electricity. While site visits are useful for verifying large liquid fuel production facilities, they are not practical for EV charging networks for several reasons:

- 035.3 • **Data Management:** EV charging networks manage fuel transaction data through electronic platforms rather than at individual charging stations. Third-party verifiers cannot access cumulative transaction data from site visits alone, as EV chargers are unmanned and lack on-site data management systems. Instead, verifiers can review electronic data from centralized systems across the network, which generates reports for CARB. This method is more cost-effective and efficient, providing necessary information for compliance assessments without the need for physical inspections.
- 035.4 • **Regulatory Oversight:** The accuracy of EV chargers is already regulated by the California Department of Food and Agriculture Division of Measurement Standards (DMS), which oversees testing and approval under the California Type Evaluation Program. This framework ensures that accuracy requirements meet or exceed those in § 95491.2 of the LCFS regulation. Since EV chargers undergo rigorous lab and field testing by DMS, additional site visits by CARB would be redundant.
- 035.3 cont • **Logistical Challenges:** EV charging networks are extensive and dispersed. While third-party verifiers can manage annual site visits to a few large liquid fuel facilities, conducting site visits to hundreds or thousands of EV charging stations across various locations is costly and time-consuming.

Xeal appreciates the opportunity to support and provide input on LCFS 15-day Changes. We look forward to continuing to work with the CARB and other stakeholders to support the deployment, access, and reliability of light-duty charging infrastructure.

Sincerely,

Michael A. Smith

August 27, 2024

The Honorable Liane M. Randolph, Chair
California Air Resources Board
1001 I Street
Sacramento, CA 95814

RE: 2024 Low Carbon Fuel Standard Amendments

Dear Chair Randolph:

036.1 The signatories of this letter appreciate the opportunity to provide comments regarding the 2024 amendments to the Low Carbon Fuel Standard (LCFS). We strongly support the increased focus by the California Air Resources Board (CARB) on ensuring that the fuels used in the LCFS program are produced in the most sustainable manner. We are strong advocates for rigorous lifecycle accounting (LCA) methods that precisely quantify the lifecycle emissions from biofuels and that recognize and incentivize lower carbon feedstocks. From a LCA perspective, “corn is not just corn.” To the contrary, corn and other crops can be grown on soil using a wide variety of techniques and inputs that substantially impact real-world carbon intensity (CI). We encourage the Board to direct staff to dedicate time and resources to analyze the lifecycle issues pertaining to crop-based feedstocks and report back to the Governing Board. This focused research, analysis, and reporting by CARB staff will enable and inform potential expansions to the LCFS regulations to include field-based practices, the recognition of soil organic carbon, and the harnessing of other CI-reducing techniques and technologies with the next update to the LCFS regulations.

The supporters of this letter represent a range of fuels, feedstocks, and technologies including agriculture trade associations, crop input companies, developers of LCFS credits, and other low-carbon fuel industry participants. This diverse group is united in its interest to provide high-quality fuels to the California transportation market with the lowest environmental footprint. This includes practices that encourage producers to reduce nitrous oxide and methane emissions and increase the carbon sequestered in the soil.

In 2018, the Intergovernmental Panel on Climate Change (IPCC) published a Special Report on the impacts of a 1.5°C global warming above pre-industrial levels. This report found that achieving global carbon neutrality by mid-century is critical to avoiding the most catastrophic impacts of climate change.¹ Moreover, the IPCC Sixth Assessment identified land-based emissions mitigation as “the only [sector] in which large-scale carbon dioxide removal may currently and short term be possible” and that it is

¹ IPCC, 2018: Summary for Policymakers. In: Global Warming of 1.5°C. An IPCC Special Report on the impacts of global warming of 1.5°C above pre-industrial levels and related global greenhouse gas emission pathways, in the context of strengthening the global response to the threat of climate change, sustainable development, and efforts to eradicate poverty [Masson-Delmotte, V., P. Zhai, H.-O. Pörtner, D. Roberts, J. Skea, P.R. Shukla, A. Pirani, W. Moufouma-Okia, C. Péan, R. Pidcock, S. Connors, J.B.R. Matthews, Y. Chen, X. Zhou, M.I. Gomis, E. Lonnoy, T. Maycock, M. Tignor, and T. Waterfield (eds.)]. Cambridge University Press, Cambridge, UK and New York, NY, USA, pp. 3-24, doi:10.1017/9781009157940.001.

“crucial to limit climate change and its impacts.”² The latest science finds that it is increasingly likely that the 1.5°C target will be exceeded³ and that large-scale greenhouse gas (GHG) reductions are critical to meeting the target.⁴

036.2

The recent modifications proposed by CARB to the LCFS regulations (the “15-Day Changes”) add stringency and oversight to the LCFS program and have the potential to facilitate more precise and accurate CI analysis. Unfortunately, certain aspects of the 15-Day Changes leverage this precision only to the detriment of biofuel CI scores rather than authorizing the adjustment of CI scores favorably or unfavorably depending on real-world performance. We encourage CARB to continue to embrace the fundamental LCFS principles of technology-neutrality and science-based performance measurement rather than introducing CI bias into the LCFS program structure.

In this final stage of the LCFS rulemaking, CARB has the opportunity to refine the 15-Day Changes so that the LCFS program will disincentivize less-sustainable biofuels and incentivize more-sustainable biofuels. Such an approach has the potential to expand and enhance the global sustainable fuels market and minimize the risk of unintended consequences at a time when the rapid phase down of petroleum-based fuels is an environmental imperative that has been codified into California law.

Already a leader in the response to climate change, CARB’s 2022 Scoping Plan Update details sector-by-sector roadmaps for California to achieve carbon neutrality by 2045 or earlier. One critical roadmap is for the aviation sector, where the scenario includes a transition of 20% of aviation fuel demand to zero-emission technologies by 2045 and sustainable aviation fuel (SAF) for the rest.⁵

036.3

The agriculture sector can play a significant role in helping California meet the goal of generating SAF. Practices including optimizing fertilizer application, reducing tillage, using enhanced-efficiency fertilizers, double-cropping and planting cover crops have the potential to reduce the CI of fuels by more than 40 g CO₂e/MJ.⁶ These practices are not limited to their GHG benefits; they provide “additional ecosystem service benefits, including watershed protection, increased biodiversity, and improved soil health and fertility.”⁷

⁶ Liu, X. et. al. (2020) Shifting agricultural practices to produce sustainable, low carbon intensity feedstocks for biofuel production. *Environ. Res. Lett.* <https://doi.org/10.1088/1748-9326/ab794e>

⁷ *ibid.*

There is significant opportunity to increase the adoption of these practices on U.S. farmland. A recent study found that no-till or strip-till is practiced on only 30% of cropland.⁸ Furthermore, these practices are not always maintained by farmers. While no-till practices were adopted on almost 8 million acres between 2012 and 2017, farmers on more than 5 million acres discontinued no-till during the same period for a net gain of only 3 million acres.⁹ Another practice that can reduce GHG emissions, the planting and cultivation of cover crops, has an even lower adoption rate than no-till. Unfortunately, only 5.1% of the approximately 300 million cropland acres planted cover crops in 2017.¹⁰ The LCFS program has the potential to provide a strong and long-term incentive for farmers to implement no-till, cover crops, double-cropping and other similar practices.

036.4

CARB is also proposing that all crop-based feedstock used for LCFS fuel pathways must obtain third-party sustainability certification by January 1, 2028, under an approved certification system. These certification systems “must consider environmental, social, and economic criteria,” an expansive list that is likely to place a significant financial burden and obligations on farmers that elect to continue to supply feedstocks for biofuels production. Given the broadness of these requirements and the significant additional administrative burden this will impose on farmers and the producers who buy from them, we urge CARB staff to clarify the specific environment, social and governance (“ESG”) criteria that these certifications are meant to address in the context of crop-based feedstocks and to seek further stakeholder feedback on development of these criteria after this rulemaking. This requirement is consistent with the verification of land use under the EU Renewable Energy Directive (RED). Under international policies such as RED, CORSIA, and RenovaBio, fuel producers are required to collect farm level data and are thus able to benefit from improved farming practices. CARB should also provide a 3-year grace period for any certification system that it plans to suspend or remove, to give stakeholders sufficient time to get certified under a different certification system.

036.5

Additionally, sustainability certifications that address these ESG criteria will often also include a rigorous GHG accounting for feedstock CI calculation. For example, both the Roundtable for Sustainable Biomaterials (RSB) and the International Sustainability & Carbon Certification (ISCC) are existing sustainability certification systems that may meet the requirements outlined in Section 95488.9(g); both systems have already developed GHG methodologies for feedstock CI calculation.^{11,12} If CARB requires farms to go through the rigorous process of third-party sustainability certification, then we respectfully request that CARB also consider accepting a feedstock CI score that is calculated and verified in accordance with certification system standards. This would provide a mechanism to compensate farmers adopting climate smart practices for the additional work of certification. Specifically, we ask the Board to

direct staff to evaluate existing GHG calculation methodologies and develop guidance around feedstock CI calculation.

036.6

We are asking the Board to direct staff to investigate how the agriculture sector can be optimized to produce low-carbon biofuels to meet the state's SAF goal. Specifically, we are requesting the Board to prioritize policy discussions and the associated technical analysis related to low-carbon feedstocks for the production of SAF. This technical analysis should include a thorough lifecycle analysis to determine the extent to which supplies of sustainable biofuels produced from various feedstocks can be expanded while not converting additional land to agricultural uses. This technical analysis should be informed by the other primary LCA methodologies including Argonne GREET. To ensure the timely analysis of this information, we request that the Board direct staff to report back to the Board by the end of 2025 on the results of lifecycle analysis and progress toward developing policies to encourage the production of SAF.

For the foreseeable future, liquid fuels will be required to power the majority of airflight thus necessitating a rapid expansion in the supply of SAF. In order to create demand for the fuels with the lowest actual CI possible, ARB needs to account for and incentivize field-based practices. Fortunately, the benefits of these sustainable agricultural practices go beyond their GHG savings, positively impacting our water, ecosystems, and soils.

CARB has been an international leader in developing and implementing programs to reduce GHG emissions across the California economy and the inclusion of climate smart agricultural practices will continue the State's leadership throughout the country. We thank CARB for this opportunity to offer these comments and look forward to continued collaboration to implement policies and strategies that further reduce emissions from the transportation sector.

Sincerely,

Re: Proposed 15-Day Changes to the Proposed Regulation Order

Dear Chair Randolph and Members of the California Air Resources Board:

The American Soybean Association (ASA) appreciates the opportunity to comment on the proposed 15-day changes (15-Day Changes) to the Low Carbon Fuel Standard (LCFS) program. ASA has welcomed engagement with the California Air Resources Board (CARB) and staff throughout this multi-year process to update the LCFS program.

ASA represents approximately 500,000 U.S. soybean farmers on domestic and international policy issues important to the soybean industry and has 26 affiliated state associations representing 30 soybean-producing states. U.S. soybean growers have long been committed to producing the world's food, feed, fuel, and thousands of bioproducts in a sustainable and climate-smart way.

CARB's 15-Day Changes to revise the LCFS was quite surprising, as it diverged significantly from what was included in the Initial Statement of Reasons (ISOR) and the April 10 public workshop. Of top concern for ASA is a proposal that would cap the use of virgin vegetable oils as feedstocks for biofuels at 20 percent by company. Another significant concern for ASA remains regarding sustainability guardrails: how sustainability guardrails will work with current soybean reporting infrastructure. ASA continues to oppose CARB using data over two decades old to set carbon intensity (CI) scores for soy. ASA opposes discretionary authority provided to the Executive Officer to stop accepting new pathways for biomass-based diesel. ASA is also concerned that the aggressive step-down of CI benchmarks, combined with other changes, will reward importers of waste feedstocks while penalizing U.S. farmers.

037.1
037.2
037.3
037.4
037.5

As CARB seeks to finalize updates to the LCFS program in the coming months, ASA strongly encourages that these updates are based on science as required by AB-32. The determination to make such drastic changes to previous CARB proposals so late in the game was shocking to the soybean and biofuels industries. For CARB to move from arguing that a vegetable oil feedstock cap was detrimental to the goals of the LCFS based on the science at the April public workshop, to now recommending a wildly stringent cap on those feedstocks without data or science, is quite difficult to comprehend given the intention of the LCFS to be driven by science. CARB's analysis showed that a feedstock cap would increase greenhouse gas (GHG) emissions in California, which is contrary to requirements in AB-32.

Vegetable Oil Feedstock Cap

The addition of a virgin vegetable oil feedstock cap in the 15-Day Changes was alarming to ASA, and clearly to the entire biofuels value chain. In the April 10 workshop on proposed LCFS updates, CARB noted that liquid fuels would continue to be needed in the transportation sector in California for at least the next decade. CARB also argued that the imposition of a virgin vegetable oil feedstock cap would have an increase in the utilization of petroleum diesel in the transportation sector (Figure 1).

Figure 1

Source: California Air Resources Board

Currently, virgin vegetable oils make up approximately thirty percent of the feedstock portfolio used in the California biofuels market. In its 15-Day Changes, CARB has recommended imposing a combined twenty percent cap on vegetable oil feedstocks, per company. However, in its own presentation on April 10, CARB staff noted that it anticipates

nearly eighty percent of vehicles on the road in California to still use combustion engines by 2030. Further, CARB staff noted that such a stringent cap on virgin vegetable oils will result in 2.8 billion gallons of fossil diesel utilization in 2030, versus 1.9 billion gallons using a scenario that does not impose the cap proposed by the Environmental Justice Advisory Committee (Figure 1).¹ This is because biofuels made with virgin vegetable oils displace a significant volume of fossil diesel, acting as a bridge fuel that will naturally move to other markets as CI thresholds decline in the LCFS program.

Using CARB's own analysis, imposing a cap on virgin vegetable oils, which already receive an unfavorable score through old modeling data and would face restrictions through other sustainability measures in the proposal, will lead to an increase in fossil diesel usage compared to the status quo by 2030. Without proof to the contrary, CARB has determined that more fossil diesel on the market in 2030 as opposed to increasing virgin vegetable oil biofuel usage is better for the long-term goals of the LCFS. However, the Intergovernmental Panel on Climate Change notes in its sixth assessment report that using existing low carbon technologies is a crucial component to avoiding catastrophic temperature increases, stating that "biodiesel and renewable diesel fuels...could offer important near-term reductions" for several technologies, including buses, rail, and long-haul trucking.²

As steps are taken to address climate change both today and in the long-term, virgin vegetable oil biofuels will remain an important tool in the toolbox in both existing diesel engines and new ultra-low carbon liquid fuel engine technologies. Carbon emissions continue to accumulate, and increased utilization of biofuels can help mitigate increasing emissions occurring at present.

ASA is concerned that a 20 percent soybean and canola cap by company could be much more restrictive in practice. Some biofuel producers utilize little to no soybean or canola oil and will likely have spare allotment. Other biofuel producers use almost all soybean oil and have few options to switch. The 20 percent cap would largely shut them out of the California LCFS program. The combination of these extremes could easily produce a result much more restrictive than the 20 percent level initially implies.

037.6

We also note that the proposed vegetable oil cap contradicts the statutory guidance in AB-32, which establishes the authority for the LCFS. We refer to the following sections of AB-32:

¹ California Low Carbon Fuel Standard Workshop, Staff Presentation, Slide 23. April 10, 2024.
<https://ww2.arb.ca.gov/sites/default/files/2024-04/LCFS%20April%20Workshop%20Slides.pdf>

² Jaramillo, P., S. Kahn Ribeiro, P. Newman, S. Dhar, O.E. Diemuodeke, T. Kajino, D.S. Lee, S.B. Nugroho, X. Ou, A. Hammer Strømman, J. Whitehead, 2022: Transport. In IPCC, 2022: Climate Change 2022: Mitigation of Climate Change. Contribution of Working Group III to the Sixth Assessment Report of the Intergovernmental Panel on Climate Change. https://report.ipcc.ch/ar6wg3/pdf/IPCC_AR6_WGIII_FinalDraft_Chapter10.pdf

38501(h)

It is the intent of the Legislature that the State Air Resources Board design emissions reduction measures to meet the statewide emissions limits for greenhouse gases established pursuant to this division in a manner that minimizes costs and maximizes benefits for California's economy, improves and modernizes California's energy infrastructure and maintains electric system reliability, maximizes additional environmental and economic co-benefits for California, and complements the state's efforts to improve air quality.

38560.5(c)

The regulations adopted by the state board pursuant to this section shall achieve the maximum technologically feasible and cost-effective reductions in greenhouse gas emissions from those sources or categories of sources, in furtherance of achieving the statewide greenhouse gas emissions limit.

38562(b)(1)

Design the regulations, including distribution of emissions allowances where appropriate, in a manner that is equitable, seeks to minimize costs and maximize the total benefits to California, and encourages early action to reduce greenhouse gas emissions.

Multiple sections of the authorizing language for the LCFS instruct CARB to achieve the maximum technologically feasible reductions in GHG emissions. As CARB's own analysis presented in the April workshop has demonstrated, that is achieved without a soybean and canola feedstock cap. CARB's 15-Day Changes to institute the cap clearly contradicts the authorizing language of the LCFS and leads to worse emission and air quality³ outcomes for the state.

AB-32 also instructs CARB to minimize costs. Markets naturally do this, and CARB's 15-Day Changes that would implement a binding cap would increase costs. This is incongruous with the legislative mandate.

Furthermore, ASA is perplexed that CARB is partially justifying this decision by making sure that other states retain access to biomass-based diesel. Section 38501(h) explicitly directs CARB to maximize benefits in California. Even if current law were waived, CARB has not shown that the cap would benefit other states. ASA remains puzzled that CARB singles out soybeans and canola-based biomass-based diesel in the LCFS program for adverse treatment while also remaining concerned that other states retain access to these fuels.

Sustainability Guardrails

037.2 cont While ASA was very surprised to find the feedstock cap in the 15-Day Changes, we were also surprised to find the sustainability guardrails retained with the cap. The cap,

³ <https://cleanfuels.org/wp-content/uploads/trinity-nbb-transportation-health-risks-review-v1-03.pdf>

sustainability guardrails and Indirect Land Use Change score all additively, and redundantly, address land use change. This has the equivalent effect of giving soy and canola a much higher CI score despite lack of evidence from the LCA modeling.

As CARB seeks to formalize sustainability requirements first presented at the April 10 workshop, ASA appreciates that CARB has developed a timetable and phase-in requirements so that industry can adapt to changes. However, if CARB's goal is to address land use change concerns, they are already capturing land use change risk by the LUC score penalty from the GTAP model. From an aggregate standpoint, whether biofuels were produced from a U.S. acre in production in 2007 or thereafter is largely irrelevant for carbon intensity. The total change in the system is the important component. Simply shifting eligibility among domestic acreage only adds costs without a program benefit.

037.6 cont Furthermore, this additional cost without benefit contradicts language authorizing the LCFS. Section 38562 (b)(7) of AB-32 directs CARB to, "Minimize the administrative burden of implementing and complying with these regulations." Adding supply chain traceability to a bulk delivery system adds significant administrative burden without changing the GHG emissions of the pathway. As aforementioned, GTAP modeling captures land use change, so the additional, and potentially significant, administrative burden of the guardrails contradicts the statutory language of AB-32.

037.7 CARB's efforts could be improved and enhanced by outreach to U.S. Department of Agriculture (USDA) personnel who have engaged in activity regarding climate-smart farming practices. USDA recently closed a comment period on its Request for Information on Procedures for Quantification, Reporting, and Verification of Greenhouse Gas Emissions Associated with the Production of Domestic Agricultural Commodities Used as Biofuel Feedstocks. With the information received, USDA seeks to quantify and qualify the benefits of climate smart agriculture practices for biofuel programs at the state, national, and international level. Communication between CARB and USDA could be enlightening regarding ongoing agricultural sustainability practices.

Through the current sustainable aviation fuel (SAF) federal tax credit (40B), the CI of soy-based biofuels can improve through no-till and cover cropping on the field that the soybeans were produced. Other farming practices like low-till, nutrient management, enhanced efficiency fertilizers, buffers, wetland and grassland management, tree planting on working lands, planting for higher carbon sequestration, and soil amendments all can and should be accounted to assign a lower CI score to an agricultural feedstock. USDA already tracks all these practices through several of their managed conservation programs. In addition, there are a variety of other practices that scientifically lower the CI score of soybean feedstocks for biofuels, and USDA is actively working to develop mechanisms to account for those.

Given this work, ASA urges CARB to reconsider its proposed sustainability requirements to allow soybean growers the opportunity to participate in the California biofuels market

through innovative and climate smart agriculture practices. CARB should look to programs already developed through farmer input and provide improved scoring for feedstocks that employ sustainability practices to minimize the changes in comparative costs.

Outdated Scoring

037.3 cont

For the last several years, ASA has urged CARB to update its scoring methodology for soy-based biofuels, which uses outdated data that does not represent current U.S. soybean farming practices and environmental footprint.

ASA is concerned that without a comprehensive update to the Global Trade Analysis Project model for biofuels (GTAP-BIO) that CARB utilizes, soy-based feedstocks will be phased out of the LCFS even without the additional limitations being proposed in the 15-Day Changes. Current data indicates a much lower CI score for soybeans, as growers continue to improve soil practices, limit water use, lower on-farm emissions and more. On the one hand, CARB is recommending stringent sustainability guardrails for U.S. soy, but on the other hand is still on track to likely phase-out soy-based biofuels from credit generation by approximately 2035 or sooner.

CARB has indicated plans to update all major models for lifecycle emissions calculations except for GTAP-BIO in the updated LCFS rulemaking. The soy industry has made vast improvements in sustainability and efficiency over the past two decades, with even greater improvement goals ahead. At the same time, CARB continues to rely on a 2014 model that uses data from 2004. The ILUC score accounts for half or more of the CI score for soy-based biofuels. CARB's current modeling assigns soy biomass-based diesel with an ILUC impact of 29.1g CO₂e/MJ whereas updated results from the model used to calculate ILUC scores indicate a value of between 9 and 10 gCO₂e/MJ for soybeans⁴. The recently released 40BSAF-GREET 2024 model has an ILUC score of 12.2 for soy-based sustainable aviation fuel in federal programs.

The benefits of the LCFS can only be achieved if CI values are accurately captured. If land use change concerns are large enough to justify sustainability guardrails and capping virgin vegetable oil feedstocks, then the modeling should also be updated to reflect current land use change data.

037.6 cont

ASA remains concerned that CARB's refusal to update ILUC modeling runs afoul of AB-32. 38562(e) of AB-32 states, "The state board shall rely upon the best available economic and scientific information and its assessment of existing and projected technological capabilities when adopting the regulations required by this section." As GTAP has been updated with more recent data and CARB has not yet updated the LCFS program despite

⁴ Taheripour, F., Karmai, O., and Sajedinia, E. (2023). *Biodiesel Induced Land Use Changes: An Assessment Using GTAP-BIO 2014 Data Base*. Purdue University

years of requests, ASA is concerned that CARB is not utilizing the best available science as required by statute.

ASA continues to urge CARB to update its GTAP model to align with other modeling changes being made.

Entities Eligible to Apply for Fuel Pathways

037.4 cont ASA is concerned about CARB's 15-Day Changes to give the Executive Officer discretion to stop accepting new pathways for biomass-based diesel starting in 2031. ASA does not understand what statute of AB-32 is served, or justifies, this arbitrary and highly selective change. CARB must under statute minimize costs and maximize GHG reductions. It is unclear how this is served by rejecting new pathways. In fact, the requirements of current law are met by allowing the most available pathways. If these pathways cannot achieve cost-effective GHG savings, they will not be utilized by the market in the LCFS. In essence, an increase in pathways can only serve to improve GHG benefits in California. Singling out a single fuel for prejudicial treatment is baffling given the goals of the LCFS and the authority that establishes it. Executive Order S-01-07 establishing the LCFS specifically cites diversity of fuels as a motivation for the program, and this proposal contradicts one of the stated purposes of the program.

Updating Carbon Intensity Benchmarks

The 15-Day Changes included a more aggressive update to CI benchmarks under the LCFS program, shifting from a five percent CI reduction for diesel fuel to nine percent starting in 2025. However, CARB is setting ambitious benchmarks while limiting the available feedstock portfolio for biomass-based diesel. Instead of seeking to achieve these benefits through domestically sourced feedstocks regulated and overseen by the U.S. government, CARB is gambling on imported feedstocks they are assigning lower CI scores to, though the provenance and actual CI of those feedstocks remains veiled from proper stringent oversight. Strong concerns remain about the integrity of these imports.

The aggressive step-down of CI benchmarks in the next few years, paired with proposed limitations on domestic biomass-based diesel feedstocks creates a system that ultimately will reward China, Brazil, or other major importers of waste feedstocks while penalizing U.S. farmers. ASA believes that our domestic clean energy sector wins when programs utilize all tools in the toolbox and support domestic fuel security.

Conclusion

ASA is encouraged by the continued successes of programs that support the development of cleaner, low-carbon fuels. However, it is critical that CARB finalizes updates in a way that does not arbitrarily exclude agricultural feedstocks through policies that are not science-based and run afoul of CARB's mandate, including capping vegetable oil feedstocks and

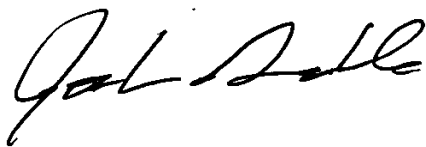

applying onerous sustainability guardrails that add cost without rewarding farming practices that lower CI.

CARB's 15-Day Changes, released in August 2024, is deeply concerning. CARB has singled out soybean and canola oil for adverse, prejudicial treatment. No scientific evidence is ever given for this treatment. In fact, CARB has refused to update the science as required by law for these feedstocks. This alone calls into question the integrity of a performance-based LCFS. On top of this, CARB is now proposing feedstock caps, traceability requirements and authority to reject applications for these fuels produced from them. CARB has not shown any scientific justification. In fact, the LCFS is already over penalizing soy for any land use change requirements.

CARB is required under law to achieve the maximum technically feasible and cost-effective reductions in GHGs. Markets minimize costs through the proper allocation of inputs. CARB's 15-Day Changes restricts those markets, thereby increasing GHG emissions and increasing costs in the program. CARB's own analysis has shown that GHG emissions are increased through a feedstock cap. While CARB is required under AB-32 to consider the cost effectiveness of the LCFS regulations, it has noticeably not shown how this proposal will affect costs. Not only does this proposal abandon a science-based approach, but it also appears to be at odds with CARB's statutory duties. We strongly urge CARB to conduct analysis on this proposal and hold a public hearing to allow for discussion prior to finalization.

ASA is eager to continue working with CARB to support the role of agriculture in diversifying the fuel supply while reducing GHGs and increasing clean air in California and beyond. On behalf of U.S. soybean farmers, we appreciate the opportunity to comment and look forward to collaborating with CARB and other relevant stakeholders on implementation of policies that expand the use of soy-based biofuels and market opportunities for soybean farmers.

Sincerely,

RE: Proposed Low Carbon Fuel Standard Amendments (August 12, 2024 release)

Dear Chair Randolph and Members of the Board:

The Center for Biological Diversity submits the following comments on the California Air Resources Board's (CARB) proposed August 12, 2024 amendments to the Low Carbon Fuel Standard (LCFS). Please note that we are submitting the references cited herein for CARB's convenience. Those references are available here:

<https://diversity.box.com/s/8jcli9f2vwyof9cbq1qx5sna1m0d0hsb>.

I. CARB must end LCFS credits to out-of-state projects conducting EOR associated with CCS.

As we called for in our February 2024 comments, and as urged by the Environmental Justice Advisory Committee (EJAC), CARB must end credits to projects outside of California that produce oil using captured carbon dioxide (CO₂).

The EJAC specifically directed CARB staff to "Prohibit enhanced oil recovery as an eligible sequestration method."¹ Crediting CO₂-based enhanced oil recovery (EOR) is also at odds with California law. SB 905 (2022) prohibits operators in California from utilizing CO₂ from carbon capture and storage (CCS) in EOR.² Yet while the State decidedly took a stand against CCS-associated EOR within California, the LCFS door remains open to incentivizing this same harmful practice *outside* the State's borders.

Under the LCFS CCS Protocol, applicable CCS projects are those "that capture carbon dioxide (CO₂) and sequester it onshore, in either saline or depleted oil and gas reservoirs, or oil and gas reservoirs used for CO₂-enhanced oil recovery (CO₂-EOR).³ Thus, non-California regulated entities conducting EOR will be compensated by CARB for causing

¹ EJAC, Recommendations to the California Air Resources Board (CARB) on the Low Carbon Fuel Standard Regulation Updates (version August 28, 2023), <https://www.arb.ca.gov/lists/com-attach/1-lcfs2024-VjMFaQNjUGABWFA0.pdf>.

² SB 905 at Section 4(b) (Caballero, 2022), to be codified in Cal. Pub. Res. § 3132(b); see also Senate Bill 1314 (Limón, 2022) (also signed into law and prohibiting EOR using CO₂ derived from CCS operations).

³ CARB LCFS CCS Protocol at 7 (Aug. 13, 2018) (emphasis added). CCS projects are eligible for LCFS participation under the Tier 2 pathway. See 17 Cal. Code Regs. § 95488.1(d)(7)(B).

environmental and community health damage elsewhere. This asymmetry is simply wrong and must be corrected by removal of CCS-related EOR from the LCFS.

It is not too late to close the out-of-state LCFS EOR loophole. Below are possible changes to accomplish this:

A. Remove the underlined language below from the LCFS CCS Protocol:

- The CCS Protocol applies to projects “that capture carbon dioxide (CO₂) and sequester it onshore, in either saline or depleted oil and gas reservoirs, or oil and gas reservoirs used for CO₂-enhanced oil recovery (CO₂- EOR).”

B. Update the following regulations:

- In 17 Cal. Code Regs. section 95490(a)(1) (stating that eligible entities include “Alternative fuel producers, refineries, and oil and gas producers that capture CO₂ on-site and geologically sequester CO₂ either on-site or off-site”), make clear that, to be eligible, capture and sequestration of CO₂ does not include EOR.
- In 17 Cal. Code Regs. section 95490(a)(2) (stating that “If CO₂ derived from direct air capture is converted to fuels, it is not eligible for project-based CCS credits. However, applicants may apply for fuel pathway certification using the Tier 2 pathway application process as described in section 95488.7”), make clear that CO₂ derived from direct air capture may not be used for EOR.

II. **CARB must not encourage continued and/or prolonged use of fossil fuels through its petroleum-plus-CCS phase-out loophole.**

In the amendments proposed earlier this year, CARB explained it is seeking to “encourage existing petroleum facilities to deploy”⁴ CCS and to allow these fossil fuel projects to continue to generate credits beyond the phase-out date of December 31, 2040.⁵ CARB kept this loophole open in its August 2024 proposal, in its “Innovative Crude” section.⁶ Specifically, for all other “Innovative Crude” crediting methods *other than* CCS, credits will end “no later than December 31, 2040.”⁷ Credits for crude using CCS, however, continue indefinitely.

This loophole evidences a fundamental misunderstanding of how CCS works. CCS does not wholly eliminate GHG emissions from any industrial process. Simply putting CCS onto a refinery does not mean the climate intensity of that production is acceptable. No CCS project has, or is, promising 100% CO₂ capture. While modeling often relies on an

⁵ LCFS Proposed Amendments, Appendix E at page 93, X.19, proposed for §§ 95489(c)(5), 95489(d)(5)(C), 95489(e)(5)(B), and 95489(f)(5)(B).

⁶ LCFS Proposed Amendments, § 95489(c)(1)(A)2 (defining general requirements for “innovative crude”).

⁷ LCFS Proposed Amendments, § 95489(c)(5).

assumed 90% capture rate, this is far from what is achieved in reality.⁸ One recent real-world California example is the Aera CarbonFrontier project proposed in Kern County. That Project's CEQA review shows that for at least the first seven years, the project will be *net positive* in GHG emissions, even while running CCS on its natural gas-fired power plants.⁹

Providing a phase-out exemption for fossil fuel projects in California invites failed and under-delivering polluting facilities to continue to pollute communities and the climate, all without any end in sight. The Board must not set California's climate goals back by allowing crude operations using CCS to receive credits far beyond the 2040 phase-out date.

III. CARB Should Limit Incentives for Hydrogen and Restrict Crediting to Renewable-Fueled Hydrogen

038.3

We appreciate that the latest proposed amendments remove hydrogen produced from fossil gas from credit generation eligibility. However, given the climate imperative to phase out fossil fuels expeditiously, waiting until the end of 2030 to remove credit eligibility for fossil hydrogen is a mistake. Instead, credit eligibility should be removed from fossil hydrogen immediately upon completion of the current LCFS amendment process. Further, as we discussed at length in our comments from February 2024, limitations on hydrogen should extend beyond fossil hydrogen to that produced from biomass and biogas as well. Instead, with the proposed amendments, hydrogen produced through steam methane formation of biogas and biomass gasification would still be credited under the LCFS.

038.4

Steam methane reformation of biogas, including that paired with CCS, and gasification or pyrolysis of biogenic resources (e.g. woody biomass and biogas), should be explicitly excluded because of their associated harms. Woody biomass, as a feedstock (e.g. in gasification or pyrolysis) or energy source to make hydrogen, harms the climate,¹⁰ communities, and ecosystems with significant emissions of CO₂¹¹ and criteria and other health-harming pollutants.¹² As the IPCC, the federal Environmental Protection Agency's

Science Advisory Board, and other scientists have established, wood bioenergy should not be assumed to be carbon neutral;¹³ Using methane to produce hydrogen increases methane leakage risk, with one biogas plant study finding that leaked methane can be as high as 14.9% of total methane production.¹⁴ There is also a significant pollution burden from biogas facilities near communities.¹⁵ The LCFS should not incentivize and subsidize feedstocks that harm the climate and pollute the same communities that have historically borne the pollution burden of our status quo energy portfolio.

At most, the LCFS should only allow hydrogen production where hydrogen generators are powered by *new* sources of zero-emissions electricity (additionality or incrementality) that directly supply the grid electrolyzers are connected to (deliverability), within the same hour that generators are running (hourly matching).¹⁶ This is reaffirmed by the IRS's proposed rulemaking in which hydrogen producers could only receive the Section 45V clean hydrogen production tax credit by adhering to the 3 pillars.¹⁷ However, CARB staff's proposed amendments would allow the continued use of problematic feedstocks like dairy biogas and biomass, despite the emissions and environmental burdens they carry.

Even if produced via electrolysis in adherence to the three pillars, the use of hydrogen should be limited to those sectors without a viable present-day alternative, such as replacing existing dirty gray fossil-based hydrogen, crude oil refineries, or steel

manufacturing.¹⁸ Whenever direct electrification can be used instead of hydrogen, as with vehicles, it's the demonstrably better choice. Electricity made from solar and wind is more efficient, lower cost, lower in CO₂ emissions, and a mature energy resource.¹⁹ The LCFS should be incentivizing full electrification rather than hydrogen which is projected to have only a limited role in a carbon-free future.²⁰

IV. CARB Should Strictly Limit the Use of Crop-based Biofuels.

038.5

The latest amendments do little to address the concerns we raised in our February 2024 comments about the continued sanctioning of crop-based biofuels. The most recent amendment put forth by CARB is to “provide credits for biomass-based diesel produced from virgin soybean oil and canola oil for up to 20 percent of annual biomass-based diesel reported on a company-wide basis.” While this is a limitation on crediting for two problematic feedstocks, the measure is too limited in scope. It still allows crediting for the use of some soybean oil and canola oil, and it does not preclude expanded use of crop-based feedstocks outside of soybean oil and canola oil such as corn and other grains. Thus, crop-based biofuels are still, in effect, incentivized, despite the known risks.

Relying on crop-based biofuels results in both direct and indirect land use change emissions that worsen the climate crisis, counter to their intended purpose. For example, in an analysis of 17 potential alternative-fuel pathways looking at different feedstocks, technologies, and world regions, researchers found that using virgin vegetable oil had the highest indirect land-use change emissions because of links to high deforestation and peat oxidation in southeast Asia, driven by palm expansion.²¹ In the same study, it was found that producing biofuels from any vegetable oil in any region, including corn and soy in the U.S. context, would encourage palm oil expansion and associated peat oxidation in southeast Asia due to substitutions among vegetable oils and international trade.²² Thus,

038.5 cont high indirect land-use change emissions from virgin vegetable oil biofuel pathways undermine some, if not all, of the greenhouse gas savings from these fuels.²³

There could also be unforeseen harms to communities and the environment. For instance, a 2017 study found that increased production of crop-based biofuels heavily contributes to global water scarcity and is not the best option for bioenergy.²⁴ Meanwhile, a 2016 study found that, just in the United States, about 140 million people could be fed with the resources for bioethanol, and about 10 million people could be fed with the resources for biodiesel, indicating the threat of crop-based biofuels to global food security.²⁵ Also, with increased production of crop-based biofuels, there is the potential for increased nutrient and pesticide runoff to surface waters and contamination of groundwater due to crop cultivation.²⁶

Another harm from crop-based biofuels is the impact to communities from biofuel refining and resulting criteria pollutant emissions. Crop-based biofuels are most often produced using the Hydroprocessed Esters and Fatty Acids (HEFA) pathway, which reacts crop feedstock with hydrogen at high temperatures and pressures to form fuel.²⁷ Because of the high temperatures and extremely high pressures, runaway increases in temperature are common, which result in operators flaring refinery gases to bring conditions back under control. However, in doing so, toxic and smog-forming air contaminants are emitted such as particulate matter, sulfur dioxide, and hydrocarbons that worsen air quality. Because HEFA processes require more hydrogen than petroleum refining, it is expected that hydro-conversion-related flaring would be worse with HEFA refining, along with explosion and fire risk.²⁸ With refineries most often sited in low-income communities and communities of color,²⁹ environmental justice harms are exacerbated by the presence of HEFA refining and would worsen with crop-based biofuel expansion.

Many of the risks associated with crop-based biofuels would have been mitigated if CARB had accepted the amendments in the Comprehensive Environmental Justice Scenario proposed by CARB's Environmental Justice Advisory Committee (EJAC). The proposal was to "[c]ap the use of lipid biofuels (commonly known as crop-based biofuels) at 2020 levels, about 855 million gallons, pending an updated risk assessment to determine phase out

timelines for high-risk, crop-based feedstocks.”³⁰ Capping the use of lipid biofuels could spur the development of less deleterious alternatives such as the use of true waste products in biofuel production such as municipal solid waste and push the needed transition to battery-electric in shipping and trucking,³¹ all while preventing the expansion of crop-based biofuel harms. Instead, crop-based biofuels are treated as the unavoidable alternative to fossil fuels, locking in the threat to communities and the environment. CARB should revisit the amendments originally proposed by EJAC.

V. CARB Should Add Conventional Jet Fuel as a Deficit-Generator But Add Strong Guardrails on Crop-Based Biofuels.

The latest amendments completely remove conventional jet fuel (“CJF”) from consideration for inclusion under the LCFS. We supported the inclusion of CJF for intrastate flights, as put forth in the previously proposed amendments, and beyond that supported the inclusion of all CJF combusted in and over California, including by interstate and international flights. The latest amendments constitute a failure in holding the aviation industry accountable for its emissions.

It is beyond time to end the unfair advantages given to CJF that perpetuate the industry’s use of fossil fuels. Many state policies heavily subsidize the industry’s use of carbon-based jet fuels, which works against the state’s efforts at decarbonizing the sector and allows this fuel to be under-regulated. For example, fuel used in international flights are exempt from sales and use taxes in California, a practice that was estimated to cost state and local governments nearly \$300 million in revenue in 2021-2022.³² Commercial airlines are also exempt from the excise tax for jet fuel, a tax break that costs the state about \$23 million each year.³³ The carveout in the Low Carbon Fuel Standard for conventional jet fuel saves the airlines an estimated \$110 to \$360 million each year³⁴ on the cost of that fuel.

With the latest amendments, CARB is allowing CJF its status as an opt-in fuel to remain. This means that refiners will not be required to reduce the carbon intensity of CJF. Further, the current opt-in model is problematic because it allows alternative aviation fuel producers to generate and sell LCFS credits for revenue, despite the quality of alternative fuel feedstock used. Such alternative aviation fuels (“AJFs”), or so-called Sustainable Aviation Fuels (“SAFs”), are often not truly sustainable, being derived from problematic sources like crop-based feedstocks and other forms of biomass, with which we have already expressed our concerns.

³⁴ State fuel use estimated using DoT T-100 data on available seat miles originating in state & DoT data on national airline fuel consumption for 2019.

Relying on such biofuels results in both direct and indirect land use change emissions that worsen the climate crisis, counter to their intended purpose. Rather than accept the true and full climate costs of aviation and invest more seriously in research for zero-emission technologies like electric aircraft, the industry has set its sights on SAFs, equating to delays in true climate progress in the aviation sector. To minimize harms from the aviation sector, CJF should be fully incorporated in the LCFS—including that for intrastate, interstate, and international flights—while eliminating from crediting crop-based and other problematic biomass biofuels, and only allowing other biofuels that meet strict and transparent sustainability criteria.

The purported reason for not including CJF in the LCFS is that “[a]viation fuel suppliers who would generate deficits under the initial proposal could simply acquire credits to meet that compliance obligation.”³⁵ This is not a valid reason for inaction. Instead, the LCFS program needs a full overhaul where fuels meet stringent criteria for sustainability, and bad actors are unable to buy their way out of true emissions reductions with surplus credits. Amendments should reflect this level of improvement to the LCFS.

VI. CARB Should Remove Woody Biomass Feedstocks from the LCFS Program.

038.7

In the latest amendments, the following definition of “forest biomass waste” is put forth, in place of “forestry residues”: “small-diameter, non-merchantable residues, limited to forestry understory vegetation, ladder fuels, limbs, branches, and logs that do not meet regional minimum marketable standards for processing into wood products.”³⁶ With this definition, CARB staff propose to include forest waste biomass feedstocks as a specified source feedstock. As noted in our previous comments, the allowance of any forest-derived material, whether designated as “waste” or “residues,” is ultimately problematic, polluting, and not climate beneficial.

First, the use of forest biomass to produce biofuels is likely to employ gasification and pyrolysis, two highly polluting techniques. The gasification of biomass at high temperatures (800-1200°C) produces a “syngas” containing large amounts of CO₂, as well as methane (CH₄), carbon monoxide (CO), and hydrogen (H₂), in addition to liquid hydrocarbons and tar, solid char and ash residues, and a wide array of air pollutants. The pyrolysis of biomass additionally produces pyrolytic oil and larger quantities of char.³⁷ Further, biomass gasification and pyrolysis produce a wide range of health-harming pollutants including fine particulate matter, NO_x, SO_x, benzene, toluene and xylenes (BTEX), tars and soot, and persistent organic pollutants such as polycyclic aromatic hydrocarbons (PAHs) (e.g., naphthalene), polychlorinated dibenzo-*p*-dioxins and

³⁵ Proposed LCFS Amendments (August 12, 2024), p. 3.

dibenzofurans (PCDD/Fs).³⁸ Importantly, gasification and pyrolysis of biomass are significant sources of fine particulate matter (PM 2.5) that can penetrate deeply into the lungs, even enter the bloodstream, and cause serious health problems.³⁹ Fine particulate matter pollution is linked to a higher risk of premature death, heart disease, stroke, and aggravated asthma.⁴⁰ With biomass gasification and pyrolysis project proposals slated for Central Valley communities already overburdened with pollution,⁴¹ to sanction forest biomass under the LCFS would contribute to environmental injustice as well, given the overarching threats of air pollution, water pollution, noise pollution, CO₂ leakage, and ecosystem damage.

Similar to biomass combustion, gasification and pyrolysis of biomass produce large quantities of CO₂ as well as methane emissions that worsen the climate emergency. The claim that woody biomass is a carbon neutral feedstock has been thoroughly debunked,⁴² given the lost carbon storage and sequestration from extracting biomass, and the significant CO₂ emissions during biomass processing and gasification, pyrolysis, or combustion.⁴³ The combustion, gasification, and pyrolysis of trees and other forest material—including residues considered to be “waste”—leads to a net increase of carbon emissions in the atmosphere for decades to centuries.⁴⁴

CARB’s proposed specifications for forest biomass waste, however well-intentioned, are too vague to limit forest degradation, nor will they meaningfully reduce the significant

harms to the climate, communities and forests detailed above. Almost all forest logging and thinning projects are done under the justification that they will promote forest health and resilience and/or are needed for fuels reduction. Trees and other forest vegetation of any size can be lopped and masticated into “small-diameter” residues and called “non-merchantable.” Incentivizing the commodification of forest materials under the LCFS will lead to the removal of more biomass from the forest than would happen if these materials were not commodified, threatening forest ecosystems and forest carbon storage. Management practices should instead prioritize leaving residues or wastes in the forest to maintain soil organic carbon, retain vital nutrients in the ecosystem, and support wildlife habitat.

CONCLUSION

August 27, 2024

California Air Resources Board
Liane Randolph, Chair
Steve Cliff, Executive Officer
1001 I Street
Sacramento, CA 95814

RE: Comments Relating to Proposed 15-Day Changes to the Low Carbon Fuel Standard

Dear Chair Randolph and Executive Officer Cliff,

We write to you today with concerns regarding the proposed 15-day changes to the Low Carbon Fuel Standard. Humboldt and Mendocino Redwood Companies collectively own 440,000 acres of sustainably managed forestlands that are third-party certified as being well managed forests. We also own a sawmill in Ukiah, CA and a sawmill and biomass facility in Scotia, CA. The biomass facility uses the by-products from the sawmilling process to create renewable, baseload power for our sawmill complex with excess energy sold to a community choice aggregator in Humboldt County.

040.1

A significant portion of the management of our forests involves the reduction of excess fuels to create fire resilient forests. The acres treated by this work aid the state in achieving the million-acre goal of fuel reduction annually. Yet, it appears that we will be excluded from eligibility for a reduced CI as we will likely be considered as an industrial forestland owner (see 95488.8(g)(1)(A)(3)). If the larger landowners are excluded then that leaves eligible non-industrial forest owners the ability to participate except for the requirement in the 15-day language requiring biomass to be sourced from certified forestlands. Very few smaller forestland owners are third-party certified in California. Therefore, the proposed language disincentivizes biomass material removed from forests across a vast majority of forest ownerships. Obviously with the loss of hundreds of thousands of forested acres to wildfires annually (some years even more) this proposed language is ill-advised.

As we do not own a biomass facility at our sawmill in Ukiah, we are investigating the potential for a \$400 million biomass-to-hydrogen/5MW biomass facility at this location. We have received two grants from Cal Fire to explore this venture. To date, we have completed a techno-economic feasibility study. We are now 50% complete with initial project engineering (FEL2). Upon completion of the engineering package, we will have invested well over \$1,000,000 toward project development. The proposed language threatens the feasibility of this project due to the lack of or reduced eligibility of biomass feedstock from our timberlands and sawmills.

In closing, the biomass portion of the LCFS rulemaking package should be removed so a conversation can begin with forestry professionals and those state agencies and associations with expertise in this area. We look forward to working with CARB to address these issues.

Sincerely,

August 26th, 2024

The Honorable Liane Randolph
Chair California Air Resources Board
1001 I Street
Sacramento, CA 95814

Dear Chair Randolph:

As a developer of dairy digester RNG and biogas-to-electricity projects for EV charging in West Coast states, Promus Energy appreciates the opportunity to comment on the 15-day proposed changes to the CA Low Carbon Fuel Standard (LCFS). Promus values CARB's serious consideration and incorporation of feedback provided by us and other stakeholders as revisions to the LCFS program have been carefully crafted over the last several years. We urge CARB to quickly finalize this urgently needed LCFS program rules package.

Carbon Intensity Target Adjustments

- 041.1 Promus supports CARB recommendation of a 9% CI reduction stepdown in 2025 to rapidly help bring credits and deficits into balance. However, as Promus and other interested parties have pointed out in past comment periods, a more aggressive 2030 target will be needed to prevent potential weakness in the credit market between 2025 and 2030. Promus recommends at least a 39% CI reduction target by 2030 to ensure both near- and medium-term strength in the credit market. A 39% CI reduction by 2030
- 041.2 is consistent with the 2 AAM trigger scenario CARB presented during the April 2024 workshop. While that scenario appeared very promising from the standpoint of drawing down the credit bank and keeping prices strong and stable long-term, the reliance in that scenario on the AAM triggering twice before 2030 adds an element of risk to investors looking at financing low carbon fuels projects. Rather than relying on AAM triggers – important as they are -- Promus believes that setting the 2030 target at a 39% reduction will give investors confidence that the credit market will be strong between now and 2030. CARB's August 12 Modification Uncertainty Scenario 1 with a single 2028 AAM triggering similarly presents short-term weakness in the credit market that would undermine investor confidence. Investors have not yet seen the AAM in action, therefore, setting a more aggressive 2030 target will ensure that credit price strength is not dependent on uncertain triggering of the AAM in the short-term.
- 041.3 The AAM proposed in the updated LCFS rules package is an absolutely essential reform to prevent a repeat of the boom-and-bust cycle that occurred after the 2017 LCFS amendments and to keep credits and deficits in balance. Promus joins other commentors in urging CARB to allow the AAM to trigger as soon as possible (before 2027) to prevent market instability within the next few years after the implementation of the new rules package.

Sustainability Guardrails on Crop-Based Biofuels

- 041.4 Sustainability guardrails on biofuels are appropriate to prevent adverse land use changes and to ensure that priority is placed on waste-based feedstock fuels that have a lower CI than crop-based biofuels. Biofuels play a critical role in decarbonizing the transportation sector, but CARB should place a priority

on leveling the playing field by fulling accounting for all externalities when calculating CI scores for biofuels in the GREET 4 calculator.

Dairy Biogas Avoided Emissions Crediting

041.5

Promus supports CARB's commitment to continue dairy biogas avoided emissions crediting. However, CARB's proposed elimination of a third crediting period raises the question of how dairy methane emission reductions will be sustained after 2045. An assured 20-year crediting period provides a solid foundation for biogas project financing, but the promise of longer-term crediting, or alternative incentives outside of the LCFS program, can prevent emissions backsliding and improve economics and investor interest in this space. Biomethane pathways (to RNG, hydrogen, electricity, etc.) are some of the only fuels that will be credit generators as the CI compliance curve approaches 90% by 2045. CARB's analysis and studies confirm that targeting avoided methane emissions produces the most bang for the buck and that it is needed to achieve the goal of a 90% reduction by 2045.

While CARB's support of avoided emissions crediting is necessary and appreciated, Promus strongly urges CARB to begin outlining and provide clarity around its desire to channel biomethane to other hard-to-decarbonize sectors. CARB has mentioned this multiple times during LCFS workshops over the past few years, but few details have been released thus far. Now that avoided emissions crediting has been reduced from a maximum of three crediting periods to two, digester developers need to understand what the future of their projects will be after their projects no longer receive critical support from the LCFS program. Without adequate incentives for the continued operation of digesters, CARB risks emissions backsliding with digester projects being abandoned after 20 years. Gaining certainty that there will be sectors outside of the transportation market that provide high value for biomethane will further incentivize the capture of methane and help California meet its emissions reductions goals.

We appreciate the opportunity to provide feedback on the proposed changes to the LCFS program and we encourage CARB to finalize the rules quickly and send them to the CARB Board for approval this November.

Thank you for your consideration.

Sincerely,

Dan Evans, President
Promus Energy LLC

Don Gilstrap
Manager, Fuels Regulations

August 26, 2024

Rajinder Sahota
Deputy Executive Officer – Climate Change and Research
California Air Resources Board
1001 I Street
Sacramento, CA 95814

Dear Ms. Sahota:

Re: August 2024 15-Day LCFS Proposal

Chevron appreciates the opportunity to review and comment on the subject Low Carbon Fuel Standard rulemaking proposal.

Chevron is a major refiner and marketer of petroleum products and renewable fuels in the state of California and a regulated party under the Low Carbon Fuel Standard (LCFS). Chevron is also an international producer of lower carbon intensity fuels with a global integrated procurement, distribution and logistics network and 11 biorefineries in the U.S. and Europe.

Key Messages

- 042.1 • Several proposals in this package are not sufficiently related to what was proposed in the original 45-day package to be included in a 15-day package.
- 042.2 • In three years of workshops, hearings, and written comments, no reasonable evidence has been presented that the production of crop-based renewable fuels is causing environmental or economic harm or that the projected growth in such production would lead to those harms. Both the sustainability guardrails and feedstock cap are unnecessary and harmful, without providing benefits to the environment or consumers.
- 042.3 • The proposed sustainability guardrails introduce sweeping changes to the agriculture industry in the United States with almost no time to prepare. Further, they are burdensome and redundant, given the existing indirect land use change factors under the LCFS and the EPA's feedstock documentation requirements under the Renewable Fuel Standard.
- 042.4 • The implementation of the sustainability guardrails in 2026 impacts feedstocks from the 2025 harvest year. This provides little to no time to implement tracking systems in the United States that do not currently exist.
- 042.5 • The proposed cap on fuels produced from soybean and canola oil is arbitrary and political, without basis in science. It has no place in a program that is meant to be market-based and technology-neutral.
- 042.6 • The proposals to limit hydrogen crediting and reduce infrastructure incentives are counterproductive in a time when the industry is facing serious economic headwinds.
- 042.7 • CARB's proposal to accelerate the reduction in biogas and renewable natural gas incentives threatens existing investments and runs counter to state and international climate goals.
- 042.8 • The proposed penalty on an exceedance of a verified CI is excessively punitive.

Chevron Global Downstream LLC
5001 Executive Parkway, San Ramon, CA 94583

Amendments Not Related to the Original Proposal

042.1 cont

CARB has included several proposals in this 15-day package that significantly depart from the content of the original 45-day proposals in January. The 15-day comment period does not provide sufficient time for analysis and response warranted for newly introduced amendments that will result in significant impacts upon the regulated community. Consequently, several of the amendments appearing in the 15-day package are in violation of both the spirit and letter of the notice requirements of §11346.8(c) of the California Administrative Procedures Act. These include:

- **Proposed limits on soybean and canola oil-based fuels** – the original notice included a discussion of a potential cap on crop-based fuels and a reasoned rejection of the concept. No regulatory amendments were proposed related to capping these fuels. Therefore, the regulated community had no reason to anticipate the seismic reversal of this decision and the addition of this new section. A change of such substantial impact, the possibility of which was essentially rejected in the original proposed amendments, warrants a full 45-day comment period.
- **Cutoff for New Biomass-Based Diesel Pathways** – CARB's proposal to refuse the approval of new pathway applications based on ZEV adoption levels was not previously discussed or proposed.
- **Elimination of crediting for fossil hydrogen** – this is not a concept that was contemplated or proposed in the January notice. It is not appropriate for a 15-day package.
- **Restrictions on Hydrogen Refueling Infrastructure (HRI) Crediting** – sunseting the existing program prior to December 31, 2025 with the effective date of the 2024 amendments and requiring state and federal grant funding for program eligibility.
- **Awarding electricity credits to OEMs** – the proposal to divert base electric vehicle charging credits to OEMs was not part of the original notice and is not sufficiently related to any amendments that were proposed.
- **Increased credit for legacy rail** – the original package did not contemplate the change to crediting for pre-baseline fixed guideway systems.

These proposals should be withdrawn for potential consideration in a future 45-day package.

Sustainability Guardrails

042.2

We urge CARB not to finalize the changes made to the proposed sustainability criteria in section 95488.9 and land use change carbon intensity in section 95488.3 and believe they should be withdrawn. The proposed sustainability criteria and land use change penalty listed in these sections are effectively superseded by the federal Renewable Fuel Standard's aggregate compliance and traceability rules. We are unaware of any renewable fuels supplied in California that do not also generate credits through the Renewable Fuel Standard. As such, credit generating biofuels are already required to meet sustainability criteria under the federal Renewable Fuel Standard. Those rules require traceability and recordkeeping on the part of a biofuel producer for crop-based feedstock back to the individual farm if the cultivated land mass exceeds the acreage of cultivated land mass established in 2007 at 402 million acres.

In no time since aggregate compliance rules were established has the U.S. Department of Agriculture determined that the number of cultivated acreage in the U.S. exceeded the 2007 baseline. Satellite and land survey evidence suggests that land mass has been lost primarily due to urbanization and not cultivation. Cultivated land mass in the U.S. has been declining. The American Farmland Trust estimates that 11 million acres of cultivated land was

lost to the expansion of urbanization between 2010 and 2016.¹

For crops cultivated outside of the United States, federal traceability and record keeping requirements on behalf of biofuel producers apply. These rules require that biofuel producers document where the feedstock was cultivated to ensure that the crops were not sourced from lands not under cultivation prior to 2007. Assigning additional conservative land use change penalties for feedstock and fuel type from certain regions, as proposed in section 95488.3, are not needed.

We recognize that CARB currently assigns an indirect land use change penalty for crop-based biofuels. We encourage CARB to review the latest science concerning the indirect effect of land use change emissions. Estimated indirect effects may trend downwards. As an example, the most recent iteration of the Global Trade Analysis Project (GTAP) model assigns a carbon intensity penalty for soybean oil that is lower than previously modeled results based on economic data concerning global commodity trade flows.

042.3 cont

The sustainability requirements for crop feedstock cultivation listed in 95488.9 (g)(1)(B) and included below are much too broad to be used for compliance by a third party. The requirements encompass specific agricultural practices that lack an appropriate definition or metric at which point compliance would be satisfied. Biofuel producers and growers need to know which specific agricultural practices apply, or do not apply, in order to maintain assurance of compliance with the proposed provisions. Adequate consideration of these cultivation practices is too onerous and complicated to undertake in this rulemaking. CARB should abandon this requirement and consider this approach through a separate rulemaking.

- (B) Biomass must be produced according to best environmental management practices that reduce GHG emissions or increase GHG sequestration, including but not limited to:
1. Maintain or enhance biodiversity habitat on agricultural or forested lands;
 2. Enhance soil fertility and avoid erosion or compaction;
 3. Apply fertilizers in a manner that minimizes runoff, and soil and water contamination;
 4. Reduce unsustainable water use, and minimize diffuse and localized pollution from chemical residues, fertilizers, soil erosion, or other sources of ground and surface water contamination.

Many of the other sustainability criteria are also unworkable in the timeframe included and CARB should instead consider each through separate rules. These proposed amendments include the ability to rely on certifications that meet the European Union's Renewable Energy Directive (EU RED), but still require location data for the farms where feedstock was cultivated to be passed to the fuel producer which is inconsistent with the EU RED. Under the EU RED, the fuel pathway holder is not the holder of the Attestation letter regarding the point of origin of the biomass. The First Gathering Point holds this and provides proofs of sustainability. The

¹ Source: [Home - American Farmland Trust](#)

proposed language in these provisions would therefore impose more stringent requirements than the EU RED currently requires. Additionally, GPS coordinates of farms per 95488.9(g)(2) are not required and a phase-in a requirement in 95488.9(g)(2) would not be applicable under an EU RED certification system in 95488.9(g)(3)(C).

042.4 cont A 2026 implementation deadline for a new requirement in 95488.9(g)(2) is not feasible since we are not aware of an existing global system that would satisfy the proposed requirement. Additionally, implementing the program by 2026 for the 2025 harvest will give producers less than a year to implement these new requirements without subject matter expertise on compliance, data collection systems, or agreements with primary suppliers. As such, a 2026 timeframe is unrealistic and may result in significant costs and difficulties for renewable fuels that could affect pricing in the market at large.

CARB needs to provide more time and receive more feedback from the grower community concerning certain elements of the proposed sustainability requirements. Most US and Canadian farmers do not currently participate in European sustainability systems and may be hesitant to do so. However, many may participate in a program recently established in Canada as part of the Canadian Clean Fuels Rules since Canada is a close trading partner with the United States. We also maintain that the 2028 deadline for implementing a sustainability system in 95488.9(g)(3) will be challenging unless it explicitly allows for the Canada Clean Fuel Regulation's Land Use and Biodiversity criteria to be an Approved Certification System in 95488.9(g)(3)(C).

042.5 cont Arbitrary Restrictions on Specific Feedstocks
We urge CARB not to finalize the proposed addition of section 95482(i) that would limit a producer's ability to generate credits from soybean and canola oil-based fuels to no more than 20 percent of total biomass based diesel (BBD). CARB has not provided any basis for the proposed limitation on biofuels derived from these oilseeds other than to claim that fuels derived from crop oils should be available to markets outside of California.

Soybean and canola oil-based biofuels are already available in markets outside of California including expanding volumes in Midwest markets and West Coast clean fuel standard incentivized states, along with growing volumes of biomass-based home heating oil in certain Northeast markets. California's LCFS is not hindering the availability of these products to other states.

Efforts to cap the use of soybean and canola oil-based BBD out of a desire to promote food security are misdirected. Raw food commodities, that include soybean and canola oil, comprise a small share of the overall cost of food production and contribute a small share of the retail price of food. Packaging, marketing and logistics make up over 80% of the retail cost of food items.² Growing volumes of soybeans and canola, owing to expanded yields and processing capacity, are additive to the food supply as most pressed soybeans and canola become meal for animal protein cultivation. Efforts to limit soybean and canola cultivation by capping the use of these feedstocks to produce credit generating fuel for the LCFS program may provide little benefit to promote food security.

The credit generating mechanism of the LCFS program provides additional financial incentives to supply the California marketplace with waste-based biofuels. According to recent LCFS quarterly report data, over 60 percent of the biodiesel pool in California is waste-derived while

² Source: [USDA ERS - Documentation](#)

nearly 70 percent of the renewable diesel pool is waste-derived. In addition, the anticipated transition from the federal blender's tax credit to a federal clean fuel production credit that rewards lower carbon fuels with greater federal tax credit will provide further financial incentives to expand the supply of waste-based biofuels. This transition is expected to occur in early 2025.

State and federal incentives that reward lower carbon biofuels are important factors that lead many companies, including Chevron, to invest in lower carbon feedstocks including intermediate crops such as winter canola, camelina and CoverCress. These oilseed crops are cultivated as an intermediate crop that meets the definition of a cover crop and are planted and harvested on land that would otherwise be idle in a rotation pattern between main crops or in a fallow rotation and is primarily intended to provide low carbon feedstocks to produce renewable biofuels and other end uses.

If the proposed 20% cap is finalized, CARB should update the regulatory language to make it clear that it applies to spring canola as a primary crop and not winter canola.

Further, the proposed restriction described in 95482(i) applies to production reported under the LCFS. This is problematic language as most of the renewable fuel delivered to the California market is never reported as production. Further, CARB has not addressed the source of its legal authority to regulate the full production of out-of-state facilities, much of which is delivered to non-California markets.

Due to the annual reduction in the overall carbon intensity benchmarks, biofuel from soybean oil is expected to become a deficit generator as early as 2033, according to previous staff analysis; or by 2030 if the proposed automatic adjustment mechanism is finalized and triggered. Prematurely limiting or capping the use of soybean and canola oil-derived biofuels would only limit near-term carbon reductions in the service of a political message.

Hydrogen Fossil Fuel Feedstock Ineligibility

Chevron objects to the 2031 crediting restriction proposed for hydrogen from fossil feedstocks. Further, it is inappropriate to substitute the hydrogen carbon intensity with that of fossil diesel. Producers who can demonstrate a lower EER-adjusted CI than the substitute fuels' baseline, even if produced from fossil feedstock, should still be eligible to obtain credits in line with a technology-neutral, science-based approach. Many EER-adjusted pathway CIs for fossil-derived hydrogen are well below the conventional ULSD CI in table 7-1. If the proposed change is finalized, CARB should update the ULSD CI reference to Table 2 rather than table 7-1 to address this concern. This will mitigate an arbitrary market distortion and will keep costs down for consumers to enable FCEV technology adoption.

Over 95% of US production of hydrogen is produced from steam methane reforming of natural gas.³ While new technologies have promise, it will take considerable time to develop these commercially on a large scale. Construction of large-scale facilities takes, at minimum, a 10-year cycle time for full capital project execution. Given that there are virtually no large-scale projects through final investment decision and permitting in California today, 2031 is far too early to create an artificial crediting restriction, much less turn hydrogen into a deficit generator as proposed. The LCFS program already has the proper mechanisms in place to drive the development of renewable hydrogen production.

³ [USDOE FE Hydrogen Strategy July2020.pdf \(energy.gov\)](#)

Hydrogen Refueling Infrastructure Crediting

042.9

The modifications to the hydrogen refueling infrastructure (HRI) crediting program as part of the 15-day package do not address the concerns raised during the last comment cycle regarding incentivizing hydrogen infrastructure development. The hydrogen retail industry in California has hit a historic crossroads with high retail prices, falling vehicle sales, and station closures due to supply.^{4,5} This is not the time to be limiting zero emission vehicle fueling infrastructure enablement if CARB staff wishes to meet ACCII, ACT, and ACF milestones as well as goals laid out in AB8 reporting.⁶

Chevron urges CARB to alleviate the following constraints to enable meaningful progress in infrastructure development: 50% capacity limit for public stations, requiring state and federal grant funding for program eligibility, shortening crediting to a 10-year window, the increase in required renewable content from 40% to 80%, and the requirement to disclose all cost and revenue data. If CARB does not relax these constraints, this will hinder infrastructure development in the state as the prospect of lower returns will limit program participation. In addition, applicants should still be allowed to participate in the existing program through 2025 as many infrastructure projects currently under development have been operating under the assumption that the existing program would be in place through December 31, 2025.

042.10

The rationale that limiting HRI crediting to 50% of capacity will encourage wider scale growth is flawed. The current LD HRI program does not have a capacity constraint, yet it has still fallen short of hitting the 2.5% obligation maximum each quarter due to the economic, technological, and permitting challenges of building hydrogen infrastructure. Shell's recent announcement that they will close several stations is illustrative of the challenges faced in this space². For heavy duty (HD) fueling stations, these challenges are only amplified due to the high capital requirements, lack of available fueling technology, and large land use requirements. Combining LD and medium duty (MD) stations into one program doesn't address these challenges.

Chevron requests that CARB work with industry to develop a realistic solution to differentiate reporting between vehicle classes for HRI crediting purposes. Since these are public access locations, there are little to no means for tracking hydrogen vehicle size to identify if the vehicular weight is less than 8,500 lbs, or within 8,501 lbs to 14,000 lbs GVWR. Also, unlike CNG, separate nozzles are not used for light duty vs. MHD vehicles today. The newly developed NREL heavy duty fueling protocol may allow for separate nozzles for fueling, however it will take many years for the industry to transition.

For the HD program, requiring that stations receive capital funding from a State or Federal competitive grant program discourages private investment in the state, increasing taxpayer burden. In addition, requiring cost and revenue data for HD HRI crediting will similarly limit participation due to the onerous requirements for reporting and record keeping relative to the incentive provided by the program. These are both arbitrary requirements and do nothing to further CARB's goals as outlined in AB8 Reporting.⁴

The requirement to increase renewable hydrogen content from 40% to 80% is arbitrary, increases costs for end consumers, and creates a market distortion. The increased costs will

⁴ [California's Hydrogen Economy Dealt A Hammer Blow By Shell's Exit \(forbes.com\)](https://www.forbes.com)

⁵ [Logistical woes and high pump prices stall California H2 market development | S&P Global Commodity Insights \(spglobal.com\)](https://www.spglobal.com)

⁶ [2023 Annual Evaluation of Fuel Cell Electric Vehicle Deployment \(ca.gov\)](https://www.ca.gov)

hurt FCEV adoption in the state and artificially penalizes hydrogen technology when BEV electricity generation is not held to the same renewable volume percent standards. CARB should focus on a technology-neutral approach focused on carbon intensity to keep costs down for consumers and drive adoption. Baseline CI requirements are already sufficient to drive the right outcomes. With the added cost for renewable content and a lack of willingness to pay from consumers, hydrogen retailers will forgo participation in the program due to these economic pressures.

Biomethane Pathway Life and Deliverability Restrictions

042.7a Chevron disagrees with the sunseting of avoided methane crediting for biogas pathways under the LCFS. This is a demonstrated, significant reduction in greenhouse gas emissions that would otherwise be released to the atmosphere. Additionally, limiting incentives for biogas and renewable natural gas producers to reduce methane emissions is inconsistent with the Subnational Methane Action Coalition's statement of purpose, the 2021 Global Methane Pledge, and threatens the additional 2.4 MMTCO₂e reductions needed per SB 1383 and California's Greenhouse Gas and Short-Lived Climate Pollutant Policy framework.⁷

042.7b Chevron does not support deliverability requirements. The current approach to book-and-claim accounting is practical, aligns with other U.S. policies, and provides the most effective means of reducing GHG emissions, which are global in nature. This language is not an improvement in reporting that would somehow provide greater accuracy, or certainty that imported RNG molecules can be traced to California Natural Gas Vehicle (NGV) fuel tanks. The development of a system map utilizing 2020-2023 data to impose deliverability requirements in 2037 is arbitrary relative to the 2041 date previously established. It is simply an arbitrary requirement—with no additional environmental benefit or grounding in the physical gas system. This has the potential to deter growth and cause backsliding.

042.7a
cont. Restricting established pathway renewals from 30 years to 20 years is an arbitrary change that devalues biomethane and biomethane production assets. Projects that came online before 2030 assumed full crediting in the project evaluation. If new programs do not arise to direct biogas and renewable natural gas to stationary sectors, we urge CARB to revisit this proposal in a future rulemaking to avoid backsliding.

Fuel Pathway Applications

042.11 **Biomass-based diesel pathways:** In § 95488(d), CARB proposes to allow the denial of new biomass-based diesel pathways beginning in 2031 if Class 3-8 ZEV registration exceeds 132,000. This is an inappropriate change as it is contrary to the technology-neutral design of the LCFS. Fuel types and vehicle technologies should be allowed to compete freely in the California market without artificial and arbitrary barriers like this. It is also possible that emerging low-CI feedstocks will become commercially viable after 2031 and arbitrarily cutting off new pathways will deny the opportunity to further reduce the carbon intensity of the diesel fuel consumed in the state. There is also no language around future BBD pathway registrations under subsequent versions of CA-GREET which raises concerns about what will happen to BBD participation in the future.

Furthermore, this change was not part of the original proposal under this rulemaking and is an inappropriate inclusion in a 15-day package.

042.12 **Credit True Ups:** We appreciate the clarification that credit true ups after annual verification

⁷ [Dairy Sector Workshop Presentation \(ca.gov\)](#)

will include the period during which a temporary pathway was in place. This is critical to addressing the extended time period that can take place while operating data is collected and CARB staff reviews submitted pathway applications prior to establishing a provisional pathway.

Regarding the added language requiring complete operational data to be eligible for a true up, it is critical that CARB clarify that this includes quarters during which an approved alternative method is used to represent any missing or invalid data. This can occur over very short periods and for perfectly valid operational reasons (e.g. the replacement of a meter for calibration). It would be wrong to deny a true up for a full quarter in such circumstances.

We also request that CARB clarify in the regulatory language that these true ups would apply for the full period during which a temporary or provisional pathway was used, even if the associated compliance periods have passed. That appears to be the intent, but it should be stated in the regulatory language to avoid confusion.

042.13

Intrastate Jet Fuel

Chevron supports CARB decision to withdraw the proposal to add deficits to the LCFS for fossil jet fuel for intrastate flights. As we noted in our past comments, this would not have added any incentive for alternative jet fuel adoption.⁸ Instead, it would have added cost to air travel and shipping in California, introduced unnecessary complexities in the jet fuel supply chain, and impacted the cost of interstate and international transportation as well.

042.8 cont

Exceedance of Verified CI Penalty

Chevron remains concerned that no changes were made to the verified CI exceedance language between the ISOR Proposed Rule and the 15-day proposal. As defined in §95486.1(g)(1), pathway holders would incur a deficit of **four times** the amount of the annual excess CI generated – and have excess credits invalidated – which effectively creates a penalty of **five times** the amount of the annual excess CI generated. We believe this penalty is excessively punitive to the severity of the violation and will likely have an outsized impact on pathway holders, particularly since any true up benefit in a CI goes to the importer of the fuel. It also seems to conflict with the eight statutory factors that CARB must consider when assessing civil penalties.⁹ We recommend that, if the verified CI is higher than the certified CI, the project should simply repay CARB for any excess credits claimed, and not be subject to any further enforcement liability (unless there is malfeasance or other such cause).

Late Filings and Reporting Corrections

CARB's policy of denying credits for report corrections or late reports is an egregious penalty for the correction of errors or delays in reporting, which can both occur for a number of reasons, many of which can be outside the reporting party's control. The proposal to only withhold valid credits at a rate of 25% per day for late reports is an inadequate correction to this policy. CARB should remove the restriction on crediting for late or amended reports and rely on existing enforcement powers to address any egregious or intentional misrepresentations that may occur.

Fixed Guideway Crediting

Chevron opposes the proposal to increase crediting for pre-2011 fixed guideway transit systems. Much of the equipment that generates credits has been in existence for decades. As

⁸ <https://www.arb.ca.gov/lists/com-attach/6150-lcfs2024-B2RQPgZiBCELf1U6.pdf>

⁹ California Health and Safety Code § 43024

such, only the incremental increase in electricity usage relative to the 2010 baseline should be allowed for credit generation. The regulation partly acknowledges this inconsistency by not allowing the use of an Energy Economy Ratio (EER) when calculating the amount of fuel energy displaced. Removing that limitation now is arbitrary and has no rationale in policy or science.

Furthermore, this change was not part of the original proposal under this rulemaking and is an inappropriate inclusion in a 15-day package.

Low-CI Electricity Balancing Period

Chevron requests that CARB modify the balancing period for low-CI electricity projects that supply renewable electricity to renewable fuel production facilities as described in § 95488.8.(h)(1) from a monthly balancing period to a quarterly balancing period. This would provide more flexibility to account for seasonal variations in renewable electricity production to reflect CI reductions taking place. This is a more modest window than the three quarters provided to low-CI electricity supplied as transportation fuel seen in § 95488.8.(i)(1) and would provide a greater incentive for additional low-CI electricity projects.

Lifecycle Analysis Modeling

We appreciate the opportunity to provide feedback on the updated LCA models and calculators. We are submitting comments separately through the LCA public comment portal.

Rulemaking Timing

Finally, it must be noted that CARB has released this notice and set the comment period during a time when regulated parties are focused on completing verification audits for the LCFS and the Clean Fuel Program in Oregon, all of which are due August 31st. These are complex, resource-intensive audits and the personnel with the expertise to comment on this package are very much engaged with that work. Compliance must take precedence. We hope that CARB will recognize this and consider any supplemental comments they may receive following the August 27th deadline.

Thank you for the opportunity to comment on these matters. If you have any questions regarding our comments, please contact me at (925) 842-8903 or DGilstrap@chevron.com.

Sincerely,

A handwritten signature in dark ink, appearing to read "DGilstrap", with a stylized, flowing script.

CAUTION: This email originated from outside of the organization. Do not click links or open attachments unless you recognize the sender and know the content is safe.

Dear California Air Resources Board,

I'm writing to express deep concern about the current state of California's Low Carbon Fuel Standard (LCFS) and to implore you to take immediate action to address the environmental injustices embedded in the program.

Originally intended as a tool to combat climate pollution in the transportation sector, the LCFS has been manipulated by powerful industries, particularly Big Ag and Big Oil. It has become the nation's largest and most lucrative pollution trading scheme for factory farm biogas, perpetuating harmful practices rather than serving its environmental objectives.

The current flaws in the LCFS, such as "avoided methane crediting" and inaccurate life cycle assessments, not only enable pollution but disproportionately harm low-income communities and communities of color. Factory farms, predominantly situated in these marginalized areas, inflict severe damage on air, water, public health, rural economies, and overall quality of life.

I urge you to consider and prioritize the following reforms to the LCFS:

1. Eliminate "avoided methane crediting" in 2024.
2. Address inaccuracies in the Life Cycle Assessment that ignore associated up- and downstream greenhouse gas emissions from factory farm gas production.
3. Remove the 10-year "grace period" for factory farm gas producers.

CARB has a pivotal opportunity this year to adopt new rules that align the LCFS with California's environmental justice commitments. Environmental justice, zero emission, and climate advocates have presented a clear alternative to the current policies that heap lavish rewards on the biggest polluters through the Comprehensive EJ Scenario. CARB should adopt those recommendations to stop moving California climate policy in the wrong direction.

Please lead the charge in demanding a future free from the clutches of Big Oil and Big Ag. By prioritizing the well-being of Californians over corporate profits, we can reform the LCFS to protect communities most affected by its current flaws. Your decisive action in this critical matter would demonstrate a commitment to bold climate action rooted in justice. Californians deserve no less.

Sincerely,

Shane Snow

044.1

Large Carbon emitters should be buying non-carbon energy credits rather Biofuel which carbon polluting fuel. It should help low income people to electrify the homes, add solar on their homes and purchase EVs.

VIA ELECTRONIC FILING

August 27, 2024

Matthew Botill
California Air Resources Board
1001 I Street
Sacramento, California 95814

Re: Aemetis, Inc. Comments on Low Carbon Fuel Standard 15-Day Amendments

Dear Mr. Botill,

Aemetis, Inc. submits these comments to the California Air Resources Board (CARB) in response to the August 12, 2024, Notice of Public Availability of Modified Text and Availability of Additional Documents and/or Information for the Proposed Low Carbon Fuel Standard (LCFS) Amendments (15-Day Package).

Aemetis, Inc. is a California based Renewable Natural Gas (RNG) and renewable fuels company focused on the production of low and negative carbon intensity products that replace fossil fuels. Aemetis is the state's largest renewable ethanol producer and is operating and constructing an extensive network of dairy digesters and interconnecting pipelines delivering negative carbon intensity (CI) RNG for truck and bus fleets throughout California. Additionally, Aemetis has been permitted to build a 78 million gallon per year Sustainable Aviation Fuel (SAF) production facility and Carbon Capture and Underground Storage (CCUS) well near Modesto, California.

We applaud CARB's leadership in creating groundbreaking policies that have become a model for other states and countries in the battle to reverse climate change. From the beginning of this century to present time, CARB has shown how the collaboration of stakeholders, both public and private, can bring about change that was once unimaginable.

Aemetis has been a significant contributor and supporter of the LCFS for almost 14 years and has committed to spending nearly one billion dollars to build new or expanded biofuel production facilities in California over the next few years. Because of CARB's innovative programs and policy leadership, we have embarked upon a very ambitious expansion plan that will allow us to contribute to both existing and future low carbon fuel markets. In short, we are "all in" on the future of the LCFS and intend to play a meaningful role in its success.

Key to this ambitious future is the ability for our company, our customers, and our investors to rely upon consistent policies from CARB. As sure as the LCFS cannot survive without robust

investment from the private sector, private investment cannot be sustained if programs and policies do not allow for markets to mature, investments to be recouped, and policy objectives to be met. This unique compact requires shared objectives, and a steady, reliable path to outcomes.

It is in this spirit that we offer our comments and suggestions as you consider the next chapter of the LCFS. Much is at stake in the coming months, and we strongly encourage CARB to keep all perspectives in full view and weighted fairly as you embark upon this critical task.

045.1

- We support CARB's approach to expanding the programmatic targets in the 15-day package. The proposed expansion recognizes that without immediate action, the carbon market will continue to languish with low targets and an oversupply of credits. This is critical as most investments already made or contemplated for the future require a higher LCFS price to merely break even, much less become profitable. The current paradigm has resulted in investors holding back, stalling projects, reconsidering future investments, or looking to other states or countries for alternative strategies. Without aggressive action, this will be catastrophic to the LCFS and similar programs that require large capital investment to move forward. **While the proposed 9% near-term-stepdown for 2025 is a clear improvement over the prior proposal, we believe that adjusting the stepdown to 10.5% - 11.5% will prove more effective. The lack of market response to CARB's proposed 15-day rule on this topic clearly demonstrates that the increase does not go far enough, nor is the suggested >\$130 credit price credible.** We encourage CARB to adopt a higher stepdown.

045.2

- The 15-Day Package continues the proposed timeline for implementing the Auto Acceleration Mechanism (AAM), such that 2028 remains the first year for which the AAM can amend CI reduction targets. This is unreasonable given the current credit oversupply and corresponding market price. Without near-term action, we fear that the current low LCFS price will simply extend for three or more years, creating even more doubt about the program's long-term viability. **We recommend that 2025's performance should be able to trigger the AAM. A 2025 data-year triggering would be able to impact CI targets in 2027.** The AAM should trigger as early as possible as a backstop if the step down is not sufficient to address the current credit oversupply.

045.3

- Similarly, **a greater than 30% reduction in CI by 2030 is not only warranted, but also achievable** and in keeping with the overall past performance of the LCFS. Biofuels have far exceeded GHG reduction targets set by CARB, and with the influx of additional fuels into the portfolio, it is not mere speculation that the market will respond once again. For true progress to be made, **CARB should not allow the program to be hampered by obligated parties who are rewarded with longer time periods and slower progress. We strongly support a CI reduction of 40% by 2030.**

045.4

- **We strongly support the 15-day package proposal of a full credit true-up after Annual Verification for RNG.** Using a full true up to verified actual CI performance for all pathways (temporary, provisional, and fully certified) makes good sense given the changing nature of bioreactors, which are sensitive to changes in weather and operating conditions. For this reason, **however, we are opposed to the arbitrary proposal in the 15-Day Package retains a "4-to-1" penalty for the case where a verified CI is higher than the certified CI.** This is unnecessarily punitive and does not follow science. It is not

only conceivable but likely that CI changes will occur year-to-year due to conditions beyond the producer's control (i.e., weather). **If the verified CI is higher than the certified CI, the project should simply repay CARB for any excess credits claimed, and not be subject to further enforcement liability** (unless there is misreporting etc.).

- 045.5
- **The 15-Day Package proposal reducing the total number of crediting periods for avoided methane emissions for some projects breaking ground before January 1, 2030, from three to two is bad policy, and could likely result in existing projects breaking covenants with debt holders.** As previously mentioned, developers and investors/lenders based significant financial decisions on CARB's stated policy – a policy that was reaffirmed and encouraged by CARB leadership for years. Changing the rules in the middle of the game will not only discourage future investment in RNG and other fuels, but it could also likely lead to loan defaults and financial distress for investors, developers, and dairy owners. Avoided methane crediting is a critical part of the economic formula that allows developers to seek – and repay – investors and lenders. **No serious alternative to avoided methane crediting has been put forward, and until a reasonable replacement or alternative strategy is established and discussed, no change should be made.** Shortening and eventually eliminating this credit will likely result in backsliding, leakage within California and to neighboring states, and millions of dollars of stranded assets. Moreover, progress made in methane remediation will be lost – without an alternative. **We urge CARB to eliminate this provision from the 15-day package.**

- 045.6
- **We strongly encourage CARB to immediately adopt a process to implement a 15% blend allowance for bioethanol.** California is the only state in the nation to restrict ethanol blending to 10%¹, effectively imposing a 90% mandate for petroleum-based gasoline. This is illogical as ethanol is a cleaner burning fuel than gasoline. An earlier study commissioned by CARB² found that adopting E15 in California could also provide significant environmental benefits, cutting emissions of tailpipe pollutants—like particulate matter and carbon monoxide—that cause air quality and human health problems. According to the Renewable Fuels Association³, if all gasoline in California in 2022 had been E15 instead of E10, the state would have seen a 450-million-gallon reduction in petroleum consumption and additional GHG savings of 2.2 billion metric tons, based on CARB's own data.

Furthermore, a recent UC Berkely/US Naval Academy study indicates that moving to E-15 will save California motorists approximately \$0.20 per gallon, or about \$2.7 billion per year⁴. All required testing for E-15 in California has been completed, and there is no reason to further delay its implementation. Until California vehicles have been converted to hybrids, EVs, or other technologies, it is antithetical to the LCFS for California to continue a 90% fossil fuel mandate, which only benefits petroleum producers.

- 045.7
- Finally, in section 95482(a), staff proposes to remove "Fossil Jet Fuel" from the list of transportation fuels that the LCFS applies to. **Aemetis does not support this change**

¹ [Montana becomes 49th state to approve the sale of E15 | Ethanol Producer Magazine](#)

² [E15 Final Report 7-14-22 0.pdf \(ca.gov\)](#)

³ [RFA Letter to CARB re E15 10-3-23.pdf \(d35t1syewk4d42.cloudfront.net\)](#)

⁴ [E15 in California Initial Report \(d35t1syewk4d42.cloudfront.net\)](#)

and believes that it will delay the adoption of SAF by air carriers in California. Rather than stipulating that the rule is faulty because it does not obligate air carriers to transition to SAF (but rather purchase credits), we recommend that staff revisit the proposal to make such a requirement and set a timeframe – as has been done with other obligated parties. Air transportation is a significant source of CO2 emissions, and it escapes logic that this sector would be excluded from the LCFS due to a faulty proposal or insufficient clarity on the transition. **We strongly CARB to reassess this change and include Fossil Jet Fuel in the LCFS.** By deferring this change, it is less likely that air carriers will move to SAF in a reasonable timeframe. Additionally, the need for in-state production of SAF will diminish, thus reducing or eliminating investor interest in supporting California based SAF production. Production facilities take years to permit and construct. **California will be woefully behind other states⁵ and the European Union⁶ in adopting incentives or requirements for air carriers to adopt SAF.**

Aemetis sincerely appreciates the opportunity to comment on the proposed 15-day rule. Our goal is to be constructive, and as one of the leading biofuel companies in California, we hope that our comments are taken in the spirit of collaboration with CARB. We understand that this process is challenging, with many different stakeholders advocating for positions that are often at odds. We trust that the CARB staff and Board will carefully consider the inputs and implications of these viewpoints upon the ultimate policy that is adopted.

Thank you for your dedication to this task, and please do not hesitate to contact us if you have any questions or require additional information.

Sincerely,

Andy Foster

**COMMENTS OF HIF USA
ON
CALIFORNIA AIR RESOURCES BOARD
NOTICE OF PUBLIC AVAILABILITY OF MODIFIED TEXT
PROPOSED LOW CARBON FUEL STANDARD AMENDMENTS**

AUGUST 26, 2024

Highly Innovative Fuels USA (HIF USA) appreciates the opportunity to offer comments in response to the California Air Resources Board's (CARB or the Board) 15-day Notice of Public Availability (the 15-day Notice) of modified text for the proposed Low Carbon Fuel Standard (LCFS) amendments.

As previously commented, HIF USA is a global e-Fuels company focused on harnessing renewable energy sources to achieve fuel sector decarbonization. HIF USA is currently developing a large-scale commercially viable facility for generating low-carbon e-Fuels that can be used in a number of transportation applications and has submitted an LCFS pathway for its process that is currently awaiting CARB approval. HIF USA has been an active participant in support of CARB's LCFS update process, submitting comments on the regulatory amendment package that CARB released on December 19, 2023, participating in the September 28, 2023 hearing and April 10, 2024 workshop, and submitting comments in response to the April workshop.

HIF USA has reviewed the 15-day Notice and observes that CARB does not in any way address the two key points made in our previous submittals. Because these two issues are important for diversifying California's transportation fuel supply and for encouraging the proliferation of low-carbon e-Fuels for a variety of transportation modes, we reiterate them here and incorporate our previous comments by reference.¹

CARB has an obligation to consider objections and recommendations raised during its rulemaking proceedings and to address timely comments that are relevant to its decision-making process. HIF USA thus respectfully requests that CARB carefully consider and respond to the following two points before finalizing the LCFS amendments:

I. The LCFS Regulations Should Be Amended to Include Low-CI Methanol as an Opt-In Fuel.

CARB should incentivize the proliferation of carbon-neutral transportation fuels by amending 17 C.C.R. § 95482 of the LCFS regulations to include low carbon intensity (CI) methanol (also referred to as "green methanol") as eligible for crediting as an opt-in fuel when sold for use in marine and other specialty transportation applications such as direct methanol fuel cells. As HIF USA has

¹ See Comment 17 for Public Meeting to Hear an Update on the Low Carbon Fuel Standard (Sept. 28, 2023), available [here](#) (HIF USA pre-proposal comments to CARB Board requesting inclusion of low-CI methanol as an opt-in fuel in the LCFS regulations); Comment 389 for Proposed Low Carbon Fuel Standard Amendments (Feb. 20, 2024) at 2, available [here](#) (HIF USA comments in response to CARB 45-day proposal regarding CARB's proposed regulatory text for 17 C.C.R. § 95488.8(i)(1)(A)) (hereinafter, "HIF USA 45-Day Comments"); Comments of HIF USA on Low Carbon Fuel Standard Public Workshop - April 10, 2024 (May 9, 2024), available [here](#).

commented in its previous submittals, amending the LCFS regulations to include green methanol as an opt-in fuel would create another opportunity for CARB to incentivize low-CI fuels in hard-to-decarbonize sectors.

In a July 2022 LCFS workshop presentation, CARB staff indicated that it was considering the inclusion of methanol as an opt-in fuel for “novel applications,” including “commercial harbor craft” under Tier 2 EER-adjusted pathways.² Yet, its proposed regulatory amendments released in December 2023 did not include this proposed change, nor did CARB include this change in the 15-Day Notice, despite recommendations from multiple entities that it do so.³

In comments submitted after the April 2024 workshop, HIF USA offered to support CARB’s efforts to obtain whatever data is needed to support inclusion of green methanol as an opt-in fuel. We reiterate our readiness to assist CARB in obtaining this data, as we believe it is critical to move forward with including low-CI methanol as an LCFS opt-in fuel.

II. Book and Claim Accounting Should Be Preserved for Low-CI Electricity Used to Produce Hydrogen as an Input to E-Fuels.

The 15-day Notice does not address HIF USA’s concern that the proposed changes to the regulatory text in 17 C.C.R. § 95488.8(i)(1)(A) appear to eliminate book-and-claim accounting for low-CI electricity used to produce electrolytic hydrogen as an input for eFuels. As commenters noted during the April 10, 2024 workshop,⁴ and as HIF USA has explained in its previous submittals, CARB’s proposed changes to this provision, if finalized, would negatively impact the commercial availability of low-CI e-Fuels in the California transportation fuel market.

CARB has not explained in this rulemaking process the rationale for the proposed change, other than brief comments at the April 10 workshop, in which a CARB representative indicated that the change may reflect CARB’s interest in prioritizing the production of hydrogen as a primary transportation fuel rather than as a process input. HIF USA does not believe that elimination of the current book-and-claim allowance for hydrogen produced by electrolysis for transportation purposes is necessary to incentivize the production and use of hydrogen as a transportation fuel—as these two uses of hydrogen are complimentary and not mutually exclusive. In any event, because CARB proposes a significant change to the current regulations, it is obligated to provide a rationale and address the comments provided on this issue.

In sum, we urge CARB to refrain from finalizing any changes to 17 C.C.R. § 95488.8(i)(1)(A) that would preclude the continued use of book-and-claim accounting for low-CI electricity used for hydrogen production through electrolysis as a process step for e-Fuels. We request that CARB review and consider our submittal on this topic in response to the 45-day proposed rule.⁵

Comment

047.1

Thank you for the opportunity to comment. The car loan for my 2016 Mirai is paid off, and I am the first owner. As a retiree on a fixed income and a Californian who cares about my carbon footprint, I'm asking CARB to preserve the HRI provisions unchanged. FCEV drivers have borne the cost for the reduced value of carbon credits. Many have gone back to gasoline fueled options because of the cost. It is much more expensive buying H2 now than it was when the credits were valued at \$100 - \$150/MTCO2. Elimination of the HRI program jeopardizes the fragile business model needed to maintain and expand the LIGHT DUTY H2 infrastructure that I absolutely depend on, unless I dip into my savings to purchase or lease another car. I love my zero emissions Mirai and the redundant infrastructure I enjoy in Orange County. It's more expensive than gasoline, but as a retiree, its one way I can reduce my carbon footprint. I need the Board to allow me to continue doing just that. Thank you, Mark Mobley

August 21, 2024
The Honorable Liane M. Randolph, Chair
California Air Resources Board

Comment Submitted Electronically

RE: Bayer Crop Science's Comments Relating to 15-Day Changes

Dear Chair Randolph:

Bayer Crop Science (Bayer) appreciates the current and historic efforts by the California Air Resources Board (CARB) to reduce the greenhouse gas (GHG) emissions from transportation through the implementation of the State's Low Carbon Fuels Standard (LCFS). Bayer supports the continued evolution of the LCFS through the CARB rulemaking process. Of particular interest to Bayer is the production of biofuels in the most sustainable manner including increasing GHG reductions through the use of lower carbon intensity (CI) crop varieties, climate smart agriculture (CSA), and the utilization of cover crops and crop rotations.

048.1

The recent modifications proposed by CARB to the LCFS regulations (the "15-Day Changes") add stringency and oversight to the LCFS program and have the potential to facilitate more precise and accurate CI analysis. Unfortunately, certain aspects of the 15-Day Changes leverage this precision only to the detriment of biofuel CI scores rather than authorizing the adjustment of CI scores favorably or unfavorably depending on real-world performance. We encourage CARB to continue to embrace the fundamental LCFS principles of technology-neutrality and science-based performance measurement rather than introducing CI bias into the LCFS program structure.

In this final stage of the LCFS rulemaking, CARB has the opportunity to refine the proposed language of the 15-Day Changes so that the LCFS program will disincentivize less-sustainable biofuels **and incentivize more-sustainable biofuels**. Such an approach has the potential to expand and enhance the global sustainable fuels market and minimize the risk of unintended consequences at a time when the rapid phase down of petroleum-based fuels is an environmental imperative that has been codified into California law. The mandatory petroleum-based fuels phase-down triggers the imperative of rapidly scaling sustainable biofuels particularly in the hard-to-abate aviation sector.

To capture these benefits, we recommend the following refinements to the language of the proposed 15-Day Changes.

048.1 cont

Recommended Modifications

The specific changes necessary to establish a non-biased LCFS land use change provision are modest revisions to proposed §95488.3(d)(2). Bayer recommends that the provision as proposed in the 15-Day Changes be modified as follows: "(2) The Executive Officer may determine that no value in Table 6 is ~~conservatively~~ representative of a particular region/feedstock/fuel combination and assign a ~~more~~ conservative LUC value that is representative. Such determination must be based on the best available empirical data, including but not limited to satellite-based remote sensing data for land cover

monitoring, crop variety yields, and emission factors from the AEZ-EF model or carbon stock datasets. For feedstocks not listed in Table 6, the Executive Officer may determine and assign an appropriate LUC value based on empirical land cover data, crop yields, and emission factors.”

One noteworthy example that illustrates the type of GHG reductions that can be incentivized by the above modification is the distinction between Spring Canola and Winter Canola. Spring Canola is planted in early spring (May) and harvested around September and accounts for the majority of U.S. canola production in northern states.¹ Winter Canola, on the other hand, is planted in the fall (September), overwinters, and is harvested in June. In general, Winter Canola has a 20 to 30 percent greater yield potential than Spring Canola due to a longer grain filling period and less competition from summer annual weeds and insect pests.²

Bayer is making investments in Winter Canola and Domesticated Pennycress because these crops can serve as valuable biomass feedstocks, fulfilling demand for lower carbon intensity (“CI”) feedstocks for Renewable Diesel and Sustainable Aviation Fuel (“SAF”). These crops also deliver ecosystem benefits such as carbon sequestration, improved soil health and socio-economic benefits for farmer communities.

Sustainability Certifications:

Bayer commends California Air Resource Board’s efforts to ensure sustainability practices and reduce land use change. Bayer recommends that to most effectively achieve California’s goals, it will be critical for CARB to work with stakeholders as CARB interprets, implements, provides further guidance, and phases in the sustainability and certification requirements.

We recommend that CARB align LCFS requirements to the greatest extent possible with voluntary programs like U.S. Department of Agriculture’s (“USDA”) Conservation Stewardship Program (“CSP”) and Environmental Quality Incentives Program (“EQIP”) administered by the Natural Resources Conservation Service (“NRCS”). It should be noted that while programs such as International Sustainability and Carbon Certification (“ISCC”) offer credible verification standards and approval processes, these programs are highly burdensome for farmers, and the audits impose significant administrative cost on farmers.

American growers have a broad range of climate-smart opportunities that reflect regional variation, crop selection and physical landscape characteristics. A 2024 literature review in “Mitigation and Adaptation Strategies for Global Change” recommends, “Policymakers should prioritize flexibility in policy frameworks, allowing for adaptation to the distinct characteristics of various agricultural landscapes. This flexibility will enable the effective customization of CSA practices, ensuring their alignment with the specific challenges and opportunities faced by farmers in diverse regions.”³

³ *Id* at 22.

Soy & Canola 20% Cap

048.3 While Bayer recognizes the intent behind the 20% cap on soy and canola proposed by CARB in the 15-day package, and the importance of ensuring other state markets have feedstock availability, we urge a reevaluation of the unintended consequences of such a cap. Limiting the use of renewable, plant-based biofuels made from crops grown on existing cropland in North America will result in greater reliance on foreign feedstocks of less certain origin and inhibit the ability to reach emission reduction goals. Further, because crop-based biofuels are already subject to ILUC and indirect emissions analysis, this cap would be redundant. We urge reconsideration of this approach, especially given CARB's own analysis presented at the April 2024 workshop, which acknowledged that the diesel pool in California cannot be entirely replaced by electrification and such a cap would result in *more* fossil fuel usage, undermining California's emission progress.

About Bayer Crop Science

Bayer is a global enterprise with core competencies in the life science fields of health care and crop science. Bayer's products and services are designed to help people and the planet thrive by supporting efforts to master the major challenges presented by a growing and aging global population. We are deeply committed to reducing emissions aggressively across our own enterprise and enabling our customers to reduce emissions throughout the agriculture sector. Bayer is pioneering farming solutions that accelerate the decarbonization of the food, fuel and agricultural supply chain and is supportive of policy development that recognizes the potential of climate-smart agriculture as an effective lever for achieving these goals.

Conclusion

CARB is a respected international leader in developing and implementing programs to reduce GHG emissions across the California economy. The inclusion of CSA practices in the LCFS will expand the State's leadership throughout the country, especially in the Midwest where a large portion of the corn and soy are grown that provide feedstocks for LCFS fuels and also yield important fuel and feed products.

Bayer appreciates the opportunity to share its perspective and expertise to raise awareness of the science and innovation enabling our customers to grow crops that contribute significantly to clean transportation fuel programs and advance the climate change goals of both California, and the United States. We thank CARB for this opportunity to offer these comments and look forward to continued collaboration to implement policies and strategies that further reduce emissions from the transportation sector.

Sincerely,

Signed by:

RE: 15-Day Changes to CARB's LCFS Proposed Amendment

Dear California Air Resources Board,

Christianson PLLP, a full-service public accounting firm based in Willmar, Minnesota, has proudly served the renewable fuels industry for over 30 years. We specialize in providing technical assistance and professional services that ensure industry compliance and promote sustainable practices.

As a trusted and chosen third-party verification body for several biofuel producers participating in California's Low Carbon Fuel Standard (LCFS) program, we are writing to provide our insights on two areas related to the recent 15-Day Changes to the LCFS proposed amendment: Sustainability Certification and the inclusion of auditing Social Practices.

049.1

Sustainability Certification

The concept of sustainability requirements for biofuels has recently emerged as a potential safeguard against land conversion for agricultural use. This mirrors the sustainability initiatives implemented into Canada's Clean Fuel Regulations (CFR), which imposes stringent criteria on land-use changes. However, it is essential to recognize that U.S. feedstock is exempted from Canada's Crops-Excluded Land criteria due to the U.S. Environmental Protection Agency's (EPA) aggregate compliance approach, citing that "the U.S. Code of Federal Regulations provides a sufficient level of environmental protection with respect to the land on which the feedstock is harvested."

Furthermore, the USDA's 2022 Census of Agriculture, released in February, highlights a significant decrease of 14 million-acres (4%) in U.S. cropland since 2017, continuing a longstanding trend of declining cropland area. This data underscores the limited need for additional safeguards for U.S. cropland, as the decline in agricultural land suggests that existing regulations sufficiently protect against unwarranted land conversion.

Given the limited availability of accredited third-party verification bodies and the stringent qualifications already required by the U.S. EPA's Renewable Fuel Standard aggregate compliance, we believe imposing additional sustainability guardrails on U.S.-

produced renewable fuels is unnecessary.

049.2

Social Practices Audit

The proposed sustainability audit introduces social audit requirements that apply exclusively to crop-based biofuels. According to Staff's April 10th presentation, this audit process would mandate the verification of social practices.

While the aim of promoting social responsibility is commendable, it is important to recognize that social criteria do not directly contribute to greenhouse gas (GHG) reductions—the primary focus of the LCFS. Implementing this requirement would place the onus on verification bodies, like ours, to enforce these standards solely on crop-based biofuels, thereby imposing an uneven regulatory burden across the industry.

At Christianson PLLP, we are committed to supporting the goals of the LCFS while ensuring that regulatory requirements remain focused on their core objectives. We respectfully request that the California Air Resources Board consider the shortage of verification bodies and the current state of U.S. agriculture when evaluating the necessity of these additional sustainability and social practices requirements.

We appreciate your time and consideration of our perspective. Should you have any questions or need further clarification, please reach out.

Sincerely,

Kari Battenhoff, CPA
Partner, Christianson PLLP

August 27, 2024

The Honorable Liane M. Randolph, Chair
California Air Resources Board
1001 I St.
Sacramento, CA 95814

RE: 3Degrees Comments in Response to Proposed Amendments to the Low Carbon Fuel Standard Regulation (15-Day Changes)

Dear Chair Randolph and California Air Resources Board (CARB) Staff,

Thank you for the opportunity to provide comments in response to the Proposed Amendments to the Low Carbon Fuel Standard (LCFS) Regulation published August 12, 2024. 3Degrees Group Inc. (“3Degrees”) is a global climate and clean energy solutions provider and is a strong supporter of the LCFS program. We participate in the program as a designated reporting entity on behalf of a variety of opt-in parties with light-duty electric vehicle (EV) chargers, electric forklifts, hydrogen forklifts, and heavy-duty EV fleets. We are also an active fuel pathway developer.

3Degrees appreciates the time and effort that Staff has put into engaging the public and crafting these updates to the program over the last few years and for considering our comments that were submitted in response to the 45-Day draft rule package published earlier this year. Our recommendations for the updated LCFS proposed rule are outlined below. Under each heading, we have organized our comments in order of what we view as the key priorities for this formal rulemaking process.

—

050.1

CARB should still consider imposing a more stringent 2030 carbon intensity target to ensure long-term credit price stability.

3Degrees applauds Staff’s proposal to go with a 9% CI step-down goal for 2025. However, even with this step-down, our market analysis continues to show that the proposed 30% CI target (§ 95484) is too low to provide the near-term price indicators that are necessary to spur the substantial industry investment in lower-CI projects, fuels, and vehicles required to reach the program’s long-term goals. 3Degrees previously advocated for at least a 35% CI reduction by 2030 and 90% by 2045 in order to align with the ambition of the 2022 Scoping Plan and other decarbonization objectives in California and we still believe this is an appropriate action.

We understand that this stringent step-down coupled with the potential that the auto-adjustment mechanism (AAM) would be triggered one or multiple times could result in an increase to the 2030 CI target by the time we enter the latter half of the decade. However, while we support the AAM, it cannot be triggered until 2028 at the earliest and takes a reactive, rather

than proactive, approach to balancing the credit market. To reiterate a point from our 45-Day comments: while lower near-term prices may achieve the objective of reducing total program costs, the post-2030 targets will only be achievable through significant investments in the low carbon fuel sector this decade. Low credit prices will not send the reliable demand signal necessary to drive the required level of investment. This can only be accomplished through increasing the CI schedule through 2030 to ensure the credit bank is drawn upon sooner than later.

050.2

We strongly urge CARB to provide clarification within the regulation that, for electricity transaction types, third-party site visits of every facility where FSE are located are not required for annual verification.

As stated in our 45-Day comments, with the introduction of new third-party verification requirements for certain electricity crediting types, it is imperative that CARB does not take a one-size-fits-all approach to the site visit obligation. As several verification providers, aggregators, and other parties have noted, it would not just be logistically and financially infeasible, but outright *impossible*, for verifiers to send their employees to visit the thousands of disparate sites containing FSE. We do not believe this was CARB's intent when including electricity transaction types as subject to third-party verification requirements under the revisions in §95500.

The proposed text in the 15-Day draft rule still states that verifiers must "annually visit each facility; and, if different from the fuel production facility, the central records location for which the records supporting an application or report subject to verification are submitted" (§ 95501(b)(3)). We request that CARB make a revision to this section and propose the following changes to the text (in **bold**):

*(3) Site Visits. At least one lead LCFS verifier accredited by the Executive Officer on the verification team must, in addition to one visit to validate an application, annually visit each facility **except as provided in 95501(b)(3)(B)**; and, if different from the fuel production facility, the central records location for which the records supporting an application or report subject to verification are submitted. Site visits, included voluntarily as part of a quarterly review, may not substitute for the required site visit for annual verification services, which must occur after all LCFS data for the prior calendar year has been submitted to the Executive Officer and attested to.*
[...]

(B) For the transaction types identified in §95500(c)(1)(E), the verification body may use a risk-based approach informed by a sampling plan to identify a subset of facilities that reasonably represents the reporting entity's FSE, and perform site visits only to these facilities, to satisfy annual site visit requirements.

As part of their rulemaking process to update the clean fuels program, Oregon has proposed clear rules that provide the necessary flexibility for third-party verifiers to ensure with adequate

certainty that participants are not misreporting data. As proposed in the current draft rules, for entities using credit aggregators (i.e., designated entities), site visits to facility locations (beyond where the aggregator's records are kept) may be performed at the verifier's discretion.¹ This represents a typical set of requirements for verification bodies to come to a *reasonable* level of assurance - the standard for a positive verification statement - as opposed to seeking an *absolute* level of assurance by visiting every parking lot in the state with a registered FSE. While we understand that CARB desires to apply verification requirements equally to all reporting entities throughout the LCFS program, the nature of EV charging equipment is such that the verification process could require multiple months of continuous travel to achieve 100% visitation of all sites with registered FSE. This impractical requirement would pose serious issues for verification bodies and designated entities alike, while adding exorbitant costs to participate in the program. Failing to make these changes would discourage EV participation in the program, especially for entities with a large number of distributed FSE.

In addition, we ask CARB staff to exempt all residential charging from verification requirements. We recommend that § 95500(c)(1)(E)(1) be revised to state, "EV Charging except as specified under 95491(d)(3)(A) **and 95491(d)(3)(B)**" (new text in **bold**). This captures both the metered and non-metered residential charging provisions under the exemption. Without this change, private individuals that own EVs and have no connection to the LCFS program could have their property become subject to a site visit, which poses serious privacy concerns.

050.3

The regulation should specify that Original Equipment Manufacturers (OEMs) may act through a designated entity.

We strongly support the opportunity for OEMs to generate a portion of base residential credits. The LCFS plays a key role in California's position as a leader in EV adoption and it makes sense to incentivize and reward OEMs for supplying those EVs. The revenue requirements outlined in § 95483(c)(1) are reasonable and provide sufficient flexibility for OEMs to use profits from credit sales for new and exciting electrification projects.

For consistency with the other electricity credit generation types, CARB should include language where applicable (e.g., throughout § 95483(c)(1)) that the OEM **or their designee** may act. Allowing OEMs the option to have a third-party manage their participation in the program would maximize efficiency for both the OEM and CARB and streamline registration and reporting activities.

We encourage CARB to add electric ground support equipment (eGSE) as an eligible credit-generating technology.

3Degrees recommends that CARB use this rulemaking opportunity to explicitly include eGSE as an eligible credit-generating technology type under the LCFS. eGSE are eligible for crediting under the programs in both Oregon and Washington, and incorporating eGSE into the LCFS would serve to incentivize an industry that is in the early stages of electrification. This would

¹ <https://ormswd2.synergydcs.com/HPRMWebDrawer/Record/6798709/File/document>

help ensure that the California LCFS remains a driving force for new technologies to transition away from fossil fuels. Since CARB is now proposing that fossil jet fuel continue to be exempt from generating deficits, adding eGSE to the program would be a way that the agency could promote emissions reductions at airports - an issue that numerous stakeholders testified was of key importance during several hearings and workshops. An EER for eGSE can be easily developed using a similar methodology to that of electric cargo handling equipment (eCHE). This category of electric off road equipment charging should, in line with other clean fuels programs, assign the owner of the FSE as the fuel reporting entity and the credit generator.

3Degrees also wishes to express our support for the following proposals.

- Missing Data Provisions in 95491.2(b)(2): The addition of specified methods for data substitution that can avoid alternative methods requests subject to approval is a straightforward and sensible approach.
- Biomass-Based Diesel Potential Phase-out 95488(d): The triggers identified in this section balance the state's electrification ambitions with the need to maintain incentives for biofuels through at least the next several years.

3Degrees appreciates this opportunity to provide feedback and we look forward to continuing to work with CARB on the success of the LCFS program. Please reach out with any questions or for further discussion.

Sincerely,

/s/ Helen Kemp

**Re: Weave Grid, Inc. Supportive Comments in Response to Proposed 15-Day
Changes: Proposed Low Carbon Fuel Standard Amendments**

Dear Chair Randolph, Honorable Board Members, and California Air Resources Board Staff,

Weave Grid, Inc. (WeaveGrid) respectfully submits these comments in response to the California Air Resources Board (CARB) Proposed 15-Day Changes to the Proposed Low Carbon Fuel Standard (LCFS) Amendments posted on August 12, 2024.

I. Introduction

WeaveGrid is a California-based software company that helps load-serving entities support increased adoption of electric vehicles (EVs) through greater understanding of EV driver charging behaviors and vehicle-grid integration. WeaveGrid's technology leverages utility and charging data, including the embedded vehicle telematics—data, controls, and communication systems—and the charging equipment to transform unpredictable and disaggregated EV charging loads into a cohesive network of controllable grid resources. We also support load-serving entities in engaging their EV customers with personalized messages, insights, and notifications via the web, email, and text. Our approach enables broad participation in EV load management programs, while helping reduce the costs to serve EV loads. WeaveGrid is a market leader in providing these solutions.

II. Comments

WeaveGrid appreciates Staff's thoughtfulness with the further proposed amendments to the LCFS regulation. LCFS plays an essential role in supporting California's ambitious transportation electrification and climate goals. WeaveGrid largely supports the regulation and the proposed amendments outlined in December 2023 and August 2024.

051.1

A. WeaveGrid commends CARB for retained language on vehicle-grid integration (VGI).

WeaveGrid is strongly supportive of the retained proposed amendments from the December 19, 2023 proposed amendment update within Section 95483(c)(1)(A)5.b.¹ As EV adoption in California increases, California needs to adapt the grid accordingly. WeaveGrid appreciates that the focus of these proposed additional allowable holdback projects supports greater grid investment to accommodate a growing number of EVs on California's roads. We support the additions in this section, including investments in distribution infrastructure for EV charging, support for vehicle-grid integration (VGI) projects, and technology, such as EV load management software, that can avoid or reduce grid upgrades. Distribution grid investments ensure that charging infrastructure needs are met, especially in underserved communities and for medium- and heavy-duty electric vehicles. VGI projects help EV drivers charge when and where it is most beneficial for the grid and customers.² VGI enables cleaner charging by increasing renewables integration and providing a signal for drivers when it is cleanest to charge.³ Technology helps enable VGI and makes it more driver-friendly by being more automated. VGI projects that use automated technology can benefit from greater participation and, therefore, better outcomes.

Increasing the use of VGI in California is critical to meet clean electricity, clean transportation, and affordability goals. Electrical distribution utilities (EDUs) are the key player to enable effective VGI. More sophisticated VGI includes managing EV charging based on ever-changing grid conditions. To enable cheaper and cleaner charging, grid-aware inputs are required for VGI. For example, renewable energy curtailments can be reduced by charging more vehicles when renewable energy generation is abundant. Another example is avoiding charging when there is higher grid congestion at a local distribution or bulk system level. Among the many approaches to VGI, EDUs are best positioned to incorporate relevant grid signals into their VGI projects. It is for this reason that we emphatically support the VGI-related pre-approved uses for EDU holdback credits.

051.2

B. WeaveGrid strongly recommends clarifying and streamlining the EDU holdback credit requirements and pre-approved uses.

WeaveGrid is a leading technology provider of VGI. Our VGI deployments through public utility commission-approved utility programs and government-selected grant opportunities within and outside of California often require or encourage a strong focus on equity. We

¹ Appendix A-1 Proposed Regulation Order, Section 95483(c)(1)(A)5.b., p. 46, https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2024/lcfs2024/15day_atta-1.pdf.

² LBNL, Quantifying the Financial Impacts of Electric Vehicles on Utility Ratepayers and Shareholders, February 2023, <https://emp.lbl.gov/publications/quantifying-financial-impacts>.

³ CPUC Decision 20-12-029.

have launched and are launching programs in partnership with community-based organizations (CBOs), with important disadvantaged community (DAC) and low-income community enrollment targets, and with tracking of meaningful community benefit metrics. As such, we do not see VGI efforts at odds with equity efforts. In fact, we think that these two categories of focus should be seen as complementary: Equity communities can benefit from greater access to VGI technology.

As currently written in Sections 95483(c)(1)(A)5.a.⁴ and 95483(c)(1)(A)5.b.⁵ under “Restrictions of Use of Holdback Credits,” equity holdback projects can be interpreted as separate and distinct from VGI holdback projects – this can inadvertently disallow equity-focused VGI projects. WeaveGrid encourages CARB Staff to clarify and streamline this language. We recommend combining the list of required and pre-approved uses of holdback credits. As explained above, meeting the 75 percent required equity spend does not need to be at odds with VGI deployment.⁶ In effect, this would also mean expanding what is included as a qualified Holdback Credit Equity Project. Currently, the LCFS regulation has a relatively narrow set of projects that qualify as equity projects, limiting the scope of what EDUs can do with this funding. In our view, any transportation electrification efforts that meaningfully benefit disadvantaged, vulnerable, and underserved communities should be eligible for LCFS funding. This is a best practice in line with what we see from other commissions, utilities, and federal and state agencies.

Moreover, as CARB finalizes amendments to the LCFS program, there is a handoff to the California Public Utilities Commission (CPUC), who also regulates the use of the holdback revenue that EDUs receive. Clearer language around the use of holdback credits upfront in the CARB regulation allows the CPUC to review and approve utility programs that best fit local communities and do not include needlessly limiting restrictions. Given the extensive regulatory guidance and approval process for EDU holdback credits, we recommend streamlining the language in the Restrictions of Use of Holdback Credits section by consolidating the required and pre-approved uses, as outlined above, so that there is greater clarity and more flexible use of credits to benefit communities across California.

051.3

C. WeaveGrid offers strong support to increase the stringency of the program.

WeaveGrid applauds CARB’s proposed amendments to the carbon intensity benchmarks to increase the stringency of the program by bringing LCFS credits and deficits in balance.⁷ To maintain the long-term effectiveness of LCFS, we believe at least a 9 percent step-down is required in 2025. As stated previously, LCFS is a critical funding source in the state for

⁵ Appendix A-1 Proposed Regulation Order, p. 46.

⁶ Appendix A-1 Proposed Regulation Order, p. 44.

⁷ Appendix A-1 Proposed Regulation Order, p. 66.

transportation electrification efforts, so maintaining reliable credit prices is necessary. Given the prominent role that LCFS plays, we are highly supportive of CARB's efforts to strengthen compliance measures, which can ultimately increase the program's success in reducing transportation emissions and promoting cleaner fuels.

III. Conclusion

WeaveGrid appreciates the opportunity to submit these comments. We thank CARB for consideration of these comments and look forward to continued engagement.

Respectfully submitted,

/s/ Amanda Myers Wisser

August 27, 2024

Chair Liane Randolph and Members of the Board California Air Resources Board
1001 I St.
Sacramento, CA 95814

RE: Newtrient LLC Comments on the Proposed Amendments to the Low Carbon Fuel Standard

Dear Chair Randolph and Members of the Board,

Newtrient appreciates the opportunity to comment on the proposed amendments to the Low Carbon Fuel Standard (LCFS). Newtrient was founded by leading milk cooperatives and organizations, representing 20,000 dairy farmers producing approximately half of the nation's milk supply. Newtrient delivers solutions to environmental and economic challenges, including advancing manure management technologies and products. Through a team of credible technical experts in manure management systems, nutrient recovery, renewable energy, and environmental asset markets, Newtrient helps dairy farms, and the dairy industry reduce its environmental footprint.

Newtrient would also like applaud the success that has been achieved by the LCFS program as was announced in August 2023, when the California Air Resources Board (CARB) announced that in Q1 2023 clean fuels replaced more than 50% of the diesel used in the state for transportation purposes, equating to nearly two billion gallons of avoided fossil diesel use in 2022.¹ This further underscores the success of the program and continued need for the LCFS to deliver GHG reductions from the transportation sector.

As we have stated in previous comments, two programs directed by the California Department of Food and Agriculture (CDFA) have been particularly vital to the progress California has made. According to the 2023 CARB Mid-Year Data Update report on the cumulative progress of the

¹ California Air Resources Board. *For the first time 50% of California Diesel Fuel is replaced by clean fuels.* August 23, 2023. <https://ww2.arb.ca.gov/news/first-time-50-california-diesel-fuel-replaced-clean-fuels>

California Climate Investments Program (CCIP), the Dairy Digester Research and Development Program (DDRDP) and the Alternative Manure Management Program (AMMP) have received a total of \$309.1 million in funding and have reduced 23.2 million MTCO₂e. The funding for these programs represents 1.86% of the California Climate Investments program as of May 31, 2023, but the GHG reductions from these two programs represent 23.69% of the total for all California Climate Investments programs².

Of the 78 subprograms listed in the 2023 CARB Mid-Year Data Update report on the cumulative progress of the California Climate Investments Program as of May 31, 2023, only the DDRDP, has produced a GHG reduction at a cost of less than \$10 per MTCO₂e. The DDRDP program has the largest GHG reductions of any single subprogram (22.1 million MTCO₂e) and represents the single most effective program in the overall strategy to achieve the ambitious climate goals set by the State of California.

In December of 2022, researchers at UC Davis published the study, *Meeting the Call: How California is Pioneering a Pathway to Significant Dairy Sector Methane Reduction* in which they stated “...analysis shows that continued implementation and commitment to the incentive-based climate smart solutions that are currently driving voluntary dairy methane reduction in California should, by 2030, achieve the full 40 percent reduction in dairy methane sought by state regulators without the need for direct regulation.”³

With our support of CARB and the LCFS in mind, Newtrient would like to offer the following comments on the proposed amendments to the Low Carbon Fuel Standard:

Strengthening Carbon Intensity (CI) Targets

052.1

Newtrient applauds CARB and is encouraged to see that the proposed amendments aim to set more ambitious carbon intensity targets. A strong CI reduction target is a critical component for driving down (GHG) emissions in the transportation sector, reducing reliance on petroleum fuels, and transitioning to electric vehicles where feasible. We are pleased to see that staff have proposed a more aggressive step-down of 9% in the 15-day changes. This is a much-needed

² California Climate Investments Program: 2023 CARB Mid-Year Data Update (May 31, 2023), (https://ww2.arb.ca.gov/sites/default/files/auction-proceeds/ci_2023mydu_cumulative_statistics.pdf)

³ Kebreab, Ermias, Ph.D., Mitloehner, Frank, Ph.D., and Sumner, Daniel A., Ph.D., Meeting the Call: California is Pioneering a Pathway to Significant Dairy Methane Reduction (December 2022), available at: <https://clear.ucdavis.edu/news/new-report-california-pioneering-pathway-significant-dairy-methane-reduction>

market correction, to align targets with available supply, which has been delivered to the LCFS program in excess in recent years, creating a credit bank. While this alone will not fully address the oversupply of credits in the cumulative credit bank, this single adjustment will translate into millions of additional tons of GHG emission reductions that would've otherwise gone unabated.

052.2

While we believe that the proposed 9% step-down in stringency is a good start at course correcting the market, we also believe that an Auto-Acceleration Mechanism (AAM) is still needed to respond to clear overperformance of the program and to send an unambiguous market signal to investors that the program is nimble and will respond to opportunities to deliver additional GHG reductions rather than “add to” an excessively large credit bank that is at odds with the objectives of the program. The AAM is a necessary complement to the CI target adjustment and as designed, will send a clear, supportive, and unambiguous market signal to continue investments in clean fuels by tightening the program in the event overperformance occurs. Adoption and implementation of this mechanism will ensure that potential emission reductions are not left on the table and will help California reach its climate goals faster if triggered.

Avoided Emission Crediting

052.3

The proposed amendments in the 45-day package sought to phase out avoided emission pathways for projects that break ground after December 31, 2029, for biomethane used as a transportation fuel through 2040 and for biomethane used to produce hydrogen through 2045. The 15-day changes aim to expand this phase out to projects breaking ground before January 1, 2030, restricting the total number of crediting periods for avoided methane emissions from three consecutive 10-year periods to two. Newtrient believes that this is inconsistent with the incentive-based approach outlined in SB 1383 and currently being implemented in California.

052.4

Moreover, eliminating or phasing out the avoided methane crediting in the dairy sector would lead to an inability to meet the state's targeted methane reduction goals and result in significant dairy methane emissions leakage. Avoided methane crediting is a key component of dairy methane reduction incentives that has achieved significant reductions to date and as stated previously, is one of the most effective tools to meet California's GHG goals.

According to a UC Davis analysis:

... misguided efforts to change course by forced coercion to pasture-based operations, direct regulation of dairy farms, or limitation on dairy digesters incentives will not only fail to achieve the desired greenhouse gas emissions reductions but will exacerbate the

problem by causing significant emissions leakage. Revenue streams that incentivize investment in biogas capture and beneficial use are critical. Phasing out of avoided methane crediting in the dairy sector would jeopardize existing projects, making them uneconomic in the long-term, and dry up investment capital for the additional digester projects sought by CARB to achieve the state's ambitious and aggressive targets.⁴

The ultra-low carbon indices within the dairy Anaerobic Digestion (AD)/Biogas sector are real and well-vetted within the national laboratory-developed Greenhouse Gases, Regulated Emissions, and Energy Use in Technologies (GREET) model. As such, anyone who values science must appreciate their role in meeting GHG and climate goals, and not selectively replace them with non-scientific reasoning.

The low carbon intensity of these projects arises from a combination of well-to-wheels carbon gains plus the methane offsets from baseline methane emissions from manure management, storage, and application. Methane offsets from baseline emissions are a legitimate accounting practice as baseline, pre-AD/biogas systems emissions exist, and are largely removed through the installation of the AD/biogas system.

CARB has carefully and correctly set the boundaries of animal agriculture and clearly defines the baseline scenario of California dairies by providing a diagram of the LCFS boundaries and indicating the project related components in the Compliance Offset Protocol for Livestock Projects Capturing and Destroying Methane from Manure Management Systems Adopted: November 14, 2014.

Some groups misrepresent the dairy industry and, as in the case of the comments submitted and made during public input sessions, misrepresent the benefits of the use of anaerobic digestion and renewable energy production on dairy farms. Anaerobic digestion systems have scientifically supported GHG reductions. By calling the scientifically supported GHG reductions achieved by AD systems “artificially inflated,” they show that they are not willing to discuss the science and the significant impact of AD on reducing GHG emissions from farms, but instead label and denigrate these projects with their own unscientific opinions.

⁴ Kebreab, Ermias, Ph.D., Mitloehner, Frank, Ph.D., and Sumner, Daniel A., Ph.D., Meeting the Call: California is Pioneering a Pathway to Significant Dairy Methane Reduction (December 2022), available at: <https://clear.ucdavis.edu/news/new-report-california-pioneering-pathway-significant-dairy-methane-reduction>

Revenue streams that incentivize investment in biogas capture and beneficial use are critical. Phasing out of avoided methane crediting in the dairy sector would jeopardize existing projects, making them uneconomic in the long-term, and dry up investment capital for the additional digester projects sought by CARB to achieve the state's ambitious and aggressive targets.

Avoided methane emissions are a critical part of science-based, life cycle assessments, and their inclusion in carbon intensity scores are consistent with internationally recognized standards of carbon accounting. The scientific evidence for this is robust and recognizes that the baseline includes methane emissions that would otherwise be released into the atmosphere. Recognizing methane and its role as a short-lived climate pollutant, while incentivizing its removal from the atmosphere, has proven highly successful in supporting the reduction of millions of metric tons of carbon dioxide equivalents. We strongly encourage CARB to continue its longstanding commitment to a science-driven framework that utilizes proven science including Argonne National Laboratory's GREET model.

In the event CARB maintains its plans to phase out eligibility for avoided methane in vehicle fuels, we encourage CARB to be clear that it is a policy decision associated with CARB's efforts to transition biomethane into non-vehicle sectors (e.g., residential, commercial, and industrial uses). CARB should be explicit that the policy decision to discontinue recognition and eligibility of avoided methane emissions in vehicle pathways should not be interpreted as a departure from the established rigorous science of accounting for the benefits of avoiding methane emissions which continues to be appropriate for non-vehicle sectors.

Deliverability Requirements

052.5

The 15-day changes added a provision to section 95488.8(i)(2) that would allow the Executive Officer to approve a gas system map that identifies transcontinental and connected pipelines for which gas flows to California at least 50% of the time. Should the Executive Officer approve this map before July 1, 2026, then entities reporting under bio-CNG, bio-LNG, and bio-L-CNG must demonstrate physical flow to the state 50% of the time after December 31, 2037, not January 1, 2041. It appears that the deadline for biomethane used as an input to hydrogen production remains January 1, 2046.

While it appears that the addition of a gas flow map, for which the Executive Officer isn't technically required to approve, may address some implementation questions, this modification does not address the overall lack of detail with the proposal or the reality that

an implementation date of 2037 or 2041 will be difficult to achieve. As mentioned in our February 16, 2024, comments, the ABC believes that CARB should require further guidance on the proposed deliverability requirements as they lack detail. The proposed amendments aim to adopt the California Renewable Portfolio Standard (RPS) requirement of ensuring biomethane injected into a common carrier pipeline physically flows towards California 50% of the time. Yet, the references RPS framework does not provide any clarity on how these biomethane molecules can be traced to California, how a 50% average flow toward California may be modeled, nor expected geographical indications of regions anticipated to remain eligible for book-and-claim accounting. While the proposed map may aid geographical clarity for some projects, those projects that remain outside geographic boundaries, but may otherwise be able to demonstrate deliverability, are left without clear guidance on how they may meet the requirements. We look forward to discussing these provisions with CARB staff in the coming year and highly encourage CARB to conduct a full and transparent public process to inform any gas maps the Executive Officer may consider.

Hydrogen

052.6

Newtrient disagrees with the modification in the 15-day changes to exclude hydrogen produced with blended renewable and fossil gas from receiving LCFS credit by January 1, 2030. Specifically, this language constrains entities that are currently blending biomethane and fossil natural gas to produce a lower-CI hydrogen via steam methane reforming (SMR). This change, which was not discussed in the 45-day package or previous public workshops, has the potential to limit the availability of low-CI hydrogen during a time when hydrogen produced via electrolysis and renewable electricity is still struggling to scale up and reach cost parity.

True-Up Provision

052.6

Newtrient is pleased to see the proposed amendments to expand the credit true-up to include periods using temporary pathway CIs after annual verification following stakeholder input highlighting the benefits of the credit true-up. Based on our understanding of the language, reporting that is submitted March 31, 2025, will cover the years 2023-2024 and include a credit true-up back to 2023. We do however take issue with the proposal including true-up provisions that adjust credits based on verified operational CIs relative to certified CIs, applying a penalty of four times the spread for shortfalls. The

052.7

justification for this 4X multiplier is unclear, as a smaller multiplier, such as 2X, would still effectively discourage overconfidence in CI analysis. Finally, we urge CARB to establish a temporary CI pathway for biogas-to-electricity projects, as the absence of such a pathway currently puts biogas-to-electricity at a disadvantage compared to biomethane projects, which already have access to temporary CI pathway.

Conclusion

Over the past year and a half, CARB staff have held numerous public workshops to gather feedback on potential changes to the program, where has Newtrient participated, and we are pleased to see that the rulemaking is nearing completion.

Thank you for the opportunity to comment on the proposed amendments, and we look forward to engaging with CARB staff on these topics.

Sincerely,

A handwritten signature in black ink, reading "Mark Stoermann".

[Board Comments Home](#)

August 27, 2024

Chair Liane Randolph and Members of the Board
California Air Resources Board
1001 I Street
Sacramento, CA 95814

Dear Chair Randolph and Members of the Board,

Cargill appreciates the opportunity to provide comments on the California Air Resources Board's (CARB) proposed 15-Day Changes to the Proposed Amendments to the Low Carbon Fuel Standard (LCFS) Regulation (15-day package), and we thank staff for consideration of our points below.

Cargill is a Minnesota-based global agribusiness company that has worked closely with small- and large-scale growers since our founding 159 years ago. We partner with farmers, food companies, retailers, and fuel producers to make, process, and move food and fuel feedstocks around the world. Cargill businesses originate, process, and convert these feedstocks into renewable fuels including biodiesel and ethanol, while working closely with our farmer partners. Our work starts at the farm level, where we are undertaking comprehensive, large-scale efforts to [reduce emissions](#) across our global supply chains – working hand in hand with farmers to scale regenerative farming practices, protect and restore vital landscapes and empower producer communities.

Cargill is taking climate action – the global food system depends on it.

Climate change has a direct and growing impact on the food and agriculture industries. With a global footprint and presence in major supply chains worldwide, Cargill has a responsibility to make the food system even more sustainable and resilient. Cargill appreciates CARB's commitment to decarbonize the State's transportation sectors. A more sustainable food system must consider how food and other vital goods move around the world from origin to destination. Incentivized markets, such as California's LCFS program, are instrumental in creating demand for these lower-carbon transportation solutions.

Near-Term Stringency Increase

053.1 Cargill welcomes CARB's proposal of a near-term increase in stringency to a 9% CI reduction in 2025 as a way to stabilize LCFS prices, but we believe there is room for a more impactful step-down given the build in the LCFS credit bank as the industry responds to the demand of lower carbon liquid transportation fuels in California. The over-performance of the program is a testament to its success, and we believe the proposed adjustment will be supportive to higher credit prices and continued investment in the state's transition to cleaner energy.

20% Cap on Soybean Oil and Canola Oil Feedstocks

053.2 **Cargill's priority will always be nourishing the world.** We believe North American agriculture still has an important role to play in the transition to cleaner energy and more sustainable food systems, and that the industry is uniquely positioned to feed the world and meet the growing global demand for low carbon biofuels. North American farmers are integral to the decarbonization of our food and energy sectors and continue to use innovative technologies and cropping systems to support carbon sequestration, sustainability, and emissions reductions throughout the supply chain.

As such, Cargill does not support the proposed cap on soybean and canola oils. Any deviation from the current policy must be nimble, non-arbitrary, and designed to effectively respond to near-term acute needs without driving longer-term unintended consequences. While we believe that innovation in agronomics and technology will lead to greater opportunities for emissions reductions for traditional feedstocks like soybeans and canola, we also acknowledge CARB's desire to send a clear market signal so that participants can make decisions that affect the long-term performance of their businesses.

Agriculture has been serving food and fuel markets for decades and will continue to support both markets with an unwavering commitment to sustainability as the energy transition evolves. As we invest and modernize assets to support near-term demand, we see a shared benefit for long-term food production supported by more advanced infrastructure.

053.3 A key driver for the long-term success of the industry will be the continued reduction in the carbon intensity of crop-based feedstocks. The growing adoption of sustainable farming practices results in the production and availability of lower carbon-intensity feedstocks for bioenergy. Farmers are increasingly adopting these practices to further reduce and sequester carbon, in addition to seeing clear economic and productivity gains. Recognizing the opportunity and imperative of regenerative agriculture, Cargill is supporting and incentivizing these sustainable practices among growers in our supply chain. We encourage CARB to promote the adoption of these reduction mechanisms by making available pathways which incorporate regenerative agriculture practices.

053.2 cont CARB's proposed cap on soybean and canola oil feedstocks disadvantages the North American grower who is integral to the decarbonization of our global food systems. In the years ahead, the global food system will be subjected to the indirect consequence of reducing the available production of soybean and canola oil – which is to reduce contingency supplies available to the food system. In essence, CARB's proposed policy guidance calls for greater decarbonization without its most flexible and scalable feedstock supply. We believe this undermines the critical imperative to provide food and to decarbonize the global transportation supply chain.

The proposed cap on soybean and canola oils for biomass-based diesel represents a material policy change to the program. CARB's 15-day package presents the first opportunity for a broad stakeholder group to review these impactful changes. Given the potential implications of this policy change, Cargill asks CARB to provide stakeholders with additional time to properly vet the intent, impact, and implications of the proposed requirements. While we expect additional question to be raised over time, we request that CARB respond to the following as soon as possible:

- Current participation % of soybean and canola oils as biomass-based diesel feedstocks – Cargill requests that CARB provide stakeholders with the composition of the "Other" feedstock type category used for data modeling in Table 6 of the LCFS Data Dashboard.

- Assessment of the 20% cap – Is the cap assessed on the volume of biomass-based diesel imported into California’s LCFS program, or is the cap assessed on the total volume of production by producer? Cargill requests that staff make available a formula or illustrative example of how staff intends to assess this cap at the producer level.
- Definition of the term “company” – Cargill requests that staff provide a clear definition of this term so stakeholders can better analyze how the cap might affect current business operations.
- Reporting and verification – Cargill requests that staff provide more details for stakeholders related to reporting and verification processes relative to the proposed cap and its implementation.

Sustainability Certification for Biomass

053.4 Cargill supports and promotes sustainable approaches to agriculture that are demonstrated through traceability back to our growers. We recognize the importance of traceability throughout the supply chain, not just for renewable biomass from crops, but for waste-based feedstocks as well. Adequate mechanisms must be in place to ensure that all feedstocks are correctly identified and that their environmental benefits match the material being used for credit-generating fuel.

Growth in waste-based feedstocks to feed our domestic market increasingly comes from foreign locations. Feedstocks sourced from outside North America are oftentimes challenging to trace back to origin. This challenge is compounded by the smaller volumes of waste that must be aggregated from hundreds of sourcing locations, and sometimes across multiple regions. Cargill believes that all feedstocks require effective compliance processes. We encourage CARB to engage with industry and relevant authorities to develop and adopt such processes and procedures.

To this end, Cargill is actively exploring the application of lipid profile analytical testing methods which would serve as support to the identification and verification of feedstocks such as used cooking oil (UCO). Developing and incorporating such testing methods would be a strong step towards ensuring rigorous compliance requirements for all feedstocks within the program.

We request that CARB align the sustainability certification requirements between biomass and waste feedstocks to ensure that all eligible feedstock for the program is subject to the same requirements, and that advantages for waste-based feedstocks are not derived from less rigorous compliance requirements.

Conclusion

Cargill respectfully requests that CARB remove the proposed cap from the rulemaking package. We recognize that crop-based feedstocks must be allocated for fuel use in a thoughtful and balanced manner. Cargill’s participation in global agriculture supply chains gives us confidence in the market’s ability to serve both food and fuel.

North American farmers continue to grow their use of climate-smart agricultural practices in support of soil health, resource conservation, and soil carbon sequestration. We know that continued reductions within the industry are essential to meeting our decarbonization goals and that farmers are leading the way to a more sustainable future for our agricultural supply chains and global food systems.

We also believe that the strong demand signal for foreign-sourced waste-based feedstocks without appropriate traceability requirements presents opportunities for ineligible material to make its way into the LCFS.

We look forward to continued collaboration with CARB as we support the role of agriculture in the decarbonization of our transportation sectors and food systems. Thank you for this opportunity to submit comments.

Sincerely,

Comments of Kia Corporation
to the
California Air Resources Board

**RE: 15-Day Notice of Modifications to
Proposed Low Carbon Fuel Standard Amendments**

August 27, 2024

The Kia Corporation (Kia) submits these comments to the California Air Resources Board (CARB) on the modifications of proposed Low Carbon Fuel Standard (LCFS) amendments issued on August 12, 2024. Kia appreciates this opportunity to provide feedback on these modifications which have potential to significantly contribute to California's LCFS goals. Kia supports the changes proposed by CARB, but we recommend a few revisions to provide more certainty for automakers.

054.1

Kia supports comments submitted by the Alliance for Automotive Innovation (AAI). Kia supports AAI's request for CARB to provide additional clarity on the definition of an "eligible OEM." Kia also supports more clarity on how this rule will impact the Clean Fuels Rewards program and the metrics that determine the allocation of "up to 45 percent" of base credits for residential EV charging.

Kia, part of the Hyundai Motor Group (HMG), is a dynamic part of the world's third largest automaker. Kia is committed to electric vehicles (EVs) and is investing \$28 billion by 2027 into EVs and other advanced technologies. Kia is focused on popularizing EVs at all levels of the market and becoming a global leader in EVs and electrification.

As more states adopt similar clean fuel programs,¹ CARB's leadership in designing and implementing a market-based program that decreases transportation fuel carbon intensity (CI) can have a lasting impact on reducing greenhouse gas emissions nation-wide.

Kia appreciates the opportunity to collaborate with CARB in developing changes to the LCFS. Kia supports the proposal to allow the Executive Officer to allocate up to 45 percent of the base credits for residential EV charging to qualified Original Equipment Manufacturers (OEMs). Further, Kia supports CARB's proposal for a 9 percent increase in stringency of the CI target for 2025. This proposal will help ensure that California residents who purchase electric vehicles (EVs) realize the benefits of this program.

Residential Charging Base Credits

¹ Washington, Oregon, and New Mexico have adopted their own Clean Fuel Standards. New York and Minnesota are among states that have had Clean Fuel Standards introduced in the legislature.

054.2

Due to the recent and ongoing low prices for credits in the LCFS program, Californians who purchased EVs were unable to receive a rebate under the Clean Fuels Rewards program. Additionally, without the rebate, the higher purchase price could have turned consumers away from purchasing an EV. If OEMs are directly able to capture revenue from the base credits generated by their own vehicles, rebates for EVs would reach consumers under all LCFS credit market conditions and potentially in higher amounts.

Under current rules where electric distribution utilities (EDU) are allotted the entirety of base credits, the Clean Fuels Rewards program has been insufficiently funded. This represents a lost opportunity in advancing LCFS goals as well as other CARB priorities such as Advanced Clean Cars II's (ACCI's) Zero Emission Vehicle (ZEV) requirement. Incremental credit proceeds, while helpful, are insufficient to provide enough revenue for OEMs to meaningfully increase EV rebates or provide for any of the other proceed usage requirements detailed in the proposed section 95483(c)(1)(B).

Conversely, Kia routinely and extensively provides rebates on their vehicles for various reasons. Kia has the ability, the know-how, and the incentive to support customers with direct rebates. New proceeds from base credits will position Kia and other OEMs to increase their ability to provide rebates on EVs. This will reduce EV transaction prices; increasing EV adoption and the use of low-CI electricity as a transportation fuel. This is a double benefit to consumers as low-CI electricity is generally more affordable than gasoline and other liquid transportation fuels.

As part of our commitment to EVs, Kia is also working to expand EV charging infrastructure through our investment in IONNA² and other efforts. The National Renewable Energy Laboratory (NREL)³ estimates that California will require 262,000 public level-2 charging ports and 29,100 public DC-fast charging ports by 2030. This is significantly higher than the current 32,667 level-2 ports and 10,677 DC-fast charging ports available in California.⁴ Ongoing issues with charger reliability, siting and permitting, and grid connectivity and capability, present hurdles in growing the public charging network. This necessitates the use of all available tools to meet the challenge. The additional revenues achievable from base credits could help Kia overcome these challenges and continue to build out the infrastructure that is critical for wider adoption of EVs.

Kia strongly supports granting OEMs up to 45 percent of residential EV charging base credits. This increases the efficiency and efficacy of the LCFS by providing a more direct conduit for LCFS credit proceeds to support California consumers in making their low-CI fuels purchasing decisions. Kia encourages CARB to finalize language that ensures OEMs are better positioned to contribute to the continued success of the LCFS.

Carbon Intensity Targets

054.3

Kia supports CARB's proposal for a "near-term increase in stringency of 9 percent CI reduction in 2025" and the addition of the "Automatic Acceleration Mechanism" to help ensure the continued success of the LCFS. Appropriate CI targets that maintain adequate LCFS credit

054.4

⁴ California Energy Commission, "Electric Vehicle Chargers in California", accessed August 2024.

pricing will support the continued growth of low-carbon fuels. We appreciate CARB recognizing the need to add these measures to advance adoption of low carbon fuels. Kia encourages CARB to continue to ensure a healthy credit trading market by monitoring program metrics.

Conclusion

Kia looks forward to participating in CARB's efforts to bring Californians more low-carbon fueling options. We appreciate the opportunity to provide comments on the proposed modifications and look forward to continued engagement with CARB on the LCFS.

Ms. Liane Randolph
Chairman, California Air Resources Board
1001 I Street
Sacramento, CA 95814

Subject: Low Carbon Fuel Standard (LCFS) Comments

Dear Chair Randolph:

The [California Hydrogen Car Owners Association](http://www.h2tonps.org) (CHCOA) is a group of hydrogen car drivers who believe in the positive role that these cars can play in California's green energy future. Our Association, which started a year and a half ago, has grown to 197 members and includes current and former lawmakers, hydrogen industry and agency representatives, research scientists and many folks who have driven these cars for as long as they have been around.

In our charter documents, CHCOA stated that the lack of reliable hydrogen refueling infrastructure is single-handedly thwarting the success of these cars in the United States. We now believe that the unabated high prices of hydrogen at the dispenser is having an equally chilling effect on the success of light-duty FCEVs. It is incumbent on the California Air Resources Board to take such actions, within their purview, to reduce this cost. At a minimum, we believe that CARB should retain the Light-Duty HRI program and do what it can to increase LCFS credit prices.

CHCOA believes that hydrogen produced for use in transportation should have a carbon intensity of zero as soon as reasonably possible, taking into consideration the need for increasing volumes of hydrogen to supply a growing industry. Our *Green Before the Grid* campaign reflects our commitment to this essential goal.

Sincerely,

Gregory R. Cane
President

RE: CARB Notice of Public Availability of Proposed Modifications ("15-Day Changes") to the Proposed Low Carbon Fuels Standard Amendments, released on August 12, 2024.

Deere & Company ("John Deere") appreciates this opportunity to submit comments following the California Air Resources Board's ("CARB") August 12, 2024 release of Proposed Modifications to its Proposed Low Carbon Fuel Standard Amendments, and specifically the proposed changes to credits for biomass-based diesel (new subsection 95482(i)).

John Deere supports policies that promote an expanding, sustainable supply of U.S.-grown renewable fuels and feedstocks. For decades, U.S. renewable fuels, including biomass-based biofuels, have provided cleaner-burning transportation fuels to U.S. consumers. It is John Deere's hope that, backed by strong fuels policies, U.S.-grown biofuels will continue to play a key role in decarbonizing the U.S. transportation sector.

056.1 Deere believes that the proposed limitation on credits for biomass-based diesel produced from virgin soy and canola oils is both unnecessary and counterproductive to the state's decarbonization goals. By limiting LCFS credits for biomass-based diesel, proposed subsection 95482(i) would effectively cap the volume of biomass-based diesel allowed into California's transportation fuel supply. Once the proposed 20 percent cap is met, additional low-carbon fuels made from soy and canola oils would be assigned a pre-determined carbon intensity score that does not reflect the sustainable, well-documented carbon reduction benefits they provide¹.

056.2 The exponential growth in adoption of climate-smart ag practices, precision technologies and data-enabled farming have brought about significant sustainability gains and production efficiencies². According to USDA data, most recent increases in U.S. production of soybeans, for example, can be attributed to increases in yields per acre. Over the past three decades, average U.S. soybean yields have risen from 32.6 to 49.5 bushels per acre, a nearly 52 percent increase.³ As productivity has increased, so has farmers' ability to generate and analyze field-level data that allows for measuring, documenting and calibrating the carbon-reducing impacts of climate-smart practices. The use of precision equipment and technologies has created a virtuous cycle of generating the data to track performance, and then the insights to improve that performance over time.

056. cont The proposed addition of subsection 95482(i) includes the rationale that California seeks to "avoid sending a long-term signal for virgin soy or canola oil to serve California demand." Yet even as California's progress towards zero-emissions continues, the demand for reliable supplies of liquid, low-carbon biofuels will continue for years to come. These fuels are and will remain the most viable, affordable option for many segments of California's economy, including heavy duty and offroad users. By limiting the availability of LCFS credits for biomass-based diesel, the state would leave rural and off-road fuel users with fewer alternatives, not more, along with higher fueling costs. This would be especially problematic for many California farmers who have a need for higher-powered equipment that cannot be met through battery electric alternatives. By ignoring this reality, proposed

JOHN DEERE

subsection 95482(i) will stifle decarbonization efforts and raise fueling costs for important segments of California's economy.

056.3 Deere reiterates comments it submitted to CARB on March 15, 2023, encouraging the Board, rather than placing caps on virgin oil feedstocks, to consider convening an Expert Working Group ("EWG") to provide a third-party evaluation of this matter and report back to CARB on its findings and any recommendations. Given that caps on virgin oil feedstocks would disproportionately impact those in the oilseed and agricultural industries, we recommend that those sectors be adequately represented among the those who comprise the EWG. In addition, we recommend the EWG conduct a review of the LCFS' indirect land use change ("ILUC") modeling data to ensure the most current scientific data is being utilized.

John Deere appreciates the opportunity to comment as CARB continues implementation of the LCFS and considers program changes. We urge CARB to set aside the proposed addition of a cap on biomass-based fuels and instead initiate a stakeholder process to thoroughly evaluate the necessity and impacts of such a restriction.

Sincerely,

John W. Rauber, Jr.

Jordan Ramalingam, Manager, Alternative Fuels Section
California Air Resources Board
1001 I Street, Sacramento, California 95814

August 27, 2024

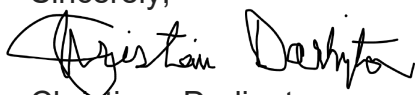

Dear Mr. Ramalingam,

Thank you for the opportunity to respond to the proposed changes to the Low Carbon Fuel Standard Regulations relating to the utilization of biomass. The District has proposed changes to the provisions that relate to forest biomass, directly or indirectly, in order for the regulations to achieve the environmental safeguards and optimize biomass utilization for biofuels. As ARB is fully aware of the benefits of such utilization over open burning or wildfire, the District chooses not to belabor the point in this letter.

- 057.1 Instead, please see the language additions that offers a few important clarifications. First, we recommend the use of the term “dimensional lumber” instead of “wood product” because it is the higher grade materials that should be prevented from being used for biofuels. The term “wood products” include things like mulch, pet bedding, and landscaping chips, which would be appropriate for use as biofuel, as well. Therefore, the phrase dimensional lumber makes more sense.
- 057.2 Second, biomass from fire salvage operations is explicitly listed as this is an important source. Next, the District proposed language that clarifies that the use of plantation style tree farm biomass that is less than fifteen years old (as proposed by CARB) must go
- 057.3 through the additional environmental safeguards for use in the program. Also, the word “compaction” is removed because that term is too broad to be used in this context, and finally, clarifies that national and state level environmental documentation could prove to satisfy environmental requirements. There are other small changes that just help clarify the regulation.

The District has consulted with several different forestry professionals to help support ARB with these changes, and is more than happy to facilitate any further discussion. Please note that attachment has the redline version of the regulation with notes.

Sincerely,

Christiana Darlington
General Counsel
Placer APCD

057.1 cont

“Forest Biomass Waste” means small-diameter residues, limited to forest understory vegetation, ladder fuels, limbs, branches, and logs that do not meet regional minimum marketable standards for processing into dimensional lumber.

057.2 cont

§ 95488.8. Fuel Pathway Application Requirements Applying to All Classifications.

g) 1_a_3) Forest biomass waste removed for the purpose of forest fire wildfire reduction, to reduce the risk to public safety, or forest stand improvement infrastructure, post-fire salvage, to create defensible space, or for forest restoration; and from a treatment wherein which no clear-cutting occurred; and that was performed in compliance with all local, State, and federal rules and permits.

§ 95488.9. Special Circumstances for Fuel Pathway Applications.

057.3

(g)(1)(A) when biomass is used in fuel pathways that is sourced from private commercially owned tree plantation lands, it must have been cleared or cultivated prior to January 1, 2008 and actively managed or fallow, , since January 1, 2008. Biomass may not be sourced from land that is covered under international or national law or by the relevant competent authority for nature protection purposes.

(g)(1) (B) Biomass must be produced according to best environmental management practices that reduce GHG emissions or increase GHG sequestration, including but not limited to: 1. Maintain or enhance biodiversity habitat on agricultural or forested lands; 2. Enhance soil fertility and avoid erosion; 3. Apply fertilizers in a manner that minimizes runoff, and soil and water contamination; 4. Reduce unsustainable water use, and minimize diffuse and localized pollution from chemical residues, fertilizers, soil erosion, or other sources of ground and surface water contamination. These requirements may be demonstrated through documentation prepared under FPA, NEPA or CEQA.

August 27, 2024

The Honorable Liane M. Randolph, Chair
California Air Resources Board
1001 I Street
Sacramento, CA 95814

RE: 2024 Low Carbon Fuel Standard Amendments

Dear Chair Randolph:

Indigo Ag, Inc. (Indigo Ag) appreciates the current and historic efforts by the California Air Resources Board (CARB) to reduce the greenhouse gas (GHG) emissions from transportation through the implementation of the State's Low Carbon Fuel Standard (LCFS). Since 2011, California's LCFS program has been tremendously successful and is a model for the nation and the world. Indigo Ag supports the continued evolution of the LCFS through the CARB rulemaking process. Of particular interest to Indigo Ag is the production of biofuels in the most sustainable manner. The use of sustainably grown biofuels directly supports the State's goal to reduce anthropogenic emissions by 85 percent by 2045.

About Indigo Ag

Indigo Agriculture, Inc. ("Indigo") was founded in 2013 and is headquartered in Boston, Massachusetts, with its commercial office based in Memphis, Tennessee. Carbon by Indigo is the first private program to quantify agricultural soil carbon benefits with registry-approved rigor at a global scale, and Indigo Source is the first program to produce low carbon intensity (CI) ag feedstocks at scale. Our ecosystem partner-based approach supports the scaling of our technology to realize the large, pooled projects needed to move beyond carbon abatement and realize mass drawdown across agricultural acres.

Thousands of US farmers across seven million acres of active cropland have enrolled in our programs, which generate carbon offsets, low CI crops, and/or other ecosystem services. Our prior work has primarily focused on the voluntary market, following Climate Action Reserve's (CAR) Soil Enrichment Protocol (SEP) and The Greenhouse Gas Protocol's (GHGP) Land Sector & Removals Guidance (LSRG). We have now taken this project through three successful rounds of independent verification by an ISO-accredited verification body. Across those three verifications we have issued nearly 300,000 credits, each representing one metric ton of CO₂e emissions either reduced, avoided, or removed from the atmosphere. We also work with our supply chain partners to deliver ~20M bushels of low CI ag commodities to voluntary buyers each year.

Over the last 6 years, Indigo has made substantive (and almost certainly unique levels) of investment in our science and technology and methods for driving carbon action and quantification farms with growers and our partners. It is through this investment that we have proven that these programs are not only robust but can be scaled in a credible way and are

excited for the opportunity to bring these capabilities to alternative fuels markets, such as the LCFS.

Leverage Existing Certification Programs to Meet Sustainability Requirements

058.1

At the April 10, 2020⁴ workshop, CARB stated that in implementing a continuous third-party sustainability certification program, it plans to “leverage existing certification programs”¹ and listed four programs approved under the European Union’s (EU) Renewable Energy Directive (RED): ISCC, RSB, REDcert, and Bonsucro. We recommend that CARB allows a fuel pathway to select the sustainability certification program that best fits their feedstock, agricultural practices, and operation. Specifically, we encourage the use of a sustainability certification programs that include the quantification of direct and indirect nitrous oxide emissions and soil carbon sequestration changes, such as the ISCC. The ISCC GHG Guidance requires the measurement of a soil carbon baseline and impacts “after at least 10 years of application” of practices. After initial soil carbon sampling, the GHG Guidance allows the use of the DAYCENT model, which has been extensively calibrated and validated in the US.²

058.2

An alternative approach that would leverage existing certification programs would be for CARB to use CAR’s SEP to meet the sustainability certification requirements. CAR has been supporting GHG reduction programs in the State for more than two decades. In 2002, the state passed SB 812 entitled “Air pollution: California Climate Action Registry.” This law mandated CAR’s predecessor, the California Climate Action Registry, to develop the first offset protocol for the sequestration of carbon in forests.³ This protocol became the U.S. Forest Projects Compliance Offset Protocol, which is currently used in the State’s Cap-and-Trade Program.

In addition, CAR is an approved Offset Project Registry (OPR) under the State’s Program. The Cap-and-Trade regulations have detailed requirements for OPRs including a conflict of interest policy, maintenance of professionally liability insurance, and personnel trained on CARB’s programs and processes.⁴ These requirements would need to be developed and implemented for organizations supporting the sustainability certification programs that CARB does not have as extensive experience with.

Finally, five projects have been successfully listed under CAR’s SEP since it was adopted in September of 2020. The protocol already includes many of the requirements proposed in §95488, such as the requirement to apply fertilizer in a manner than minimizes runoff, enhance soil fertility, and monitor land use change. For the requirements that are not quantified in the protocol, such as maintaining or enhancing biodiversity, minimizing runoff, and reducing

³ California Senate. SB 812 (2002) SB 812, Sher. Air pollution: California Climate Action Registry. https://leginfo.ca.gov/faces/billNavClient.xhtml?bill_id=200120020SB812

⁴ CARB (2018) Regulation for the California Cap on Greenhouse Gas Emissions and Market-Based Compliance Mechanisms. Title 17. CCR § 95986. https://ww2.arb.ca.gov/sites/default/files/2021-02/ct_reg_unofficial.pdf

unsustainable water use, CAR requires all projects to publicly track and disclose how each project meets the United Nations (UN) Sustainable Development Goals (SDGs), which include “provisions for monitoring, reporting and verification.”⁵ The use of the UN SDGs is part of the requirements of being an Eligible Emissions Unit Programme under the International Civil Aviation Organization’s (ICAO) Carbon Offsetting and Reduction Scheme for International Aviation (CORSIA).⁶ CAR is an approved Eligible Emissions Unit Programme. The UN SDGs required to be tracked and reported by Programmes cover the following best environmental management practices:

- Maintain or enhance biodiversity habitat on agricultural or forested lands
 - SDG 15 “Protect, restore and promote sustainable use of terrestrial ecosystems, sustainably manage forests, combat desertification, and halt and reverse land degradation and halt biodiversity loss”
- Enhance soil fertility and avoid erosion or compaction
 - SDG 2 “End hunger, achieve food security and improved nutrition and promote sustainable agriculture”
- Apply fertilizers in a manner that minimizes runoff, and soil and water contamination
 - SDG 2 “End hunger, achieve food security and improved nutrition and promote sustainable agriculture”
 - SDG 6 “Ensure availability and sustainable management of water and sanitation for all”
- Reduce unsustainable water use, and minimize diffuse and localized pollution from chemical residues, fertilizers, soil erosion, or other sources of ground and surface water contamination
 - SDG 2 “End hunger, achieve food security and improved nutrition and promote sustainable agriculture”
 - SDG 6 “Ensure availability and sustainable management of water and sanitation for all”

Between the quantification requirements in the protocol and the UN SDG reporting required by CORSIA, the CAR SEP more than meets the requirements in § 95488.

058.3

Remote Sensing Should be Allowed to Monitor and Report Land Use Changes

Remote sensing has become a powerful tool for agronomic data collection and validation. It also shows great promise for soil carbon quantification. Indigo currently uses publicly available remote sensing data, together with our significant volume of ground-truthing data, to develop advanced algorithms for these purposes. Today our algorithms are able to identify field boundaries (with greater accuracy than the Common Land Units) and generate data on

⁵ ICAO (2019) CORSIA Emissions Unit Eligibility Criteria. https://www.icao.int/environmental-protection/CORSIA/Documents/ICAO_Document_09.pdf

⁶ ICAO (2024) CORSIA Eligible Emissions Units. https://www.icao.int/environmental-protection/CORSIA/Documents/CORSIA%20Eligible%20Emissions%20Units/CORSIA%20Eligible%20Emissions%20Units_March%202024.pdf

management events such as tillage, irrigation, planting, cover crops, and harvesting. The Cropland Data Layer is also a very useful tool for determining crop type and crop rotations over time. These outputs can be used to reduce the data collection burden on individual farmers, as well as for providing a validation check on land use change around the world. They can also be used to generate estimates of carbon intensity of specific fields.

058.4

Challenges Implementing the Sustainability Requirements

IndigoAg is encouraged about the inclusion of sustainability criteria in the 15-Day Changes to the LCFS regulations. We support the leveraging of existing certification programs and encourage CARB to seek additional feedback about the design and implementation of the requirements from organizations with expertise in the quantification of environmental impacts from agriculture. If implemented thoughtfully and carefully, there are opportunities not only to implement the certification requirements by using existing programs, but also in a manner to encourage agricultural producers to implement multiple practices that increase the sustainability of the fuel. Not seeking additional feedback on the design and implementation could result in “overly simplistic metrics” that “fail to conserve the key ecological values they seek to protect”⁷ as was found by a 2020 paper that evaluated 255 peer-reviewed publications on biodiversity programs and found 24 different categories that included metrics for habitat area and condition, ecological diversity, and biological population density.

IndigoAg has Valuable Experience Designing and Implementing Sustainability Certifications for Agriculture

For more than five years, Indigo has been strongly supportive of including climate-smart agricultural practices in the LCFS. We feel that these practices need to be accurately measured, monitored, and verified. Agriculture is an inherently variable system that depends on a myriad of variables including crop rotation, geography, soil type, and weather. The ability to implement a certification program that certifies the “best environmental management practices” related to agricultural practices such as enhancing biodiversity, avoiding erosion, minimizing runoff, and optimizing water use should be done carefully and leveraging programs that have demonstrated experience with agricultural systems, such as the ISCC and CAR programs.

Since 2013, we have pursued innovative ways for science and technology to drive sustainability and profitability in agriculture. Our core mission is “Harnessing nature to help farmers sustainably feed the planet.” Our four key principles are:

- Helping farmers enhance their profitability and soil health
- Improving the quantity, quality, and traceability of the food available to consumers
- Protecting the environment by reducing and removing harmful greenhouse gases from the atmosphere, while incentivizing sustainable land stewardship practices
- Creating long-term value for our shareholders

⁷ Marshall, E., Wintle, B.A., Southwell, D., Kuhala, H. (2020) What are we measuring? A review of metrics used to describe biodiversity in offsets exchanges. *Biological Conservation*. (241) 108250 <https://doi.org/10.1016/j.biocon.2019.108250>

We are prepared to work with staff and stakeholders to identify and leverage the tools, processes, and procedures to determine the “best environmental management practices.”

058.5

Reducing Land-Based Emissions is Key to Meeting California Targets

In 2018, the Intergovernmental Panel on Climate Change (IPCC) published a Special Report on the impacts of a 1.5°C global warming above pre-industrial levels. This report found that achieving global carbon neutrality by mid-century is critical to avoiding the most catastrophic impacts of climate change.⁸ Moreover, the IPCC Sixth Assessment identified land-based emissions mitigation as “the only [sector] in which large-scale carbon dioxide removal may currently and short term be possible” and that it is “crucial to limit climate change and its impacts.”⁹ The latest science finds that it is increasingly likely that the 1.5°C target will be exceeded¹⁰ and that large-scale GHG reductions are critical to meeting any state or global target, including the goals of the Paris Agreement under the United Nations Framework Convention on Climate Change (UNFCCC).¹¹

In 2016, the California legislature adopted Senate Bill 32, codifying a statewide GHG reduction target of at least 40 percent below 1990 levels by 2030. In 2022, the California legislature adopted Assembly Bill 1279, requires the state to achieve net zero GHG emissions as soon as possible, but no later than 2045.¹²

The agriculture sector will need to play a significant role in helping California meet the goal of reducing statewide GHG emissions by 40 percent by 2030 and net zero no later than 2045. Not only can the agriculture sector help the State meet its GHG goals, but it can also do so while implementing “best environmental management practices.” However, those practices need to be clearly defined and quantified. Practices including optimizing fertilizer application, reducing tillage, using enhanced-efficiency fertilizers, double-cropping, and planting cover crops have the

¹² CARB (2022) 2022 Scoping Plan for Achieving Carbon Neutrality. <https://ww2.arb.ca.gov/sites/default/files/2023-04/2022-sp.pdf>

potential to reduce the CI of fuels by more than 40 g CO₂e/MJ^{13,14} or up to 74 percent.¹⁵ And these practices are not limited to their GHG benefits; they provide “additional ecosystem service benefits, including watershed protection, increased biodiversity, and improved soil health and fertility,”¹⁶ which will help the State meet the proposed requirements in §95488.

For the foreseeable future, liquid fuels will be required to power a significant portion of transportation in the state. To create the supply for the fuels with the “best environmental management practices,” CARB needs to account for and incentivize field-based practices. We are prepared to help the State meet this challenge.

CARB has been an international leader in developing and implementing programs to reduce GHG emissions across the California economy. The inclusion of a “continuous third-party sustainability certification” for biomass used in fuel pathways will continue the State’s environmental leadership. We look forward to continued collaboration with CARB to design and implement policies and strategies that further reduce emissions from the transportation sector.

Sincerely,

Christopher M. Malone

Sacramento, CA 95814

RE: Proposed Low Carbon Fuel Standard Amendments issued August 12, 2024

Dear Chairperson Randolph,

EcoEngineers appreciates the opportunity to submit comments regarding the Proposed Low Carbon Fuel Standard Amendments issued on August 12, 2024.

EcoEngineers is one of the nation's leading auditing, verification, and consulting firms for renewable fuel and clean energy technologies. We are accredited under the California Low Carbon Fuel Standard (LCFS), USEPA Renewable Fuel Standard (RFS), the Washington and Oregon Clean Fuel Standards, and the Canadian Government Clean Fuel Standard. We are also accredited by the American National Standards Institute (ANSI) National Accreditation Board (ANAB), in accordance with the International Organization for Standardization (ISO) standards ISO/IEC 17029:2019. EcoEngineers has performed over one thousand registrations and audits under the LCFS program and is proud to be a strong partner and advocate for the program. We appreciate the opportunity to share some of our thoughts and comments on the proposed amendments.

EcoEngineers strongly supports the advancement of policies, regulations, and programs that address the global reduction of greenhouse gas (GHG) emissions across all sectors. The LCFS program continues to be a vital tool that can assist California and the U.S. meet their climate reduction goals. This program serves as an example to jurisdictions around the world looking to decarbonize their transportation fuel sector and, as such, should continue to strive towards ambitious targets while closely considering market dynamics. EcoEngineers applauds the steadfast ambition that CARB has demonstrated to reduce GHG emissions in the transportation sector. This leadership has made the LCFS and related climate policies a model for other states and countries pursuing decarbonization strategies.

EcoEngineers presents the following comments on the Proposed Amendments.

1. Program Benchmarks

059.1 As stated in Eco's comments on the Proposed Amendments issued on December 19, 2023, including a step-down mechanism is a crucial element of the proposed rules and, if implemented correctly, could help stabilize the credit market. EcoEngineers supports the increase in the step-down mechanism from the originally proposed 5% to 9% in 2025. Our modeling has shown that this will be valuable for program performance in the short and medium term, and we thank CARB for re-examining this key element for program success.

2. Modification to Treatment of Fossil Jet Fuel

059.2 The LCFS compliance mechanism has proven that the proper policy structure can reduce emissions. As of September 2023, over 25 billion gallons of petroleum fuel have been displaced from transportation since the program began in 2010. This happened because the LCFS set a strict carbon intensity reduction requirement for on-road fuels. Fuels in use today, such as renewable diesel and renewable natural gas, did not exist in significant volumes when the program was launched. However, the right combination of policy and credit pricing created a marketplace for those fuels. Regulated entities have consistently over-complied with the standard, generating a bank of credits, and at the end of Q1 2024, the bank stood at nearly 26.07 million credits. The lessons learned from decarbonizing on-road transportation should now be applied to the aviation sector.

EcoEngineers recommends that CARB stays firm in setting a carbon intensity reduction goal for the aviation fuel sector. As such, EcoEngineers strongly recommends the intrastate flight obligation be added to the list of transportation fuels included in the LCFS as proposed on December 19, 2023. This inclusion would result in a positive ripple effect across the industry while providing positive market signals to both obligated parties and low-carbon aviation fuel producers. The inclusion of fossil jet fuel would be consistent with European initiatives as well as support the International Civil Aviation Organization's (ICAO) Carbon Offsetting and Reduction Scheme for Aviation (CORSIA). EcoEngineers continues to support the inclusion of aviation fuel under the obligation. We encourage CARB to reevaluate its decision continuously to ensure the LCFS remains successful at meeting its overarching objectives and those of the State of California.

3. Hydrogen

059.3 EcoEngineers applauds CARB's efforts to support the development of a low-carbon intensity hydrogen economy. However, the LCFS regulation has always been science-based and technology-neutral, and the removal of LCFS crediting eligibility for hydrogen from fossil natural gas after January 1, 2031, defies these long-standing CARB principles within the LCFS. This proposed amendment discounts the potential for carbon capture and sequestration and assumes the carbon intensity of the natural gas grid will remain the same until 2030. The rule effectively eliminates natural gas production pathways with carbon capture, regardless of carbon intensity, including hydrogen produced via steam methane reforming (SMR), autothermal reforming (ATR), or methane pyrolysis, from supporting California's hydrogen economy. Doing so narrows the field of low-carbon producers (and supply), reduces competition among low-carbon hydrogen suppliers, and enables green

hydrogen producers to charge a premium for their product absent competition. EcoEngineers strongly recommends that CARB reconsider this amendment.

059.4 Regarding heavy-duty hydrogen refueling infrastructure (HD-HRI), the proposed amendments include restrictive location requirements per section (a)(1)(B)(1):

"The proposed HD-HRI station must be located in California, and if a shared HD-HRI station be: Located within five miles of any ready or pending Federal Highway Administration Alternative Fuel Corridor."

Linking HD-HRI funding to a designated clean corridor ignores the fact that some high-density freight corridors, particularly along the California-Mexico border, would not qualify. EcoEngineers recommends that CARB reconsider the restrictive location requirements so that the industry can grow across the state.

059.3 cont Finally, changes to substantially narrow process energy to renewable co-located electrolytic hydrogen only devalue and undermine progress on energy policy. Current energy policy allows grid-connected hydrogen to provide "good load," thus reducing curtailment and distribution needs by being located closer to demand. Narrowing this policy will be contrary to program goals.

4. RNG Compliance Requirements

059.5 We thank CARB for including RNG projects that have broken ground by January 1, 2030, to be eligible for the two consecutive 10-year renewal periods. Additionally, an essential element to achieving sustainability is ensuring that the industry can meet effective requirements economically and without undue administrative burden. EcoEngineers is concerned about the proposed regulations regarding RNG directionality requirements.

059.6 Book-and-claim is an essential element of RNG project implementation and success. The requirement to prove directionality for RNG will add complexity to project implementation and cause inconsistencies in LCFS policy. For example, phasing out book-and-claim for RNG while promoting book-and-claim for hydrogen is an inconsistency that will weaken the confidence producers and investors need in policy stability to make project financing decisions. Requiring proof of directionality will also increase the administrative burden while providing no additional benefits for the LCFS program's success. EcoEngineers encourages CARB to revise this amendment.

5. Land Use Change, Biodiversity, and Other Sustainability Requirements for Purposely Grown Feedstock

EcoEngineers strongly supports the advancement of measures to ensure renewable fuel is produced in a sustainable and ecologically sound manner. Land use change and biodiversity loss are important issues to consider while reviewing the environmental impact of low-carbon fuel policy. However, we have concerns regarding CARB's proposed approach to regulating these issues: the 20% limit for soy and canola renewable diesel/biodiesel-based fuels, the proposed sustainability requirements for biomass, and the approach to determining land use change risks.

059.7

EcoEngineers is concerned with the ability of pathway holders to meet the proposed sustainability requirements without additional details on what is needed to demonstrate compliance. Though sustainability requirements were further clarified and given a phase-in period from the 45-day amendments, there are outstanding questions on quantification and demonstrating how producers can satisfy these requirements. There could be an immense administrative and economic burden due to certification requirements that many producers may be unable to satisfy. As an accredited LCFS auditor, we have first-hand experience that clarity in compliance requirements is of utmost importance as we attempt to retrieve and review all necessary documentation during a verification.

To address the potential negative impact of land use change from incentives for purposely grown feedstock, CARB indicates Global Trade Analysis Project - Biofuels Model and Database (GTAP-BIO) and Agro-Ecological Zone Emission Factor Model (AEZ-EF) models should be used for estimating Indirect/Induced Land Use Change (ILUC). EcoEngineers requests clarification on the definition of regions with "higher LUC risk." Since GTAP geographical levels are based on 18 agro-ecological zones (AEZs), EcoEngineers requests clarification on which AEZs and counties are considered higher LUC risk. This will ensure consistency across ILUC estimates.

059.8

Finally, that biomass-based feedstocks are the most feasible solution to decarbonizing transportation (on-road, aerial, and marine) in the short and medium term, EcoEngineers objects to the 20% cap on soy and canola renewable diesel/biodiesel-based fuels.

Instead of setting a cap on two of the most successful feedstocks and creating additional administrative burdens for producers, EcoEngineers recommends CARB convene a committee dedicated to addressing how the energy in purposely grown feedstock can be harnessed ecologically. Emissions from land-use change, impact on food and feed markets, and a commitment to biodiversity and sustainability should be studied to understand how to cultivate low-carbon feedstock for fuel. This committee can provide recommendations for how these necessary fuels can be produced in the most sustainable, ecologically sound manner.

Thank you once again for the opportunity to comment on the proposed amendments. Please do not hesitate to contact me for more details. We look forward to continuing to work with CARB on implementing a successful LCFS program.

Sincerely,

Lisa Hanke

Re: Proposed Amendments to the Low Carbon Fuel Standard (15-Day Changes)

Mainspring Energy, Inc. ("Mainspring") appreciates the opportunity to submit comments to the California Air Resources Board ("CARB") on the Proposed Amendments to the Low Carbon Fuel Standard (15-Day changes) released August 12, 2024. Specifically, we appreciate the development of the amendments, including the 9% proposed stepdown, and support adoption of the proposal.

Driven by its vision of the affordable, reliable, net-zero carbon grid of the future, Mainspring has developed and commercialized a new power generation technology —the linear generator— delivering local power that is dispatchable and fuel-flexible. Mainspring's linear generator offers a unique non-combustion capacity and energy solution that simultaneously addresses the critical need of reducing greenhouse gas and criteria pollutant emissions, while also enhancing grid reliability and resilience. Linear generators use a low-temperature, uniform non-combustion reaction that maintains peak temperatures below the levels at which NO_x forms (1500°C), resulting in near-zero NO_x emissions at all loads – including during start-up. This contrasts with the combustion of a fuel with a non-homogenous flame-front, a process that results in higher temperatures and high NO_x emissions.

Modular and scalable, Mainspring's linear generators can be deployed near load, either customer- or grid-sited, with the ability to immediately generate electricity from a range of renewable fuels – including both 100% hydrogen and ammonia (a hydrogen carrier). Mainspring's inverter-based technology offers a full range of valuable grid benefits including fast (and unlimited daily) starts/stops, a wide dispatch range from minimum to maximum load, quick ramping, and in many cases on-site fuel storage which allows linear generators to firm renewables for short or extended

periods of time, thereby facilitating the continued rapid adoption of a reliable renewable energy grid.

The LCFS has been a highly successful program as part of a broad package of regulations and incentives to address climate change. Currently the LCFS is overperforming as the carbon intensities are too easy for the market to meet, leading to low credit prices that are undermining investment in electric cars, trucks, buses, and charging infrastructure, as well as infrastructure for other low-carbon fuels. For the LCFS program to continue to be successful, it is essential that the stringency be increased expeditiously and be implemented as soon as possible to ensure the LCFS continues to contribute substantially to the state's clean air, climate change, and zero-emission transportation requirements and goals. Within the proposed amendments, we strongly support CARB's proposal for a 9% step-down in 2025, which will help relieve the surplus in credits and help support the market and credit pricing so that it can efficiently incentivize low carbon fuels and reduce emissions.

As a California based manufacturer, Mainspring appreciates the development of the 15-Day Proposed Amendments to the LCFS. We strongly support the LCFS program, the development of the amendments, and encourage staff to move forward with the proposal at the November Board Hearing and encourage approval by the Board. This provides industry and stakeholders with the certainty needed for LCFS to be successful to planners, implementers, and investors.

Sincerely,

Kent Leacock
Senior Director, Public Affairs
Mainspring Energy

August 22, 2024

Subject: Comments on the Proposed Low Carbon Fuel Standard Amendments Related to Changes for Electric Forklift Operators

My company is a small owner of electric forklifts that currently generates about 1,000 LCFS Credits a year. The following changes will significantly impact my and other small electric forklift credit generators' ability to remain in the LCFS program and may force us to opt-out based on the following proposed changes:

- 061.1 • Requiring 3rd party verification of all electricity-based credits, which would increase compliance cost;
- 061.2 • Requiring direct metering of electricity supplied to forklifts by the start of 2026 which will significantly increase operating cost and potentially decreasing the number of credits generated;
- 061.3 • Decreasing the Energy Economy Ratio for electric forklifts from 3.8 to 2.4 for most of our electric forklift fleet, significantly decreasing the number of credits generated from most grid electric-powered forklifts by a factor of 2 or more;
- 061.4 • Decreasing the carbon intensity benchmarks for diesel, which would further decrease future LCFS credits generated from electric forklifts; and
- 061.5 • Not allowing any LCFS credit proceeds to offset the cost of verification and meter installation.

All these factors could decrease annual LCFS generated to the level that most of our proceeds would be used to pay for verification services. Many entities would have annual metering errors impacting more LCFS credits than an entity like ours could generate over a five-year period. We therefore suggest the following:

- 061.1 cont • Exempt verification for all entities that generate less than 1,500 LCFS credits a year;
- Require a less-intense verification requiring a simple statement without a report for all entities that generate between 3,000 LCFS credits to 3,000 LCFS deficits a year;
- 061.5 cont • Modify the requirements of the LCFS credit proceeds for credits from electricity-fueled equipment to allow costs for LCFS program operation to be excluded from proceeds required to promote electric vehicle use; and
- Ensure the requirements for direct metering of electricity used by forklifts is not cost-prohibitive.

If some of these proposed changes are not made to the regulation, it will drive my company as well as many other small owners of electric forklifts and associated fuel supply equipment to opt-out of the LCFS program, especially since it places an unnecessary regulatory burden on the small operators with respect to the impact on the total deficits and credits generated under the LCFS program.

Sincerely,

Tim Hellem

Sacramento, CA 95814

Re: Comments of Bloom Energy - Proposed 15-Day Changes to the Low Carbon Fuel Standard

Dear Chair Randolph,

Bloom Energy appreciates the opportunity to submit comments in response to the proposed 15-day changes to the proposed amendments to the Low Carbon Fuel Standard (LCFS). We thank the Air Resources Board for steady and thoughtful management of the program while balancing a broad range of interests and stakeholders. Bloom Energy previously submitted comments on the December 19, 2023 proposed amendments, filed on February 20, 2024.

Bloom Energy is a manufacturer of solid oxide fuel cell (SOFC) technology that utilizes an electro-chemical process to power non-combustion microgrids as well as high efficiency electrolyzer systems designed to convert renewable electricity into renewable “green hydrogen.” Bloom Energy’s solid oxide fuel cells and electrolyzers are designed in a modular fault-tolerant format that provides mission critical reliability with no downtime for maintenance. The company has installed over 1000 of its non-combustion solid oxide fuel cell systems for customers in thirteen U.S. states as well as in Japan, South Korea, India, Italy and Taiwan. Bloom Energy’s emission reducing systems have proven resilient through outages caused by hurricanes, winter storms, earthquakes, forest fires, and other extreme weather and natural disasters.

Bloom Energy’s modular design, high efficiency, and ability to utilize biogas without the significant upgrading required for pipeline injection, allow for smaller and remotely located biogas projects to make the most efficient use of this valuable form of renewable energy, producing more electricity for equivalent volumes of biogas than other available technologies. Its electrochemical process produces far fewer criteria pollutants than competing technologies that rely on combustion. Our SOFCs also require virtually no water during operation, mitigating water supply concerns in many areas across the country.

062.1

We applaud Staff’s proposal of a more aggressive Carbon Intensity (“CI”) step-down of 9% from the previous 5% in the 15-day changes. This is a much-needed market correction in order to align targets with available supply, which has been delivered to the LCFS program in excess in recent years, creating a credit bank. While this alone will not fully address the oversupply of credits in the cumulative credit bank, this single adjustment will translate into millions of additional tons of GHG emission reductions that would’ve otherwise gone unabated.

Based on our experience developing projects that consume or generate renewable fuels, Bloom submitted detailed comments on the December 19th proposal that offered suggestions to further enhance the environmental benefits of the program while fostering a robust market. Those comments are attached to this letter as Appendix A. In addition, below we provide brief comments relevant to the 15-day rulemaking.

Bloom Energy Corporation
4353 North First Street, San Jose, CA 95134
408 543 1500
www.bloomenergy.com

062.2 **Avoided Methane Crediting**

Bloom Energy reiterates that we do not support a phaseout of avoided methane emission credits for biogas to electricity projects. These projects promote beneficial use of biogas while meeting numerous state objectives, such as providing renewable energy generation to support air quality goals via Zero Emission Vehicle (ZEV) deployments.

062.3 **Book-and-Claim**

Currently, book-and-claim under LCFS does not provide a level playing field across pathways. Biogas-to-electricity projects under the LCFS must physically wheel the power into California, while RNG projects may be located anywhere in North America and utilize book-and-claim accounting to demonstrate use for LCFS compliance. We believe that pathways that rely on the same feedstock should adhere to the same book-and-claim requirements. A major step in this direction would be to allow such projects to utilize book-and-claim accounting anywhere in the Western Electricity Coordinating Council (WECC), as is already the case in Oregon under their Clean Fuels Program. Additionally, we recommend allowing biogas-to-electricity projects to qualify when electricity generation and biogas production are not co-located.

Consideration of Total Environmental Impact

062.4 Furthermore, Bloom Energy encourages CARB to allow LCFS to value environmental results beyond carbon reductions. Environmental benefits such as reduced criteria air pollutant emissions in particular warrant consideration as part of the calculation methodology. An increasing body of research has found the economic and health benefits associated with reducing NOx and PM emissions often exceed the economic and health benefits of reducing GHG emissions on a per ton basis. Currently, while biogas combustion narrowly serves LCFS program objectives, the associated air pollution runs counter to CARB's broader new and long-standing air quality goals. Alternatively, non-combustion biogas-to-electricity projects meet LCFS objectives while also reducing local air pollution and furthering air quality objectives.

Bloom Energy appreciates the opportunity to provide comment on this important proceeding. Please do not hesitate to contact the undersigned if we can provide additional information. We look forward to further engagement as stakeholders collaborate to strengthen the LCFS program.

Sincerely,

/s/Jordan Garfinkle

Re: Comments of Bloom Energy - Proposed Amendments to the Low Carbon Fuel Standard

Dear Chair Randolph,

Bloom Energy appreciates the opportunity to submit comments in response to the December 19, 2023 Staff Report regarding proposed amendments to the Low Carbon Fuel Standard (LCFS). Acknowledging the complexity and far-reaching nature of the program, we thank the Air Resources Board for steady management over the years while balancing a broad range of interests and stakeholders.

Bloom Energy is a manufacturer of solid oxide fuel cell (SOFC) technology that utilizes an electro-chemical process to power non-combustion microgrids as well as high efficiency electrolyzer systems designed to convert renewable electricity into renewable “green hydrogen.” Bloom Energy’s solid oxide fuel cells and electrolyzers are designed in a modular fault-tolerant format that provides mission critical reliability with no downtime for maintenance. The company has installed over 1000 of its non-combustion solid oxide fuel cell systems for customers in thirteen U.S. states as well as in Japan, South Korea, India and Italy. Bloom Energy’s emission reducing systems have proven resilient through outages caused by hurricanes, winter storms, earthquakes, forest fires, and other extreme weather and natural disasters.

Bloom Energy’s modular design, high efficiency, and ability to utilize biogas without the significant upgrading required for pipeline injection, allows for smaller and remotely located biogas projects to make the most efficient use of this valuable form of renewable energy, producing more electricity for equivalent volumes of biogas than other available technologies. Its electrochemical process produces far fewer criteria pollutants than competing technologies that rely on combustion. Our SOFCs also require virtually no water during operation, mitigating water supply concerns in many areas across the country.

Based on our experience developing projects that consume or generate renewable fuels, we offer the following comments on a few key aspects of the proposal and Staff Report.

Avoided Methane Crediting

Bloom Energy does not support a phaseout of avoided emission credits for biogas to electricity projects, and commends CARB for recognizing the value of these projects by proposing to retain this aspect of the program.

Converting biogas into electricity through scalable, efficient, non-combustion technologies provides outsize environmental benefits by eliminating methane emissions and generating reliable clean, firm, renewable electricity. As a short-lived climate pollutant and potent greenhouse gas, methane is a core contributor to climate change and often a difficult pollutant to mitigate. Phasing out avoided methane credits would have the unintended consequence of leaving small or remote methane sources

062.2 cont

undeveloped, creating stranded resources that emit methane with no mitigation options. Because small or remote farms or digesters are not biomethane project candidates due to their size and distance from pipelines for injection, in many cases biogas-to-electricity is the only viable option for emissions reductions. In addition, non-combustion biogas-to-electricity projects that supply EV chargers directly serve CARB's goal of improving air quality by reducing vehicle tailpipe emissions through increasing market penetration of Zero Emission Vehicles (ZEVs). As noted in the Staff Report, "[r]educing criteria pollutants and toxic emissions from fuel combustion in line with California's air quality goals requires deploying ZEVs and ensuring the availability of fueling infrastructure to support ZEV deployment."¹ Supporting extremely low carbon intensity (CI) renewable energy to power ZEVs serves both climate and local air quality objectives.

062.3 cont As highly efficient, non-combustion and modular electricity generation systems, fuel cells meet the needs of these small/remote sources. Developing biogas to electricity projects in these locations would deliver critical methane reductions and valuable clean, firm electricity that can be delivered to meet transportation energy demand around the clock. Avoided methane credits are critical to leveraging these resources and developing such projects. And the carbon benefits are not just theoretical; as of this writing, Bloom has three operational non-combustion solid oxide fuel cell biogas-to-electricity projects operational at dairy farms in California. The first project, located in Kerman, CA, received a CARB-certified CI score of -790, the lowest CI score in the history of the LCFS program.²

Book-and-Claim

Currently, biogas-to-electricity projects under the LCFS must physically wheel the power into California, while RNG projects may be located anywhere in North America and utilize book-and-claim accounting to demonstrate use for LCFS compliance. We acknowledge CARB's proposal to limit book-and-claim accounting for RNG starting in 2040 but that is a long time away. We believe that the most efficient, cost-effective way to ensure that the LCFS program enables the most beneficial projects is to maintain a level playing field for pathways that rely on the same feedstock. A major step towards aligning requirements for projects with the same feedstock, and unlocking the untapped emissions reductions of biogas-to-electricity, would be to allow such projects to utilize book-and-claim accounting anywhere in the Western Electricity Coordinating Council (WECC), as is already the case in Oregon under their Clean Fuels Program. This, coupled with the proposed sunset for national book and claim available for RNG projects, would eventually result in regulatory consistency for projects with the same feedstock.

Additionally, Bloom recommends changes that allow biogas-to-electricity projects to qualify when electricity generation and biogas production are not co-located. This is in-line with the California RPS's treatment of "directed biogas" and allows greater project penetration by supporting optimal siting of both the RNG source and the electricity generator rather than requiring co-location. Specifically, where electricity generation is used for on-site EV charging, the project should be permitted to utilize directed biomethane as a power generation fuel provided that the biogas source and the electricity generator are located within the WECC. This additional flexibility would allow many more biogas to electricity projects to participate and would provide for greater deployment of biomethane-fueled microgrids at EV charging stations, which, as noted above, would further CARB's efforts to promote vehicles with zero tailpipe emissions. Of course, this would also bolster California's efforts to address the significant grid capacity

² Application No. B0490, available at:

https://ww2.arb.ca.gov/sites/default/files/classic/fuels/lcfs/fuelpathways/comments/tier2/b0490_cover.pdf

issues associated with large scale deployment of charging infrastructure across the State by enabling renewable generation to be deployed where it is most needed, rather than where the fuel is generated.

Consideration of Total Environmental Impact

Furthermore, Bloom Energy encourages CARB to reward market participants in the LCFS Program for achieving environmental results beyond carbon reductions. Environmental benefits such as reduced criteria air pollutant emissions in particular warrant consideration as part of the calculation methodology. An increasing body of research has found the economic and health benefits associated with reducing NOx and PM emissions often exceed the economic and health benefits of reducing GHG emissions on a per ton basis.³ Currently, while biogas combustion narrowly serves LCFS program objectives, the associated air pollution runs counter to CARB's broader new and long-standing air quality goals. Alternatively, non-combustion biogas-to-electricity projects meet LCFS objectives while also reducing local air pollution and furthering air quality objectives.

Over the past several years, research has shown that local combustion-related air pollutants are far more harmful to human health and the environment than previously understood. Some key findings that demonstrate the need for clean energy programs to value these impacts include:

- Combustion related air pollution may be as harmful to human lungs as smoking cigarettes;⁴
- Combustion related air pollution increases preterm birth risk;⁵
- Particulate matter (PM) is the largest environmental health risk factor in the nation, and the resulting health impacts are borne disproportionately by disadvantaged communities.⁶

This information is not new to CARB. In fact, the benefits of reduced criteria pollutant emissions are well documented in the Staff Report. To the extent that the proposed amendments do already reduce these emissions, the report states, "[t]he total statewide health benefits derived from criteria emissions reductions is estimated to be approximately \$5 billion, with \$4.9 billion resulting from reduced premature cardiopulmonary mortality and \$85 million resulting the reductions in other adverse health impacts."⁷

The following table shows the different environmental impacts of non-combustion via a solid oxide fuel cell versus combustion uses of biogas.

⁷ California Air Resources Board. *Public Hearing to Consider the Proposed Amendments to the Low Carbon Fuel Standard, Staff Report: Initial Statement of Reasons*. December 19, 2023.

Table 1: Comparison of NO_x and SO₂ Emissions

g/MMBtu			
	Non-combustion SOFC ¹	Engine ²	% reduction
NO _x	0.402	385.55	99.9%
SO ₂	0.00039	0.27	99.8%

1. From source testing
2. AP-42 Chapter 3 Section 2 for 2SLB engines

58,000 MMBtu/year of biogas equates to roughly a 1 MW Bloom solid oxide fuel cell system, or 7,900 MWh/year. Using the emissions factors above for an illustrative biogas-to-electricity project and utilizing the corresponding emissions for EPA's Co-Benefits Risk Assessment Health Impacts Screening and Mapping Tool (COBRA),⁸ results in \$1.3 to \$3M of air quality driven health benefits for non-combustion fuel cell over combustion-based generation or flaring. The illustrative 1 MW Bloom project in the above example emits roughly 3,000 MT CO₂e/yr. At the midpoint of the COBRA health benefits calculation (\$2.4M), the additional air quality-driven health benefits of the project equate to roughly \$800/MT. While the LCFS credit market generally values carbon abatement at anywhere from ~\$50 to ~\$200/MT, it does not value air quality benefits at all.

In order to value these significant benefits, Bloom strongly encourages CARB to include a mechanism that appropriately considers criteria air pollutant emission reductions when evaluating electrical generation from biogas and natural gas, across all pathways. One possibility is to include an LCFS credit multiplier such that, when utilizing the same fuel, a project that does not exacerbate air quality issues generates more credits than one that does. Under this model, we recommend setting an emissions threshold of <0.1g/MWh NO_x and <0.01g/MWh SO₂, below which projects receive a credit multiplier of 1.5.⁹ At current and expected LCFS credit prices, this results in far less additional value than the \$800/MT shown above and would be a modest but direct acknowledgement of the societal benefits of improved air quality.

062.5

Tier 1 Calculator for Biogas-to-Electricity

For certain fuel pathways the LCFS currently provides Tier 1 CI calculators that help to streamline the application review and validation process. As part of the proposed amendments, Staff proposes to update the calculators to increase usability and further reduce administrative burden on applicants and agency staff. Additionally, the proposed amendments would create a new Tier 1 CI calculator for hydrogen. While the Staff Report justifies the existing Tier I option due to extensive experience reviewing certain pathways, no such claim can be made of hydrogen, which is relatively new and still emerging. This acknowledges the benefits of streamlining without risking the integrity of an existing and robust process.

Bloom supports both of these proposals and the Tier 1 calculators in general. Additionally, we respectfully request that a Tier 1 calculator or other streamlining option be made available for biogas-to-electricity projects. Given the fact that this option is already available for RNG, this would help to provide equal treatment for pathways dependent on the same feedstock.

⁸ <https://www.epa.gov/cobra>

⁹ Note that the emission rates shown in Table 1 are represented in terms of grams per MMBtu.

062.6

GREET Model Treatment of CO₂ Storage

With the emergence of various forms of above ground permanent CO₂ storage, such as manufacturing products (including concrete, plastics, etc.) from captured CO₂, we encourage CARB to broaden the definition of permanent CO₂ storage beyond the limited “underground” storage definition currently used. This will incentivize more projects to capture and sequester CO₂, thus achieving even lower carbon intensities and furthering CARB’s goals of aggressive decarbonization of the transportation sector.

062.7

A Broader Clean Fuels Standard Will Support Industrial and Commercial Sector Decarbonization

Notwithstanding all of the above, Bloom Energy also wishes to point out that a broader Clean Fuels Standard is necessary to support industrial and commercial sector decarbonization. These sectors have proven hard-to-decarbonize and remain a significant source of GHG emissions that must be addressed to achieve the State’s carbon neutrality goals. As the adopted 2022 Scoping Plan recognizes, changes in fuel use are also critical to reducing GHG emissions from these sectors and biomethane use in these sectors is critical to meeting both 2030 and 2045 Scoping Plan goals.

CARB could and should expand the LCFS program outside of transportation or use the LCFS program as an example to develop and adopt a broader Clean Fuels Standard that would complement the LCFS. Such a standard could impose a decreasing, rate-based target on regulated entities, allowing these sectors to achieve emission reductions in a technology neutral manner by choosing between electrification, procuring low- and zero-carbon and carbon-negative fuels, and/or improving energy efficiency. Such a standard would achieve significant reductions at least cost by enabling compliance flexibilities and harnessing technological innovation. The current LCFS program is providing critical support to the RNG market. Because a significant amount of RNG usage today is occurring in the transportation sector, the LCFS program holds continued importance as the State explores opportunities to incentivize RNG use in other sectors. Competitive pricing and availability of supply will be critical when looking to expand RNG usage to other hard-to-abate sectors. For these reasons, Bloom Energy continues to recommend that discussions about the potential expansion of LCFS or the potential development of a broader standard should happen in parallel with ongoing support provided to the RNG market through the current LCFS.

Bloom Energy appreciates the opportunity to provide comment on this important proceeding. Please do not hesitate to contact the undersigned if we can provide additional information. We look forward to further engagement as stakeholders collaborate to strengthen the LCFS program.

Sincerely,

/s/Jordan Garfinkle

[Board Comments Home](#)

To: California Air Resources Board

Thank you for the opportunity to once again comment on the Board's LCFS rulemaking process. Allotrope Partners, LLC, has been working over a decade on developing sustainable demand for forest biomass waste streams to create long-term economic and policy drivers for increased forest health management in California. This work closely aligns with the CARB 2022 Scoping Plan for Achieving Carbon Neutrality, specifically its goal to "accelerate the pace and scale of climate smart forest management to at least 2.3 million acres annually."¹

Through our subsidiary, Allotrope Cellulosic Development Company (ACDC), we have been actively developing a cellulosic ethanol plant to be located in Anderson, CA. The plant will utilize 330,000 bone dry-tons of biomass per year and produce 22 million gallons of low-carbon ethanol, which will ultimately be used for production of sustainable aviation fuel, and approximately 500,000 MMBTUs of renewable natural gas per year. The plant will contribute to carbon neutrality while improving forest management by expanding waste biomass processing infrastructure, a strategy specifically cited in the CARB Scoping Plan², and improving air quality by mitigating the risk of wildfires and reducing open pile burning of forest and agricultural biomass.

ACDC presently has key technology, offtake and strategic partners in place, including Axens North America, bp (formerly, British Petroleum PLC), and Sumitomo Corporation of the Americas, respectively. ACDC and its partners have invested significant time and resources into the development of this project, which will be one of the largest economic opportunities benefiting Shasta County in many decades. The project will qualify for federal tax credits through the Inflation Reduction Act and is in the second stage of the USDA's 9003 loan guarantee process.

Definition of Forest Biomass Waste

063.1

ACDC is concerned about the definition of "forest biomass waste" on page 14 of the Appendix A-1. The document proposes to define the forest biomass waste as:

"Forest Biomass Waste" means small-diameter, non-merchantable residues, limited to forest understory vegetation, ladder fuels, limbs, branches, and logs that do not meet regional minimum marketable standards for processing into wood products.

¹ CARB 2022 Scoping Plan Update, December 2022. Page 252.

² IBID. Page 252

We believe that the definition of “forest biomass waste” should be broadened to include material from wildfire mitigation, fuel removal and forest restoration activities, recognizing that in many cases this material, whose removal helps combat wildfire and associated GHG emissions, may include some larger “merchantable” sized material. Please consider that in situations where only a small portion of material is merchantable, it is more efficient to treat all the material as biomass waste rather than separate out the merchantable portion. That cost/benefit is a decision best made on a case-by-case, site-specific basis by those doing the work, rather than by a rule that applies across the board.

As such, we recommend that the definition be amended as follows:

“Forest Biomass Waste” means residues that are 1) removed for wildfire mitigation, forest restoration projects, or the protection of public safety, or 2) small-diameter, non-merchantable residues, limited to forest understory vegetation, ladder fuels, limbs, branches, and logs that do not meet regional minimum marketable standards for processing into wood products.”

063.2 Specified Source Feedstocks and Forest Biomass Waste

In addition, the general definition of “specified source feedstock” in section 95488.8(g), and as it pertains to forest biomass waste in section 95488.8(g)(1)(A)(3) in particular, are not clear. The language appears to imply that the specific source feedstocks listed in 95488.8(g)(1)(A) would qualify for a reduced Carbon Intensity score (CI). Are they to receive a lower CI, beyond the calculated CI from their GREET models? Will the CI of non-specified sources be calculated using factors beyond their GREET models and Life Cycle Analyses?

063.3 More specifically restricting forest biomass waste specified source feedstocks to “non-industrial forestland” would limit the amount of sustainable material available for biofuels projects like ours for a number of reasons:

- Industrial forestland owners are the only large landowners in the state that can offer reliable long-term forest biomass supply agreements that provide the needed certainty necessary for long-term investors and lenders needed to develop low carbon biofuel projects.

- At present, there are no entities that can reliably aggregate supply from smaller nonindustrial landowners into such long-term contracts at adequate scale.
- Federal biofuel regulations restrict us to utilizing material from private landowners only. Thus blanket restrictions on the use of forest biomass from private lands prevents the establishment of needed long-term feedstock contracts.

According to the California's Legislative Analyst Office, 39% of California forests are privately owned, with 35% of that portion considered industrial forestlands.³ Thus, if this requirement is adopted, over one third of private forestlands will not be allowed as a specified source feedstock. In the Redding/Anderson area the situation is even more striking, as 64.4% of private forest lands within 60 miles of Redding are considered industrial.⁴ As a result, this prohibition could significantly restrict the amount of available qualified material in the area.

It is important to consider as well that many forest communities in California were initially founded around timber mills located in the proximity of large private landholdings (i.e. industrial timberlands) to assure access to wood for the mills. As a result, today, many of the most at-risk and under-served rural communities are surrounded by industrial forestlands whose biomass would be much less accessible under the draft definition in Section 95488.8(g)(1)(A)(3). As proposed, all forestlands, both industrial and non-industrial, would remain at a higher risk of destruction from wildfire and natural degradations such as beetle rot and unrestrained undergrowth. This is because while only industrial forestlands are excluded, doing so likely will make projects such as ours unsustainable and thus remove an important incentive/sustainability measure for performing wildfire treatments on non-industrial forestlands.

It's also important to note that the term "non-industrial forestland" is ambiguous. It is not defined in the LCFS Regulation, nor does Section 95488.8(g)(1)(A)(3) reference a definition in any other regulation. The Legislative Analyst Office report cited in Footnote 3 uses the terms "industrial" and "nonindustrial" to generally describe categories of forest *owners*, not forest *lands*. Thus, in addition to being imprecise, the term proposed for inclusion in Section 95488.8(g)(1)(A)(3) is potentially discriminatory. CARB should not be in the business of discriminating between which kinds of private landowners qualify for this LCFS pathway.

³ Taylor, Mac "Improving California's Forest and Watershed Management" California Legislative Analyst Office, April 2018. Page 5.

⁴ Based on GIS work done by an industry partner.

063.4

Furthermore, the phrase “forest stand improvements” should remain in the language, as thinning programs as part of a holistic forest management regime, are exceedingly important treatments that enhance forest health as well as reduce fire risk. Eliminating the phrase suggests that such forest management activity will not qualify. A recent review of scientific literature and related meta-analysis found “overwhelming evidence” for the efficacy of thinning programs when combined with prescribed burning or pile burning.⁵

063.5

As described in detail in our initial submission, we also believe that any material extracted in compliance with California Forest Practice Act should be considered eligible. The exception of “clear cuts” does not recognize that single age forest management is permitted within the California Forest Practice Rules, considered some of the most protective forest management rules in the world. We do support the proposed addition of the phrase “that was performed in compliance with all local, State, and federal rules and permits.” This language makes it very clear that in California the requirements of the California Forest Practice Act and related regulations apply, and that provides sufficient protection. Excluding “clear cuts” – another term that is not defined in the LCFS Regulation and is thus ambiguous – creates potential conflicts between Section 95488.8(g)(1)(A)(3) and the California Forest Practice Act and its implementing regulations.

We respectfully request that, if the regulations are going to define a specified source feedstock for forest biomass waste, the initial definition should be for forest biomass waste from California only, and the language amended as follows:

063.1 cont

3. *Forest biomass waste from ~~non-industrial~~ forestlands removed for the purpose of wildfire fuel reduction or forest stand improvement, to reduce the risk to public safety or infrastructure, to create defensible space, or for forest restoration; and from a treatment ~~in which no clear-cutting occurred~~ and that was performed in compliance with the California Forest Practices Act, as well as any local, and federal rules and permits.*

⁵ See USFS publication: <https://research.fs.usda.gov/treesearch/67659>

Thank you for the opportunity to contribute to this rulemaking process. Our goals are strongly aligned with the State's vision for scaled up forest management as a key solution to California's wildfire crisis as well as combating climate change. We respectfully request the LCFS program rules be amended to support sustainable forest management that helps avoid megafires and associated climate and health impacts.

Sincerely,

Robert Hambrecht

The Honorable Liane M. Randolph, Chair
California Air Resources Board
1001 I Street
Sacramento, CA 95814

RE: Gevo, Inc.'s Comments on 15-Day Notice of Changes to the Proposed Low Carbon Fuel Standard Amendments

Dear Chair Randolph:

Gevo, Inc. (Gevo) appreciates this opportunity to comment on the California Air Resources Board (CARB) 15-Day Notice of Changes to the Proposed Low Carbon Fuel Standard (LCFS) Amendments (hereinafter "15-Day Notice"). Gevo submitted comments on CARB's proposed LCFS amendments on February 20, 2024, and on the content of the CARB Workshop held on April 10, 2024, and we incorporate those comments here by reference.¹ Although we continue to urge CARB's consideration of all of the comments we previously submitted, the comments here relate to areas elaborated in the 15-Day Notice, as specified by CARB in its Notice of Public Availability of Modified Text and Availability of Additional Documents and/or Information Proposed Low Carbon Fuel Standard Amendments.²

As a refresher, Gevo's mission is to produce low-carbon, renewable energy-dense liquid hydrocarbons for drop-in transportation fuels such as gasoline, jet fuel, and diesel. Our alcohol-to-hydrocarbons production process uses a combination of decarbonization technologies and sustainably farmed feedstock to produce fuels with substantially

¹ See Gevo, Inc.'s Comments on "Proposed Amendments to the Low Carbon Fuel Standard" (February 20, 2024) (available as Comment #196 in CARB's Public Comments Received portal) and Gevo, Inc.'s "Comments on the Low Carbon Fuel Standard Workshop, April 10, 2024" (May 10, 2024) (available in CARB's LCFS Meetings and Workshops portal).

² CARB, Notice of Public Availability of Modified Text and Availability of Additional Documents and/or Information Proposed Low Carbon Fuel Standard Amendments, at 2 (August 12, 2024) (noting that "staff will only address comments received during this 15-day comment period that are responsive to this notice.")

reduced carbon intensity (CI) compared to fossil fuel equivalents. We broke ground on our first alternative jet fuel (AJF)/sustainable aviation fuel (SAF)³ production facility, "Gevo Net-Zero 1" (NZ1), in Lake Preston, South Dakota, in September 2022. This facility will use a three-part strategy to produce low-CI SAF: 1) use locally-sourced corn feedstock from farmers engaged in sustainable agriculture to both reduce on-farm greenhouse gas (GHG) emissions and sequester carbon dioxide (CO₂) in the soil; 2) decarbonize the fuel production process by replacing conventional fossil fuel inputs with wind energy, renewable natural gas, and green hydrogen; and 3) use carbon capture and sequestration (CCS) technology to reduce emissions from the production process further. The Gevo approach is aimed at decarbonizing every step in our SAF's life cycle, which we track all the way from the farm field through to the aircraft using our Verity Tracking platform.

Gevo currently is participating in the LCFS through our production of renewable natural gas (RNG) from three dairies, for which we installed dairy-manure biomethane capture and upgrading equipment, thereby producing pipeline quality RNG rather than allowing the methane from the manure to continue to be released from the dairy lots. In addition, we intend to submit a Tier 2 LCFS Provisional Pathway application for the SAF, renewable diesel, and renewable naphtha fuels that will be produced at the NZ1 facility, utilizing our field corn starch feedstock and alcohol-to-jet (ATJ)/alcohol-to-hydrocarbons production process.

I. Gevo Strongly Supports CARB's Proposal for a Nine Percent Near-Term CI Benchmark Stringency Increase (Section 95484(d)-(f))

- 064.1 In both of our earlier sets of comments, Gevo supported CARB's intent to provide a near-term CI stringency increase (i.e., "stepdown") in tandem with a strengthening of the overall compliance curve and adoption of an Automatic Acceleration Mechanism (AAM), while also urging CARB to go farther in increasing the stringency of these provisions. Accordingly, we welcome and strongly support CARB's 15-Day Notice
- 064.2 proposal for a near-term stepdown of nine percent, rather than the five percent CARB originally proposed.

As noted in our previous comments, the five percent and seven percent stepdown options that CARB analyzed would be insufficient to address the excess credit buildup in

³ Gevo typically uses the term "sustainable aviation fuel" or "SAF" to refer to our fuel. This fuel meets the definition of "alternative jet fuel" (AJF) as set forth in the LCFS regulations. Accordingly, our references to SAF in this comment letter should be deemed synonymous with AJF.

the bank that weakens the effectiveness of the LCFS, even if accompanied with an AAM trigger. While we continue to believe that a stepdown of ten to eleven percent would be supportable based on the ICF analysis presented to CARB,⁴ the nine percent option is the most preferable of the options CARB assessed as it is projected to result in credits closer to the demand to be sparked by the compliance curve. Therefore, we strongly support this proposal and urge CARB to adopt it.

II. Gevo Supports the Tier 2 and Renewable Diesel Definition Proposed Changes Recognizing Alcohol-to-Hydrocarbons Pathways and Urges Further Alignment of the Renewable Naphtha Definition

In various places in the initial LCFS proposal, provisions enumerated certain production processes, seemingly omitting alcohol-to-hydrocarbons fuels pathways. As noted below, Gevo supports the proposal to expressly include the alcohol-to hydrocarbons pathway in the Tier 2 classification provisions. Further, we support CARB's proposal to make the "renewable diesel" definition process- and feedstock- neutral and we urge CARB to do the same with the "renewable naphtha" definition.

- 064.3
- CARB's Inclusion of Alcohol-to-Hydrocarbons in the Tier 2 Classification Provisions (Section 95488.1(d)(4)): While Gevo understood that the Tier 2 pathway classification might not be limited to the production processes listed in this section of the originally proposed regulation, we expressed concern in our earlier comments that the omission of the alcohol-to-hydrocarbon conversion process might be misread as an exclusion. Therefore, we support and appreciate CARB's proposal in the 15-Day Notice to add this pathway to the list of drop-in fuels. We also appreciate CARB's recognition in the Notice of Public Availability document that alcohol-to-hydrocarbon conversion is one of the ways in which SAF can be produced.⁵
- 064.4
- The Proposed Revision of the Definitions of "Renewable Diesel" and "Renewable Naphtha" (Section 95481(a)): CARB's original proposal for the "renewable diesel" and "renewable naphtha" definitions would import specific feedstocks and production pathways (i.e., hydrotreated lipids and biocrudes or from gasified biomass converted using the Fischer-Tropsch process and portions from co-processing) into these definitions. Concerned that the proposed definitions would

⁴ As we laid out in our February 20 comments, ICF's analysis demonstrates that "a stepdown of at least 10.5% in 2025 likely is needed to ensure that the credit bank reverses and is drawn down to the level necessary to continue to incentivize LCFS-driven emissions reductions, i.e., with the credit bank holding approximately two to three quarters' worth of deficits."

⁵ CARB, Notice of Public Availability of Modified Text and Availability of Additional Documents and/or Information Proposed Low Carbon Fuel Standard Amendments, at 10.

exclude feedstocks and production pathways such as Gevo's feedstock (corn starch) and production process (the alcohol-to-hydrocarbons conversion process), we urged CARB to make the definitions feedstock and pathway neutral. As we explained in our comments, renewable diesel and renewable naphtha are hydrocarbon fuels that are produced alongside our SAF/AJF in alcohol-to-hydrocarbons production facilities.

We are pleased that CARB provided a new proposal for the "renewable diesel" definition in the 15-Day Notice that would make it process- and feedstock-neutral. However, CARB has not proposed a corresponding change to the "renewable naphtha" definition. As we had noted in our previous comments, there is no rational reason for excluding from CA-LCFS eligibility the renewable naphtha from a process such as Gevo's. Accordingly, we urge CARB to also make the "renewable naphtha" definition neutral as to non-petroleum feedstocks and production processes.

064.5

III. CARB Should Not Limit the Time Period of Eligibility for Avoided Methane Projects as Proposed in the 15-Day Notice (Section 95488.9(f)(3)(A))

In the 15-Day Notice, CARB proposes to reduce the total number of crediting periods for pre-2030 avoided methane emissions projects from dairy and swine manure and landfill-diverted organic waste disposal to two 10-year crediting periods, rather than the three 10-year periods in the original LCFS proposal. Gevo opposes this proposed change. Accordingly, we urge CARB to discard this new proposal and to revert to the original proposal.

As noted, Gevo participates in the LCFS via the RNG captured from three dairies, for which we installed dairy manure biomethane capture and upgrading equipment, thereby producing pipeline quality RNG rather than allowing the methane from the manure to continue to be released to atmosphere. LCFS policies create incentives for dairy farmers to capture methane emissions from their cows to convert into biogas. As CARB has recognized, "capturing methane from dairies is one of the primary measures for achieving the state's 2045 greenhouse gas reduction targets and SB 1383 methane reduction target."⁶ In addition, we note that use of dairy digesters creates synergistic environmental benefits, as farmers can generate soil amendments that provide nutrients and decrease the amount of fertilizer needed.⁷

⁶ California Air Resources Board, "Proposed Amendments to the Low Carbon Fuel Standard Initial Statement of Reasons," Dec. 19, 2023, at page 124.

⁷ See, e.g., University of California, Agriculture and Natural Resources, "California Dairy Farmers Generate Renewable Energy from Waste," (Nov. 3, 2023) available at <https://ucanr.edu/News/?postnum=58234&routeName=newsstory>.

In our February 20 comments on the LCFS proposal, Gevo supported CARB's proposal to continue avoided methane crediting, including for dairy RNG, and we urged CARB to decline to impose time limits (or other restrictions) on such crediting. As we noted, dairy manure methane avoidance projects such as ours require significant capital investment and carry with them significant ongoing operating costs. Accordingly, limits on the crediting period for such projects not only inhibit initial investment but can also threaten the viability of continuing methane avoidance operations over time. Accordingly, CARB's 15-Day Notice proposal to limit the crediting periods for these avoided methane projects would unnecessarily limit the viability of these important projects and the climate benefits they bring.

CARB asserts in the 15-Day Notice of Public Availability document that two 10-year crediting periods "still provid[es] an incentive to develop methane capture projects."⁸ Yet no support is provided for this assertion. CARB further asserts that the "proposed modifications to the proposed credit true-up concept in section 95488.10(b)" will "ensure sufficient return on investment for fuel pathways reporting using temporary fuel pathways."⁹ While, as detailed below, Gevo supports CARB providing an extended opportunity for credit true-ups, as Gevo had explained in its previous comments, such true-ups are warranted even with the previously proposed three 10-year crediting periods. Again, Gevo urges CARB to withdraw the proposal to limit the crediting periods and to revert to the original proposal.

064.6

IV. Gevo Supports CARB's Proposal to Extend the Credit True-Up Periods for Temporary Pathways, with a Two-Year Lookback (Section 95488.10(b))

As we noted in our February 20 comments, Gevo supports a credit true-up in the LCFS program for all pathways – including for dairy RNG. Accordingly, we support CARB's proposal in the 15-Day Notice for a true-up for temporary pathways, with data-based true-ups to be initiated by reports submitted in 2025. As we understand the proposal, CARB would authorize true-ups for data reports submitted in 2025 to cover the 2023 through 2024 time-period (e.g., report submitted March 31, 2025, covering 2023-2024, with the true-up back to 2023).

Gevo strongly supports this proposal with a two-year lookback. With specific respect to our RNG operations, we note that the RNG temporary pathway score of -150 CI for swine and dairy manure biomethane projects is more than 50% greater than the actual

⁸ CARB, Notice of Public Availability of Modified Text and Availability of Additional Documents and/or Information Proposed Low Carbon Fuel Standard Amendments, at 12.

⁹ *Id.*

CI of Gevo's operating facility. As CARB recognized in the Notice of Public Availability, the true-up for temporary pathways "enables the eventual recovery of credits based on verified operational data" and such true-ups are expected to "alleviate or mitigate any business impacts associated with a delay in pathway certification" allowing "recognition for the full amount of climate benefit of a fuel."¹⁰ A two-year lookback supported by operational data is duly warranted due to the length of time required for pathways to receive initial CARB review, undergo a completeness evaluation and finally receive a full review. Indeed, by allowing such true-ups from temporary CI's, CARB would allow fuel producers like Gevo to be credited for the actual climate value of these projects, thereby supporting and promoting investment in climate mitigating projects and advancing California's emissions reduction efforts.

064.7

V. Gevo Is Committed to Strong Sustainability and Tracking Requirements, but Urges CARB to further Refine the Proposed Crop-Based Biomass Sustainability Provisions (Section 95488.9(g))

As Gevo explained in our February 20 comments on the original LCFS proposal and in our comments on the content of the April 10 workshop, Gevo is fully committed to providing low-carbon, sustainable SAF and other renewable fuels and to meeting appropriately tailored regulatory requirements for demonstrating sustainability. Against that backdrop, we respectfully submitted that CARB's original sustainability certification proposal for crop- and forestry-based feedstocks was unduly vague and not fit for purpose, urging CARB to convene a stakeholder process to flesh out an appropriately tailored approach to sustainability certifications that would include crediting the emissions reductions from climate-smart agriculture.

While CARB has not convened a stakeholder process to flesh out the proposed sustainability provisions or established crediting for emissions reductions from climate-smart agriculture as Gevo advocated, Gevo notes the progress CARB has made in the 15-Day Notice in terms of providing more detail and more practicable implementation steps for the sustainability certification provisions. We appreciate that CARB has provided some specifics, such as the provision stating that "biomass used in fuel pathways must only be sourced on land that was cleared or cultivated prior to January 1, 2008," and set out a transition to full sustainability certification from 2026 to 2028 to 2031.

Although CARB's 15-Day Notice proposal is an improvement relative to the original proposal, we respectfully submit that it still needs significant work. As detailed below, the proposed sustainability criteria that California is seeking to satisfy remain unduly

¹⁰ CARB, Notice of Public Availability of Modified Text and Availability of Additional Documents and/or Information Proposed Low Carbon Fuel Standard Amendments, at 13.

vague and several areas in the proposed regulatory provisions appear to have errors. Further, to the extent that CARB is requiring sustainability certification and tracking of crop-based feedstocks, CARB also should credit the emissions reductions from climate-smart agriculture practices covered by the sustainability and tracking provisions.

A. The Sustainability Criteria Remain Unduly Vague

As noted, Gevo supports and is committed to fully meeting appropriate sustainability criteria. Unfortunately, what CARB has proposed in the 15-Day Notice still misses the mark. CARB has failed to fully define the problem it purportedly is trying to solve and, relatedly, has failed to provide an appropriately defined solution. During the April 10 LCFS Workshop, CARB repeated that its main objective in proposing sustainability certification for fuels that use crop-based (and wood-based) feedstocks is to ensure "biofuel production must not come at the expense of deforestation or food production."¹¹

In terms of defining the problem, virtually all the data CARB presented at the Workshop about the potential for crop-based feedstocks to negatively affect food and forests discussed crop-based oil seeds and virgin oil. Notably, Gevo's process uses only residual starch from low-carbon corn, first ensuring that the protein from the corn goes to food and feed uses. Yet, there was no mention of corn starch feedstock creating impacts of concern in the slides presented by CARB.¹² In fact, U.S. corn production has long had multiple uses in food, feed, and fuel and has not resulted in increased land use, nor has it negatively affected food prices.¹³ Since 1920, U.S. farmers have increased their yield by approximately 140 bushels of corn per acre while reducing agriculture's land footprint by 9% nationwide.¹⁴ Indeed, leveraging existing agricultural land, regenerative agriculture practices, and clean energy to produce both feed and fuel from the same crop while sequestering carbon throughout the production process maximizes land use

¹¹ This intent was restated in the slide deck presented by CARB at the Workshop, "California Low Carbon Fuel Standard Workshop, April 10, 2024," at slide number 51 (hereinafter "CARB Workshop Slide Deck").

¹² CARB Workshop Slide Deck, at slides 52-56.

¹³ See Oladosu, Gbadebo & Kline, Keith & Langeveld, "Structural Break and Causal Analyses of U.S. Corn Use for Ethanol and Other Corn Market Variables," *Agriculture*. 11. 267. 10.3390/agriculture11030267 (2021) ("The casualty analysis finds that U.S. corn use for ethanol is not a driver of corn price and net corn exports.") See also Taheripour, Baumes & Tyner, "Economic Impacts of the U.S. Renewable Fuel Standard: An Ex-Post Evaluation," *Front. Energy Res., Sec. Sustainable Energy Systems* Volume 10 (2022) ("The long-run effects of biofuel production and policy on food prices were negligible... biofuels' contribution to commodity price increases is really no different from fructose corn syrup, increased feed demands, or other market demands.")

¹⁴ See USDA, "Crop Production Historical Track Records."

efficiency and carbon abatement. Making multiple products from one crop is an efficient, sustainable use of cropland and better for our environment.

CARB's 15-Day Notice proposal provides one clear sustainability criterion, stating that "biomass used in fuel pathways must only be sourced on land that was cleared or cultivated prior to January 1, 2008,"¹⁵ a provision clearly related to the stated CARB goal that "biofuel production must not come at the expense of deforestation or food production." However, the other criteria set out in the 15-Day Notice remain unduly vague and untethered from the stated goal that biofuel production not come at the expense of deforestation or food production. CARB proposes at Section 95488.9(g)(1)(B) that "[b]iomass must be produced according to best environmental management practices that reduce GHG emissions or increase GHG sequestration," yet then leaves this requirement open-ended, asserting that this requirement includes, but is not limited to the following general criteria:

- 1. Maintain or enhance biodiversity habitat on agricultural or forested lands;*
- 2. Enhance soil fertility and avoid erosion or compaction;*
- 3. Apply fertilizers in a manner that minimizes runoff, and soil and water contamination;*
- 4. Reduce unsustainable water use, and minimize diffuse and localized pollution from chemical residues, fertilizers, soil erosion, or other sources of ground and surface water contamination.¹⁶*

While providing a bit more detail regarding expectations than the original sustainability certification proposal, CARB still defers the interpretation of how these general criteria might be satisfied to third-party schemes, and specifically those under the European Renewable Energy Directive (EU RED),¹⁷ which was designed by European regulators and presumably based on European conditions and structures. CARB's failure to set out more specific requirements calls into question not only what problem CARB is trying to solve, but also how producers might comply. It also raises the question of whether CARB has the legal and regulatory authority to import into the LCFS undefined substantive provisions from outside schemes.

¹⁵ 15-Day Notice, Attachment A-1, Section 95488.9(g)(1)(A).

¹⁶ 15-Day Notice, Attachment A-1, Section 95488.9(g)(1)(B).

¹⁷ 15-Day Notice, Attachment A-1, Section 95488.9(g)(3)(C).

By way of example, the 15-Day Notice proposal further specifies that, in addition to certain of the general criteria noted in 95488.9(g)(1)(B), the third-party “certification system must consider environmental, social, and economic criteria.” Yet, like the general criteria noted in 95488.9(g)(1)(B), this “environmental, social, and economic criteria” provision could be interpreted in a variety of ways. It is unclear from the proposed language which specific environmental, social, and economic criteria would be deemed essential for the CA-LCFS program and how those criteria might align with program goals. Further, CARB’s failure to establish clear criteria calls into question why the current analytical, science-based methodologies used by CARB are assumed to be insufficient to provide the necessary controls on crop-based (and forestry) feedstocks to ensure environmental integrity. Moreover, given that CARB only detailed potential concerns about oil seed crops during the April 10 Workshop, there does not appear to be a basis for the broad application of the proposed sustainability certification requirements to all low-carbon fuels that use any form of crop-based feedstock.

064.9

In addition, it is unclear why crop and forestry-based fuels are being singled out for meeting social and economic criteria, which have implications for any fuel pathway participating in the program. These additional criteria have the potential to add substantial administrative burden to both farmers and fuel producers, potentially creating barriers to LCFS participation, and, as such, should be carefully considered in the context of what the program hopes to achieve by applying these criteria.

During the April 10 Workshop, CARB staff reiterated that its remit from the Board at the September 28, 2023, informal Board meeting regarding crop-based fuels was to “investigate guardrails.”¹⁸ It does not appear that CARB staff has done so, instead, as noted, CARB simply defers to third-party sustainability certification schemes without determining what “guardrails” might be required to meet the state’s objectives and bypasses the public stakeholder process in the development of standards. Although the proposed LCFS regulatory revisions do not cite specific third-party schemes, during the April 10 Workshop, CARB staff referred to the Roundtable on Sustainable Biomaterials (RSB) and the International Sustainability and Carbon Certification (ISCC) initiative as the types of certification systems it believed would be applicable.

While Gevo is a member of and works with both RSB and ISCC, in our experience, despite being well-intentioned regarding stakeholder input from their members, these entities have not actively included farmers in the development of standards and, as European certification bodies, do not have first-hand experience with U.S. agriculture. Also, both of these entities have multiple certification standards, yet CARB has not provided sufficient detail to suggest which standards might be applied.

¹⁸ CARB Workshop Slide Deck, at slide 51.

In light of the above, we implore CARB to remove the sustainability certification requirement from the current rulemaking and continue to mature the development of specific program requirements with multi-stakeholder input and workshop feedback to align any requirements CARB might impose with specific LCFS goals and make the provisions practicable. Critically, this stakeholder input must include farmers and others who work in agriculture. Farmers are often omitted from the development of program standards, despite being the most critical actors in implementation of those standards.

By focusing in on what the State of California seeks to achieve through additional sustainability criteria, and delineating those criteria with appropriate inputs, CARB can ensure program requirements are fit for purpose, clear, transparent, applied fairly across feedstocks and fuel production processes, properly credit GHG emissions reductions from agricultural feedstocks, and align with LCFS-specific program goals. Such a process need not be open-ended, as CARB could set up a process with a specified time frame (e.g., six months) as it has in other instances in which program requirements needed to be refined.

B. The Proposed Regulatory Provisions Have Apparent Errors and Conflicts

In reviewing the regulatory text proposed in the 15-Day Notice, we identified a number of apparent errors and conflicting provisions, further calling into question whether the sustainability proposal is fit for purpose. We identify the problematic provisions here and, again, urge CARB to revisit and refine its sustainability certification proposal.

- 064.10
 - Section 95488.9(g)(1) asserts that “biomass used in fuel pathways is subject to the sustainability criteria listed in subsections 95488.9(g)(1)(A) through (C).” However, there is no subsection (C) under (g)(1). We note that missing (or otherwise unintended) subsection 95488.9(g)(1)(C) is referenced again under the 2031 Approved Certification Systems.
- 064.11
 - The 2026 provisions in Section 95488.9(g)(2)(C) require field shapefiles/coordinates and attestations that the information is accurate. For existing pathways, the provision states the fuel producer must “maintain” the associated records, whereas for new pathways, the provision states the fuel producer must “maintain” the records and “submit” them to CARB. While that distinction seems reasonable, we note that the proposed regulatory text has instructions not only for fuel producers with new pathways to submit the records to CARB but also has instructions for those producers with existing pathways to submit the records, a seeming contradiction with the requirement that those with existing pathways simply “maintain” the records.

- As noted in the 15-Day Notice of Availability document, CARB intends the 2028 sustainability certification to ensure only that “feedstocks are not sourced on lands converted after 2008,” with certification to any other sustainability criteria being optional.¹⁹ This intent is carried through in the initial regulatory text at Sections 95488.9(g)(3)(A)&(B), which state that “pathways utilizing biomass under section 95488.9(g)(1) must []²⁰ at least meet the sustainability requirements for biomass under section 95488.9(g)(1)(A)” (i.e., the 2008 land conversion provision). However, the subsections numbered (1) under 95488.9(g)(3)(A)&(B) contradict the stated intent to only require certification of the 2008 land conversion provision, by stating that the “chain-of-custody evidence for sustainable biomass must meet requirements of section 95488.8(g)(1)(B)1. through 3.,” which are three of the separate environmental management practices.²¹ We believe the inclusion of the additional sustainability criteria here is an error, as including them would contradict the stated intent and also would make the 2028 requirements the same as the 2031 requirements.

C. Emissions Reductions from Climate-Smart Agriculture Practices Should Be Credited

CARB proposes at Section 95488.9(g) that “[b]iomass must be produced according to best environmental management practices that reduce GHG emissions or increase GHG sequestration,” and yet, while the drive for lower CI fuels already incentivizes use of lower CI feedstocks, CARB does not provide crediting within the LCFS for the climate-smart agriculture processes that are “best.”

Climate-smart agriculture is an important lever for carbon abatement. Accordingly, in establishing specific sustainability criteria for crop-based feedstocks, CARB should also allow for climate-smart agriculture practices to be credited under the LCFS. Implementation of these feedstock production practices requires transition from usual practice and significant additional effort from farmers. Critically, as recognized by the U.S. Department of Agriculture (USDA), the National Academy of Sciences, the IPCC,

¹⁹ CARB, Notice of Public Availability of Modified Text and Availability of Additional Documents and/or Information Proposed Low Carbon Fuel Standard Amendments, at 13.

²⁰ The actual regulatory text that has been proposed repeats the word “must,” so it reads “pathways utilizing biomass under section 95488.9(g)(1) must must at least meet the sustainability requirements for biomass under section 95488.9(g)(1)(A).”

²¹ See 15-Day Notice, Attachment A-1, Sections 95488.9(g)(3)(A)(1) and 95488.9(g)(3)(B)(1).

and others, these practices can bring significant GHG emissions reductions.²² Indeed, although CARB has not spelled out in detail what it might expect for the “best practices” it calls for under Section 95488.9(g)(1)(B) with respect to soil and fertilizer, various soil and fertilizer best practices can bring CI reductions, and most sustainability certifications would include a GHG analysis of the feedstock in addition to certification of sustainable practices. Yet, while proposing to require sustainability certifications that would cover such practices, CARB offers no emissions reduction credits to cover the additional cost and effort these requirements would impose on the farmer or the fuel producer.

As noted, CARB should revisit its sustainability certification proposal and include within it crediting for emissions reductions associated with climate-smart feedstock production practices. To expedite such crediting, CARB could leverage recent efforts at the federal level by USDA (and others) to include emissions crediting for agricultural practices under the Section 45Z tax credit. While still in development, the work to develop criteria for crediting emissions reductions from climate-smart agriculture practices under Section 45Z is being informed by a public stakeholder process that includes input from those with expertise in U.S. agriculture.

As noted, Gevo plans to source sustainably grown, low-CI field corn from the Lake Preston, South Dakota area and use Verity Tracking to measure and verify carbon intensity and all farm activities to the field level. The Gevo Growers’ Program is currently enrolling farmers under our \$30 million USDA Climate-Smart Commodities grant, which allows us to pay farmers more for implementing climate-smart agriculture practices such as cover crops, reduced tillage, organic fertilizers, and nutrient management. Simply put, such climate-smart agricultural practices are critical to producing sustainable feedstocks and lowering the CI of fuels. In addition to sequestering carbon in soil, these production practices provide significant additional ecosystem benefits such as soil health, water quality improvement, water use efficiency, more resilient crops, and long-term land fertility. These practices are a significant component of Gevo’s approach to producing sustainable SAF and other low-carbon

fuels, and we urge CARB to support these practices by crediting the emissions reductions they provide under the LCFS.

VI. CARB's Proposal to Assign Land Use Values Other Than Those Published Is Arbitrary and Capricious (Section 95488.3(d))

In the 15-Day Notice, CARB proposed to authorize the Executive Director to adopt "more conservative" land use change (LUC) values than currently provided in the regulations upon a determination that a published value is not "conservatively representative of a particular region/feedstock/fuel combination."²³ While stating that any such decision would be based on "the best available empirical data, including but not limited to satellite-based remote sensing data for land cover monitoring, crop yields, and emission factors from the AEZ-EF model or carbon stock datasets," the proposed regulatory text does not set out clear criteria for the Executive Director to make a determination that a published value is not "conservatively representative" or what value might be more "conservative" or "representative." Such broad and undefined authorization would create tremendous regulatory uncertainty, while also calling into question CARB's assignment of LUC values in the first place.

We also note this approach confuses the concepts of indirect land use change (iLUC) with direct land use change (dLUC). Economic models such as GTAP-BIO simulate causal relationships between sectors of the economy and cannot be replicated by empirical data such as satellite imagery. Models like GTAP-BIO simulate both land use change estimated to occur directly in cultivation of biofuel feedstock, as well as land use change estimated to occur in non-biofuel sectors in reaction to changes in biofuel production. While satellite data can indicate that land use change has occurred, it cannot provide evidence of why it occurred, and so cannot capture estimated economic ripple effects. Hence, it is not clear how empirical data could be used to arrive at a conceptually comparable value to the already modeled iLUC values and, if implemented, CARB's proposal would inappropriately create two different standards for LUC calculations for different feedstocks.

Accordingly, for the reasons cited above, the proposal as it stands is arbitrary and capricious and should be withdrawn.

²³ 15-Day Notice, Attachment A-1, Section 95488.3(d).

VII. Conclusion

Thank you for the opportunity to comment on the 15-Day Notice of additional changes to the Low Carbon Fuel Standard amendments proposal. Please let us know if you have any questions regarding our comments. We look forward to continuing to participate in this program with our RNG and as Gevo begins commercial scale production of SAF and other biofuels.

Respectfully,

[Board Comments Home](#)

August 27, 2024

Liane Randolph, Chair
Members of the Board
California Air Resources Board
1001 I Street
Sacramento, CA 95814

Dear Chair Randolph and Members of the Board,

- 065.1 I helped develop and enthusiastically support the LCFS. A strong LCFS is critical to helping California achieve its zero emission transportation goals. In the 15-Day Notice, staff have proposed several improvements to the LCFS amendments proposal that I agree with. These improvements include:
- allowing pre-2011 transit to generate full credit,
 - classifying forest waste biomass as a specified source feedstock,
 - applying sustainability criteria to prohibit biofuel feedstock sourcing from land cultivated after 2008,
 - allowing staff to apply more conservative LUC CI values based on source of feedstock,
 - limiting avoided methane crediting to 20 years instead of 30 years,
 - removing hydrogen produced using fossil gas with CCS as eligible credit generator in 2031,
 - and a very weak, short-term signal discouraging soy and canola biomass-based diesel.

The short discussion below focuses on four issues related to the 15-Day Notice and Recirculated Draft Environmental Impact Analysis that I hope you will further consider for a second 15-Day Change Notice or direction to staff in the Board Resolution. This discussion is followed by an appendix which provides more detailed suggestions for changes to reduce pass-through costs and better align the LCFS with California's long-term transportation goals.

- 065.2 1. What do Donald Trump and CARB staff have in common? They both assume that you are foolish enough to believe that pass-through costs do not exist. While Trump continues to double-down on the claim that tariffs do not increase the cost of goods, CARB staff continue to double-down on the equally false claim that assessing LCFS deficits does not increase the cost of gasoline. **SAD!**

- 065.3 In the appendix to these comments, I have reiterated several suggestions from my 45-Day Comment Letter that will reduce the LCFS pass-through cost to consumers of gasoline. These actions involve limiting credit generation that does not advance California's long-term zero-emission transportation goals, eliminating excessive credit generation that only results in excessive profits, eliminating LCFS subsidies that do not result in additional global GHG emission reductions beyond what would already occur through other State and Federal programs, eliminating double-

counting of LCFS credits and GHG reductions purchased through the voluntary carbon market for DAC and CCS projects, removing Enhanced Oil Recovery as an eligible sequestration method for out-of-state CCS and DAC projects, and minimizing the potential for credit price spikes. Cutting out unnecessary and ineffective credit generation will allow for less stringent targets and lower pass-through costs, without sacrificing real, additional GHG reductions achieved by the program.

065.4

In addition to adopting the suggestions in the appendix, I encourage you to direct staff to split the LCFS program into two separate markets with two different percentage CI reduction targets. Credits generated in one market would not be fungible in the other market. One market would be restricted only to gasoline and substitutes and would have a less aggressive CI benchmark schedule, which will reduce pass-through costs to low-income gasoline consumers. The other market would include diesel, jet fuel, and their substitutes and would have a much more aggressive CI benchmark schedule to accommodate the high market penetration of renewable diesel, biodiesel, and negative CI dairy gas. Because of the more aggressive CI benchmark schedule, the diesel market will have much higher pass-through costs. Having two separate markets will insulate the gasoline consumer from high pass-through costs necessary to decarbonize the diesel side. Moreover, gasoline consumers in California should not be paying most of the cost to decarbonize the heavy-duty transportation sector when the State can more effectively pass much of those costs on to out-of-state consumers of goods passing through California ports.¹ While this is a major change that is likely not appropriate for a second 15-Day Change Notice, I do hope you will direct staff in the Board Resolution to consider it for future amendments. I fear that if CARB is unwilling to acknowledge that pass-through costs exist and take reasonable steps to address them, especially on the gasoline side, the LCFS may become hard to defend politically by 2035.

065.5

2. While the staff proposal discouraging soy and canola biomass-based diesel in section 95482(i) of the 15-day Change Notice² is a step in the right direction, it is not a cap and likely will not effectively reduce long-term use of these feedstocks. The proposal should be further strengthened to address the issues discussed below.

¹ Because much of the diesel consumed in California is used for goods movement, pass-through costs on the diesel side will ultimately get passed on to consumers of goods that move through California ports. Since most goods moving through California ports have a destination outside of California, these costs will mostly be passed on to consumers outside of the state.

² The proposed 15-day Change reads: "Biomass-based diesel produced from soybean oil and canola oil is eligible for LCFS credits for up to twenty percent combined of total biomass-based diesel annual production reporting, by company. Any reported quantities of biomass-based diesel produced from soybean oil or canola oil in excess of twenty percent on a company-wide basis will be assigned a carbon intensity equivalent to the carbon intensity benchmark shown in Table 2 in Section 95484(e) for the applicable data reporting year, or the certified carbon intensity for the associated fuel pathway – whichever is greater. For companies with biomass-based diesel pathways certified prior to the effective date of the regulation and for which the percentage of biomass-based diesel produced from soybean oil or canola oil was greater than 20 percent of combined reported biodiesel and renewable diesel quantities for 2023 LCFS reporting, this provision takes effect beginning January 1, 2028."

- Credit generation and avoided deficit generation are two sides of the same coin.³ It is important to recognize that for volumes more than 20%, CARB is proposing to assign a CI value equal to the carbon intensity benchmark shown in Table 2 of the LCFS regulation or the certified pathway CI, whichever is greater. CARB is not proposing to assign the CI value for fossil diesel. As such, it may still make economic sense for a company that produces only soy or canola renewable diesel to sell it in California, even if volumes above 20% are assigned a CI that does not generate credits or deficits. The LCFS incentive comes from a combination of the credit value and the higher market price for fuel in California versus other markets. The higher market price for diesel in California is driven in part by the LCFS pass-through cost⁴ and the Cap-and-Trade pass-through cost. Because the market price for biomass-based diesel follows the market price for diesel, the market price for biomass-based diesel in California likewise exceeds that in other states. And as the LCFS benchmark CI value decreases over time, the LCFS pass-through cost will continue to increase, resulting in a widening price gap between selling (bio or fossil) diesel in California versus other markets. The higher selling price may be sufficient to justify participating in the California market even if the biofuel does not generate credit.⁵ **If CARB is truly interested in removing the LCFS incentive to sell more than 20% of soy and canola-based diesel, I recommend assigning the carbon intensity of fossil diesel to volumes in excess of 20%.**
- Staff's proposal effectively self-sunsets in less than ten years⁶ and sooner if the auto-acceleration mechanism is triggered. The diesel benchmark CI declines every year and once the pathway CI is higher than the benchmark, all fuel volumes will be assigned the actual pathway CI. There will no longer be less incentive for volumes above 20%. In the 15-Day Notice, CARB staff claim that the "proposed addition avoids sending a long-term signal for virgin soy or canola oil to serve California demand". No, it does not. It provides a short-term signal. In the long-term, this proposal really does nothing, as beyond the year 2035 the

³ Most soy and canola renewable diesel pathways have CI values between 50 and 65 g/MJ. In 2028, the diesel benchmark CI is proposed to be 77.10 g/MJ. So as an example, if a company produces soy (and/or canola) renewable diesel with a CI of 60 g/MJ, those volumes below 20% will be assigned the pathway CI of 60 g/MJ and those volumes above 20% will be assigned the diesel benchmark CI of 77.10 g/MJ. All of the volume, however, will be displacing diesel which has a CI of 105.76 g/MJ. So, while there will be less LCFS incentive for selling volumes above 20%, there will still be some incentive because displacing the fossil diesel avoids the deficits generated by fossil diesel (and also avoids the Cap-and-Trade compliance obligation). In other words, credit generation and avoided deficit generation are two sides of the same coin.

⁴ The LCFS pass-through cost is a function of the credit price, and the quantity of deficits generated by a gallon of fossil diesel, which increases as the diesel benchmark decreases.

⁵ By similar reasoning, even when soy and canola renewable diesel start generating LCFS deficits, there will still be an incentive to sell it in California, as it will displace fossil diesel which generates considerably more deficits (and also incurs a compliance obligation from the Cap-and-Trade program).

⁶ The proposed diesel benchmark is scheduled to drop below 65 g/MJ in 2032 and drop to 50 g/MJ by 2035. In other words, the difference in CI value assigned to volumes above and below 20% decreases each year after the amendments are adopted and the provision effectively self-sunsets between the years 2032 and 2035 for most producers of biomass-based diesel.

proposal doesn't affect the incentive to sell soy and canola-based diesel in California. **Assigning the fossil diesel CI to volumes above 20% would send the appropriate long-term signal.**

- 065.6
- Under the staff proposal, an unlimited quantity of fuel produced from other crop-based feedstocks can be sold in California. The provision does not apply to oilseed crops such as camelina, sunflower, or carinata, so biomass-based diesel produced from these crops will not be affected. **Only applying the provision to soy and canola may result in some perverse incentives in the oilseeds market that can be avoided by applying the provision to all oilseed crops.**
 - Under the staff proposal, an unlimited quantity of soy or canola-based jet fuel, gasoline, and propane can be sold in California. The provision only applies to biomass-based diesel and not to renewable jet fuel, renewable gasoline, or renewable propane produced from soy and canola. Many renewable diesel biorefineries produce more than one product and some produce all of these fuels, but only the renewable diesel will be affected by the 20% threshold. An important question to ask staff is how flexible they will be in allocating feedstocks to finished fuels. For example, if a biorefinery produces renewable diesel and renewable jet fuel from used cooking oil and soy oil, will CARB allow them to avoid exceeding the 20% threshold for renewable diesel by arbitrarily saying that the jet fuel is produced from soy oil and the diesel is produced from used cooking oil, when in fact the biorefinery is fed a mixture of these oils? **I recommend applying the 20% limit to the combined volume of biomass-based diesel, renewable jet fuel, renewable gasoline, and renewable propane sold in California and specifically prohibiting arbitrary preferential allocation of feedstock to product.**

- 065.7
3. **Staff should be directed to correct the air quality assessment in the Draft Environmental Impact Analysis.** It is disappointing to see staff rely on science and mathematics when it is convenient, but then ignore both when they don't support their point of view. For example, staff clearly believes in statistics when a study shows that a higher rate in growth of dairies with digesters is not statistically significant (see slide 47 of a recent CARB presentation on [dairies](#)), but they don't believe in statistics when a study shows that using renewable diesel in new technology diesel engines does not result in statistically significant reductions in tailpipe emissions (see page viii of the recent [Low Emission Diesel Study](#) prepared for CARB⁷). As a second example, staff continue to assume that a reduction in the consumption of fossil diesel in California will result in a proportional reduction in oil production in California and then attribute the reduced criteria pollutant and GHG emissions associated with the oil production decline to the LCFS (see page B-1 of the SRIA for equations). These calculations ignore the obvious fact that California oil production has been in terminal decline for decades (see figure 1 on page 7 of

⁷ Page viii reads "There were no statistical differences in PM emissions in the NTDEs observed in any test fuel or test cycle compared to the CARB reference fuel, indicating that PM emissions are effectively controlled by the exhaust aftertreatment systems, no matter the biofuel blend or test cycle."

the California State Oil and Gas Supervisor Annual Report 2020) and oil production will continue to decline rapidly without the LCFS. Furthermore, staff has demonstrated no link between a decline in California refinery output and a decline in oil production in the State. CARB staff should provide the Board with the best available information to make an informed decision, not skew the data and calculations to support a pre-determined policy outcome. It is unfortunate to see CARB selectively use science and mathematics.

- 065.8 4. **Staff should address the potential for the Auto-Acceleration Mechanism (AAM) to overcorrect the market.** I suggest not allowing an acceleration to occur in either 2031 or 2032⁸ as the rate of CI decline for the benchmarks is already more than tripling starting in 2031 and an acceleration that occurs in either of these years would increase the rate of target CI decline more than sixfold. Such a rapid CI stepdown may result in an overcorrection of the market with the credit price going to the ceiling, at which it may be stuck for many years. Under the above scenarios, credit price at the ceiling may result in a pass-through cost of approximately \$1.30 per gallon of gasoline in the early 2030s. Such a pass-through cost would likely be politically untenable for the program.

As always, I am available to discuss these comments with you individually at a time of your convenience.

Best regards,

Jim Duffy

⁸ This caution assumes that the AAM has not already been triggered prior to 2030. If the AAM has previously been triggered, then the years of concern will advance by one year. In other words, I suggest not allowing an acceleration to occur in either of the two years following the transition from a 1.45% rate of benchmark decline to a 4.5% rate of decline.

Appendix: Actions that CARB can take to reduce the pass-through cost to consumers of gasoline.

These actions involve limiting credit generation that does not advance California's long-term zero-emission transportation goals, eliminating excessive credit generation, eliminating LCFS subsidies that do not result in additional global GHG emission reductions beyond what would already occur through other State and Federal programs, and minimizing the potential for credit price spikes. Cutting out unnecessary and ineffective credit generation will allow for less stringent targets and lower pass-through costs, without sacrificing real, additional GHG reductions achieved by the program.

Eliminate double counting of emission reductions from direct air capture (DAC):

In several provisions of the LCFS regulation amendments (e.g., book-and-claim electricity, book-and-claim RNG, book-and-claim hydrogen, renewable or low-CI process energy), the regulation text prohibits generating LCFS credits if the RECs or environmental attributes are "being claimed in any other voluntary or mandatory program with the exception of (insert list of programs where stacking is allowed)". However, such language is conspicuously absent from section 95490 for DAC or other CCS projects. It is public knowledge that Oxy 1PointFive is already preselling future emission reductions in the voluntary carbon market for its first DAC project and intends to bundle DAC emission reductions with crude oil being marketed as "carbon neutral crude" or "net zero oil". See:

- [1PointFive announces agreement with Airbus for purchase of 400,000 tonnes of carbon removal credits](#)
- [Amazon makes first investment in direct air capture climate technology | Reuters](#)
- [Oxy teams with Macquarie to deliver the world's first carbon-neutral oil from Permian basin to India](#)
- [1PointFive Announces Agreement to Sell 500,000 Metric Tons of Direct Air Capture Carbon Removal Credits to Microsoft](#)
- [1PointFive and AT&T Announce Direct Air Capture Carbon Removal Agreement](#)

While I agree that the LCFS value for CCS and DAC should stack with Federal 45Q tax credit, generating LCFS credit for emission reductions that are also sold to other entities in the voluntary carbon market and/or bundled with crude as "net zero oil" is a clear instance of double or maybe even triple counting of emission reductions. If your intention is to allow double or triple accounting, then that should be transparently stated and discussed in a public forum.

Remove Enhanced Oil Recovery (EOR) as an Eligible Sequestration Method: California SB 1314 prohibits the use of EOR as a sequestration method for CCS projects in California. Section 1 of SB 1314 reads "The Legislature finds and declares that the purpose of carbon capture technologies, and carbon capture and sequestration is to facilitate the transition to a carbon-neutral society and not to facilitate continued dependence upon fossil fuel production." CO₂ EOR is a tertiary oil production method that is only used when oil field production has declined to the point that it is no longer

profitable to continue producing using secondary production methods such as waterflood. As such, use of EOR results in the recovery of oil that otherwise would not be produced. The LCFS program should not be providing incentive to squeeze additional oil from these fields. Let's leave this oil in the ground! Out of consistency with California requirements, I strongly encourage the Board to remove EOR as an eligible sequestration method under the LCFS. This can be done by setting a grandfather date (e.g., 2028) after which projects using EOR cannot be certified.

Place a cap on out-of-state DAC projects: Based on press releases, DAC projects are expected to be massive, resulting in credit generation of up to one million MT annually for each project. At a credit value of \$200, a single out-of-state project may result in approximately \$200 million leaving the California economy annually, while providing no jobs for Californians, displacing no fossil fuels in California, resulting in no air pollution benefits to California communities, and not even counting toward California's AB32 emission reduction goals. Therefore, not only will Californians be paying for a large out-of-state project that provides no immediate benefit to the state, but they will also have to pay again for separate emission reductions that do count toward the State's goals. In effect, these DAC projects would act as "LCFS offsets", allowing oil companies to comply with the LCFS without affecting their fossil fuel sales. Credit generation for out-of-state DAC projects should either be quickly phased out through a grandfather date or tightly capped as is done in the Cap-and-Trade program for offsets. If left uncapped, a proliferation of DAC projects⁹ could result in repeated triggering of the Auto-Acceleration Mechanism leading quickly to excessive pass-through costs to California consumers.

Stop receiving new petroleum project applications in 2025 and phase out crediting by 2030: The innovative crude and refinery investment projects that have been approved to date are certainly not innovative and are excessively subsidized. These projects should not be credited through the LCFS. All projects certified under the innovative crude provision are for solar electricity, which is cost effective without LCFS credit value. Likewise, the refinery investment credit project certified for the Chevron refinery in Richmond is providing approximately 60,000 credits annually for a hydrogen plant upgrade that Chevron was planning to do before the LCFS was even adopted.¹⁰ These are certainly not additional emission reductions. In effect, the LCFS is subsidizing oil companies to meet their Cap-and-Trade obligation.

Stop overcompensating dairy digester projects: It is my understanding that capital financing for dairy digester projects is commonly paid off in ten years, after which only maintenance and operating costs remain. While dairy digester operators may reasonably argue that they need full avoided methane credit for the first ten years while paying of capital costs, having full avoided methane credit for the next twenty years is gross overcompensation. **Moreover, after paying off capital costs for the digester, it is no longer appropriate to assume a baseline of methane emissions to the**

⁹ Oxy 1PointFive has announced a [goal of completing 70 DAC projects by 2035](#).

¹⁰ See <https://ccpulse.org/2014/07/31/richmond-approves-stalled-modernization-plan-at-chevron-refinery-2/>

atmosphere. With avoided methane crediting, a dairy digester project generates approximately \$70 to \$125 per MMBtu in total value from the LCFS, RFS, and gas sales.¹¹ The operating and maintenance costs for a digester project are about \$25 per MMBtu (\$35 per MMBtu if trucking of the gas is required).¹² In other words, digester projects getting avoided methane credit are generating about 100 to 400 percent annual profit after paying off the digester. To avoid this needless overcompensation, I recommend assigning a fixed CI value of zero g/MJ for the remaining 20 years of LCFS crediting.¹³ At a CI value of 0 g/MJ, the dairy digester project would generate a combined value of approximately \$40 to \$60 per MMBtu, which is much more in line with the operating and maintenance costs.

Do not allow dairy projects to get more credit for increasing the herd size: Avoided methane credit should be capped based on the historic herd size before LCFS certification. This would prevent dairy projects from receiving additional credit for growing the herd size and exacerbating local air quality problems.

Apply biomethane deliverability requirements for all biomethane pathways: In a last-minute revision, staff decided to grandfather all RNG projects that break ground prior to 2030 from proposed deliverability requirements, and projects breaking ground in 2030 or later will only be affected by deliverability requirements starting in 2040. I recommend the Board direct staff to revert to the original concept discussed in workshops and apply deliverability requirements for all pathways starting in 2028. As an exception, I recommend that dairy digester projects that break ground prior to 2025 be allowed to complete their first 10-year crediting period under current deliverability requirements. These dates will provide sufficient time for out-of-state RNG projects that do not meet the deliverability requirements to contract with fleets outside of California and continue receiving value from the RFS. This timing will also allow these digester operators sufficient time to work with their own state legislatures to provide additional funding if necessary to avoid potential stranded assets. Gasoline consumers in California have jump started the dairy digester industry in these states, they shouldn't be asked to fund these projects in perpetuity.

Quickly phase-out book-and-claim accounting for landfill gas: Landfills do not need LCFS credit as the RFS incentive for these projects is already excessive. Moreover, over 98 percent of the landfill gas generating credit under the LCFS is from out-of-state sources. Producing landfill gas for transportation is estimated to cost approximately \$10

¹¹ At an LCFS credit price of \$100 to \$200, dairy digester gas generates approximately \$40 to \$80/MMBtu in value from the LCFS, \$26 to \$40/MMBtu in value from the federal Renewable Fuel Standard, and about \$5/MMBtu for the gas for a total value of approximately \$70 to \$125/MMBtu.

¹² See calculation details at <https://asmith.ucdavis.edu/news/digester-update>

¹³ This recommendation should be made together with a phase out of book-and-claim accounting for landfill gas.

per MMBtu¹⁴ but these projects currently receive about \$40 per MMBtu in incentive from the RFS. In other words, the LCFS providing incentive for these projects does not result in additional global GHG reductions, only more profits. I recommend eliminating book-and-claim accounting for landfills in 2028, which will provide sufficient time for out-of-state landfill gas operators to find a different purchaser for their gas.

Phase out crediting for light-duty and heavy-duty forklifts: Staff took a step in this direction by reducing the EER for light-duty forklifts but should go a step further and set phase out dates of 2030 for light-duty forklifts and 2040 for heavy-duty forklifts. With limited exceptions, all forklifts will be required by regulation to be zero-emission by 2040.¹⁵

Return to the Board if the Auto-Acceleration Mechanism (AAM) is triggered repeatedly: The AAM is designed to automatically increase the stringency of the program if there is a chronic excess of credit leading to a buildup of the credit bank and reduction of credit prices. In discussing the rationale for the AAM, CARB wrote “The existence of an AAM is expected to decrease market volatility and increase market confidence, which will promote low-carbon technology investments.” However, modeling released as part of the 15-Day Changes shows credit prices varying from a low of \$0 (approximately \$75 with one trigger of the AAM) to a high at the credit price ceiling. Will the AAM effectively set a credit price floor that is well above \$75? Will unexpected credit generation result in multiple triggers of the AAM and unexpectedly high pass-through costs, especially when credit prices subsequently increase to the price ceiling? Because of the uncertainty surrounding the impact of the AAM on credit price and pass-through cost, I recommend requiring that a rulemaking be initiated if the AAM is triggered twice in any six-year period. Moreover, this rulemaking should be completed before a third acceleration is allowed. Repeated triggering of the AAM indicates market conditions that staff and the Board did not anticipate when approving these amendments. Staff should be required to investigate and return to the Board with amendments to establish new compliance targets and address the cause(s) of the market imbalance, if necessary.

Address the potential for the AAM to overcorrect the market: I suggest not allowing an acceleration to occur in either 2031 or 2032 as the rate of CI decline for the benchmarks is already more than tripling and an acceleration that occurs in either of these years would increase the rate of target CI decline more than sixfold. Here are the scenarios of concern:¹⁶

¹⁴ See <https://www.erm.com/globalassets/documents/mjba-archive/issue-briefs/rngeconomics07152019.pdf>

¹⁵ See [workshop materials](#) for the forthcoming Zero-Emission Forklifts Regulation.

¹⁶ I wrote these scenarios assuming that the AAM has not already been triggered prior to 2030. If the AAM has previously been triggered, then the years of concern will advance by one year. In other words, I suggest not allowing an acceleration to occur in either of the two years following the transition from a 1.45% rate of decline to a 4.5% rate of decline.

- The AAM is triggered in May of 2030. This trigger has occurred because the market is generating too many credits based on an annual benchmark decline from 2026 through 2030 of 1.45 percent. In 2031, the rate of benchmark decline is already scheduled to more than triple to 4.5 percent. An acceleration in 2031 would more than sextuple the rate of benchmark decline to 9 percent.
- The AAM is triggered in May of 2031. Again, this trigger has occurred because the market is generating too many credits based on an annual benchmark decline from 2026 through 2030 of 1.45 percent. In 2031, the benchmark has already declined by 4.5 percent, which may itself correct the market. However, in 2032, an acceleration will occur increasing the target CI reduction another 9 percent.

Either of these scenarios may result in an overcorrection with the credit price going to the ceiling, at which it may be stuck for many years. Under the above scenarios, credit price at the ceiling will result in a pass-through cost of approximately \$1.30 per gallon of gasoline. Such a pass-through cost would be politically untenable for the program.

Subject	Comments on the August 2024 Proposed Changes to the LCFS

Comment

066.1

Chair Randolph:

The Transport Project (TTP) respectfully submits the attached comments on the California Air Resources Board (CARB) staff proposed modifications to the California Low Carbon Fuel Standard (LCFS) program and in support of the objective, to continue to incentivize the lowest carbon fuels and technologies available to the transportation market. The LCFS modifications proposed by CARB staff are comprehensive and represent significant efforts that are appreciated. It is our belief that California should continue to be fuel neutral through the LCFS, using national standards and the Argonne GREET model to determine the best LCFS credit generators.

The Transport Project is a national coalition of fleets, vehicle and engine manufacturers and dealers, servicers and suppliers, and fuel producers and providers dedicated to the decarbonization of North America's transportation sector. Through the increased use of gaseous motor fuels including renewable natural gas and hydrogen, California can help achieve ambitious climate goals and greatly improve air quality safely, reliably, and effectively without delay and without compromising existing commercial business operations.

Thank you for your consideration of our comments and please let me know if you have any questions.

Sincerely,

Sherrie Merrow
The Transport Project Director of State Government Affairs

RE: The Transport Project Comments on the CARB Staff Proposed Modifications to the CA LCFS

Chair Randolph:

The Transport Project (TTP) respectfully submits the following comments on the California Air Resources Board (CARB) staff proposed modifications to the California Low Carbon Fuel Standard (LCFS) program and in support of the objective, to continue to incentivize the lowest carbon fuels and technologies available to the transportation market. **The LCFS modifications proposed by CARB staff are comprehensive and represent significant efforts that are appreciated. TTP supports most changes with some caveats as detailed in the paragraphs on the second page. It is our belief that California should continue to be fuel neutral through the LCFS, using national standards and the Argonne GREET model to determine the best LCFS credit generators.**

The Transport Project is a national coalition of fleets, vehicle and engine manufacturers and dealers, servicers and suppliers, and fuel producers and providers dedicated to the decarbonization of North America's transportation sector. Through the increased use of gaseous motor fuels including renewable natural gas and hydrogen, California can help achieve ambitious climate goals and greatly improve air quality safely, reliably, and effectively without delay and without compromising existing commercial business operations.

California has achieved significant emission reductions through the LCFS program, but is falling behind in achieving its longer-term goals as stated in the following two current articles:

[California needs to triple pace of emissions cuts to meet 2030 goal, report says | Reuters](#)

[CA isn't on track to meet climate change mandates, report says - CalMatters](#)

The information presented above coupled with significant issues in electric vehicle (EV) performance in the Medium- and Heavy-Duty vehicle market including, cost, range, technical issues, battery issues, a lack of 1 to 1 vehicle replacement for duty cycles (including the need for more drivers for the additional EVs needed) and the lack of stations and grid availability raise questions as to the effectiveness of relying primarily on potential emissions reductions from EVs.

Zero Emission Vehicles (ZEV) have played a role in California's vehicle emissions reductions, but low carbon and low NOx fuels have produced most of these emissions reductions to date, and there is a need to retain these fuels until ZEV technology, charging/fueling and supply reach full operational capacity. There is **no one solution** to the pressing environmental issues facing the transportation sector. Policy makers should move quickly to deploy those technologies and solutions that are readily available,

maximize cost-effective emission reductions, and provide a real pathway to carbon neutral or carbon-negative emissions.

The Transport Project offers the following comments regarding the CARB staff LCFS proposed amendments outlined in the “Notice of Public Availability of Modified Text and Availability of Additional Documents and/or Information:”

- 066.2 **Page 3, New Subsection 95482(h)** – Removes LCFS credit generation eligibility for hydrogen produced using fossil gas as a feedstock, effective January 1, 2031 (this aligns with the current operational timeline for projects funded under the hydrogen hub grants). Hydrogen is to be low-carbon renewable hydrogen produced through steam methane reformation of biomethane, electrolysis and biomass gasification. **TTP requests that CI scores be the driver for LCFS fuels recognizing that a blended fossil natural gas and renewable natural gas producing a lower CI score for hydrogen is a necessary path to hydrogen that will likely be needed beyond the January 1, 2031 date.**
- 066.3 **Page 5, Section 95484** – Increases the near-term average carbon intensity benchmarks’ stringency to a 9% CI reduction in 2025 from the 5% year-to-year increase included in the initial amendments’ proposal (will help bring the deficits and credits back into balance). The compliance targets between 2025 and 2030 are adjusted in the 15-day modifications package to smooth the curve between the more ambitious 2025 compliance target and the originally proposed 30% reduction in 2030 that will be maintained. **TTP commends the 9% CI reduction and encourages CARB to move to a 35% reduction in 2035.**
- 066.4
- 066.5 **Page 10, Section 95488.3** – Staff proposes to specify a process by which the Executive Officer may correct the Tier 1 CI Calculators to align more closely with the CA GREET 4.0 model and facilitate modeling consistency and efficiency. **TTP believes this would be appropriate if the alignment mirrors the national GREET model. Specific CA parameters make sense if they are calculated using the methods of the national GREET model.**
- 066.6 **Page 12, Section 95488.8** – Modifications to deliverability requirements for book-and-claim accounting for biomethane where a gas pipeline system map identifying interstate pipelines and their majority directional flow based on specified flow data by July 1, 2026. LCFS pathways for bio-CNG, bio-LNG and bio L-CNG combustion in vehicles would have to show physical flow to CA after December 31, 2037. **TTP requests that the pipeline map be approved as of January 1, 2026 to extend the deliverability time for NGVs.**
- 066.7 **Page 12, Section 95488.9** – Staff proposes to reduce the total number of crediting periods for avoided methane emissions crediting periods to two, rather than three, to align more closely with the end dates for avoided methane pathways that break ground after December 31, 2029. **TTP is concerned that this reduction in crediting periods will adversely affect the number of avoided methane projects that will be eligible and asks that there be no change.**
- 066.8 **Page 13, Section 95488.10** – Staff proposes to expand the credit true up to include periods using temporary pathway CIs after annual verification, enabling the eventual recovery of credits based on verified operational data. **TTP agrees with this true up and appreciates the ability to recover credits. However, we oppose the process that would impose a four-to-one CI penalty mechanism for CI changes on a project as being unnecessary since there already is a path for correction through the Annual Fuel Pathway Reporting process.**

The Transport Project thanks CARB for their work and requests consideration for our comments and requests made with regard to the proposed LCFS modifications. We strongly believe that multiple fuels and technologies will be needed to reduce emissions, and that the “best fit for the purpose” should be the guiding principle. The key is to find proven products that are available, that effectively and affordably lower emissions, have existing infrastructure for fueling/charging and fit the current business model.

Please contact me with any questions.

Sincerely,

A handwritten signature in dark ink, appearing to read "Sherrie Merrow". The signature is fluid and cursive, with the first name "Sherrie" and last name "Merrow" clearly distinguishable.

Re: Comments regarding the 15-day public notice for the proposed amendments to California's Low Carbon Fuel Standard

Dear Chair Randolph,

Thank you for the opportunity to provide comments on the 15-day public notice for the proposed amendments to California's Low Carbon Fuel Standard. Environmental Defense Fund (EDF) appreciates the work CARB staff has dedicated to amending the Low Carbon Fuel Standard. EDF looks forward to continuing to engage in this rulemaking and supporting the successful decarbonization of California's transportation sector.

As we have stated in previous comments, updating LCFS to increase the program's ambition and efficacy will be integral to ensuring California can deliver the outcomes and emissions reductions envisioned in the final Climate Change Scoping Plan, as well as achieve carbon neutrality by 2045.

We are pleased to see amendments that strengthen the CI reduction benchmarks both pre- and post-2030. EDF hopes that this increased rigor alongside other amendments will sustain the LCFS's role in promoting the use of lower carbon alternatives, thus bringing substantial health, economic, and environmental benefits. To that end, we offer the following comments regarding three aspects of the proposed LCFS amendments: 1) crediting for manure biogas, 2) crediting for medium- and heavy-duty vehicle charging, and 3) sustainable decarbonization of the aviation sector.

1. Crediting for Manure Biogas

067.1 Agriculture, particularly the dairy industry, is a major source of California's methane emissions. Almost 25% of California's total methane emissions are estimated to come from dairy manure. Addressing dairy manure methane emissions is a key action needed to meet California's climate goals. We applaud the state for establishing a specific methane reduction for the dairy and

livestock sectors in SB 1383 (Lara, 2016). California dairy farmers, as price takers, have little market power to pass costs associated with methane reduction solutions on to the consumer, we therefore also recognize the significant role that programs such as the LCFS continue to play in incentivizing and supporting reductions in livestock methane sources.

We appreciate CARB's stance that capturing methane from landfills, dairies, and wastewater is critical to achieving climate targets, and we are aligned with CARB's preference for biomethane to be used to produce low-carbon intensity hydrogen and electricity. We agree that attention is needed to ensure methane capture projects are not abandoned as LCFS transitions away from combustion vehicles towards hard-to-decarbonize sectors.¹

Manure biogas systems, when operated and installed in a responsibly maintained farm system, are a proven technology that can address existing sources of agriculture methane (from dairy manure storage systems) while replacing fossil fuel-derived methane. Given the considerable number of liquid manure systems that exist in California (and US) dairies, continuing to include manure biogas systems—as part of an environmentally comprehensive farm nutrient management system—in the LCFS is a powerful tool to drive agriculture methane reductions from existing sources. Continued eligibility is important to meet California's climate goals and drive further agriculture methane reductions across the US.

Today, the LCFS is the most impactful market-based tool to incentivize livestock farmers to adopt methane capture technologies. However, as with any program, it is not perfect. We cannot focus on solving methane, a global climate pollutant, without also ensuring meaningful improvement in the local environment and community.

Local air quality impacts that result either directly or indirectly from anaerobic digestion must be addressed.

One of the most significant local air pollutants of concern surrounding biogas systems is ammonia. Approximately 80% of ammonia emissions in the United States, encompassing emissions from both natural sources and human activities, are from agricultural sources. Notably, around 60% of these national emissions stem from livestock manure.² Ammonia is a health concern, as it has the potential to form fine particulate matter (PM_{2.5}), which can lead to respiratory and pulmonary issues in nearby communities.³ Ammonia emissions also present an environmental risk contributing to soil acidification and/or eutrophication in downwind ecosystems.⁴

¹ <https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2024/lcfs2024/isor.pdf>

² <https://www.epa.gov/air-emissions-inventories/2017-national-emissions-inventory-nei-data#doc>

³ <https://pubmed.ncbi.nlm.nih.gov/20458016/>

⁴ <https://www.sciencedirect.com/science/article/pii/S0301479722018588?via%3Dihub>

During anaerobic treatment or storage, manure organics decompose in an oxygen-free environment and produce methane, ammonia, and other gases. In open-system manure storage or treatment lagoons, as the manure undergoes anaerobic decomposition, most of these compounds are lost to the atmosphere. If the anaerobic decomposition takes place in an enclosed environment (such as a covered lagoon or anaerobic digester), the methane degases from the liquid phase and is captured under the cover where it can be collected and flared or used as a fuel. However, the ammonia stays in the solution and hence the dissolved ammonia becomes concentrated inside the anaerobic digester, particularly relative to that remaining dissolved in an open lagoon.

Once the digestate from the anaerobic digester or covered lagoon is discharged from beneath the cover into an open lagoon or storage tank, the ammonia is lost to the atmosphere in the same quantity or perhaps somewhat higher quantities, relative to that lost in an open lagoon, presenting a serious health risk to downwind communities.

We strongly recommend that any LCFS credit generated from biogas created from manure in covered lagoons or anaerobic digesters for hydrogen production should be predicated upon the management of the digestate to reduce ammonia losses. Specifically, in Section 95488.9(f)(1). *Special Circumstances for Fuel Pathway Applications: Carbon Intensities that Reflect Avoided Methane Emissions from Dairy and Swine Manure or Organic Waste Diverted from Landfill Disposal*, we recommend adding an additional requirement that the digestate from the digester from which the biomethane is captured must be treated to control ammonia emissions by using a cover or other mechanism to substantially reduce ammonia emissions.

Keeping the digestate in an enclosed system would greatly reduce the loss of ammonia from the digestate as well as allow for the capture of the residual methane in the digestate. The residual methane could be added to the digester biogas and used as fuel. An impermeable cover on the digestate reduces ammonia losses by 55-100% and residual methane emissions by 90%^{Error!} **Bookmark not defined.** while a permeable cover is estimated to reduce ammonia by 40-80%.⁵

Farm systems can have a negative impact on local communities, specifically around air pollutants, odors, and other downwind ecosystem and water concerns. Producers of biomethane from digesters should have a robust system in place to participate in LCFS to ensure the digester and its nutrients are managed properly. It is critical that crediting be contingent upon meeting specific standards that further reduce environmental and community impacts.

2. Crediting for Medium- and Heavy-Duty Vehicle Charging

Medium- and heavy-duty vehicles are responsible for a disproportionate amount of greenhouse gas (GHG) emissions and local pollution relative to the size of their population. In California,

⁵ <https://extension.colostate.edu/topic-areas/agriculture/best-management-practices-for-reducing-ammonia-emissions-lagoon-covers>

despite the fact that trucks are just seven percent of all vehicles in the state, they emit nearly 33% percent of particulate matter, 25% percent of nitrogen oxides (NOx), and nearly 9% percent of greenhouse gas emissions⁶ from the transportation sector; electrifying these vehicles will therefore produce outsized climate and local air pollution benefits. This is particularly important in the state's disadvantaged communities, because while the health impacts, which can negatively affect "every organ in the body,"⁷ are experienced to some extent all across the state, "low-income and communities of color...are often disproportionately affected by emissions from freight movement due to their proximity to transportation infrastructure,"⁸ such as ports, railyards, and freight corridors. Because of this disproportionate impact, there is an urgent need to electrify medium- and heavy-duty vehicles in these neighborhoods.

067.3

CARB should remove the minimum nameplate power rating requirement for the MHD FCI program.

While EDF appreciates CARB lowering the FSE minimum nameplate power rating to 50kW, we still recommend removing the minimum nameplate power rating entirely. As noted in our previous comments, while some electric trucks and buses will rely on direct current fast chargers (DCFCs) with higher nameplate capacities, many will not require the same level of charging. This is particularly true for fleets operating out of and charging at private depots which may have shorter duty cycles and can spread their charging overnight and/or several daytime blocks with lower-power DCFC or level-2 charging. Removing the nameplate requirement would allow these fleets to optimize their charging based on their own operational needs, resulting in grid-beneficial charging behavior, while still remaining eligible for the program. Consistent with this recommendation, CARB should also remove or modify the limitation that no more than ten chargers per applicant per site would be eligible for credits. The proposed 10 MW cap per customer per site is a sufficient constraint on individual customers accumulating credits while retaining the flexibility for applicants to deploy chargers in number and capacity consistent with their needs. Otherwise, applicants would potentially be incentivized to oversize chargers' nameplate capacity to maximize credit eligibility.

3. Sustainable Decarbonization of the Aviation Sector

For almost a decade, EDF has been working to reduce harmful pollution from aviation to mitigate climate change and deliver public health benefits utilizing alternative fuels. This includes engagement in climate policy at the International Civil Aviation Organization (ICAO), leading and participating in expert working groups developing ICAO's Sustainability Framework for Sustainable Aviation Fuel (SAF) – an effort that builds heavily on California's Low Carbon Fuel Standard (LCFS). We were also deeply involved in the inclusion of SAF tax credits in the federal Inflation Reduction Act (IRA).

⁶ <https://ww2.arb.ca.gov/ghg-inventory-graphs>

⁷ <https://www.ucsusa.org/resources/cars-trucks-buses-and-air-pollution#toc-effects>

⁸ https://ww2.arb.ca.gov/sites/default/files/2021-09/Proposed_2020_Mobile_Source_Strategy.pdf

The Low Carbon Fuel Standard program plays a significant role in California's decarbonization efforts in the aviation sector and any proposed reforms warrant thorough consideration. EDF believes that expanding the scope of LCFS to include aviation fuels beyond the existing voluntary opt-ins for alternative jet fuels⁹ is a necessary step towards achieving carbon neutrality in California by 2045 and will likewise support collective climate ambition. The structured deployment of sustainable aviation fuels (SAF) in California is crucial for the civil aviation sector to reach the International Civil Aviation Organization (ICAO)'s global goal of net-zero climate impact by 2050.

067.4 *CARB should consider the inclusion of all fossil jet fuel in California during the next regulatory process.*

EDF recommends that in the next regulatory process, CARB carefully consider the inclusion of all fossil jet fuel uplifted in California. Considering the full scope of aviation fuel ensures the greatest degree of climate benefits and that the aviation sector shares responsibility for a portion of the cost of deploying SAF uplifted in California. In the meantime, the State Strategy for the State Implementation Plan represents a unique opportunity for CARB to take a leadership role in protecting communities adversely affected by aviation's toxic emissions.

067.5 *CARB must protect workers' and airport-adjacent communities' health by considering action under the State Strategy for the State Implementation Plan.*

Jet fuel-related emissions from landing and take-off operations disproportionately affect local communities, as well as workers within the airport envelope. Communities living in proximity to airports are exposed to elevated levels of ultrafine particles (UFP) and are at risk of adverse health effects, a critical issue upon which CARB needs to act without further delay.

While SAF blends uplifted in California have the potential to reduce harmful aviation emissions from take-off operations by reducing aromatic content, such an outcome will not happen unless additional regulations are enforced. Furthermore, the gradual scale-up of SAF means that a fuel swap will help only marginally in the near term - if at all - which is insufficient to protect overburdened communities already suffering decades' worth of accumulated adverse health effects.

To deliver tangible near-term public health benefits, CARB should expeditiously consider action under the State Strategy for the State Implementation Plan, with the goal of regulating jet fuel composition. Jet fuel aromatic content could be reduced with existing refining infrastructure in California while tapping on IRA's generous clean hydrogen subsidies to cushion price impacts

⁹ Important to note, 'alternative jet fuels' denotes a broader category than does 'SAF.' Per definitions established at the federal and international levels, 'SAF' refers solely to fuels produced using renewable energy sources, wastes and residues and meet sustainability criteria.

and GHG emissions penalties. This is low-hanging fruit measure that could slash PM2.5 emissions without adversely affecting safety, i.e., in a manner that would be fully compatible with existing federal airworthiness certifications.

Thank you for your consideration of these comments. EDF looks forward to continuing to work with CARB to update the LCFS. If you have questions or would like to discuss any of these recommendations, please contact Katelyn Roedner Sutter at kroedner@edf.org.

Sincerely,

Subject: Please further strengthen the Low Carbon Fuel Standard --
Notice of Public Availability of Modified Text and Availability of
Additional Documents and/or Information for the Proposed Low Carbon
Fuel Standard Amendments

To Governor Gavin Newsom, CARB Chair Liane M. Randolph, and CARB
Board Members:

I am deeply concerned about the current state of California's Low Carbon Fuel Standard (LCFS), the program that's supposed to incentivize transition to "low-carbon" transportation, and, therefore, am greatly appreciate that the California Air Resources Board has released a proposed update to the LCFS. Disappointingly, the revision doesn't go far enough. Despite persistent opposition from the environmental justice community, it continues those parts of the program that provide financial support for harmful practices, such as biofuel produced from virgin soy and canola oil, and factory farm production of "biomethane." I implore you to take immediate action to address the environmental injustices embedded in the program.

Originally intended as a tool to combat climate pollution in the transportation sector, the LCFS has been manipulated by powerful

068.1

industries, particularly Big Ag and Big Oil. It has become the nation's largest and most lucrative pollution trading scheme for factory farm biogas, perpetuating harmful practices rather than serving its environmental objectives.

068.2

The proposal to remove credits for hydrogen produced from fossil fuels is a positive step. But delaying implementation of this measure until 2030 means production of hydrogen from fossil fuels will continue to receive financial rewards for another five-plus years, thus incentivizing the harm we should be preventing.

068.1 cont

Biofuels produced from virgin soy or canola oil have major negative consequences, including deforestation, and incentivizing industrial agriculture that generates large amounts of greenhouse gas and other pollution, and drives up food prices. The proposed revision acknowledges such problems, but continues to provide credits for the production of biofuels that include up to 20 percent from these destructive sources. And even this weak restraint will not take effect until 2028. Environmental justice advocates have repeatedly called instead for caps on vegetable-oil based biofuels.

068.3

The proposed draft continues to provide credits for industrial dairy "biogas," a false solution that has infected California's climate policies. This financial support continues to incentivize the expansion of large-scale factory dairy farms, causing serious harm to the health of surrounding communities, increasing the greenhouse gases and pollution generated by the production of feed for cows confined to barns; concentrated methane emitted by pools of waste; the inevitable leakage of methane during storage and transportation; and greenhouse gas emissions produced by combustion of the product. Incentivizing the buildout of dirty factory farms

068.4

not only enables pollution but disproportionately harms low-income communities and communities of color. Factory farms, predominantly situated in these marginalized areas, inflict severe damage on air, water, public health, rural economies, and overall quality of life. Collecting methane from factory farm cesspits does nothing to alleviate the massive harm mega-dairies and other large factory farms do to these communities. I strongly urge CARB to phase out support for biomethane as rapidly as possible.

Unlike previous versions of the LCFS, the new proposal does not require airlines to take any responsibility for the combustion of fossil jet fuel, even for intrastate travel. This is a step backward, excluding a major source of greenhouse gases and pollution from fossil fuel combustion.

Instead of doubling down on dirty factory farm gas, I demand a future free from the clutches of Big Oil and Big Ag and to prioritize Californians over corporate profits.

Thank you for your consideration of my comments. Please do NOT add my name to your mailing list. I will learn about future developments on this issue from other sources.

Sincerely,
Christopher Lish
San Rafael, CA

RE: Electrify America comments on Proposed 15-Day Changes to the Proposed Low Carbon Fuel Standard (LCFS) Amendments

Dear Ms. Sahota:

Electrify America is grateful for the opportunity to provide feedback on the newly proposed 15-Day Changes to proposed amendments to the LCFS regulations. Electrify America is the nation's largest open network of DC fast chargers for electric vehicles (EVs), with over 4,250 fast chargers across more than 950 locations in North America, and over 1,100 chargers across more than 250 locations open to the public in California.

We strongly support the LCFS, which is critical to advancing development of electric vehicle (EV) charging infrastructure and the state's transportation electrification goals, and we appreciate the efforts of CARB staff to engage stakeholders and strengthen the program to ensure its ongoing durability. While we believe a stronger 2030 carbon intensity target and more responsive auto acceleration mechanism (AAM) are necessary to achieve the state's 2030 targets identified in the 2020 Scoping Plan,¹ we strongly support a step-down in stringency of at least 9% and the inclusion of the AAM as a new feature of the program. We also support the proposed amendments related to fast charging infrastructure (FCI) crediting. We request minor additional changes to the proposed verification requirements for EV charging to better align practical implementation considerations.

Proposed step down of at least 9% is crucial to address credit oversupply

We appreciate CARB's willingness to re-evaluate the step-down percentage in the 15-Day Changes. While we support the ICF analysis suggesting that a step-down of 10.5-11.5% is needed to achieve a targeted credit bank of 2-3x quarterly deficits,² a 9% step down will nonetheless narrow the accumulated credit bank and support ongoing investment in EV charging and other low carbon fuels under the program.

¹ See Electrify America's previous comments on LCFS amendments, for example here: <https://www.arb.ca.gov/lists/com-attach/6868-lcfs2024-UTRUPIA0V2dXJQI7.pdf>

² <https://www.arb.ca.gov/lists/com-attach/7078-lcfs2024-VDVcNFlyVGsLdFQu.pdf>

069.2 cont **The auto acceleration mechanism should be more responsive to market conditions**

The auto acceleration mechanism (AAM) is an important new element of the LCFS program that complements existing cost containment features and will provide greater ongoing market certainty to support ongoing investment in clean fuels and ZEV infrastructure for California. We strongly support its inclusion in the Proposed Amendments.

However, in its current form, the first year the ratchet mechanism could be implemented would not be until 2028. This would greatly limit its potential to stabilize near-term market conditions and support achievement of carbon intensity outcomes in 2030 that will likely be necessary to achieve Scoping Plan objectives.³ The AAM is conservatively designed to only trigger when market conditions warrant and there is both a significant, and growing, credit bank. Accordingly, the AAM should be allowed to take effect based on end-2025 market conditions, with a May 2026 mechanism announcement to take effect with the 2027 compliance year. This would allow issues of credit oversupply to be corrected as soon as necessary, while by design, the AAM would not take effect unless it is needed.

Electrify America believes a more responsive AAM will help maximize the potential of this new element of the program. We recommend applying the AAM one year earlier, with accelerated targets taking effect if needed in 2027, which would allow the mechanism to adjust program stringency more proactively in response to near-term market developments, without creating undue risk to the credit bank and the LCFS program as a whole. Especially if the step-down remains below 10.5-11.5%, which ICF has identified as necessary to return the credit bank to levels below those in the AAM trigger, a more responsive AAM will help ensure ongoing health of the program. We also encourage changes to allow the AAM to apply in consecutive years, should it be appropriate given the dual trigger.

069.5 **The verification process should reflect the distinct differences between EV charging stations and other fuel pathways**

Electrify America understands CARB's need to validate and verify that fuel pathway holders are operating in line with LCFS regulations. We support efforts to ensure accurate and transparent data sharing and have implemented robust data verification procedures internally to ensure accuracy of reported data. However, we have concern that the language in §95501(b)(3) pertaining to site visits has not been sufficiently updated to address the EV charging use case.

The regulation's stated goals of verification site visits—such as interviewing personnel and examining data management practices—are sensible in the context of biofuel production facilities. However, unlike biofuel plants or refineries, EV charging stations are typically unstaffed facilities where the actual data validation and accounting practices do not occur. Therefore, verifiers would gain little value from on-site visits, and would not be able to accomplish many of the regulation's verification requirements, as there would be no personnel

³ <https://www.arb.ca.gov/lists/com-attach/132-lcfs-wkshp-nov22-ws-VDFWMQNdv2cEbVQ5.pdf>

on site to interview nor data management systems to inspect. Additionally, CARB should strive to ensure that any on-site verification procedures do not duplicate or overlap with measurement requirements that already exist under California Department of Food and Agriculture's Division of Measurement Standards regulations.⁴

Electrify America recommends CARB establish a separate verification process that minimizes or eliminates the site visit requirement for electric vehicle service providers (EVSPs). A verification approach focused on data checks and desktop review would better accommodate the operational realities of the charging station model, while still effectively verifying the fuel dispensed at the charger level. Verification processes may include phone or video interviews with relevant EVSP staff, as they would not be present at individual charging stations. This modified EVSP verification approach would uphold the integrity of the LCFS program and prove more cost-effective for CARB and program participants.

Our continued support of the LCFS program and the transparent stakeholder process

Electrify America appreciates the opportunity to provide comments on CARB's latest proposal for the Low Carbon Fuel Standard (LCFS) program. We believe the proposed changes represent a meaningful step towards cleaning up California's transportation sector and supporting the EV transition. However, we do hope CARB will consider minor additional changes, including advancing the AAM trigger date by a year and revisiting site visit requirements around EV charging stations.

Electrify America remains committed to partnering with CARB through the LCFS amendment process to advance California's clean transportation and climate priorities. We welcome the chance to discuss our feedback and recommendations further. Please don't hesitate to reach out if you have any questions.

Sincerely,

/s/

Re: WRI comments on the proposed 15-day changes to the proposed amendments to the LCFS

Dear Liane,

Thank you for the opportunity to comment on the proposed 15-day changes to the proposed amendments to the LCFS regulation. This letter focuses on the issue of crop-based biofuels and also provides feedback on proposed amendments related to aviation fuel.

- 070.1 WRI greatly appreciates the additional environmental safeguards included in the 15-day changes, which have the potential to address the risk that expanded reliance on crop-based biofuels would drive deforestation and a net increase in greenhouse gas emissions. To realize this potential, however, it is
- 070.2 essential to expand the proposed limit on LCFS credits generated by biomass-based diesel produced from soybean oil and canola oil to cover all virgin vegetable oils.

A 20 percent limit on LCFS credits generated by biomass-based diesel made from virgin vegetable oils could be an appropriate and effective mechanism to fulfill CARB's commitment that biofuels production must not come at the expense of deforestation and food production, particularly if other clean fuel programs adopt similar limits. As CARB staff noted at the April 10th workshop, 6 million tons of US soybean production is already going to non-food uses, particularly biofuels—A 50% increase since 2020. CARB staff also noted that increased demand for biofuels has contributed to increasing the price of vegetable oils.

Basic economic logic tells us that increased vegetable oil prices result in increased production, and empirical studies show that at least some of that increased production comes from deforestation. Globally, net cropland area expansion accelerated from 5 million hectares per year during 2004-2007 to 9 million hectares per year during 2016-2019 according to the best available [satellite-based estimates](#). Regardless of the specific source of feedstocks for crop-based biofuels, this market-driven land use change, including deforestation, and the associated LUC emissions are the reason why safeguards are needed, such as the proposed 20 percent limit on LCFS credits generated soybean oil and canola oil. The price of vegetable oils from all crops are highly correlated, however, which implies that there is no basis for limiting the cap to just soybean and canola oil. CARB should apply the 20% cap to all virgin vegetable oils. The cap should also apply to aviation fuel, which is functionally equivalent to biomass-based diesel with respect to the risk of driving land use change due to demand for crop-based fuel.

Any use of virgin vegetable oil in excess of the 20% limit should be assigned the carbon intensity of the fossil baseline, not the carbon intensity (CI) benchmark. Assigning additional fuels made from virgin vegetable oil a CI equal to the benchmark would mean continuing to incentivize them relative to fossil fuels, which conflicts with CARB's commitment that biofuels production must not come at the expense of deforestation and food production.

- 070.3 Relatedly, it will be essential for CARB to be vigilant in preventing fraud in the waste oil market. The enhanced chain-of-custody tracking for biomass feedstocks proposed in the 15-day changes will be an important mechanism to ensure that virgin vegetable oil is not contaminated with used oil in order to qualify for the lower carbon intensity appropriately assigned to waste oils.
- 070.4 As noted in previous comments, the biofuel ILUC values generated by the GTAP model have no reasonable scientific basis and are systematically biased downward as demonstrated clearly by the report [submitted to the 45 day LCFS docket](#) by Professor Berry. WRI therefore welcomes the 15-day proposal to give the Executive Officer additional authority to assign more conservative LUC values to biofuels based on the best available empirical evidence. We urge CARB to use this authority to reevaluate the LUC values of all crop-based biofuels using empirically validated methods.
- 070.5 While WRI appreciates and supports most of the proposed 15-day changes, we are disappointed that CARB is proposing to continue exempting all aviation fuel from the LCFS. The rationale offered for this change does not withstand scrutiny. As a market-based program, no deficit generator in the program is required to directly substitute lower carbon fuels for fossil fuels. This in no way eliminates the benefit of including aviation fuel in the program, which would establish an incentive to develop genuinely lower carbon aviation fuels (such as those made from clean hydrogen and captured CO₂) and strengthen the program overall. As one of the fastest growing emission sources in California and globally, eliminating the LCFS exemption for aviation fuels would be an important signal for CARB to send, both for emissions within the state and as a model for other jurisdictions.

Sincerely,
Dan Lashof, U.S. Director, World Resources Institute

August 27, 2024

Submitted electronically: <https://ww2.arb.ca.gov/lispub/comm/bclist.php>
The Honorable Liane Randolph, Chair
California Air Resources Board
1001 I Street
Sacramento, California 95814

Dear Chair Randolph:

Electrochaea Corporation (Electrochaea) appreciates the opportunity to submit a public comment on the proposed amendments to the Low Carbon Fuel Standard 15-Day Changes recently posted by the California Air Resources Board. Electrochaea's comments are in support of the increase in stringency of the annual carbon intensity benchmarks.

Electrochaea is a technology provider for a process that produces low CI synthetic methane using CO₂ and hydrogen. Our process uses a microorganism, an archaea, to synthesize methane at grid scale which can be used as RNG/biomethane to replace fossil fuels in transportation and beyond.

072.1 Electrochaea supports the proposed modification to Section 95484 of the annual carbon intensity (CI) benchmarks to further advance the States attainment of a net-zero carbon economy. The proposed 9% reduction in the annual CI benchmark for fuels, used as a substitute for fossil fuels, from the previously proposed 5% reduction, is a welcome modification. The increased stringency should have a positive outcome on the further adoption of low CI fuels in the California transportation market.

072.2 Electrochaea also supports the Automatic Acceleration Mechanism as described in Section 95484. This mechanism, designed to bring into balance the credit bank, credits, and deficits in the LCFS program, can reduce the oversupply of credits and provide a market signal to sustain the success and importance of the LCFS program.

Electrochaea supports science-based approaches and technologies that can reduce the use of fossil fuels and reduce GHG emissions. Use of low CI synthetic methane is an important component in the fight against climate change. Thank you for your consideration of our public comment.

Sincerely,

/s/ Chris Wilson

Re: Comments on August 12, 2024 Proposed 15-Day Changes to Proposed Regulation Order

Ms. Rajinder Sahota
California Air Resources Board
1001 I Street
Sacramento, CA 95814

Ms. Sahota:

We reviewed with interest and concern the Proposed 15-Day Changes to the Low Carbon Fuel Standard (LCFS) proposed amendments. ADM and the broader biofuels sector has been central to the LCFS as a landmark policy in emissions reduction. Our company and industry are integral to the greenhouse gas (GHG) reduction California has seen under the program, and in order to continue this positive trajectory, all manner of biofuels must contribute, including those produced from crop-based feedstocks. Deployment of these fuels is essential to decarbonizing the transportation sector in California, North America, and the world. In fact, according to the International Energy Agency, biofuels must triple globally by 2030 in order to remain on the organization's net zero pathway.¹

CARB's mission is "to promote and protect public health, welfare, and ecological resources through effective reduction of air pollutants while recognizing and considering effects on the economy."² And one of its foremost values, as identified in the agency's most recent Roadmap is, "Science-based: We develop and implement research, policies, and technologies on evidence-based foundations to create positive change."³

- 073.1 On both counts, this latest proposal falls short of both objectives. Rather than trusting CARB's own carbon intensity scoring model and allowing the market to work as intended, it arbitrarily establishes a cap on biofuels derived from oilseeds. This neither considers "effects on the economy" nor relies on "evidence-based foundations." In reality, the proposed 9% stepdown
- 073.2

² <https://ww2.arb.ca.gov/about>

³ https://ww2.arb.ca.gov/sites/default/files/2021-01/CARB_vision_roadmap_0121.pdf

in GHG emissions and increase in stringency will promote low carbon intensity feedstock fuels immediately, making a crop-based biofuel cap wholly unnecessary. Importantly, this would allow California to maintain optionality and better navigate potential reactionary fuel price impacts on drivers.

Further, this latest proposal – which was released without the benefit of stakeholder engagement, despite numerous public workshops focused on every other proposed amendment to the program – would disincentivize farmers from investing in more sustainable practices at a time that they are adopting them at a rapid pace. Squelching agricultural innovation at this time sends the wrong signal to the largest current and future source of significant carbon intensity reductions for California’s transportation fuel market. ADM recently announced the establishment of Gradable, a joint venture with Farmers Business Network to expand a technology platform that enables more farmers and buyers to derive value from grain produced using sustainable practices. 20,000 farmers across more than 12 million acres already are leveraging this program. It has scored for carbon intensity reductions more than 200 million bushels of corn and soybeans, analyzed 48 million acre-years of agronomic events, and facilitates over \$30 million in financial incentives for sustainable practices each year. We cannot afford to squander this progress.

Our company does not offer these observations lightly. ADM made substantial contributions to low-carbon energy policy long before passage of California’s AB 32. Since our founding, we have transformed crops into products that serve the energy and food security needs of a growing world. Specific to biofuels, we first produced ethanol in 1978 and added biodiesel production in 2006. Each year in the U.S., we manufacture more than 1.4 billion gallons of corn-based ethanol and produce or market more than 400 million gallons of biodiesel. This production directly supports CARB’s aim to reduce GHG emissions, displacing nearly two billion gallons of fossil fuels each year. These contributions across the biofuels sector are the most significant reason for the success of the LCFS over the years.

Following are specific comments regarding the most recent proposal’s more ambitious target reduction for 2025; soy and canola feedstock cap; and updated sustainability requirements. **We appreciate your careful consideration of our comments and respectfully request an additional workshop before the November Board meeting to receive answers to our and sector questions on the proposal.**

073.2 cont ***Nine percent increase in stringency for 2025 in benchmark schedule***

ADM has consistently supported and contributed to GHG reduction targets under the LCFS. As noted, our record of biofuels production and deployment of these fuels to the California market have been critical to the success of the program. Signaling our commitment, we joined other industry stakeholders last year in urging CARB to finalize its updated GHG targets in 2024 and ensure their applicability this compliance year. The latest proposal to increase the 2025 stepdown immediately by 9% is an admirable action to further displace fossil fuels and will likely reduce the bank of excess credits in the system significantly, particularly if the increased stringency applies to the full calendar in 2025. This increased stringency would promote less carbon intense fuels naturally and render the 20% oilseed-based feedstock cap unnecessary.

073.1 cont *Virgin soy or canola oil cap*

ADM, our biofuels sector partners, and the broader agricultural community have engaged CARB staff in good faith during the consideration of these amendments over the past eight months and since the outset of this process through all of 2023, seeking to find a reliable path forward on sustainability practices. Our dialogue has yielded positive policy concepts to address concerns on deforestation and environmental justice; supply California with reliable, verified fuels; and support U.S. farmers who supply the feedstock for cleaner fuels and the consumers who realize lower prices thanks to their availability.

We were therefore disappointed by the recent proposal to establish in 2028 a 20% eligibility cap on a company's biomass-based diesel produced from virgin soy or canola oil. The proposal was dropped in the 15-day package with no notice or supporting stakeholder engagement through the workshop process. Throughout the workshops CARB staff signaled its perspective that arbitrary feedstock caps would undermine the effectiveness of the program while noting that additional guardrails (i.e., the sustainability provisions) needed to be integrated into the program.

While the impact on fuels production and flows may not be immediate, the arbitrary cap sends a chilling message to the biofuels sector and our farmer partners who have contributed dutifully to the program's GHG goals since its inception. The most consequential impacts:

- 073.3
- Lack of uniform traceability across feedstocks: With the more stringent 9% stepdown, it is essential that additional fuels flowing into the California market be fully and transparently verified as to their origin, composition, and supply chain. If oils from crop-based feedstocks must be fully traceable and meet sustainability provisions, so too should oils derived from waste-based feedstocks. As proposed, this is not the case. The absence of traceability for waste oils could be an incentive for feedstock providers to blend them with virgin oils, with feedstocks ranging from oilseeds to palm and more.

- 073.4
- Undermining of Climate Smart Agriculture and farmers: Regenerative and Climate Smart agriculture is critical to driving new value for feedstocks and reducing carbon intensity through more sustainable farm practices. ADM's regenerative agriculture program features direct financial support for farmers; easy processes and cutting-edge technologies to ensure low barriers to entry; and a broad range of support and guidance from third-party experts. That is what will allow us to enroll 5 million acres of farmland globally by 2025. Our program helps customers, including those in the fuels space, meet emissions commitments and requirements. Sustainability is a hallmark across the agricultural sector. You may be aware that the American Soybean Association is a founding partner of the Soy Sustainability Assurance Protocol (SSAP), which verifies and documents sustainable production on a national scale.

If oilseed feedstocks are limited in the California market, more farmers practicing regenerative agriculture will be left on the sidelines. Shutting them— and the clean fuels they help to provide — out will restrict supply and drive costs higher.

A significant enabler of our nation's path to energy security has been the agricultural sector. Even before – but especially since – the U.S. Renewable Fuel Standard (RFS), liquid biofuels have been an essential part of our domestic energy mix. Other programs to incentivize use of these lower-carbon fuels globally and here at home – including the LCFS – have followed suit. Such programs have had a parallel benefit to farmers, whose crops not only meet the world's food needs, but can also drive cleaner energy. Farmers have long shouldered the responsibility of feeding and fueling society, and limiting their involvement in the LCFS would be a clear sign that the California market is no longer open for their business.

Despite this artificial cap's impacts on liquid fuels for on-road transportation, we do recognize and support the fact that it would not apply to sustainable aviation fuel. This nascent market needs feedstock variety. Our sector is prepared to be a foundation of this new market, just as it has for on-road transportation emissions reductions. However, it should be recognized that refiners that produce SAF also produce significant volumes of renewable diesel as a matter of plant design and optimal efficiency. Thus, the proposal to cap virgin oil feedstocks may have the unintended consequence of constraining the production of SAF. Feedstock diversity across the transportation fuels system is essential, and the proposed cap should not be adopted.

Sustainability requirements

In our February 20, 2024 comments to the December 2023 proposed amendments, we and others in our sector provided very specific feedback on CARB's proposed sustainability criteria. The April workshop was so heavily attended that not all stakeholders were able to fully engage and receive clarity on how the sustainability requirements would be administered. This is another reason why an additional workshop before November is warranted.

The latest proposed changes to these criteria leave us with similar questions to those raised earlier this year, largely regarding the administration and predictability of these proposed new elements of the program. For example, we understand that beginning in 2026, fuel producers must collect and submit supply chain data including spatial data of farm boundaries where feedstocks are sourced; and maintain an attestation letter that assures that the feedstocks have not been sourced by lands that were converted after 2008.

To comply, a company would need to have attestations and spatial data for canola or soy that is harvested in 2025. Contracting with canola and soy growers will begin over the next two months. Therefore, we will be entering into contracts and making business decisions with no clear guidance on what will be required and how the requirements will be administered. To enable planning, participation and provide a degree of investment certainty, delaying implementation of these requirements to 2027 would ensure feedstock providers can make business decisions and enter into contracts with a full understanding of the requirements.

Likewise, we understand that beginning in 2028, fuel producers must obtain third party certification that, at a minimum, ensures feedstocks are not sourced on lands converted after 2008. Again, clarity on the administration of these requirements is important. As discussed with CARB staff and noted below, we believe there are existing standards that are consistent with the proposed sustainability provisions and, as such, there is no benefit in creating new

073.5

073.6

duplicative or inconsistent standards. We are prepared to work with staff on subsequent implementation guidance which will be critical for effective administration of the provisions.

As a reminder, under the RFS, sustainability criteria as proposed by CARB are met and in some cases exceeded. Specifically, under the RFS:

- Fuel feedstocks must not be sourced from agricultural land cleared or deforested after December 19, 2007.
- Environmental, social, and economic criteria are taken into account in developing annual fuel volumes under the program.
- Transparent public review of and comment on proposed annual volumes and changes to the rule are central to the continual development of the program. Proposed changes, public comment, and associated documents are posted on the U.S. EPA's website to review by stakeholders and the general public.
- Scientific experts within EPA and associated technical advisory panels provide regular input into changes to the program.
- A rigorous audit program via EPA, including high standards, training to ensure competency, and transparency to the public, is maintained.

On each of these and more points, the comprehensive RFS meets or exceeds sustainability certification criteria as proposed by CARB. Moreover, as we highlighted in our February comment letter, recognizing the RFS in this manner would avoid the burden of duplicative criteria and reporting, allowing the program to stand on firm, proven ground on sustainability while ensuring that biofuels producers and feedstock providers are held to account.

073.7

Finally, in our review of the latest proposed changes, there are no sustainability criteria applied to waste oils and foreign waste importers. For reasons explained earlier in this letter, ensuring the validity of these feedstocks is necessary to ensure the LCFS program operates with the integrity expected by all stakeholders. Please note that the European Union is establishing a Union Database to trace all feedstocks, including used cooking and waste oils, and biofuels to ensure integrity of the supply chain. The database is backed by the data and verification practices of the International Sustainability & Carbon Certification (ISCC) and should be a model and resource for CARB.

Conclusion

ADM has long been and continues to be a leader in biofuels production and an innovator in sustainable agricultural practices. The most recent proposal from CARB staff would reverse course on the progress our company, sector, and country are making on both. We appreciate your consideration of our comments and look forward to engaging with CARB staff at an additional workshop before the Board's November vote. Ultimately, we ask that CARB consider an additional set of 15-day amendments to remove the provision concerning the establishment of an arbitrary cap on certain feedstocks.

073.8

As always, we offer the opportunity to discuss our comments further at your convenience. We associate ourselves with comments submitted by Growth Energy, Clean Fuels Alliance America, National Oilseed Processors Association, American Soybean Association, and California Advanced Biofuels Association.

If you have any questions or need further clarification and detail, please contact me at greg.morris@adm.com.

Sincerely,

California Air Resources Board
1001 I Street, Sacramento
California 95814

Subject: LCFS 15-day Notice Comments

Dear Ms. Sahota,

FirstElement Fuel (FEF) is pleased to provide these comments on the proposed changes in the subject notice. While we are encouraged by some of the proposed language on the Hydrogen Refueling Infrastructure (HRI) provisions, we are still very concerned about the delayed timing of the regulation and the overall ambition of the program. Our overall comments are prioritized below.

Program Ambition

074.1 Although staff has outlined a steeper initial stepdown of 9% (compared to the original 5%), the size of the credit bank will likely remain at historically high levels until post-2027. This 3 year period of depressed value will exacerbate the financial hardship our industry has suffered and further limit our ability to aggressively build hydrogen refueling stations (HRS) as desired by the state. The delays in amending this regulation and bringing credit prices back to reasonable levels has significantly damaged our reputation with fuel cell vehicle drivers, the vehicle manufacturers and the policy makers in the legislature, and has crippled our ability to continue building stations due to lack of capital. We urge the staff to adopt a steeper stepdown followed by implementation of the AAM as soon as practicable.

Renewable Content

074.2 We applaud the vision of the staff for the aggressive renewable content (80% after 2030) proposed for hydrogen, but we are equally concerned about a level playing field with electricity and the grid. Furthermore, staff is eliminating fossil-based feedstock for hydrogen after 2030. These actions overly rely on production of renewable hydrogen through the ARCHES program, which will likely not come online until after 2030. We believe that hydrogen and the grid should maintain equitable renewable content and carbon intensity. So, we recommend that the renewable hydrogen content be made consistent with grid electricity.

HRI – Light and Medium Duty (LMD)

074.3 We thank the staff for adjusting the HRI program to incorporate MD with LD, which is how the US truck makers envision fueling of their vehicles¹. We agree with the deletion of the disadvantaged community geographic requirements but remain concerned regarding the low station capacity requirements at 2,000 kg/d with a 50% derate. Our latest generation LD stations are capable of 1,600 kg/d and garner 1,200 kg/d HRI credits. Under the staff proposal, we would need to build larger stations that would receive even less HRI credit than the current program for MD trucks. We would need to build stations 20% larger and receive 20% less credits.

Furthermore, staff is also proposing to limit credits by capping the cumulative credit generation to 1.5 times the capital expenditures (capex). The HRI capacity credit is intended to offset the station's ongoing operations and maintenance (O&M) costs and thereby reduce the cost to the drivers. Tying the cumulative HRI credits to capex ignores this intent. It reduces the ability of station providers to (a) provide ongoing O&M support while keeping hydrogen prices low and (b) continue building additional stations. We highly recommend that the 50% derate for public stations and the capex limit be removed.

We also believe that further constraining participants in the HRI program to 1% of total deficits will slow the growth of the network, especially since we have grants from the California Energy Commission for an additional 41 LD stations under GFO-19-602 and have made significant capital investments in leases, permitting and equipment for these stations. We did not intend to be the market leader in retail stations and hoped for competition to increase fuel availability, lower supply costs, and increase vehicles on the road. However, with Shell's departure from the LD station market, we do not want to be unintentionally disincentivized from building and deploying stations in the future. We ask that any stations previously awarded through competitive solicitations by the CEC be grandfathered into the existing HRI rubric at the 1,200 kg/d capacity cap.

HRI - Heavy-duty (HD)

074.4 We appreciate staff including a HD HRI mechanism and expanding the proximity to the FHWA corridors to 5 miles instead of 1 mile. However, many HD station locations will necessarily be near warehousing centers or truck parking that are further than 5 miles from an existing or proposed corridor. We recommend adding a case-by-case approval mechanism by the Executive Officer. This could also include the exception of funding by local air districts or other local and regional entities that considered location in a competitive bid as opposed to only state or federal grants. We recommend this minor addition:

1

https://uscar.org/publications/?q=medium%20duty%20hydrogen&catid=50&show_pagination=1&paged=1&limit=20

§ 95486.4. Generating and Calculating Credits for ZEV Fueling Infrastructure Pathways for Heavy-Duty Vehicles.

(1) (B) (3) Has received capital funding from a State, ~~or~~ Federal, or local competitive grant program for heavy-duty hydrogen refueling that includes location evaluation as criteria.

We also urge staff to reduce the discount (derate) of the station capacity as proposed by the California Hydrogen Coalition, California Hydrogen Business Council, and the Green Hydrogen Coalition in their May 10, 2024 letter. The original 50% discount rate was intended to prohibit over-credit generation while still incentivizing larger stations (6,000 kg/d maximum). Staff's proposal to increase the stepdown to 9% and 30% by 2030 will further reduce the credits allowed for HRI making the discount in effect even greater. We recommend either a lower discount rate of 25% instead of 50% OR allow increased station capacity of 8,000 kg/d to address this new stepdown and 2030 target.

We appreciate CARB staff's work on enabling zero-emissions transportation technologies, and our company was built to enable these same goals through infrastructure. Indeed, the LCFS HRI program is critical to our continued success. However, without the changes recommended herein, we are concerned about the sustainability of our business and the ability of the state to reach our common zero emissions, carbon intensity goals. We look forward to working with staff to implement these changes.

Respectfully,

Matt Miyasato, Ph.D.
Chief Public Policy & Programs Officer

RE: California Farm Bureau's Comments Relating to the Proposed Low Carbon Fuel Standard Amendments

Dear Chair Randolph,

We appreciate this opportunity to provide feedback on the proposed amendments to the Low Carbon Fuel Standard.

California Farm Bureau (CAFB) is an innovative, service-based organization dedicated to being the foremost advocate, protecting the future and quality of life for all California farmers and ranchers. CAFB protects California's diverse farming and ranching legacy and enables the whole agriculture community to thrive. With over 29,000 members, CAFB is California's largest agricultural association.

California family farmers are community members and are committed to the health and wellbeing of their neighbors. Unlike other economic sectors, the products California's farmers produce are used and needed by all Californians. We take great exception to much of the anti-farming, and anti-science rhetoric being offered up at the workshop by representatives of the AB 32 Environmental Justice Advisory Committee and some public comments which are clearly attacks on the agriculture community.

Section 95481

CAFB supports the need to protect our forests. As such, we support language that defines forest biomass waste. However, the language that CARB has inserted in Section 95481 critically leaves out many or even most wildfire mitigation and forest restoration projects in California. That is because wildfire mitigation, forest restoration, and fuel removal to address bark beetle or other

forest health issues generally includes some amount of merchantable residues. In addition, all forest biomass waste can be converted to wood pellets or biochar, which are "wood products," so the exclusion of biomass that can be converted into other wood products effectively excludes all forest biomass waste. Biochar is recognized and defined as an Auxiliary Soil and Plant Substance by the California Department of Food and Agriculture with benefits as a soil amendment. Biochar is primarily composed of carbon and can be used as a long-term carbon storage sink in soils. It contributes directly to carbon sequestration and efforts to mitigate climate change".

To ensure that LCFS eligible forest biomass waste is environmentally sustainable and protects forest health, CAFB recommends the following edits to the definition:

"Forest Biomass Waste" means residues that are 1) removed for wildfire mitigation, forest restoration projects, or the protection of public safety, or 2) small-diameter, non-merchantable residues, limited to forest understory vegetation, ladder fuels, limbs, branches, and logs that do not meet regional minimum marketable standards for processing into wood products."

These changes will also make the definition of forest biomass waste consistent with the requirements of Section 95488.8(g)(1)(A)(3) which references wildfire mitigation, the need for defensible space (which often requires clearcutting), forest restoration, and threats to public safety or infrastructure.

Section 95482

Rather than outright eliminate credit generation for hydrogen produced using fossil gas as a feedstock, CARB would be better suited to incentivize non-fossil gas hydrogen at a higher level. We

currently need all the hydrogen we can produce. Eliminating credits entirely from hydrogen from fossil gas does nothing to encourage and develop a hydrogen market.

Further, CAFB recommends that CARB not place a cap on crop-based fuels. We ought to be encouraging more native and homegrown fuel sources than limiting ourselves on a fuel source that we know is better and cleaner than diesel.

If CARB must place a cap on biofuels, we recommend the cap be based on science and available data and not just an arbitrary number.

CARB's own research shows a negative impact by placing a cap on crop-based fuels. By doing this, we continue to send the signal that LCFS is a bridge fuel, while removing diesel from the system.

Section 95488.9(g)

CAFB is very concerned that section 95488.9(g), which was originally written to ensure the sustainability of crop-based fuels, has been expanded to cover all waste biomass and the sustainability certification requirements. CAFB supports efforts to reduce deforestation, however the requirements in this section are entirely inappropriate for agricultural or forest residues where the feedstock is a waste product, and the fuels producer has no control over the crop growing practices. Applying the same standards to agricultural or forest residues as to purpose grown crops does not make sense and will effectively close the door to fuels that could be produced from agricultural and forest residues.

Section 95490(a)

CAFB supports the use of CCSU to drive down carbon intensities and

generate carbon negative emissions where possible. The proposed amendments, however, limit sequestration to geologic storage and limit the use of captured carbon to fuels production. These restrictions exclude the use of biochar, which can be a co-product of hydrogen, electricity or biofuels production from waste biomass.

Biochar can be used for carbon sequestration in soil or to reduce emissions from cows, livestock manure and compost. Biochar can also be used in the production of concrete, pavement, tires, ink and other products. And biochar can replace charcoal for water filtration and purification. These are all beneficial uses that either sequester carbon or displace fossil fuel and higher emitting alternatives. Excluding the use of biochar will harm the economics and viability of forest waste and agricultural waste to fuel projects and contradicts the recommendations in the 2022 Climate Change Scoping Plan to increase the use of bioenergy with CCS (BECCS).

CAFB urges CARB to revise the definition of CCS in section 95490(a) as follows:

(a)(1) Alternative fuel producers, petroleum refineries, and oil producers that capture CO₂ on-site, including at the location of the production of hydrogen used as an intermediate input, and geologically sequester CO₂ geologically or in the form of biochar, either on-site or off-site.

CAFB urges CARB to revise the definition of CCS on page 8 as follows:

"Carbon capture and sequestration (CCS) project" means either 1) a project that captures CO₂ by an eligible entity specified in

section 95490(a) of this sub article, transports the captured CO2 to an injection site, and injects and permanently sequesters the captured CO2 pursuant to the Carbon Capture and Sequestration Protocol and as specified by section 95490 of this sub article, or 2) a project that captures carbon in the form of biochar during the conversion of waste biomass to fuels and that biochar is used in a manner that sequesters the carbon.

These changes will allow for the use of biochar to sequester or use carbon that is captured during gasification or pyrolysis of waste biomass.

Sincerely,

Steven Fenaroli
Political Affairs Director, California Farm Bureau

Board Comments Home

August 27, 2024

The Honorable Liane M. Randolph, Chair

California Air Resources Board

P.O. Box 2815

Sacramento, California 95812

RE: California Farm Bureau's Comments Relating to the Proposed Low Carbon Fuel Standard Amendments

Dear Chair Randolph,

We appreciate this opportunity to provide feedback on the proposed amendments to the Low Carbon Fuel Standard.

California Farm Bureau (CAFB) is an innovative, service-based organization dedicated to being the foremost advocate, protecting the future and quality of life for all California farmers and ranchers. CAFB protects California's diverse farming and ranching legacy and enables the whole agriculture community to thrive. With over 29,000 members, CAFB is California's largest agricultural association.

California family farmers are community members and are committed to the health and wellbeing of their neighbors. Unlike other economic sectors, the products California's farmers produce are used and needed by all Californians. We take great exception to much of the anti-farming, and anti-science rhetoric being offered up at the workshop by representatives of the AB 32 Environmental Justice Advisory Committee and some public comments which are clearly attacks on the agriculture community.

Section 95481

CAFB supports the need to protect our forests. As such, we support language that defines forest biomass waste. However, the language that CARB has inserted in Section 95481 critically leaves out many or even most wildfire mitigation and forest restoration projects in California. That is because wildfire mitigation, forest restoration, and fuel removal to address bark beetle or other forest health issues generally includes some amount of merchantable residues. In addition, all forest biomass waste can be converted to wood pellets or biochar, which are "wood products," so the exclusion of biomass that can be converted into other wood products effectively excludes all forest biomass waste. Biochar is recognized and defined as an Auxiliary Soil and Plant Substance by the California Department of Food and Agriculture with benefits as a soil amendment. Biochar is primarily composed of carbon and can be used as a long-term carbon storage sink in soils. It contributes directly to carbon sequestration and efforts to mitigate climate change".

075.1

To ensure that LCFS eligible forest biomass waste is environmentally sustainable and protects forest health, CAFB recommends the following edits to the definition:

“Forest Biomass Waste” means residues that are 1) removed for wildfire mitigation, forest restoration projects, or the protection of public safety, or 2) small-diameter, non-merchantable residues, limited to forest understory vegetation, ladder fuels, limbs, branches, and logs that do not meet regional minimum marketable standards for processing into wood products.”

These changes will also make the definition of forest biomass waste consistent with the requirements of Section 95488.8(g)(1)(A)(3) which references wildfire mitigation, the need for defensible space (which often requires clearcutting), forest restoration, and threats to public safety or infrastructure.

075.2 **Section 95482**

Rather than outright eliminate credit generation for hydrogen produced using fossil gas as a feedstock, CARB would be better suited to incentivize non-fossil gas hydrogen at a higher level. We currently need all the hydrogen we can produce. Eliminating credits entirely from hydrogen from fossil gas does nothing to encourage and develop a hydrogen market.

075.3 Further, CAFB recommends that CARB not place a cap on crop-based fuels. We ought to be encouraging more native and homegrown fuel sources than limiting ourselves on a fuel source that we know is better and cleaner than diesel.

If CARB must place a cap on biofuels, we recommend the cap be based on science and available data and not just an arbitrary number. CARB’s own research shows a negative impact by placing a cap on crop-based fuels. By doing this, we continue to send the signal that LCFS is a bridge fuel, while removing diesel from the system.

075.4 **Section 95488.9(g)**

CAFB is very concerned that section 95488.9(g), which was originally written to ensure the sustainability of crop-based fuels, has been expanded to cover all waste biomass and the sustainability certification requirements. CAFB supports efforts to reduce deforestation, however the requirements in this section are entirely inappropriate for agricultural or forest residues where the feedstock is a waste product, and the fuels producer has no control over the crop growing practices. Applying the same standards to agricultural or forest residues as to purpose grown crops does not make sense and will effectively close the door to fuels that could be produced from agricultural and forest residues.

075.5 **Section 95490(a)**

CAFB supports the use of CCSU to drive down carbon intensities and generate carbon negative emissions where possible. The proposed amendments, however, limit sequestration to geologic storage and limit the use of captured carbon to fuels production. These restrictions exclude the use of biochar, which can be a co-product of hydrogen, electricity or biofuels production from waste biomass. Biochar can be used

for carbon sequestration in soil or to reduce emissions from cows, livestock manure and compost. Biochar can also be used in the production of concrete, pavement, tires, ink and other products. And biochar can replace charcoal for water filtration and purification. These are all beneficial uses that either sequester carbon or displace fossil fuel and higher emitting alternatives. Excluding the use of biochar will harm the economics and viability of forest waste and agricultural waste to fuel projects and contradicts the recommendations in the 2022 *Climate Change Scoping Plan* to increase the use of bioenergy with CCS (BECCS).

CAFB urges CARB to revise the definition of CCS in section 95490(a) as follows:

(a)(1) Alternative fuel producers, petroleum refineries, and oil producers that capture CO₂ on-site, including at the location of the production of hydrogen used as an intermediate input, and ~~geologically~~ sequester CO₂ **geologically or in the form of biochar**, either on-site or off-site.

CAFB urges CARB to revise the definition of CCS on page 8 as follows:

“Carbon capture and sequestration (CCS) project” means **either 1)** a project that captures CO₂ by an eligible entity specified in section 95490(a) of this sub article, transports the captured CO₂ to an injection site, and injects and permanently sequesters the captured CO₂ pursuant to the Carbon Capture and Sequestration Protocol and as specified by section 95490 of this sub article, **or 2) a project that captures carbon in the form of biochar during the conversion of waste biomass to fuels and that biochar is used in a manner that sequesters the carbon.**

These changes will allow for the use of biochar to sequester or use carbon that is captured during gasification or pyrolysis of waste biomass.

Sincerely,

Steven Fenaroli

Political Affairs Director, California Farm Bureau

RE: Joby Aviation Comments on the Low Carbon Fuel Standard's August 2024 15-Day Comment Period

Joby Aviation¹ (Joby) appreciates the opportunity to submit comments to the California Air Resources Board (CARB) on the 15-Day Changes released on August 12, 2024.

Joby's mission is to help the world connect faster and more easily with the people and places that matter most by delivering a new form of clean, quiet, electric vertical take-off and landing (eVTOL) aerial transportation. Building on recent advancements in energy storage, microelectronics, material science, and software, we are developing an all-electric aircraft with zero operating emissions that will transport a pilot and four passengers at speeds of up to 200 mph, while also having the ability to take off and land vertically.

Joby is headquartered in Santa Cruz, California, with over 1,400 employees across the state. In 2022, we completed the construction of our pilot production lines in San Carlos and Marina, California, and we began manufacturing our production prototype aircraft. We are excited to support the clean transportation and climate goals of our home state.

As expressed in our comments submitted in response to the April 10 LCFS Workshop, Joby believes CARB can be instrumental in helping California unlock zero-emission and sustainable aviation technologies and fuels.² This includes the LCFS, which will play an important role in incentivizing a less carbon-intensive aviation industry. To do so, CARB should not only seek to streamline the participation of the aviation sector in the LCFS but also initiate a rulemaking process to implement its aviation goals.

Joby Supports the Increased Stringency Proposed in the 15-Day Comment Period

076.1

First and foremost, Joby supports increasing the carbon intensity (CI) reduction target of the LCFS program. As expressed in our previous comments, a more ambitious initial step-down – when paired with the “auto-acceleration mechanism” – will help to expedite investments in low-carbon

¹ See <https://www.jobyaviation.com/>.

² Joby Aviation Comments in Response to April 10 Workshop. Available at: <https://ww2.arb.ca.gov/form/public-comments/submissions/11311>.

076.2

fuels and serve to maximize California's potential for emissions reduction in the transportation sector.³ Therefore, Joby is appreciative of the proposed near-term increase in stringency to a 9% CI reduction in 2025 in the 15-Day Changes.⁴ This increased stringency aligns with the 2022 Scoping Plan Update, which finds that the aviation sector holds an important role in California's ambitious journey toward carbon neutrality by 2045.⁵

Joby Encourages Explicit Inclusion of Electric and Hydrogen Aviation for Capacity Credits

076.3

As expressed in our previous comments, Joby is supportive of the hydrogen refueling provisions and their inclusion of both private and public infrastructure.⁶ While the hydrogen refueling station pathways proposed in the 15-day changes are to be grouped in a new manner – one category for light- and medium-duty (LMD-HRI) hydrogen refueling stations and a separate one for heavy-duty (HD-HRI) – Joby nevertheless believes it is imperative that electric and hydrogen aviation be

076.4

explicitly included within the relevant definitions.

The inclusion of electric and hydrogen aviation will likely have national impacts given that California policy frameworks are often used as models for federal legislation. Specifically, California's LCFS is often replicated by other states. To date, four states have adopted similar clean fuel programs and an additional eight states have pending policies.⁷ Therefore, the explicit inclusion of electric and hydrogen aviation can help set precedent for a cleaner aviation sector nationally.

Conclusion

In summary, Joby is appreciative of CARB's continued work on the LCFS and looks forward to working with CARB on achieving California's zero-emission aviation and larger climate goals.

Sincerely,

/s/ George Kivork

Re: Proposed 15-Day Changes to the Proposed Regulation Order

Dear Chair Randolph and Members of the California Air Resources Board,

On behalf of the Biodiesel Coalition of Missouri (BCM), thank you for the opportunity to comment on the proposed 15-day changes to the Low Carbon Fuel Standard (LCFS) program. BCM represents the biodiesel industry in the state of Missouri, and we are dedicated to the commercial success of biodiesel in the marketplace.

Missouri is home to five biodiesel plants with a production capacity of 247 million gallons.

Over 70% of California's diesel pool now consists of biomass-based diesel fuels like biodiesel. In Q1 of 2024, that number reached 73%. Biomass-based diesel is the most successful fuel in meeting LCFS reductions. At 45% of the carbon reductions from the LCFS program, Biomass-based diesel has contributed more reductions than electric vehicles, hydrogen and renewable natural gas COMBINED.

Because of this, we were surprised to see CARB's 15-Day Changes to revise the LCFS based off what was included in the Initial Statement of Reasons (ISOR). Of top concern for biodiesel producers across our state and the rest of the nation is a proposal that would cap the use of soybean oil as feedstocks for biofuels at 20 percent by company.

These reductions in particulates and toxic air pollution are improving local air quality today, particularly in environmental justice communities. Utilization of biodiesel now diminishes the impacts of carbon emissions into the future. For every five years of delay, 13 times more emissions reductions would be required to have the same environmental impact. Biomass-based diesel fuels, like biodiesel, are the leaders in helping California meet their emissions reductions goals NOW.

In the Notice, CARB asserts that these modifications are intended to encourage zero-emission technologies and ensure that only waste oils are used to replace fossil diesel, yet they do not provide any scientific evidence to support these claims. The Notice also neglects to pinpoint any specific issues within the current LCFS or ISOR, nor does it explain how the proposed changes would effectively address such problems.

This cap does not align with the historical direction of the LCFS and their fuel/technology neutral approach to decarbonization. The cap could jeopardize the momentum towards 100% displacement of petroleum diesel in the heavy-duty sector, leading to backfilling of petroleum diesel. The unintended consequences could further delay California's path to decarbonization.

077.2 Placing an artificial limit on the market, combined with the inclusion of sustainability guardrails, as proposed, will fail to reduce emissions and will only increase costs. Our
077.3 biodiesel plants and the farmers and feedstock suppliers we work with remain frustrated that CARB insists on using data and methods that are over two decades old to set carbon intensity (CI) scores for soy, while refusing to consider new economic data.

077.1 cont Our biodiesel plants rely on soybean oil for their feedstock. Over 85% of our biodiesel production utilizes soybean oil. Soybeans are the number one crop in Missouri. The cap on vegetable oils would undermine innovation and economic viability, essentially shutting down a key market for biodiesel to our members.

077.1 cont As CARB seeks to finalize updates to the LCFS program in the coming months, we strongly encourage the agency to ensure these updates are based on science. The determination to make such drastic changes to previous CARB proposals so late in the game was shocking to the biofuels industries. For CARB to move from arguing that, based on the modeling, a vegetable oil feedstock cap was detrimental to the goals of the LCFS at the April public workshop, to now recommending a wildly stringent cap on those feedstocks without data or science, is quite difficult to comprehend. CARB's own April 10th analysis showed that a feedstock cap would increase greenhouse gas (GHG) emissions in California.

077.4 BCM was surprised to find that not only was a feedstock cap in the 15-Day Changes, but the sustainability guardrails were also retained. Soybean farmers continue to lower the CI of soybeans through innovative conservation and climate smart practices, such as no-till, cover crops, nutrient management, enhanced efficiency fertilizers, and buffer strips, among others

BCM encourages CARB to reconsider its proposed sustainability requirements to allow soybean growers the opportunity to participate in the California biofuels market through innovative and climate smart agriculture practices.

077.3 cont For the last several years, biofuel producers have urged CARB to consider updating its scoring methodology for crop-based biofuels. A comprehensive update to the Global Trade Analysis Project model for biofuels (GTAP-BIO) is needed. Current data indicates a much lower CI score for soybeans, as growers continue to improve soil practices, limit water use, lower on-farm emissions and more.

CARB has indicated plans to update all major models for lifecycle emissions calculations except for GTAP-BIO in the updated LCFS rulemaking. The soy industry has made vast

improvements in sustainability and efficiency over the past two decades, with even greater improvement goals ahead. At the same time, CARB continues to rely on a 2014 model that uses data from 2004. The Indirect Land Use Change (ILUC) score accounts for half or more of the CI score for soy-based biofuels. CARB's current modeling assigns soy biomass-based diesel with an ILUC impact of 29.1g CO₂e/MJ whereas updated results from the model used to calculate ILUC scores indicate a value of between 9 and 10 gCO₂e/MJ for soybeans. The benefits of the LCFS can only be achieved if CI values are accurately captured.

Biodiesel Coalition of Missouri is encouraged by the continued successes of programs that support the development of cleaner, low-carbon fuels. However, it is critical that CARB finalizes updates in a way that does not arbitrarily exclude agricultural feedstocks through policies that are not science-based and run afoul of CARB's mandate, including capping vegetable oil feedstocks and applying onerous sustainability guardrails that add cost without rewarding farming practices that lower CI.

Biodiesel producers, feedstock suppliers and farmers across Missouri remain eager to continue working with CARB to support the biodiesel industry's role in diversifying the fuel supply while reducing GHGs and increasing clean air in California and beyond. On behalf of our members, we appreciate the opportunity to comment and look forward to collaborating with CARB and other relevant stakeholders on implementation of policies that expand the use of soy-based biofuels.

Sincerely,

Re: Proposed 15-Day Changes to the Proposed Regulation Order

Dear Chair Randolph and Members of the California Air Resources Board,

On behalf of the Minnesota Soybean Growers Association, thank you for the opportunity to comment on the proposed 15-day changes (15-Day Changes) to the Low Carbon Fuel Standard (LCFS) program. The Minnesota Soybean Growers Association (MSGA) represents our members and the nearly 26,000 soybean farmers across Minnesota on public policy issues important to the soybean industry. Growers across Minnesota have long been committed to producing the world's food, feed, fuel, fiber, and thousands of bioproducts in an environmentally and economically sustainable way.

CARB's 15-Day Changes to revise the LCFS was quite surprising, as the final package diverged significantly from what was included in the Initial Statement of Reasons (ISOR) and the April 10 public workshop. Of top concern for farmers Minnesota and the rest of the nation is a proposal that would cap the use of soybean oil and canola oil as feedstocks for biofuels at 20 percent by company.

Placing an artificial limit on the market, combined with the inclusion of sustainability guardrails, as proposed will fail to reduce emissions and will only increase costs. Minnesota farmers, who successfully advocate for the nation's first biodiesel mandate more than years ago, remain frustrated that CARB insists on using data and methods that are over two decades old to set carbon intensity (CI) scores for soy, while refusing to consider new economic data and failing to consider the potential indirect emission impacts their expanding preference for waste is having.

MSGA opposes the proposed discretionary authority provided to the Executive Officer to stop accepting new pathways for biomass-based diesel. In addition to discriminating against the lipid-based fuel platform, we are concerned this could have unintended impacts for non-lipid pathways which could produce biomass-based diesel as a co-product. We are also concerned that the aggressive step-down of CI benchmarks, which partially result from the removal the proposed regulation of fossil jet fuel, combined with other changes, will reward importers of waste feedstocks while penalizing farmers across Minnesota and the broader United States.

As CARB seeks to finalize updates to the LCFS program in the coming months, we strongly encourage the agency to ensure these updates are based on science as required by AB-32. The determination to make such drastic changes to previous CARB proposals so late in the game was shocking to the soybean and biofuels industries. For CARB to move from arguing that, based on the modeling, a vegetable oil feedstock cap was detrimental to the goals of the LCFS at the April public workshop, to now recommending a wildly stringent cap on those feedstocks without data or science, is quite difficult to comprehend. CARB's own April 10th analysis showed that a feedstock cap would increase greenhouse gas (GHG) emissions in California, which is contrary to requirements in AB-32.

Vegetable Oil Feedstock Cap

The inclusion of a virgin vegetable oil feedstock cap in the 15-Day Changes was alarming to farmers and the entire biofuels value chain, as reflected in market activity. You may understand our surprise based on the April 10 workshop in which CARB noted that liquid fuels would continue to be needed in the transportation sector in California for at least the next decade. In that same workshop, CARB also argued that the imposition of a virgin vegetable oil feedstock cap would increase the utilization of petroleum diesel in the transportation sector. In the staff's own presentation on April 10, staff noted that nearly eighty percent of vehicles on the road in California to still use combustion engines by 2030. Further, they noted that such a stringent cap on virgin vegetable oils may result in 2.8 billion gallons of fossil diesel utilization in 2030, versus 1.9 billion gallons using a scenario that does not impose the cap proposed by the Environmental Justice Advisory Committee.

In a full reversal of staff's prior analysis, which is only four months ago, staff is now essentially recommending to the board that more fossil diesel be sold into the market in 2030. This recommendation appears to not only go against the goals of AB-32, but also science. This recommendation seems to flatly disagree with the Intergovernmental Panel on Climate Change, which notes in its sixth assessment report that using existing low carbon technologies is a crucial component to avoiding catastrophic temperature increases, stating that "biodiesel and renewable diesel fuels...could offer important near-term reductions" for several technologies, including buses, rail, and long-haul trucking.¹

In our current interpretation, the cap may lock out of the market producers of the lowest cost, lowest carbon intensity soybean oil-based biofuel (soy methyl esters). Most soy methyl esters are produced at biodiesel plants adjacent to soybean processing plants. Often, the companies which own operate these soybean processing are not involved in the procurement and processing of non-crop-based oils, such as UCO and tallow. They

¹ Jaramillo, P., S. Kahn Ribeiro, P. Newman, S. Dhar, O.E. Diemuodeke, T. Kajino, D.S. Lee, S.B. Nugroho, X. Ou, A. Hammer Strømman, J. Whitehead, 2022: Transport. In IPCC, 2022: Climate Change 2022: Mitigation of Climate Change. Contribution of Working Group III to the Sixth Assessment Report of the Intergovernmental Panel on Climate Change. https://report.ipcc.ch/ar6wg3/pdf/IPCC_AR6_WGIII_FinalDraft_Chapter10.pdf

exclusively make biofuels out of soy oil or canola oil. The current language limits crediting of soy and canola to 20 percent of reported gallons. This leaves integrated agriprocessing/biofuel producers two choices: 1) exit the market entirely, or 2) be denied a government benefit on 80 percent of their fuel. If this is the current interpretation of the proposed provision, it would significantly and arbitrarily disadvantage the sustainable oilseed biodiesel community.

We echo the concern of the American Soybean Association that new requirement appears to contradict the statutory guidance laid out in AB-32 to minimize costs.

Sustainability Guardrails

078.2

MSGA was surprised to find that not only was a feedstock cap in the 15-Day Changes, but the sustainability guardrails were also retained. The cap, sustainability guardrails and Indirect Land Use Change score all additively, and redundantly, address land use change. This has the equivalent effect of giving soy and canola a much higher CI score increasing the compliance cost associated with delivering the product, despite the lack of direct evidence.

078.3

Broadly, we are concerned that the requirement proposed by CARB is unneeded given the longstanding, excessively high ILUC figure (relative to more recent modeling efforts). Furthermore, we are extremely disheartened that CARB has not followed the example of governments across North America, where farmers who submit data for compliance are also given the opportunity to be incentivized for conservation efforts. This additional cost without benefit contradicts language authorizing the LCFS. Section 38562 (b)(7) of AB-32 directs CARB to, “Minimize the administrative burden of implementing and complying with these regulations.” Adding supply chain traceability to a bulk delivery system adds significant administrative burden without changing the GHG emissions of the pathway.

CARB’s efforts could be improved and enhanced by outreach to U.S. Department of Agriculture (USDA) personnel who have engaged in activity regarding climate-smart farming practices. USDA recently closed a comment period on its Request for Information on Procedures for Quantification, Reporting, and Verification of Greenhouse Gas Emissions Associated with the Production of Domestic Agricultural Commodities Used as Biofuel Feedstocks. With the information received, USDA seeks to quantify and qualify the benefits of climate smart agriculture practices for biofuel programs at the state, national, and international level. Communication between CARB and USDA could be enlightening regarding ongoing agricultural sustainability practices.

Through the current sustainable aviation fuel (SAF) federal tax credit (40B), the CI of soy-based biofuels can improve through no-till and cover cropping on the field that the soybeans were produced. Other farming practices like low-till, nutrient management, enhanced efficiency fertilizers, buffers, wetland and grassland management, tree planting on working lands, planting for higher carbon sequestration, and soil amendments all can

and should be accounted to assign a lower CI score to an agricultural feedstock. USDA already tracks all these practices through several of their managed conservation programs. In addition, there are a variety of other practices that scientifically lower the CI score of soybean feedstocks for biofuels, and USDA is actively working to develop mechanisms to account for those.

Given the work being undertaken by USDA and EPA as part of the implementation of the Inflation Reduction Act, MSGA urges CARB to reconsider its proposed sustainability requirements to allow soybean growers the opportunity to participate in the California biofuels market through innovative and climate smart agriculture practices.

Outdated Scoring

078.4

For the last several years, state soybean associations, national associations, and biofuel producers have urged CARB to consider updating its scoring methodology for crop-based biofuels. CARB has refused to even consider the request.

We remain deeply concerned that without a comprehensive update to the Global Trade Analysis Project model for biofuels (GTAP-BIO) that CARB utilizes, soy-based feedstocks will be phased out of the LCFS even without the additional limitations being proposed in the 15-Day Changes. Current data indicates a much lower CI score for soybeans, as growers continue to improve soil practices, limit water use, lower on-farm emissions and more. On the one hand, CARB is recommending stringent sustainability guardrails for U.S. soy, but on the other hand is still on track to likely phase-out soy-based biofuels from credit generation by approximately 2035 or sooner.

CARB has indicated plans to update all major models for lifecycle emissions calculations except for GTAP-BIO in the updated LCFS rulemaking. The soy industry has made vast improvements in sustainability and efficiency over the past two decades, with even greater improvement goals ahead. At the same time, CARB continues to rely on a 2014 model that uses data from 2004. The ILUC score accounts for half or more of the CI score for soy-based biofuels. CARB's current modeling assigns soy biomass-based diesel with an ILUC impact of 29.1g CO₂e/MJ whereas updated results from the model used to calculate ILUC scores indicate a value of between 9 and 10 gCO₂e/MJ for soybeans². The recently released 40BSAF-GREET 2024 model has an ILUC score of 12.2 for soy-based sustainable aviation fuel in federal programs.

The benefits of the LCFS can only be achieved if CI values are accurately captured. If land use change concerns are large enough to justify sustainability guardrails and capping virgin vegetable oil feedstocks, then the modeling should also be updated to reflect current land use change data.

² Taheripour, F., Karmai, O., and Sajedinia, E. (2023). *Biodiesel Induced Land Use Changes: An Assessment Using GTAP-BIO 2014 Data Base*. Purdue University

078.5 **Entities Eligible to Apply for Fuel Pathways**

We are concerned about CARB's 15-Day Changes to give the Executive Officer discretion to stop accepting new pathways for biomass-based diesel starting in 2031. We do not understand what provision of AB-32 statute is served, or justifies, this arbitrary and highly selective change. CARB must under statute minimize costs and maximize GHG reductions. It is unclear how this is served by rejecting new pathways. In fact, the requirements of current law are met by allowing the most available pathways. If these pathways cannot achieve cost-effective GHG savings, they will not be utilized by the market in the LCFS. In essence, an increase in pathways can only serve to improve GHG benefits in California. Singling out a single fuel for prejudicial treatment is baffling given the goals of the LCFS and the authority that establishes it. Executive Order S-01-07 establishing the LCFS specifically cites diversity of fuels as a motivation for the program, and this proposal contradicts one of the stated purposes of the program. In addition, this provision if implemented could also significantly disadvantage other biofuel production processes which may produce biomass-based diesel as a co-product, for example in system where SAF is a main product.

Conclusion

MSGA is encouraged by the continued successes of programs that support the development of cleaner, low-carbon fuels. However, it is critical that CARB finalizes updates in a way that does not arbitrarily exclude agricultural feedstocks through policies that are not science-based and run afoul of CARB's mandate, including capping vegetable oil feedstocks and applying onerous sustainability guardrails that add cost without rewarding farming practices that lower CI.

Unfairly adding demands on U.S. soybean farmers and eliminating them from these programs will drive incentives for other bad actors to continue to pass off deforested soy oil or palm oils as used cooking oil. These practices could and would actually do more damage to the climate and make it harder to meet climate goals.

CARB's 15-Day Changes, released in August 2024, is deeply concerning. CARB has singled out soybean and canola oil for adverse, prejudicial treatment. No scientific evidence is ever given for this treatment. In fact, CARB has refused to update the science as required by law for these feedstocks. This alone calls into question the integrity of a performance-based LCFS. On top of this, CARB is now proposing feedstock caps, traceability requirements and authority to reject applications for these fuels produced from them. Again, CARB has not shown any scientific justification. In fact, the LCFS is already over penalizing soy for any land use change requirements.

Farmers across Minnesota remain eager to continue working with CARB to support the role of agriculture in diversifying the fuel supply while reducing GHGs and increasing clean air in California and beyond. On behalf of Minnesota's soybean farmers, we appreciate the

opportunity to comment and look forward to collaborating with CARB and other relevant stakeholders on implementation of policies that expand the use of soy-based biofuels and market opportunities for soybean farmers.

Sincerely,

Darin Johnson
President, Minnesota Soybean Growers Association

August 27, 2024

To California Air Resources Board Staff

Submitted Electronically via On-Line Public Comment Form

California LCFS Rulemaking – Comment on August 12, 2024, “15-Day” Package

Dear CARB,

Phillips 66 Company (Phillips 66) appreciates the opportunity to comment on the proposed amendments to the LCFS regulation.

Phillips 66 has invested over a billion dollars at its Rodeo Renewable Energy Complex in Contra Costa County, California, to transform the facility into a world scale renewable fuels facility. The facility no longer processes crude oil. The facility currently produces renewable diesel, renewable naphtha and is gearing toward the production of sustainable aviation fuel. Phillips 66 also operates a petroleum refinery in Los Angeles. Both facilities in Rodeo and Los Angeles are operated by union labor.

Phillips 66 operates several fuel terminals and markets products under the 76[®] brand in California. Most 76[®] sites that previously dispensed petroleum diesel are now offering renewable diesel. Phillips 66 believes that renewable fuels are an important part of the transitioning energy market. With our significant investments and development of sustainable aviation fuel (SAF) production, Phillips 66 has demonstrated its support of sustainable programs that promote renewable fuel development and consider these proposed amendments in context of promoting SAF production and placement in California.

New Carbon Intensity (CI) Benchmarks – Section 95484

079.1

First, Phillips 66 supports a sustainable LCFS regulation, which allows compliance options and supports operation, expansion, and new project development of renewable fuel production and other transport decarbonization. While we recognize that the strong LCFS bank may stifle further investments in low carbon transport energy sources, we are concerned that the magnitude of the front-loaded reduction may serve to create instability in the program. Phillips 66 supports a step down of the program to allow the oversupply of credits to moderate. We caution against moving too much too quickly. Although the California LCFS credit bank has grown significantly in the last few years, with much more stringent standards ahead and only a small portion of diesel pool left for substitution with biofuels, the program may face challenges if the electrification of the vehicle parc does not occur at the pace anticipated by CARB. Under the proposed amendments, the LCFS now includes a mechanism to auto-advance the standards which we support. However,

Marc Ventura
Fuel Issues Advisor
Fuels, Sustainability & Regulatory Affairs

Phillips 66 Company
1380 San Pablo Avenue
Rodeo, California 94572
Phone: (1) 510-245-4405
Email: marc.v.ventura@p66.com

California LCFS 2024 Rulemaking
Page 2 of 4

there is no provision to soften the standards if not enough credits are available to balance deficits. As such, Phillips 66 recommends that CARB reinstates a formal annual program review to evaluate the LCFS performance. CARB should consider adopting a similar process to the ones in place in Oregon and Washington under their LCFS programs. These processes require an annual fuel forecast and a mechanism to reevaluate the CI standards if credits are in a shortfall position.

Furthermore, the state has emphasized its desire to keep fuel costs affordable, which requires a balanced approach for the establishment of the CI benchmarks.

079.2 Renewable Feedstocks – Section 95482 (i)

Phillips 66 urges CARB to remove the twenty percent restriction on soybean oil and canola oil that is proposed under 95482 (i). Phillips 66 believes that CARB should allow relative CI scores of the renewable fuels to dictate the most efficient mechanism to decarbonize fuels. Additional arbitrary restrictions should not be used to limit renewable feedstocks and/or renewable products in the LCFS. Restricting feedstocks will increase the cost and availability of low carbon fuels, which will hurt California residents, and goes against the efforts of Senate Bill SB X1-2. If CARB decides to implement the 20% limit, the phase-in in 2028 should clearly be based on company fuel production, and imported product and purchases from third parties should be excluded from the 20% trigger.

Hydrogen Production – Section 95482 (h)

079.3

As mentioned above, CARB should not arbitrarily exclude feedstocks for the production of low carbon fuels. Restricting natural gas to produce hydrogen will reduce the availability of hydrogen at the time when CARB is trying to incentivize the development of hydrogen fuel cell vehicles. Once again, the fuel LCFS crediting should be based on its CI score, not on an arbitrary limit, such as the “color” of the fuel. CARB would preempt future technologies that may enable low CI hydrogen from natural gas coupled with carbon capture, for example, or other technologies not yet available or economical.

Furthermore, hydrogen is also used in renewable fuel production. Natural gas greenhouse gas emissions used in the production of hydrogen are accounted for in the life cycle emissions and the CI of renewable fuels. CARB should allow instead more flexibility for enabling book-and-claim options to lower the CI of hydrogen used in renewable fuel production.

Fuel Pathways – Section 95488 (d)

079.4

Phillips 66 recommends that CARB continues to allow new biomass-based diesel fuel pathways after 2031. Maintaining a fuel neutral approach will ensure that the lowest cost, lowest carbon intensity, most efficient projects can continue to be developed for all fuels used in California. The

California LCFS 2024 Rulemaking
Page 3 of 4

CI score will efficiently drive the market to supply the fuels best suited to meet the lowering standard.

Alternative jet fuel production is typically accompanied with renewable diesel at renewable fuel facilities. Preempting new diesel fuel pathway applications may shut the door to the development of sustainable aviation fuel beyond 2030, as fuel pathway applications typically cover all products at a given facility. Prohibiting new fuel pathway applications would be in contradiction with the goals of California and the Federal Government to increase the production of sustainable aviation fuels.

CARB should not close the doors today to future opportunities that may arise as technology evolves.

079.5 **Indirect Land Use Change – Section 95488.3 (d)**

CARB should undertake a separate rulemaking to revisit the indirect land use change (LUC) values. The values in Table 6 date back from the CARB 2015 LUC study. New research papers have showed evidence for lower LUC values, and lower LUC values have been adopted by other programs, including the Carbon Offsetting and Reduction Scheme for International Aviation (CORSIA).

Until new LUC values are established through rulemaking, if CARB wants to allow adjustments to the LUC values, not only factors that contribute to higher LUC values should be considered, but also factors that contribute to lower LUC values should be recognized.

079.6 **Sustainability Requirements for Biomass – Section 95488.9 (g)**

Phillips 66 encourages CARB not to develop new processes for sustainability tracking, but rather allow the use of existing protocols currently in place in the LCFS, the EPA Renewable Fuel Standard and other organizations such as the International Sustainability and Carbon Certification (ISCC).

079.7 **CI Exceedance - Section 95486.1 (g)**

Although not a change from the “45-day” package published in January 2024, Phillips 66 requests that CARB removes the four times penalty when the CI is verified above the operational CI. This penalty defeats the purpose of auto-adjustments of fuel CI. CARB should instead reset the CI score to the verified CI and true-up the credits and deficits, without adding an unjustified penalty of four times the incremental credit generation.

California LCFS 2024 Rulemaking
Page 4 of 4

This substantial penalty will force obligated parties to set overestimated CI scores, well above the actual pathway CI score to reduce the risk of a penalty. The LCFS program could not capture the full benefit of greenhouse gas reductions, while the CI standards become ever more stringent, and the benefit of this provision will be muted.

Jet Fuel – Section 95489

Phillips 66 supports CARB's latest proposal to keep petroleum jet fuel exempt from the LCFS and continue to allow alternative jet fuel to opt-in the LCFS based on CI scores. This will avoid higher costs for jet fuel.

Please reach out if you would like to discuss these items.

Thank you for your consideration.

Sincerely,

Marc Ventura

Subject: Low Carbon Fuel Standard – 15-Day Notice Comments

The Alliance for Automotive Innovation (Auto Innovators) and our members appreciate the opportunity to comment on the proposed 15-Day changes to the Low Carbon Fuel Standard (LCFS).¹ We support the proposed changes for crediting ZEV fueling infrastructure and for allowing the California Air Resources Board (CARB) Executive Officer (EO) to direct up to 45 percent of the base credits generated by light-duty (LD) electric vehicle (EV) residential charging to the automakers (aka, "OEMs") producing those vehicles.

No sector is investing more than OEMs to develop the EV market. By 2030, the auto industry is expected to invest more than \$1.2 trillion globally² in everything from critical minerals and critical mineral processing to battery cell and pack production, to vehicle development, certification, and production, to charging stations and consumer education. It makes sense for OEMs to receive a portion of the base residential EV charging credits to allow them to continue to make the necessary investments in the electric transportation transition.

Not only does no other sector have as much at stake, but also, no other sector has comprehensive knowledge of the auto-buying consumer market. The focus of CARB and the auto industry is a robust, vibrant, and sustainable EV market that serves the needs of every community from every economic sector and every part of the state and globe. Thus, if the goal is to use LCFS revenue to grow the EV market across all sectors and communities, automakers, more than any other sector, are uniquely positioned to do that in all communities including environmental justice (EJ) communities.

¹ California Air Resources Board. (2024, August 12). *Notice of Public Availability of Modified Text and Availability of Additional Documents and/or Information Proposed Low Carbon Fuel Standard Amendments*. Retrieved August 15, 2024, from https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2024/lcfs2024/15day_notice.pdf

² <https://www.reuters.com/technology/exclusive-automakers-double-spending-evs-batteries-12-trillion-by-2030-2022-10-21/>

In fact, the regulations allow OEM base credit projects that include “multilingual marketing, education, and outreach... designed to increase awareness and adoption of EVs.” Projects like this might be combined with other EJ projects, such as EJ projects identified in the Advanced Clean Cars II regulations, Clean Cars for All (CC4A) program, or the Sustainable Transportation Equity Project (STEP). Moreover, the regulations allow OEMs to develop and implement other projects with approval from the Executive Officer. These projects may also include EJ outreach and engagement.

As we have noted in the past, the transition to zero emission vehicles (ZEVs)³ for light-duty vehicles (LDVs) is far from complete. California’s ZEV market share climbed to over 25% in 2023 but has since stalled in the first half of 2024. While this stall might be temporary, substantial progress is still needed to meet the Advanced Clean Cars (ACC) II requirements of 51% ZEV in 2028, 68% ZEV in 2030, and 100% ZEV in 2035. To ensure the full transition to ZEVs, funding generated by residential plug-in electric vehicle (PEV) charging should be used exclusively to develop the LDV EV market through infrastructure, vehicle incentives, and public education.

To strengthen the approach and increase the likelihood for success, we recommend the following revisions.

080.1

First, as noted above, revenue from LDV PEV residential charging should be directed to LDV PEV market expansion. This applies equally to past revenue that was collected for the LDV Clean Fuel Reward Program and future funding generated by residential charging. Consequently, we recommend adding the following definition in 17 CCR §95481:

“Light-Duty Vehicle California Clean Fuel Reward (CCFR)” is a statewide program to provide a reduction in price on new light-duty electric vehicle purchases or leases in California, including light-duty and medium-duty electric vehicles with a gross vehicle weight rating of 10,000 pounds or less and sold or leased on an individual basis to non-fleet customers. The California Clean Fuel Reward is funded exclusively through LCFS proceeds generated from electricity used for residential charging of electric vehicles up to 10,000 pounds gross vehicle weight rating.

The proposed definition of “California Clean Fuel Reward” should be revised to “Medium- and Heavy-Duty California Clean Fuel Reward (CCFR).”

³ In this letter, “ZEVs” include battery, plug-in hybrid, and fuel cell electric vehicles (BEV, PHEV, and FCEV, respectively). “PEVs” include BEV and PHEV only.

080.2

The regulation allows that the “Executive Officer may direct up to 45% of base credits to eligible OEMs,” but there is no definition of “eligible OEMs.” Presumably this includes all OEMs producing and selling light-duty plug-in electric vehicles in California, but clarification would be helpful.

080.3

The regulation appears to allow the EO to direct anywhere from 0 percent to 45 percent of the base credits to eligible OEMs, but there is no indication of the criteria that might be used to determine the portion directed to OEMs. Clarifying the criteria would make the regulation more transparent.

The regulation is also not clear if the portion assigned to OEMs is fixed or could change year-to-year. Presumably the portion cannot change since OEMs and utilities need long-term stable funding to efficiently administer EV market support programs.

080.4

The regulation appears to eliminate the California Clean Fuel Reward (CCFR) as soon as any portion of the base credit is directed to OEMs. Since the EO could direct anywhere from 0 percent to 45 percent of the base credits to eligible OEMs, it seems the CCFR could be eliminated even though only a small portion (e.g., 1 percent) of the base credits are directed to the OEMs. We agree the light-duty vehicle CCFR is unnecessary if 45 percent of the base credits are directed to the OEMs. However, if only a small portion is directed to automakers, the utilities should continue to administer the light-duty vehicle CCFR. We recommend modifying §95483(c)(1)(A)2 and 3 to read “unless 45 percent of the base credits are allocated to the OEMs pursuant to section 95483(c)(1)(B)...” and §95483(c)(1)(B) to read “If the Executive Officer directs 45 percent of the base credits to eligible OEMs, the requirements of section 95483(c)(1)(A)2. do not apply.”

We estimate the utilities have collected over \$400 million⁴ for the CCFR program. However, they eliminated the reward beginning September 1, 2022. CARB should direct the utilities to

⁴ Estimation:

- 10,705,332 MT of base credits generated between 2019 and 2023
 - Source: <https://ww2.arb.ca.gov/resources/documents/low-carbon-fuel-standard-reporting-tool-quarterly-summaries>
- \$128.23 /MT weighted average price over that period
 - Source: <https://ww2.arb.ca.gov/resources/documents/lcfs-credit-transfer-activity-reports>
- = \$1,372,737,229 worth of base credit value generated
- 67% should have gone to CFR rewards
 - Source: page 32 of regulations: https://ww2.arb.ca.gov/sites/default/files/2020-07/2020_lcfs_fro_oal-approved_unofficial_06302020.pdf
- = \$919,733,944 should have gone to CFR rewards
- \$450,540,222 were the reported total program expenses (\$416.8 million in CFR rewards + \$33.7 million in administrative expenses)
 - Source: <https://cleanfuelreward.com/reporting#mark-equity>
- = **\$469,193,722 in missing money** through the end of 2023

reestablish the light-duty vehicle CCFR until those funds are exhausted, or have those funds allocated to the OEMs to use in their own rebate programs.

080.5

The regulation also states that any entity is eligible to generate incremental credits for improvements in carbon intensity of electricity used for residential EV charging, which would seem to include OEMs. If this is in fact the case, we recommend modifying section 95483(c)(1)(E)(3) to read “For non-metered residential EV charging, an EDU or OEM is eligible to generate incremental credits for supplying low-CI electricity ~~to the EVs in its service territory~~.”

080.6

Finally, section 95500(c)(1)(E)(1) lists EV charging as requiring verification of Quarterly Fuel Transaction Reports including site visits. This is not practical or feasible for metered electricity using telematics data or home charging. CARB should work with industry stakeholders to determine an appropriate verification process for telematics data, while reducing any potential double-counting.

Again, we support changes in the 15-Day Notice with the clarifications indicated above and sincerely appreciate the hard work and collaboration by CARB staff on proposed changes. Please don’t hesitate to contact me if you have any questions or need additional information.

Sincerely,

Dan Bowerson

Chair Liane M. Randolph and Members of the Board
California Air Resources Board
1001 I Street
Sacramento, CA 95812

Re: Comments on Proposed LCFS Amendments, August 12, 2024 15-Day Notice

Dear California Air Resources Board Members;

Air Liquide Hydrogen Energy U.S. LLC ("Air Liquide") submits this letter to comment on the proposed amendments to the Low Carbon Fuel Standard ("LCFS") Regulation, published in the 15-day notice dated August 12, 2024 (the "15-Day Notice"). Specifically, Air Liquide urges CARB to treat hydrogen produced with fossil feedstock in the same manner as other fuels, and to allow book-and-claim accounting for process energy. As members of the California Hydrogen Coalition, we are also supportive of the positions outlined in its comment letter regarding the impacts of the proposed amendments on LCFS credit market values, changes to the HRI program for light-, medium-, and heavy-duty vehicles, and the call for an additional 15-day review.

Air Liquide and its affiliated companies operate 128 facilities and employ nearly 2,000 people in California. Air Liquide's parent and affiliated companies are the world's leaders in industrial and medical gases. In California, Air Liquide is one of the largest producers of hydrogen for fuel-cell electric vehicles.

The proposed modifications to the LCFS regulations regarding hydrogen production:

- are inconsistent with the requirements of CARB's December 2022 Scoping Plan[1];
- Are not aligned with the LCFS's long-standing principle of encouraging carbon reduction by all means possible;
- Will constrict supply and increase costs in the California hydrogen sector; and
- Will negatively impact investment in the state, because project decisions are strongly influenced by the need for a stable investment landscape without arbitrary rule changes that run counter to the state's own climate plans.

Adoption of the modifications proposed in the 15-Day Notice risks suppressing California's nascent low-carbon hydrogen industry, stranding existing assets and projects, and increasing the overall cost of low-carbon hydrogen for California consumers.

1. Eligibility of Hydrogen Produced From Fossil Feedstocks to Generate LCFS Credits

081.1

The foundation of the LCFS is that every fuel is evaluated on the basis of the carbon emissions that result from its production and use. The emissions associated with each gallon or kilogram of fuel are quantified, in grams of carbon-dioxide-equivalent emissions per megajoule of energy, from "well to wheels," or from whatever the source of the fuel to the end use of the fuel for transportation purposes. In this sense, the LCFS is technology neutral. The state does not pick winners and losers, and does not

dictate to industry the means of producing the lowest carbon fuel. Instead, the state allows fuel producers to reduce emissions in the most efficient manner possible to produce fuels that will generate LCFS credits.

This is one of the primary virtues of the LCFS. The LCFS's science-based, quantitative approach is efficient and produces the maximum possible climate benefit, because it rewards producers of low-carbon fuels only in proportion to their ability to reduce climate-warming emissions. It does not reward fuels that may in some sense be "renewable" but do not reduce emissions, and it rewards most highly those fuels that have the greatest impact on the climate and the planet.

081.2 The draft amendments in the 15-Day Notice depart from this quantitative, science-based approach with respect to hydrogen. The proposed amendments include a new Section 95482(h) that assigns a carbon intensity to hydrogen unrelated to the emissions associated with its production and use:

Effective January 1, 2031, hydrogen produced using fossil gas as a feedstock is ineligible for LCFS credit generation unless biomethane attributes are matched to the hydrogen production as described in Section 95488.8(i)(2). Any volumes of hydrogen produced using fossil gas as a feedstock must be assigned the ULSD carbon intensity found in Table 7-1 of the LCFS regulation, as well as an EER of 1.

Under this section, hydrogen produced with fossil feedstock is assigned the carbon intensity of diesel fuel unless the fuel producer uses book-and-claim accounting to match environmental attributes to the feedstock used for the production of the hydrogen. Under the proposed amendment, the actual emissions associated with the production and use of the hydrogen fuel are not quantified. The proposed amendment does not allow any credit for the reduction in emissions that may result from production with carbon capture and sequestration ("CCS").

Hydrogen produced with fossil fuel feedstocks should not be treated differently than other fuels under the LCFS. Although hydrogen produced from fossil fuel feedstocks may not generate any credits under the LCFS as the benchmarks for gasoline and diesel fuels decline over time, it nevertheless has the potential to contribute to reduced emissions in two ways. First, hydrogen produced with fossil fuels may have a very low carbon intensity if the emissions from its production are captured and sequestered with CCS. The 2022 Scoping Plan Update specifically recognizes an important role for hydrogen produced with CCS: "If steam methane reformation is paired with CCS, the hydrogen produced could potentially be low carbon. ... Steam methane reformation paired with CCS can thus ensure a rapid transition to hydrogen and increase hydrogen availability until such time as electrolysis with renewables can meet the ongoing need"[1] The Scoping Plan Update sets a target of 100 million tons of carbon dioxide removed with CCS by 2045. Discouraging production of hydrogen with CCS is directly contrary to CARB's climate plans as set forth in the Scoping Plan Update.

081.3 Second, fossil hydrogen is often blended with low-carbon hydrogen to produce the carbon intensity demanded by the market. Hydrogen fuel retailers are currently demanding hydrogen with a zero carbon intensity. To provide that hydrogen, hydrogen producers purchase environmental attributes to apply, with book-and-claim accounting, to the fuel sold. Those attributes, however, often have negative carbon intensity. For example, dairy digester feedstock may have a carbon intensity of negative 300 gCO₂e/MJ, and to obtain a zero CI for the hydrogen produced it may not be necessary to purchase environmental attributes for all of the hydrogen produced. Some fossil hydrogen may be blended with very low carbon hydrogen to produce a CI of zero.

If CARB were to adopt the amendments as proposed, hydrogen producers and sellers of environmental attributes would adapt by using multiple feedstocks to obtain the zero CI demanded by the market. But requiring these actors to, in effect, “game the system” would be inefficient. It would result in higher prices for environmental attributes, potentially reduce production or sales of hydrogen, and create market friction where CARB should be seeking the opposite result.

081.4 The policy rationale that CARB provides for this proposed change is not persuasive. CARB states, in the 15-Day Notice, that CARB “is proposing to remove LCFS crediting eligibility for hydrogen produced from fossil fuels at the end of 2030 to align with the current operational timeline for projects funded under the hydrogen hubs grants, which will expand the supply of renewable hydrogen in California.” In other words, CARB is assuming that the ARCHES hydrogen hub projects will be sufficient to produce enough electrolytic hydrogen, in just six years, to meet the state’s needs. But whether the hydrogen hub projects will produce a vast new supply of renewable hydrogen is unknown. Those projects are in their infancy, and the degree to which they will succeed cannot be predicted with any certainty today. CARB’s reliance on these projects is a quintessential example of counting one’s chickens before they hatch. CARB should be using every available means to reduce carbon emissions, not assuming that some projects, which have not even started yet, much less succeeded, will be sufficient to satisfy the state’s demand for low-carbon hydrogen.

Assigning a carbon intensity to hydrogen that does not reflect its actual carbon intensity is an unnecessary and counterproductive change to the LCFS. It is not justified by the reasons that CARB has provided and will make it less likely that the state will meet its climate change goals.

Moreover, adopting such disruptive changes sends the wrong signal to investors who are considering whether to support low-CI hydrogen projects. The 15-Day Notice represents an unexpected and surprising proposal and will negatively impact the investment and lending communities and ultimately risks provoking a retreat from investment in all low-carbon fuels because of fears of arbitrary and last-minute regulatory changes. CARB must refocus its efforts on sending clear regulatory support for all types of low-CI hydrogen projects.

Recommendation: Do not adopt the 15-day proposed changes regarding the restricted eligibility of fossil-produced hydrogen in the credit generating market.

2. Book-and-Claim Accounting for Process Energy Used to Produce Hydrogen

When hydrogen is produced, its carbon intensity is a product of emissions associated with both the feedstock (which may be gas, if the hydrogen is produced with steam methane reformation, or electricity, if it is produced by electrolysis) and “process energy.” Process energy is the energy that is used to compress, liquefy, and distribute the fuel. The LCFS currently does not allow the use of book-and-claim accounting to reduce the CI of process energy.

CARB’s proposed amendments to the LCFS published in the 45-day notice in December 2023 would have allowed the use of book-and-claim accounting for process energy used in the production of hydrogen.[2] The 15-Day Notice, however, limits the use of book-and-claim accounting to electrolytic hydrogen. (For electrolytic hydrogen, most of the process energy is used to liquefy the hydrogen.)

CARB has never provided a meritorious rationale for limiting the application of book-and-claim accounting under the LCFS. Book-and-claim accounting is efficient, because it allows fuel producers to use renewable feedstocks and energy wherever they may be found to produce the lowest possible

carbon-intensity fuels. With the use of book-and-claim accounting, a fuel producer can obtain renewable power and feedstocks in a single location, without having to build the infrastructure to transport solar, wind or hydroelectric power, or biomethane, to the production facility. The benefits of broad application of book-and-claim accounting would be enormous, and the risks, if any, would be insignificant. CARB has never published any information suggesting that book-and-claim accounting has been or would be abused if it were more widely available. The LCFS's requirements for third-party verification, which are already applied to book-and-claim accounting, assure that any abuse would be rare, and that it would be detected.

CARB should, at a minimum, reverse the changes made in the 15-Day Notice to Section 95488.8(i)(1)(C) and allow the use of book-and-claim accounting for process energy used in the production and distribution of hydrogen. Air Liquide also supports the use of book-and-claim accounting more widely, for all fuels, consistent with Air Liquide's belief that the LCFS should provide a level playing field and create a fair marketplace for all fuels.

Recommendation: Allow the use of book-and-claim accounting for process energy for all LCFS pathway evaluations regardless of the hydrogen production methods or energy sources. This would include electricity used in compression, refrigeration, liquefaction, storage, and distribution and all other energy sources used for process heat and distribution.

3. Effects on LCFS Credit Value and Changes to HRI Credit Program

081.6

As a founding member of the California Hydrogen Coalition (CHC), Air Liquide supports the comments made in the CHC's letter to CARB regarding the proposed amendments. In particular, the CHC letter has extensive comments on the potential effects of the proposed changes on the LCFS credit value and on changes in the light-duty HRI credits and the expansion of HRI to the heavy-duty vehicle market.

Air Liquide appreciates CARB's willingness to consider input from all stakeholders, and looks forward to working with CARB on amendments to the LCFS. We would also be happy to meet with CARB staff to discuss Air Liquide's comments.

Best Regards

David P. Edwards, PhD

August 27, 2024

Chair Liane Randolph and Members of the Board
California Air Resources Board
1001 I Street
Sacramento, CA 95814

Dear Chair Randolph and Members of the Board,

Cargill appreciates the opportunity to provide comments on the California Air Resources Board's (CARB) proposed 15-Day Changes to the Proposed Amendments to the Low Carbon Fuel Standard (LCFS) Regulation (15-day package), and we thank staff for consideration of our points below.

Cargill is a Minnesota-based global agribusiness company that has worked closely with small- and large-scale growers since our founding 159 years ago. We partner with farmers, food companies, retailers, and fuel producers to make, process, and move food and fuel feedstocks around the world. Cargill businesses originate, process, and convert these feedstocks into renewable fuels including biodiesel and ethanol, while working closely with our farmer partners. Our work starts at the farm level, where we are undertaking comprehensive, large-scale efforts to [reduce emissions](#) across our global supply chains – working hand in hand with farmers to scale regenerative farming practices, protect and restore vital landscapes and empower producer communities.

Cargill is taking climate action – the global food system depends on it.

Climate change has a direct and growing impact on the food and agriculture industries. With a global footprint and presence in major supply chains worldwide, Cargill has a responsibility to make the food system even more sustainable and resilient. Cargill appreciates CARB's commitment to decarbonize the State's transportation sectors. A more sustainable food system must consider how food and other vital goods move around the world from origin to destination. Incentivized markets, such as California's LCFS program, are instrumental in creating demand for these lower-carbon transportation solutions.

Near-Term Stringency Increase

Cargill welcomes CARB's proposal of a near-term increase in stringency to a 9% CI reduction in 2025 as a way to stabilize LCFS prices, but we believe there is room for a more impactful step-down given the build in the LCFS credit bank as the industry responds to the demand of lower carbon liquid transportation fuels in California. The over-performance of the program is a testament to its success, and we believe the proposed adjustment will be supportive to higher credit prices and continued investment in the state's transition to cleaner energy.

20% Cap on Soybean Oil and Canola Oil Feedstocks

Cargill's priority will always be nourishing the world. We believe North American agriculture still has an important role to play in the transition to cleaner energy and more sustainable food systems, and that the industry is uniquely positioned to feed the world and meet the growing global demand for low carbon biofuels. North American farmers are integral to the decarbonization of our food and energy sectors and continue to use innovative technologies and cropping systems to support carbon sequestration, sustainability, and emissions reductions throughout the supply chain.

082.2 As such, Cargill does not support the proposed cap on soybean and canola oils. Any deviation from the current policy must be nimble, non-arbitrary, and designed to effectively respond to near-term acute needs without driving longer-term unintended consequences. While we believe that innovation in agronomics and technology will lead to greater opportunities for emissions reductions for traditional feedstocks like soybeans and canola, we also acknowledge CARB's desire to send a clear market signal so that participants can make decisions that affect the long-term performance of their businesses.

Agriculture has been serving food and fuel markets for decades and will continue to support both markets with an unwavering commitment to sustainability as the energy transition evolves. As we invest and modernize assets to support near-term demand, we see a shared benefit for long-term food production supported by more advanced infrastructure.

082.3 A key driver for the long-term success of the industry will be the continued reduction in the carbon intensity of crop-based feedstocks. The growing adoption of sustainable farming practices results in the production and availability of lower carbon-intensity feedstocks for bioenergy. Farmers are increasingly adopting these practices to further reduce and sequester carbon, in addition to seeing clear economic and productivity gains. Recognizing the opportunity and imperative of regenerative agriculture, Cargill is supporting and incentivizing these sustainable practices among growers in our supply chain. We encourage CARB to promote the adoption of these reduction mechanisms by making available pathways which incorporate regenerative agriculture practices.

082.2 cont
CARB's proposed cap on soybean and canola oil feedstocks disadvantages the North American grower who is integral to the decarbonization of our global food systems. In the years ahead, the global food system will be subjected to the indirect consequence of reducing the available production of soybean and canola oil – which is to reduce contingency supplies available to the food system. In essence, CARB's proposed policy guidance calls for greater decarbonization without its most flexible and scalable feedstock supply. We believe this undermines the critical imperative to provide food and to decarbonize the global transportation supply chain.

The proposed cap on soybean and canola oils for biomass-based diesel represents a material policy change to the program. CARB's 15-day package presents the first opportunity for a broad stakeholder group to review these impactful changes. Given the potential implications of this policy change, Cargill asks CARB to provide stakeholders with additional time to properly vet the intent, impact, and implications of the proposed requirements. While we expect additional question to be raised over time, we request that CARB respond to the following as soon as possible:

- Current participation % of soybean and canola oils as biomass-based diesel feedstocks – Cargill requests that CARB provide stakeholders with the composition of the "Other" feedstock type category used for data modeling in Table 6 of the LCFS Data Dashboard.

- Assessment of the 20% cap – Is the cap assessed on the volume of biomass-based diesel imported into California’s LCFS program, or is the cap assessed on the total volume of production by producer? Cargill requests that staff make available a formula or illustrative example of how staff intends to assess this cap at the producer level.
- Definition of the term “company” – Cargill requests that staff provide a clear definition of this term so stakeholders can better analyze how the cap might affect current business operations.
- Reporting and verification – Cargill requests that staff provide more details for stakeholders related to reporting and verification processes relative to the proposed cap and its implementation.

Sustainability Certification for Biomass

082.4 Cargill supports and promotes sustainable approaches to agriculture that are demonstrated through traceability back to our growers. We recognize the importance of traceability throughout the supply chain, not just for renewable biomass from crops, but for waste-based feedstocks as well. Adequate mechanisms must be in place to ensure that all feedstocks are correctly identified and that their environmental benefits match the material being used for credit-generating fuel.

Growth in waste-based feedstocks to feed our domestic market increasingly comes from foreign locations. Feedstocks sourced from outside North America are oftentimes challenging to trace back to origin. This challenge is compounded by the smaller volumes of waste that must be aggregated from hundreds of sourcing locations, and sometimes across multiple regions. Cargill believes that all feedstocks require effective compliance processes. We encourage CARB to engage with industry and relevant authorities to develop and adopt such processes and procedures.

To this end, Cargill is actively exploring the application of lipid profile analytical testing methods which would serve as support to the identification and verification of feedstocks such as used cooking oil (UCO). Developing and incorporating such testing methods would be a strong step towards ensuring rigorous compliance requirements for all feedstocks within the program.

We request that CARB align the sustainability certification requirements between biomass and waste feedstocks to ensure that all eligible feedstock for the program is subject to the same requirements, and that advantages for waste-based feedstocks are not derived from less rigorous compliance requirements.

Conclusion

Cargill respectfully requests that CARB remove the proposed cap from the rulemaking package. We recognize that crop-based feedstocks must be allocated for fuel use in a thoughtful and balanced manner. Cargill’s participation in global agriculture supply chains gives us confidence in the market’s ability to serve both food and fuel.

North American farmers continue to grow their use of climate-smart agricultural practices in support of soil health, resource conservation, and soil carbon sequestration. We know that continued reductions within the industry are essential to meeting our decarbonization goals and that farmers are leading the way to a more sustainable future for our agricultural supply chains and global food systems.

We also believe that the strong demand signal for foreign-sourced waste-based feedstocks without appropriate traceability requirements presents opportunities for ineligible material to make its way into the LCFS.

We look forward to continued collaboration with CARB as we support the role of agriculture in the decarbonization of our transportation sectors and food systems. Thank you for this opportunity to submit comments.

Sincerely,

Chair Randolph and Honorable Members of the Board
California Air Resources Board
1001 I Street Sacramento, California 95814

Re: Recommendations for the Low-Carbon Fuel Standard Program

The Natural Resources Defense Council and the undersigned 28 organizations submit the following comments both in support of a critical change made to the latest draft of the proposed Low Carbon Fuel Standard (LCFS) regulations, as well as to urge the California Air Resources Board (CARB) to make further changes to the LCFS program to prevent harm to vulnerable communities related to waste incineration.

083.1

The previous draft LCFS regulations, released in January 2024, included a definition of “petroleum product” which included a highly problematic clause that explicitly stated that this term did

“not include plastic or plastic products.” This clause was both inaccurate and confusing given that more than 99% of plastic is made from fossil fuels.¹ We therefore support the following proposed change to the LCFS regulations in the draft released on August 12, 2024:

“Petroleum Product” means all refined and semi-refined products that are produced at a refinery by processing crude oil and other petroleum-based feedstocks, including petroleum products derived from co-processing biomass and petroleum feedstock together. ~~“Petroleum product” does not include plastics or plastic products.~~

Given the LCFS program’s focus on climate mitigation, it is worth noting that a recent study by the U.S. federal government found that global plastic production is a major driver of climate change.² The study, which was conducted by scientists at the Lawrence Berkeley National Lab, estimates that by 2050 plastic production could account for between 21% to 31% of the global carbon emission budget required to limit global temperature increase to just 1.5 degrees Celsius. Currently, the industry is responsible for four times more greenhouse gas emissions than the airline industry, or about 600 coal-fired power plants.³ It is important, therefore, that the LCFS program does not incentivize the production of plastic or plastic waste in any way, or suggest that plastic is not a petroleum product.

083.2 In addition, we wish to express our deep concern with and opposition to the numerous ways that the LCFS will incentivize the conversion of municipal solid waste (MSW) into fuel, particularly MSW containing plastic. Data show that the two most common technologies used for such conversion will be pyrolysis and gasification⁴, both of which are regulated as incineration under federal law.⁵ While the emissions from pyrolysis and gasification are concerning no matter what the feedstock, they are particularly toxic when the feedstocks include plastic—either directly or as a component of MSW. According to the Environmental Protection Agency’s most recent data (2018), plastics typically comprise over 12 percent of municipal solid waste.⁶

⁶ Environmental Protection Agency, “National Overview: Facts and Figures on Materials, Wastes and Recycling,” accessed August 19, 2024, <https://www.epa.gov/facts-and-figures-about-materials-waste-and-recycling/national-overview-facts-and-figures-materials>

Pyrolysis and gasification emit hazardous air pollutants including benzene, toluene, styrene, formaldehyde, ethyl benzene, and dioxans/furans when they incinerate plastic.⁷ Pyrolysis and gasification facilities also generate large amounts of hazardous waste; one pyrolysis facility alone generated 484,000 pounds of hazardous waste in 2019.⁸

Pyrolysis and gasification facilities tend to be located in communities that are disproportionately low income, people of color, or both.⁹ If the LCFS is incentivizing the building of new pyrolysis and gasification incinerators in California (and/or elsewhere), they will most likely be sited in environmental justice communities. These communities will bear the brunt of the toxic impacts of the hazardous air pollutants and waste that is generated.

In summary, to protect the health of California communities and prevent the building of large numbers of new incinerators, we urge CARB to (1) finalize the strike-out of the previously proposed language that explicitly and inappropriately excluded plastics from the definition of petroleum products in the LCFS; and (2) remove incentives for the conversion of municipal solid waste to fuel, especially when this conversion involves pyrolysis or gasification.

Thank you for considering our views.

August 27, 2024

Ms. Liane M. Randolph
Chair
California Air Resources Board
1001 I Street
Sacramento, CA 95814

Re: Proposed Amendments to the Low Carbon Fuel Standard Regulation of August 12, 2024

Dear Chair Randolph,

The undersigned Direct Air Capture (DAC) Coalition and leading DAC companies thank you for the opportunity to comment on the additional proposed amendments to the Low Carbon Fuel Standard (LCFS) Regulation.

The LCFS is a vital program to lower California's carbon emissions, achieve air quality benefits, and accelerate technology deployment needed for California to achieve its carbon neutrality targets. As the world's first carbon compliance regulation to include DAC, LCFS helped launch the DAC industry and exemplifies California's global leadership in addressing climate change while highlighting the essential role of carbon dioxide removal for achieving net zero.

We commend the California Air Resources Board (CARB) for its dedication and diligent work to design, implement, and refine the LCFS to be an effective emissions reductions and innovation driver. We are specifically grateful for CARB's commitment to engaging with interested stakeholders in this process and for considering our feedback about LCFS regulations that will have profound implications for the DAC industry.

084.1 The latest proposed amendments to the LCFS Regulation Section 95488.8(i)(1)(C) issued on Monday, August 12th move in the right direction in allowing a longer temporal period in book-and-claim accounting for low-carbon intensity (CI) electricity for DAC (three quarters) as compared to the previous proposed amendments of January 2, 2024 (quarterly). **However, book-and-claim accounting spanning three quarters cannot accommodate DAC's continuous 24-7/365 operations given the seasonal fluctuations in wind and solar power production, and is therefore not fit for purpose nor achievable for DAC at this stage of the industry's development. Instead, annual book-and-claim accounting for DAC is necessary, appropriate, and consistent with the leading global standards today. Moreover, there is a lack of analytical evidence that emissions accounting accuracy or resource shuffling prevention would be enhanced by three-quarter accounting compared with annual.**

The need for annual book-and-claim matching for DAC is driven by underlying physical and technological constraints, as well as market realities. DAC is more nascent in technological

development and deployment than other technologies relevant to LCFS. For example, the first commercial DAC plus storage facility commenced operation in 2021, while advancements in hydrogen electrolysis are building on over 100 years of commercial operational experience.

DAC technologies need to operate constantly with limited ability to ramp up and down load because they often contain equipment components and chemical and physical processes that cannot be rapidly fluctuated or turned on and off. Currently, the vast majority of low-CI electricity generation capacity being added to the US grid is intermittent renewable electricity sources like solar and wind. Book-and-claim accounting to match intermittent renewable supply with a constant DAC load over an annual period within the same grid is a challenge that requires detailed modeling and risk management to account for annual variability in renewable output. Limiting the accounting period to three quarters significantly exacerbates the challenge, since the electricity production from these intermittent renewable resources is seasonal and a quarter of the annual cycle would be missed.

Any temporal matching period spanning less than a full year would present a severe barrier for DAC deployment given the current state of technology's needs for continuous, additional and local low-emissions electricity supply, and the lack of market and technological systems to support more granular temporal matching. For example, one commercial DAC project currently under development in the United States estimated that three quarter book-and-claim matching could require the the procurement an additional 10-15% low-CI power under a three quarter book-and-claim accounting period compared with an annual period, increase electricity price risk and the risk of power matching shortfalls, and could make economics infeasible.

Recognizing these constraints, leading global standards bodies and registries provide for annual book-and-claim for DAC, with an eye to re-evaluate in the future as DAC and electricity sector technologies, markets, and policies evolve. These standards include Verra, Puro.earth, and Isometric¹. Our DAC facilities under development will sell credits to voluntary market customers using the carbon registries' methodologies with annual matching. **Importantly, we cannot generate credits with different matching periods from the same facility, since we cannot effectively operate under two different sets of energy procurement and operating patterns at the same facility. The LCFS market can help accelerate DAC facilities and add to demand to justify new facilities, but only if generating LCFS credits is compatible with the global DAC standards and market.**

Over time as DAC matures with technology advancements, economies of scale, market and supply chain development, and as firm dispatchable low-carbon electricity becomes more available, increasingly granular book-and-claim accounting may become more achievable and could be considered under LCFS. We would like to highlight our suggestion for CARB to convene a dialogue with key stakeholders to consider how electricity book-and-claim accounting for DAC should evolve alongside DAC industry maturation. Such a dialogue

¹ Isometric standard currently allows annual book-and-claim for projects under 10 MW

would provide a venue for collecting valuable input to ensure that LCFS requirements mitigate resource shuffling and maximize long-term climate benefits.

We reaffirm our support for the LCFS and gratitude for CARB's important work, and we look forward to further engagement to help ensure the LCFS is a practically workable market that can help drive DAC technology deployment.

Signed:

Re: Proposed Amendments to the Low Carbon Fuel Standard Regulation

California Air Resources Board:

The U.S. Canola Association (USCA) appreciates the opportunity to comment on the California Air Resources Board's (CARB) Proposed Amendments to the Low Carbon Fuel Standard Regulation issued on August 12, 2024.

The USCA is a non-profit commodity organization whose mission is to increase domestic canola production and promote the establishment and maintenance of conditions favorable to growing, marketing, processing and utilization of U.S. canola. Canola has multiple uses and markets and is a renewable, plant-based feedstock used to produce clean burning biomass-based diesel.

The BBD market provides a valuable outlet for surplus canola oil not utilized for food production. Consistent with the intent of the LCFS, biomass-based diesel from canola provides significant environmental benefits as well as contributing to national energy security and the economy. Canola biomass-based diesel contributes to the expansion and diversification of U.S. fuel and energy production, reduces emissions and improves air quality, and provides jobs and additional economic benefits, especially in rural communities. The canola and biomass-based diesel industries have provided these benefits without significant disruption or adverse impacts to consumers.

Currently, U.S. canola production is primarily in the Northern Plains and Pacific Northwest regions of the country. It is predominantly a spring-planted crop harvested in the fall and grown as part of a beneficial crop rotation on diversified farms that grow five or more different crops. Canola production has grown modestly, but steadily over the past few decades. There is potential for continued expansion of canola production on existing cropland in the U.S., including winter canola, in the Pacific Northwest, Great Plains, and Southeast regions. The winter canola with a double crop option in the Southeast provides additional vegetable oil feedstocks from otherwise fallow land.

085.1 **Proposed amendment to limit biomass-based diesel produced from soybean oil and canola oil to twenty percent of total biomass-based diesel annual production**

The 20 percent cap on biofuels made from canola and soybean oils proposed by CARB is arbitrary, unnecessary and unwise. There is no science or data-based justification provided by CARB for the proposed cap. Limiting the use of renewable, plant-based biofuels made from crops grown on existing cropland in North America will result in greater reliance on foreign feedstocks of less certain origin and inhibit the ability to reach emission reduction goals.

CARB's own findings presented at the April 2024 workshop indicated that renewable diesel and biodiesel have a positive impact on both consumers and the environment. CARB's "Staff Report: Initial Statement of Reasons" (ISOR) specifically modeled an alternative (Alternative 1) which "includes several policy mechanisms that have the effect on limiting the number of credits created from existing low-CI pathways" including "a limit on total credits from diesel fuels or sustainable aviation fuel produced from virgin oil feedstocks." The report found that a cap on vegetable oil feedstocks would result in more fossil diesel use.

- 085.2 Canola and other crop-based biofuels are already subject to Induced Land Use Change (ILUC) and indirect emissions analysis, making a cap redundant and unnecessary. Moreover, capping renewable, plant-based feedstocks without any scientific basis sends a signal to markets that California's LCFS program is arbitrary and unpredictable. This will undercut existing investments and potentially eliminate future innovation in plant-based biofuels, which have been the most commercially viable source of emission-reducing fuels.

California reached its previous emissions reduction targets thanks mostly to biomass-based diesel. As a result of that success, it is ramping up future emission reduction targets and plant-based biofuels, especially biodiesel and renewable diesel from soy and canola, providing a low-cost way to reach emissions goals.

- 085.3 Capping canola and soy biomass-based diesel will require California to rely on more imported feedstocks such as used cooking oil (UCO) from China. There has already been a significant increase in UCO imports from China in the past year for renewable diesel in California. It is harder to guarantee or be certain of the origin of UCO or other imported feedstocks, compared to those derived in North America. For example, there is concern that some of the flood of UCO imports in the past year could include palm oil from southeast Asia, which is the subject of significant concerns due to the environmental profile of its production and the concerns over deforestation. There is no deforestation in North America from canola and soybean production and any "indirect" impacts are already accounted for in the overly conservative life-cycle analysis and carbon intensity scores that have been developed for canola and soy biofuels.

- 085.4 The availability of alternative markets for surplus canola production allows farmers to include canola as a sustainable rotational crop on existing farmland. History shows that the agricultural and biofuel industries can respond to demand quickly with sustainable expansion and innovation. Canola acreage and yields in the primary growing state of North Dakota and in the Pacific Northwest continue to grow prudently and efforts are underway to significantly expand winter canola in the Southeast and Great Plains. Oilseed processing capacity is also expanding in tandem.

U.S. canola production has grown modestly, but steadily over the past few decades. There is potential for continued domestic expansion, including winter canola with a double crop option,

in newer growing regions. Winter canola crops, grown on land that would otherwise remain fallow, provides environmental and agronomic benefits. The benefits of winter cover crops are well-documented and ways are being sought to incentivize this practice, which has a cost to farmers. As a winter crop, canola provides ground cover and promotes soil health with more living roots in the soil. This naturally increases the beneficial soil carbon cycle and decreases the need for carbon-based fertilizer and chemicals. Having viable commercial markets for winter crops offsets the cost to growers and provides renewable, plant-based feedstock for biofuels production. Double-cropping soybean with winter canola provides additional vegetable oil feedstocks on existing cropland and fallow land. However, these innovative winter and double-cropping practices will not get established with farmers if biofuel policies and markets are subject to arbitrary actions such as CARB's proposed cap.

Phase out of new Biomass-Based Diesel pathways

085.5

The proposal to phase out new biomass-based diesel pathways in 2031 is also concerning and unwarranted. CARB has a stated goal to achieve 100 percent renewable diesel utilization and the proposed phase out of new biomass-based diesel pathways is unnecessary and counterproductive. If the market becomes saturated, new pathways would no longer be needed and applications for new pathways will stop on their own. If the market has not yet achieved 100 percent saturation, then additional pathways could help achieve the emission reduction goals of the LCFS.

Crop-Based Biofuels Sustainability Criteria

085.6

The CARB proposal to require pathway holders to track North American feedstocks to their point of origin and require independent feedstock certification are unnecessary. There is no evidence to suggest that deforestation or land use change is occurring in the U.S. due to land being converted to agricultural production. Increased agricultural productivity in North America is occurring through yield increases, improved agronomic practices, double cropping and use of previously fallow land that benefits environmentally from having "cover" crops.

085.7

CARB's proposal would further disadvantage plant-based feedstock production in the U.S. and Canada, which are regions with zero or low-risk of deforestation that are already subject to multiple compliance programs. Instead, CARB's proposal would favor feedstocks produced in regions with a significantly higher risk of fraud or deforestation. Despite a large surge in imported waste feedstocks, CARB did not include any measures to address potential fraud in sourcing waste feedstocks. Implementing a targeted, risk-based approach to the proposal's sustainability criteria offers several advantages. It allows CARB to prioritize resources and regulatory efforts where they are most needed, ensures that sustainability criteria are effectively applied without imposing unnecessary burdens on low-risk regions or established sustainability programs, and ensures sufficient supplies of low-carbon fuels for the California market.

085.8

Regions identified as having the lowest risks of deforestation associated with crop-based feedstocks, such as the United States and Canada, should be deemed to be in compliance with CARB's proposed sustainability criteria. If additional measures are imposed, CARB should use an aggregate approach and utilize existing programs and data sources, such as the federal Renewable Fuel Standard (RFS) and USDA crop production data and statistics, to certify that feedstocks grown in North America that are used in the production of biomass-based diesel are produced sustainably and meet CARB's proposed criteria.

The federal RFS already includes protections against land conversion to cropland for biofuel feedstock production. In fact, crop-based biofuels are the only energy sources subject to analysis of indirect emissions and land use change impacts. To be eligible for the RFS, feedstocks have to come from land that was non-forested and in production prior to December 19, 2007. EPA set a national baseline for eligible cropland in 2007 of 402 million acres. If cropland in subsequent years exceeds that baseline, biofuel producers would be required to track and trace where its feedstocks were grown. There is also a threshold of 397 million acres which, if exceeded, would trigger investigation and reassessment of the aggregate compliance program. Neither of these thresholds have been exceeded since 2007. We would also note that the most recent Census of Agriculture data released by USDA on February 13, 2024 shows a 2% decline of total farmland in the United States since 2017. We believe CARB could utilize the existing federal protections and monitoring of land conversion instead of imposing additional, unnecessary compliance burdens. The approach used for the RFS has proven to address sustainability concerns while limiting regulatory burden on market participants.

The USCA urges you to recognize that fuels produced and certified under the federal RFS meet CARB's proposed sustainability criteria. Additional requirements would place an unnecessary burden on the fuel and feedstock providers as well as on CARB's staff and resources for LCFS implementation and enforcement. This additional burden would increase costs without providing any additional environmental benefit.

085.9

We would also point out that, as noted in the proposed amendments issued by CARB in December, the California LCFS already accounts for land use change emissions in its life cycle methodologies. Additional certification requirements would be redundant and create unnecessary burdens and expenses that could increase costs and reduce the amount of renewable fuel available to achieve the LCFS targets.

We hope CARB will make sound decisions based on fact and science, rather than emotion and politics, and recognize the beneficial role that plant-based renewable fuels have made to the emissions reductions achieved over the past decade and the necessary and beneficial role they will play in meeting California's future emissions reduction goals. Again, the USCA appreciates the opportunity to comment on the proposed amendments to the LCFS Regulation and looks forward to continue to contribute toward your efforts to implement an effective program.

Sincerely,

Tim Mickelson

California Air Resources Board
Low Carbon Fuel Standard Program

Re: Comments on Proposed Amendments to LCFS Regulation

086.1 PineSpire supports the strength of the proposed amendments to the regulation, including the strengthened CI standards, Auto-Acceleration mechanism, and overall efforts to improve the integrity of credit generation. We continue to support starting the auto-acceleration method sooner, in order to ensure the changes made in this rulemaking are meaningful in the near term as well as long term.

PineSpire offers the following specific comments on the proposed changes to how e-forklifts participate in the program:

Forklift Energy Economy Ratio (EER)

086.2 CARB's updated proposal to modify the EER of forklifts is an improvement and provides a more consistent methodology. However, forklift capacity is not the best indicator of what forklifts were electrified prior to the baseline year of the regulation. The capacity of a forklift overlaps significantly across Class I, II, III, IV and V forklifts. PineSpire continues to recommend that rather than adjusting the Energy Economy Ratio, CARB phase out eligibility of Class III (pallet jack) forklifts, which were the primary electrified class prior to the baseline year. By phasing out Class III lifts, there is a reconciliation with the pre-regulation baseline while maintaining full incentives for electrification of the significant population of internal combustion forklifts still in California. Using forklift class is also an easier metric to report and to verify than forklift capacity. Alternatively, if CARB feels capacity is the best tool for defining EER adjustments, then PineSpire would recommend the capacity for the full EER is set at 3,000 lbs in order to continue to encourage conversion of all internal combustion forklifts in California.

Phase In of e-Forklift Metering Requirements

086.3 We support the move to metering of forklifts and the newly proposed phase-in is a meaningful step towards feasibility. We appreciate CARBs receiving input from the industry in considering this issue. PineSpire does still recommend CARB extend the phase in period to mid 2026 or even 2027, due to the very significant number of meters that must be deployed throughout the state to meet this requirement. The tens of thousands of forklifts in California will require significant manufacturing, customer education, and resources for deployment. Based on experience in Oregon, a realistic timeline for achieving deployment at this scale is 18 to 24 months from when the regulation is passed.

Thank you for your consideration of our comments.
Sincerely

Ryan Huggins, Partner
PINESPIRE

California Air Resources Board
1001 I Street
Sacramento, CA 95814
VIA Electronic submittal through CARB portal

Re: Valero Renewable Fuels Company, LLC Comments on 15-Day Low Carbon Fuel Standard Amendments Package

Dear Ms. Sahota:

Valero Renewable Fuels Company, LLC ("VRF") appreciates the opportunity to provide comments on the proposed on the California Air Resources Board ("CARB") 15-Day Low Carbon Fuel Standard ("LCFS") Amendments Package (the "Amendments"). VRF is the owner and operator of 12 ethanol plants in the United States with an annual production capacity of approximately 1.6 billion gallons of ethanol. VRF sells its ethanol into California, as well as other low carbon markets in the U.S. and around the world. As one of the nation's largest producers of ethanol, and with its experience both in California and globally, VRF offers the following comments for the California Air Resources Board's consideration.

Approved Certification Systems

087.1 The Amendments propose to allow CARB to approve pathway certification systems that have been recognized by the European Commission for the European Union Renewable Energy Directive ("EU RED") 2018/2001 as of December 31, 2025. VRF supports CARB in using global standards, but would encourage CARB to allow other international low carbon sustainability standards such as the Canadian Fuel Regulations.

Land Use Change

087.2 The Amendments propose a modification of CARB's conservative land use change carbon intensity ("CI") values. The proposed Amendments would allow the Executive Director to further modify already conservative land use change CI values based on region. VRF has a concern surrounding the tremendous amount of discretion provided to the Executive Officer in changing established land use change CI values in a manner that circumvents the rulemaking process and excludes stakeholder input. VRF also has a concern that though CARB's indirect land use values ("ILUC") for corn ethanol are not consistent or appropriate. CARB is using an extremely conservative ILUC value for U.S. corn ethanol while providing a lower ILUC value for Brazilian sugarcane ethanol even though such Brazilian ethanol may be coming from potentially new deforested land.¹ In addition,

087.3

¹ Using the Tier 1 Simplified Calculator, the ILUC for corn-based ethanol is 19.8 gCO₂e/MJ, whereas Brazilian sugarcane ethanol receives an ILUC value of 11.8 gCO₂e/MJ.

ILUC penalties are not extended to the installation of solar arrays, wind turbines, or the extraction of minerals to support EV batteries, despite their potential for significant direct and induced land use changes. For instance, the Department of Energy projects that 10.4 million acres of solar arrays will be needed to help decarbonize the nation's power grid – as much as 83% of that acreage will likely be farmland², which will need to be replaced. VRF urges CARB to adopt a policy that eliminates inconsistencies in its ILUC emissions calculations.

087.4 Given that this Amendment proposal is new and was not included or contemplated in CARB's January 2024 proposal, VRF supports removing this particular proposal from the current Amendments and re-issuing this proposal under a separate rulemaking that allows for full and complete industry contribution.

BEV Lifecycle Emissions

087.5 In its new round of amendments, CARB has once again failed to accurately account for the full lifecycle emissions of battery electric vehicles (BEVs). In stark comparison to CARB's abrupt and dramatic treatment of biofuels to ensure indirect emissions with biofuels are accounted for and subjecting such fuels to a cap, CARB has turned a blind-eye to the analogous indirect emissions associated with BEV and battery production and the mining necessary for the vehicles to function. CARB should abandon this unequal treatment of fuels and vehicle technologies within the LCFS and adopt a full lifecycle emissions analysis for BEVs, including indirect emissions, consistent with CARB's treatment of biofuels and traditional fuels.

Sustainability Requirements for Biomass

087.6 The Amendments propose new sustainability requirements for fuel pathways effective 2026. Unfortunately, this timeframe does not allow for a realistic phase-in of these new requirements. Assuming that CARB adopts these new requirements in November 2024, and the Office of Administrative Law approves them in early 2025, the 2026 requirement for tracking would begin at harvest in Fall 2025. Unfortunately, this also means that the new farmer sustainability requirements for the harvest must occur during planting of the crop in Spring of 2025, or mere weeks after final approval of the Amendments. This does not allow time for farmer implementation of these practices, which in turn could significantly impede the flow of low carbon ethanol into California.

In VRF's experience, only a small subset of farmers currently engage in audited sustainability programs, which means that there is a small amount of qualifying U.S. corn ethanol available to California as well as other international low-carbon programs. VRF urges CARB to extend the 2026 deadline to allow time for farmer outreach and additional farmer participation to increase the volume of ethanol available for the California market.

Crop Cap

087.7 CARB's newly proposed biofuel crop cap is unnecessary; undermines program stability, investment, and low carbon fuel supply; and increases costs for California consumers. Throughout the

² Heller, Marc, "Fight grows over converting farmland to solar fields," GREENWIRE, June 3, 2024.

course of the LCFS program, including during this rulemaking, CARB has maintained that crop-based biofuels play an important role in lowering the carbon intensity of transportation fuels and that the program's stringency in combination with the sustainability guardrails proposed in the 45-day package "reduce the risk that rapid expansion of biofuel production and biofuel feedstock demand could result in deforestation or adverse land use change."³ In fact, as recently as the April 10, 2024 workshop, CARB's Staff presentation continued to support the 45-day package position that they do not believe a crop cap is necessary⁴.

- Slide 40, "Credit Generation for Virgin Oil Feedstocks Naturally Phases Out," which specifically highlights that virgin oil feedstocks become *deficit generating* in 2033 unless the AAM is triggered twice at which point, they generate deficits in 2030.
- Slide 57, CARB states that, "Based on current and future understanding of market conditions, it is uncertain if substantial increases in virgin oil fuel use in California will occur over long-term."
- Slide 58, CARB presents a portfolio of guardrail mechanisms that are already adopted in the LCFS or under evaluation – crop caps are noticeably absent.

While CARB has previously and continuously indicated it does not believe a crop cap is necessary, in its abrupt position change—at this late stage of rulemaking—it has failed to provide any empirical data to support such a position change. In fact, in the 15-Day Changes package "Notice", CARB does not identify any concerns with Land Use Change (LUC) or even mention emissions related to the use of soybean oil or canola oil to produce low-carbon fuels related to the proposed biofuels crop cap. Instead, CARB attempts to justify its position based on a self-identified new responsibility that CARB "must ensure that other regions are able to also access increasing volumes of low-carbon alternative fuels."⁵ However, CARB is not tasked with developing an LCFS that ensures the availability of low-carbon fuels to other markets, and certainly not one which is both arbitrary in its application and detrimental to LCFS program participants and California consumers alike. Indeed, CARB's own justification acknowledges that the fuels subject to the biofuels cap are low-carbon alternative fuels. Thus, CARB's newfound justification—ensuring other markets can access low-CI fuels—directly contradicts the entire purpose of the state's LCFS because it prevents fuels that could reduce the carbon intensity of the transportation fuel pool from ever reaching the market.

CARB's late stage position reversal and newly proposed crop cap risk undermining innovation in the Biomass-based diesel markets, including those who have begun to explore potential opportunities in the production of sustainable aviation fuel (SAF), another of CARB's key areas of concern. Moreover, investors and producers may view such unsupported position changes as a potential slippery slope under which CARB may simply decide to extend such limits to broader categories of feedstocks (e.g. all lipids or all crops) or even all liquid pathways, limiting investor confidence and forestalling future low-carbon investments and innovation. Policy makers in other states may also find that such arbitrary actions by CARB limit the exportability of the California LCFS to new markets and may well result in an unintentional regional crop cap program, should Oregon and Washington adopt CARB's updates to the program.

³ CARB, LCFS 2023 Amendments, Initial Statement of Reasons (ISOR), December 19, 2023 at 32, <https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2024/lcfs2024/isor.pdf>.

⁴ <https://ww2.arb.ca.gov/sites/default/files/2024-04/LCFS%20April%20Workshop%20Slides.pdf>

⁵ CARB, Notice of Public Availability of Modified Text and Availability of Additional Documents and/or Information August 12, 2024 at 4, https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2024/lcfs2024/15day_notice.pdf

In addition, CARB has not provided any analysis as to the projected effect of the proposed crop caps on the supply of Biomass-based diesel to the California markets, including the potential for physical supply shortages, impacts to market liquidity, the potential for low-carbon Biomass-based diesel to be displaced by CARBULSD (given CARB's proposal to apply the same CI to both fuels, if produced above the cap) thus potentially increasing emissions, and the increased program compliance costs borne by California consumers.

Finally, CARB's proposed crop cap conflicts with the intent of the federal Renewable Fuel Standard (RFS) by artificially limiting the domestic markets available to Biomass-based diesel. CARB should refrain from implementing the proposed crop cap unless and until there is sufficient analysis of the impacts to domestic Biomass-based diesel production, imports, and exports, and the resulting ability to achieve RFS obligations.

We appreciate your consideration of our comments. If you have any questions or would like to discuss any of the points discussed in this letter, please do not hesitate to contact us.

Sincerely,

Fight grows over converting farmland to solar fields

By Marc Heller

06/03/2024 01:19 PM EDT

A fight to stop the conversion of farmland to solar energy production is bumping into efforts to make farming and energy production work together.

The emerging practice of “agrovoltatics,” or using land both for solar energy and food production, could be a casualty of a conflict that’s playing out among policymakers, industry groups and lawmakers as the 2024 farm bill takes shape.

The pressure is almost certain to grow.

The American Farmland Trust estimated that several million acres of farmland — much of it highly productive for crops — could end up as solar farms in the coming years as the U.S. seeks to reduce greenhouse gas emissions, unless federal agencies or Congress step in to guide decisions.

The Department of Energy projects that 10.4 million acres of solar arrays would be needed to help decarbonize the nation’s power grid. But that may be an underestimation, said Samantha Levy, conservation and climate policy manager at the AFT.

As much as 83 percent of that acreage would likely be on farmland, Levy said. And half of the farmland could otherwise be productive for agriculture, she said, citing the organization’s own analysis.

Farmland is appealing, Levy said, because it’s flat, has already been cleared of trees and often is near electric transmission lines.

Levy and other analysts at the AFT projected in 2022 that one county in New York’s Mohawk Valley could lose almost 35 percent of its active farmland, or 4,000 acres, to proposed solar projects.

Between federal and various state incentives, the AFT said in a report, “this huge boost to solar energy makes the outcomes envisioned by solar modeling scenarios that lead to net-zero [greenhouse gas] emissions in the energy sector much more likely.”

The report continued, “These scenarios anticipate a much larger demand for solar, significantly increasing the amount of land needed to host solar projects.”

The federal government supports solar energy development on farms through initiatives such as the Rural Energy for America Program, which provides loan guarantees and grants to energy efficiency projects in rural areas. Every year, the program funds hundreds of small farm-based solar energy projects that fill on-farm energy needs and provide electricity to a handful of homes, for instance.

“Solar done right like on rooftops and smart agrivoltatics (as well as other distributed renewables) is simply put a massive opportunity for farmers across America,” said Lloyd Ritter, director of Green Capitol and executive director of the Agriculture Energy Coalition, in an email. “We need more, not less, distributed renewables in farm country to help keep farmers farming and on the land.”

Combining farming and solar energy still faces hurdles. In Gainesville, Texas, the solar development company Adapture Renewables produces electricity for 14,000 homes on a farm where 400 sheep graze around the panels. The animals keep the grass from growing tall enough to shade the panels, the company said.

But most of Adapture's 36 projects around the country aren't agrovoltaic, and combining solar energy with cattle grazing or crop production adds expenses or practical challenges — like raising the panels more than the 3 feet provided for sheep — that the company hasn't tried to tackle, said Elora Arana, project development manager.

"Everything comes down to economics," Arana said.

Adapture is also looking into combining solar production with pollinator habitat, Arana said.

Whether such projects count as farming is open to interpretation. Growing plants for bees and butterflies around solar panels, or bringing in sheep to graze only on occasion to trim the grass, may be "dual use" but don't meet the AFT's definition of agrovoltaics.

"For AFT, all agrovoltaics are dual-use, but not all dual-use is agrovoltaic," the organization said in comments submitted to the Department of Agriculture at a clean energy siting listening session.

Farm bill debate

The conflict over solar projects played out in deliberations on the 2024 farm bill in the House Agriculture Committee on May 23.

Rep. Chellie Pingree (D-Maine) criticized a provision in the bill that would block the USDA from funding solar energy projects on productive farmland.

Pingree said she, too, worries about land being taken out of food production to support solar arrays. But the bill was written in a way that could discourage or possibly block agrovoltaic projects, she said.

The bill, which passed in committee and is awaiting House action, would prohibit the USDA from funding solar projects that result in conversion of more than 5 acres of farmland, or more than 50 acres if most of the energy produced goes to off-farm use. Exceptions would apply if a project is approved by local counties and municipalities.

Pingree said farmers in Maine raise sheep and grow blueberries among solar panels and in one town provide solar power to local schools. Federal funding that has helped farmers launch such projects could dry up, she warned.

"There's a variety of things going on, and that would be prohibited under this," Pingree said.

Among other ventures, the University of Maine Cooperative Extension service [is researching combining solar energy and wild blueberry production](#).

Pingree said the bill's provision is "overly broad, vague and could cause a lot of confusion for farmers who are using solar power," although committee Chair Glenn Thompson (R-Pa.) said it allows for dual-use solar production.

Thompson based the provision on a bill by Rep. Mike Bost (R-Ill.). A spokesperson for Bost, Kadin Asbery, said farmers could still receive USDA funding for solar energy projects if the land meets state-level requirements for agricultural production.

The National Rural Electric Cooperative Association worries that limiting solar development on farms could hamper efforts to diversify energy sources in areas its members serve, said Stephen Bell, senior director of media and public relations.

"Electric cooperatives are locally owned and governed organizations," Bell said. "We are concerned this proposal limits a co-op's ability to make the best decisions to preserve affordability and reliability for the unique communities they serve."

In 2023, the AFT launched a "smart solar" project to spotlight how farming and solar energy production can co-exist.

While solar production should be focused on rooftops and land that's not suitable for crops or livestock, agrovoltaics should be expanded across the country through state and federal incentives, the AFT said. In comments submitted to the Biden administration in January, the organization said the USDA should adopt a clear definition of the practice and encourage it throughout agriculture programs.

“America needs both renewable energy and productive, resilient farms and ranches,” the AFT said. “Having both will take intentional federal, state and local action.”

Public Hearing to Consider the Proposed Amendments to the Low Carbon Fuel Standard

Staff Report: Initial Statement of Reasons

Date of Release: December 19, 2023
Scheduled for Consideration:
March 21, 2024

This report has been reviewed by the staff of the California Air Resources Board and approved for publication. Approval does not signify that the contents necessarily reflect the views and policies of the California Air Resources Board, nor does mention of trade names or commercial products constitute endorsement or recommendation for use.

VMT	Vehicle Miles Traveled
ZEV	Zero-Emission Vehicle

Executive Summary

California is the midst of a rapid transition to cleaner fuels and carbon neutrality, with just over 20 years to transition from today's significant fossil fuel usage to a future of clean fuels and technology. In 2022, the California Air Resources Board (CARB) approved the 2022 Scoping Plan for Achieving Carbon Neutrality (2022 Scoping Plan Update), which charted a path to achieving carbon neutrality by 2045 and reducing greenhouse gas emissions 85% below 1990 levels by 2045. Meeting this goal will require the deployment of greenhouse gas (GHG) emission reduction strategies at an unprecedented scale and pace.

Many of the strategies identified in the 2022 Scoping Plan Update to address climate change and achieve carbon neutrality are the same strategies needed to drastically improve air quality. As transportation emissions, primarily from the use of fossil fuels, are California's single biggest source of greenhouse gas emissions and contributor to poor air quality, the State is working to rapidly increase the numbers of zero-emission vehicles on the road and deploy cleaner fuels to power them. If California is successful in meeting the clean fuel and vehicle goals identified in the 2022 Scoping Plan Update, we will reduce fossil fuel demand by 94% by 2045. CARB has already taken significant steps to reducing transportation emissions by adopting regulations such as Advanced Clean Cars II, Advanced Clean Fleets, Advanced Clean Trucks, Innovative Clean Transit, and other rules that promote and accelerate the deployment of low and zero-emission technologies.

The Low Carbon Fuel Standard (LCFS) is a key part of California's transportation decarbonization strategy and a successful one thus far. The LCFS provides the economic incentives to produce cleaner fuels like electricity, hydrogen and biofuels that are needed to displace fossil fuels and reduce transportation sector emissions. The LCFS has supported the displacement of billions of gallons of petroleum fuels with lower carbon alternatives, and without these alternative fuels the State risks returning to higher levels of fossil fuel use and fewer climate and air quality benefits. With clear scientific consensus on the need to rapidly decarbonize and achieve carbon neutrality by mid-century, the significant health and economic benefits of phasing down fossil fuel use, and the introduction of federal funding for alternative fuels and clean energy, now is the time to update and strengthen the LCFS regulation. This regulatory update proposal, which is described in detail in this staff report, is focused on the following key concepts:

- Increasing the stringency of the program to reduce emissions and decarbonize the transportation fuel sector, which will also aggressively reduce our dependence on fossil fuels;
- Strengthening the program's equity provisions to promote investment in disadvantaged, low-income and rural communities;
- Supporting electric and hydrogen truck refueling;
- Incentivizing more production of clean fuels needed in the future, such as low-carbon hydrogen;
- Supporting methane emissions reductions and deploying biomethane for best uses across transportation; and
- Strengthening guardrails on crop-based fuels to prevent deforestation or other potential adverse impacts.

These proposed changes, if adopted, would result in significant GHG reductions as well as air quality, health, and economic benefits across the State. These benefits include:

GHG Reductions

- 90% reduction in carbon intensity of California's transportation fuels by 2045.
- 558 million metric tons of life cycle CO_{2e} reductions from the amendments.

Health Benefits

- Almost \$5 billion in total avoided health costs resulting from nearly 4,300 tons of PM_{2.5} reduction and more than 25,000 tons of NO_x reductions.

Economic Benefits

- \$128 billion in revenue estimated accruing to California businesses from credit generation/sales.
- Job growth in the electricity and biofuel sectors as demand for these fuels grows.
- Increases the diversity and competitiveness of transportation fueling options for California consumers, transitioning supply from just ten fossil fuel refiners to hundreds of individual biofuel, electricity, and hydrogen producers.

The changes would also help support implementation of California's world-leading zero-emission vehicle policies, align with the 2022 Scoping Plan Update, and provide a model for other jurisdictions looking to deploy clean fuel and climate policies. And finally, as Californians transition away from less-efficient fossil fuels and into more energy efficient zero-emission vehicles (ZEVs) and lower-carbon fuel alternatives, the fuel costs Californians pay to travel would also decrease, providing Californians billions of dollars in savings. CARB staff estimates the amount of money Californians spend on fueling costs across all vehicle class could be up to 42% lower in 2045 than compared to fuel costs in 2021. This translates into an annual savings of over \$20 billion in fuel expenditures in 2045 alone.

I. Introduction and Background

In this chapter, the California Air Resources Board (CARB or Board) staff provides a brief overview of the Low Carbon Fuel Standard (LCFS) regulation (California Code of Regulations, title 17, sections 95480-95503), information on the history and status of the LCFS program, and an overview of the proposed revisions to the program.

The purpose of the LCFS regulation is to reduce the carbon intensity (CI) of transportation fuels used in California, thereby reducing GHG emissions, and to incentivize the production of low-carbon and renewable alternatives, such as low-CI electricity and renewable hydrogen, and biofuels to displace fossil fuels and allow more energy security in the transportation sector. It is the most direct tool being deployed to reduce dependence on fossil fuels in the transportation sector.

The Board approved the LCFS regulation in 2009 as a discrete early action measure under the California Global Warming Solutions Act of 2006 (Assembly Bill [AB] 32, Núñez and Pavley, Chapter 488, Statutes of 2006; Healthy and Safety Code sections 38500 et seq.). Since the passage of AB 32, California has developed bold, creative, and durable policy solutions to protect our environment and public health. In fact, California met the target established in AB 32—a return of GHG emissions to 1990 levels by 2020—six years ahead of schedule.

Recognizing California's early successes in achieving GHG emissions reductions and the need to accelerate climate mitigation efforts, California has continued to enact ambitious goals and take concrete steps to achieve them. There have been several major new climate statutes enacted and executive orders issued since the last major LCFS rulemaking in 2018. In 2022, Governor Gavin Newsom signed several climate bills, including AB 1279 (Muratsuchi, Chapter 337, Statutes of 2022), Senate Bill (SB) 905 (Caballero, Chapter 359, Statutes of 2022), and SB 1020 (Laird, Chapter 361, Statutes of 2022). AB 1279 requires an 85% reduction in anthropogenic GHG emissions below 1990 levels by 2045. SB 905 requires CARB to adopt regulations creating a framework for the development of carbon capture, removal, and storage projects by 2025. And SB 1020 includes new benchmarks of 90% clean electricity by 2035 and 95% by 2040 ahead of the 100% goal by 2045. A particular focus on the transportation sector was established through Executive Order N-79-20.¹ Signed in 2020, Executive Order N-79-20 established a State goal that sales of all new passenger vehicles be zero emission by 2035 and that 100% of medium- and heavy-duty vehicles in the State be zero emission by 2045 for all operations where feasible and by 2035 for drayage trucks. The 2022 Scoping Plan Update,² approved by the Board in December 2022, lays out a cost-effective and technologically feasible path to achieve these targets and achieve carbon neutrality by 2045.

The 2022 Scoping Plan Update signals the need for an aggressive reduction of fossil fuel use, building on and accelerating greenhouse gas reduction programs that have been in place for a decade and a half, including the LCFS program. This means rapidly moving to zero-emission

¹ State of California Executive Department, Executive Order N-79-20. September 23, 2020. <https://www.gov.ca.gov/wp-content/uploads/2020/09/9.23.20-EO-N-79-20-Climate.pdf>

² California Air Resources Board, 2022 *Scoping Plan for Achieving Carbon Neutrality*. November 16, 2022. https://ww2.arb.ca.gov/sites/default/files/2022-12/2022-sp_1.pdf

transportation; transitioning the cars, buses, trains, and trucks that now constitute California's single largest source of planet-warming pollution to zero-emission technology. In the transportation sector, the transition to complete zero-emission vehicle (ZEV) technology will not happen overnight.

Achieving GHG emissions of 85% below 1990 levels by 2045 will require significant investment and use of lower carbon opportunities while zero-emission technologies gain market penetration and achieve interim climate goals. Conventional internal combustion engine vehicles from legacy fleets will remain on the road for some time, even after all new vehicle sales have transitioned to ZEV technology. Therefore, it is necessary to ensure there are reliable and adequate low-carbon fuel supplies available and continue expansion of low-carbon fuel production in ways that use existing infrastructure where possible, such as transitioning refineries to clean fuel production.³

Meeting this demand requires building out significant new low-carbon energy supply capacity, which the LCFS incentivizes in the transportation sector. Specifically, a greater demand for electricity and renewable hydrogen is expected, necessitating the expansion of renewable electricity and hydrogen production; the transition of low-carbon liquid biofuels from end-uses from on-road vehicles with many zero-emission options into sectors that are more difficult to decarbonize like aviation, marine, and other off-road uses; and transition of biomethane used as compressed natural gas (CNG) in vehicles to a feedstock for hydrogen or an energy source to decarbonize the broader natural gas system. Successful implementation of the technology and fuel switching called for in the 2022 Scoping Plan Update results in a 94% reduction in liquid petroleum demand by 2045 compared to 2022, as shown in Figure 1. For these outcomes to happen, California must accelerate the pace of clean energy and technology deployment. Private investments, policy signals such as a more stringent LCFS, and federal incentives will all need to be leveraged to realize the outcomes in the 2022 Scoping Plan Update.

³ State of California Executive Department, *Executive Order N-79-20*. September 23, 2020. <https://www.gov.ca.gov/wp-content/uploads/2020/09/9.23.20-EO-N-79-20-Climate.pdf>

Figure 1: Fossil Fuel Demand Projections in 2045 relative to 2022 (from 2022 Scoping Plan Update)

The LCFS also supports other existing State GHG reduction efforts; notably, the Short-Lived Climate Pollutant (SLCP) Reduction Strategy, Advanced Clean Cars II (ACC II) regulations, Advanced Clean Fleets (ACF) regulation, Clean Truck Partnership, Advanced Clean Trucks (ACT) regulation, 2020 Mobile Source Strategy, Sustainable Freight Action Plan (SFAP), Commercial Harbor Craft (CHC) regulation, In-Use Locomotive regulation, Innovative Clean Transit (ICT) regulation, and Renewable Portfolio Standard (RPS). SB 1383 (Lara, Chapter 395, Statutes of 2016) requires a 40% reduction in California’s methane emissions by 2030 and the LCFS facilitates significant private investment in technologies that provide the methane reductions from dairy, livestock manure, organic waste, and landfill management operations called for by SB 1383. On the vehicle side, ACC II serves as the primary mechanism to help deploy ZEVs in the light-duty vehicle (LDV) sector. The LCFS supports ACC II implementation by incentivizing electricity and hydrogen infrastructure through the ZEV infrastructure crediting provisions, providing credits for the delivery of low-CI electricity and hydrogen to vehicles, and through rebate and other transportation electrification support from the proceeds from LCFS credit sales earned by electric utilities. Similarly, the opportunity to generate LCFS credits helps to reduce the up-front costs for fleets to purchase new zero-emission trucks, locomotives, and buses and equipment to achieve the SFAP, ACF, ICT, In-Use Locomotive, and ACT goals. By recognizing the carbon intensity of renewable electricity used to produce transportation fuels, the LCFS rewards fuel providers across the supply chain for the displacement of fossil fuel consumption by biomethane, wind, solar, and other lower carbon technologies, as well as the use of renewable power for vehicle charging. Several of these regulations also require the use of renewable fuels during the transition to zero-emission technology. The ICT regulation requires large transit agencies to use renewable fuel in remaining combustion-powered buses, and the ICT and In-Use Locomotive regulations

support the use of hydrogen as well. The ACF regulation requires fleet turnovers beginning in 2024; however, this transition is contingent upon the availability of refueling infrastructure, which this LCFS proposal would incentivize.

The LCFS provides the necessary price signals and incentives to leverage private investment and scale the low-carbon fuel production needed to displace fossil fuels. This is borne out in the program's history. As shown in Figure 2, California has doubled the volume of the State's low-carbon fuel consumption in just 10 years and diversified the fuel mix considerably, due in large part to the LCFS program.

Figure 2: Alternative Fuel Volumes in California between 2011-2022

The 2022 Scoping Plan Update directly identifies that the stringency of the LCFS CI benchmarks should be increased, both pre- and post-2030, which is the key change staff is proposing for this rulemaking. The objective is to send clear, long-term market signals to support investment in low-carbon fuel production and technologies that are needed to achieve deep emissions reductions in the transportation sector while supporting the broader portfolio of zero-emission vehicle regulations and climate statutes. Another goal is to align the crediting opportunities in the LCFS with the fuel and technology pathways identified in the 2022 Scoping Plan Update. To encourage additional GHG reductions in key areas where decarbonization will be important to meet long-term climate goals, staff proposes to eliminate the current exemption for intrastate fossil jet fuel starting in 2028 and expand ZEV infrastructure crediting to the medium- and heavy-duty vehicle sector under the program. Given the need to quickly scale low-carbon fuel production in this decade and staff's experience implementing the program for over a decade, staff also proposes to update and streamline several quantification methods and analysis tools so that the program does not unnecessarily slow down the investment or availability of low-carbon fuels and so other jurisdictions can establish similar programs without significant administrative needs. As a means of increasing the flexibility of the program to be

able to respond to rapid and unanticipated shifts in the market, such as significant overperformance of ACC II or ACF implementation, staff also proposes a mechanism that would automatically accelerate the carbon intensity benchmarks under certain conditions. Finally, in response to the near-term over-performance, staff has included a step down in the carbon intensity beginning in 2025.

A. Overview of the Low Carbon Fuel Standard

Transportation plays a key role in California's economy and lifestyle. The production and use of traditional petroleum-derived transportation fuels—such as gasoline and diesel—are responsible for almost 50% of statewide GHG emissions, the largest source of GHG emissions in 2020.⁴ The LCFS is part of the State's set of policies to meet California's ambitious climate goals, which are described in the 2022 Scoping Plan Update. The 2022 Scoping Plan Update demonstrates that significant increases in low-carbon fuel and technologies are needed in a faster timeframe than we have historically seen.

The LCFS is designed to decrease the carbon intensity of California's transportation fuel pool and provide an increasing range of low-carbon and renewable alternatives, which reduce petroleum dependency and achieve air quality benefits.⁵

Providers of transportation fuels must cumulatively demonstrate that the mix of fuels they supply for use in California meets the LCFS carbon intensity standards, or benchmarks, for each annual compliance period. Regulated entities required to report fuels provided may demonstrate compliance through a system of credits and deficits. Credits are generated by supplying fuels with lower carbon intensity than the benchmark. Deficits result from supplying fuels with higher carbon intensity than the benchmark. This concept is illustrated in Figure 3. A deficit generator meets its compliance obligation by retiring credits it earns or otherwise acquires from another party equal to the deficits it has incurred. Credits and deficits are generally determined based on the quantity of fuel sold, the carbon intensity of the fuel, and the efficiency by which a vehicle converts the fuel into usable energy.

⁴ California Air Resources Board, *California Greenhouse Gas Emissions for 2000 to 2020, Trends of Emissions and Other Indicators*. Pages 10-14. 2022. https://ww2.arb.ca.gov/sites/default/files/classic/cc/inventory/2000-2020_ghg_inventory_trends.pdf. This includes upstream oil extraction and refining emissions.

⁵ Carbon Intensity (CI) is a measure of the GHG emissions associated with the various production, distribution, and consumption steps in the "life cycle" of a transportation fuel, denoted in units of gCO₂e/MJ.

Figure 3: Illustration of LCFS Mechanics – How Credits and Deficits are Calculated

There are three ways to generate credits in the LCFS: fuel pathways, projects, and capacity-based crediting. Under fuel pathway-based crediting, all transportation fuels need a CARB-certified carbon intensity score to participate in the LCFS, and the fuel type dictates which process is used to determine that CI. Additionally, there are CARB-approved LCFS project-based actions that may generate credits, such as by demonstrating carbon capture and sequestration, using solar-generated steam at oil and gas extraction sites, and investing in refinery improvements that reduce GHG emissions. Finally, the 2018 amendments added capacity-based crediting to support the deployment of ZEV refueling infrastructure. Crediting for ZEV infrastructure is based on the capacity of the hydrogen station or fast charging site minus the actual fuel dispensed. Credits and deficits are denoted in metric tons of GHG emissions. Credits may be banked and traded within the LCFS market to meet compliance obligations.

The LCFS carbon intensity benchmarks are an annually declining standard, which is defined in the LCFS regulation as a percentage reduction from the historical average carbon intensity of gasoline and diesel fuel in the year 2010. To determine the carbon intensity value of a particular fuel, the GHG emissions from the fuel's life cycle are summed and divided by the fuel's energy content (in megajoules). GHG emissions from each step can include carbon dioxide (CO₂), methane (CH₄) and nitrous oxide (N₂O), which are adjusted by the Intergovernmental Panel on Climate Change global warming potentials to their CO₂ equivalent. Thus, carbon intensity is expressed in terms of grams of CO₂ equivalent per megajoule (gCO₂e/MJ).

The LCFS is based on the principle that each fuel has life cycle GHG emissions. This life cycle assessment (LCA) examines the GHG emissions associated with the production, transportation, and use of a given fuel. The LCA includes direct emissions from the energy and material inputs for the production, transport, and use of the fuels, as well as significant GHG emissions from market-driven changes, such as changes in land use for some crop-derived biofuels, and emissions that may result from market displacement effects (e.g., when a material is diverted from its historic use in order to produce a fuel, causing increased demand for another material to substitute the fuel for feedstock). The system of declining benchmarks that is used to calculate credits and deficits, and the obligation of deficit-generating fuels to be canceled out by credits, result in a decrease in the total life cycle GHG emissions from the transportation fuel pool in California.

A more complete description of how the LCFS regulation is designed to work, as well as its underlying scientific and economic principles, can be found in the initial and final statements of reasons for the original 2009 rulemaking,⁶ and the 2011,⁷ 2015,⁸ 2018,⁹ and 2019 LCFS rulemakings.¹⁰

B. History and Current Status of the Low Carbon Fuel Standard

CARB initially approved the LCFS regulation in 2009 as an early action measure under AB 32 and began implementation in 2010. Throughout the 14 years since the Board's original adoption, the basic framework of the current LCFS—including the use of LCA, the LCFS credit market, and the electronic registry of fuel reporting—has worked well and continues to support growth in an increasingly diverse and low-carbon transportation fuel pool.

CARB approved revisions to the LCFS in December 2011, which became effective on November 26, 2012, and were implemented by CARB on January 1, 2013. On July 15, 2013, the State of California Court of Appeal, Fifth Appellate District (Court) issued its opinion in POET, LLC versus California Air Resources Board (2013) 218 Cal.App.4th 681, resulting in a stay of the LCFS. The Court held that the LCFS adopted in 2009 and implemented in 2010 (referred to as 2010 LCFS) would remain in effect and that CARB could continue to implement and enforce the 2013 regulatory standards while taking steps to remedy California Environmental Quality Act and Administrative Procedure Act issues as required in the ruling.

To address the court ruling, CARB brought a revised LCFS regulation to the Board for readoption in February 2015. The 2015 rulemaking included many amendments, updates, and improvements to the program, including a compliance schedule that maintained the 2009 LCFS regulation's target of a 10% reduction in average carbon intensity by 2020 from a 2010 baseline. On September 24, 2015, the Board approved that revised LCFS regulation, which became effective on January 1, 2016.

In September 2018, the Board approved amendments to the LCFS regulation, which became effective on January 4, 2019. The 2018 rulemaking included many amendments, updates, and improvements to the program, including strengthening the CI reduction benchmarks to a 20% reduction from a 2010 baseline by 2030, in line with the 2017 Scoping Plan Update and California's 2030 GHG target enacted through SB 32 (Pavley, Chapter 249, Statutes of 2016) and adding a third-party verification provision to enhance the integrity of the program.

As part of the hearings to adopt the amendments proposed in 2018, the Board directed the Executive Officer to monitor the cost containment provisions of the LCFS program, including the Credit Clearance Market, and to propose technical adjustments through future rulemaking to strengthen the cost containment provisions, if needed. The Board also directed the Executive Officer to work with stakeholders to establish an equity-based framework for the possible uses of base credit value from residential charging, consistent with legislative priorities. To address Board direction, CARB brought changes focusing on strengthening the cost containment provisions of the LCFS program and addressing equity in the use of LCFS credit value for electricity to the Board through a rulemaking in 2019. In April 2020, the Board approved the current LCFS regulation. The current regulation became effective on July 1, 2020.

California is receiving significant volumes of low-carbon fuels in response to the LCFS, including ethanol, biomass-based diesel, biomethane, and low-CI electricity. In addition to increased volumes, fuel producers have also been successfully reducing the carbon intensity of their fuels over the past years by using low-carbon feedstocks, improving production efficiency, and reducing fugitive emissions. The effect of both increasing volumes of low-carbon fuels and reduced carbon intensity of those fuels has meant that California's overall petroleum fuel use has declined by 1.3 billion gallons since 2019, the overall carbon intensity

of California’s transportation fuels has declined by 12.63% relative to 2010 levels, and the LCFS credit bank of excess credits has grown to its highest level to date with 15 million credits, as shown in Figure 7. The financial benefits are distributed among providers of various alternative fuels (as illustrated in Figure 3), geographically across California,¹¹ and across the participating credit generators.¹²

Figure 4: Quarterly Credits and Deficits for All Fuels Reported and Cumulative Credit Bank (Q1 2011 through Q4 2022)

By decarbonizing the transportation fuel sector, the LCFS has resulted in increased diversification of transportation fuel options in California and less dependence on fossil fuels. Before the LCFS, the only alternative fuels with market share were natural gas and ethanol. Since the inception of the LCFS, California has doubled the volume of low-carbon fuel consumption and diversified the fuel mix considerably. Collectively, alternative fuels supported by the LCFS displaced over 3.9 billion gallons of petroleum fuel in 2022 in California. More recently, renewable diesel and electricity have taken on an increasingly larger share of the fuel pool, as shown in Figure 8. Electric vehicle (EV) charging has increased substantially in the last few years, and it is expected that electric vehicles will be an increasing portion of the market share, driven in part by California’s vehicle regulations, including ACC II, ICT, and ACF regulations in conjunction with recent federal incentives. Renewable diesel capacity also increased by over 500% between 2013 and 2020, and many U.S. fuel producers have made

¹¹ Beneficiaries include California municipal transit agencies, fueling facilities, equipment service providers, utilities, as well as fuel producers and project developers across the United States and abroad.
¹² California Air Resources Board, *LCFS Data Dashboard Figure 9: LCFS Credit Market Net Position Histogram*. (Updated on July 31, 2023). <https://ww2.arb.ca.gov/resources/documents/lcfs-data-dashboard>

announcements for expanded production in the coming years. Nearly half of California's diesel pool was composed of alternative fuels in 2022.¹³

Figure 5: Annual Alternative Fuel Volumes and Credit Generation by Fuel Type

In addition to increases in renewable diesel and electricity, hydrogen and alternative jet fuel (AJF) quantities reported to the LCFS have increased as well. Since 2019, when AJF became eligible as an opt-in fuel in the LCFS, volumes have increased from about 1.8 million gallons in 2019 to about 11.6 million gallons in 2022, and those volumes continue to increase as momentum builds in the aviation sector and with new federal incentives. Hydrogen quantities, although still relatively small, nearly doubled from 2018 to 2019, and have more than quadrupled since 2018.¹⁴ The program is also supporting refueling infrastructure needed to refuel ZEVs. The 2018 LCFS amendments added the Hydrogen Refueling Infrastructure (HRI) and Direct Current (DC) Fast Charging Infrastructure (FCI) provisions. These provisions are designed to support the buildout of publicly-available ZEV refueling infrastructure for light-duty vehicles in California in the early years while refueling demand is low, with the expectation that vehicle demand will increase as refueling availability increases. Crediting is provided for eligible infrastructure based on the unused refueling capacity, and credit generation phases out naturally as fueling throughput increases and unused capacity decreases. The provisions limited infrastructure crediting to 5% of deficits and required applications to be submitted prior to 2026. To date, CARB has approved 75 hydrogen stations and over 3,200 DC fast chargers at 511 sites.¹⁵

Over 30 million LCFS credits were sold or traded in approximately 3,100 transactions in 2022, demonstrating an active credit market with an annual transactional value of nearly \$4 billion.

¹³ California Air Resources Board, *LCFS Quarterly Data Spreadsheet*. (Updated on July 31, 2023). <https://ww2.arb.ca.gov/resources/documents/lcfs-data-dashboard>

¹⁴ Ibid.

¹⁵ California Air Resources Board, *LCFS ZEV Infrastructure Crediting webpage*. (Accessed on April 18, 2023). <https://ww2.arb.ca.gov/resources/documents/lcfs-zev-infrastructure-crediting>

Credits in 2022 were generated primarily from renewable diesel (36%), electricity (24%), biomethane (16%), and ethanol (14%). More than 522 active entities are registered for reporting in the LCFS Reporting Tool and Credit Bank & Transfer System (LRT-CBTS), and more than 1,300 individual alternative fuel pathways have been approved with carbon intensities below the current benchmarks.

The current LCFS targets a 20% reduction in fuel carbon intensity by 2030 and maintains that benchmark for all subsequent years. A primary objective of this rulemaking is to strengthen the carbon intensity benchmarks of the LCFS regulation both pre- and post-2030 so that the LCFS continues to serve as a key policy to reduce GHG emissions from the transportation sector. Achieving the GHG reduction goals of the 2022 Scoping Plan Update will require significant changes in every sector of the State's economy. California's transportation industry remains the largest contributing sector to the GHG Inventory,¹⁶ and transitioning to ZEVs and deploying low-carbon fuels is critical for achieving California's climate and air quality targets.

Federal policy support plays a role in the fuels and technologies that come to California through the LCFS. The U.S. Environmental Protection Agency (U.S. EPA) implements a Renewable Fuel Standard (RFS) program (Code of Federal Regulations, title 40, part 80, sections 1100 et. Seq.) that mandates the blending of specific volumes of renewable fuels into gasoline and diesel sold in the U.S. to achieve a specified ratio for each year. As defined, "renewable fuels" under the RFS resemble the list of transportation fuels subject to the LCFS. The two policies are complementary and support a reduction in fossil fuel consumption and diversification of the fuel pool. In addition to the RFS, the Inflation Reduction Act (IRA) of 2022¹⁷ provides tax incentives and financial support for biofuel and hydrogen production. The newly created Hydrogen Production Tax Credit (45V)¹⁸ incentivizes the domestic production of clean hydrogen, which will make this emerging low-carbon fuel source more cost-competitive and help the country meet the ambitious goals of the Hydrogen Shot¹⁹, an effort to accelerate breakthroughs in hydrogen technology and cut the cost of clean hydrogen by 80% to \$1 per kilogram in one decade. This federal support represents a once-in-a-generation investment in clean fuel production and infrastructure, and California is poised to leverage the existing LCFS mechanism to bring investment to California. The LCFS also supports use of carbon capture and sequestration (CCS) in connection with transportation fuel production, and direct air capture (DAC) with carbon sequestration projects. These capital-intensive projects are also supported by the federal government through the 45Q tax credit for CCS^{20,21} and research and

deployment grants from federal agencies.^{22,23} Investments in California leveraging federal support will be key to achieving the deep emissions reductions called for in AB 1279 and the 2022 Scoping Plan Update.

Like so many of CARB's innovative programs, the success of California's LCFS program is inspiring other jurisdictions to adopt their own clean fuels programs. CARB works closely with other jurisdictions that have chosen to adopt similar programs, including Oregon, Washington, and British Columbia. CARB also collaborates closely with other states and is seeing growing interest from several jurisdictions. Other jurisdictions including Japan, New Zealand, Australia, and the European Commission also continue to seek information and technical experience on the LCFS. As interest in the LCFS grows and other jurisdictions consider their own programs, CARB continues to improve efficiency and maintain program integrity to ensure that the LCFS remains an exportable policy.

C. Overview of the Proposed Amendments

This section provides a broad overview of amendments staff is proposing for adoption. Chapter II provides a more in-depth description of the purpose of the rulemaking and the problems that the proposal is intended to address. Appendix E provides a summary, purpose, and rationale for each proposed regulatory modification.

The most significant change in this proposal is to strengthen the CI reduction benchmarks both pre- and post-2030 in support of California's goal for achieving carbon neutrality by 2045 and achieving an 85% reduction in GHG emissions by 2045, as called for by AB 1279 and the 2022 Scoping Plan Update. The 2022 Scoping Plan Update, which identifies the outcomes needed to achieve carbon neutrality by 2045, was approved by the Board in December 2022. The State must accelerate the pace of clean energy and technology development, and the LCFS is one of the primary mechanisms for transforming California's transportation fuel pool with low-carbon alternatives. The benchmarks provide the basis for calculating credits for low-carbon fuels and deficits for high carbon fuels.

If adopted, the proposed amendments would require a 30% reduction in fuel CI by 2030 and a 90% reduction in fuel CI by 2045 from a 2010 baseline, as shown in the proposed CI benchmark schedule for gasoline and gasoline substitutes listed in Table 1, below, and shown in Figure 6. To accommodate rapid advances in transportation fuel production and use, the proposed amendments also include a near-term step-down and an Automatic Acceleration Mechanism (AAM). The step-down is a one-time 5% reduction in the CI benchmark in 2025 that increases the stringency of the CI target. The AAM is another tool to increase the stringency of the CI benchmark, but is activated only when specific regulatory conditions are

met. These triggered reductions in the CI benchmark would help bolster market stability in the event that transportation fuel decarbonization is growing rapidly and outpacing deficit generation in the program.

Table 1: Proposed Carbon Intensity Benchmarks for Gasoline and Fuels Used as a Substitute for Gasoline²⁴

Year	Average Carbon Intensity (gCO ₂ e/MJ)
2010	Reporting Only
2011	95.61
2012	95.37
2013	97.96
2014	97.96
2015	97.96
2016	96.50
2017	95.02
2018	93.55
2019	93.23
2020	91.98
2021	90.74
2022	89.50
2023	88.25
2024^a	87.01
2025^b	80.73
2026	78.50
2027	76.26
2028	74.03 ^δ
2029	71.79 ^δ
2030	69.55 ^δ

²⁴ Benchmarks for years 2011, 2013, 2016, 2019, and 2024 reflect reductions from revised base year (2010) CI values for California Reformulated Gasoline that were calculated using the CI for crude oil supplied to California refineries. For more information, see Table 1 in Appendix A.

Year	Average Carbon Intensity (gCO ₂ e/MJ)
2031	65.08 ^δ
2032	60.61 ^δ
2033	56.14 ^δ
2034	51.67 ^δ
2035	47.20 ^δ
2036	42.73 ^δ
2037	38.26 ^δ
2038	33.78 ^δ
2039	29.31 ^δ
2040	24.84 ^δ
2041	21.86 ^δ
2042	18.88 ^δ
2043	15.90 ^δ
2044	12.92 ^δ
2045	9.94 ^δ

^a The benchmark for years 2024 through 2045 reflect reductions from revised base year (2010) CI Values for CaRFG (99.15).

^b The benchmark schedule in 2025 has been updated to include a 5% increase in stringency, achieving an 18.75% CI reduction compared to the 13.75% CI reduction specified in the 2018 adopted regulation.

^δ These CI targets may be accelerated by the Automatic Acceleration Mechanism based on the regulatory criteria specified in section 95484(b) in the proposed Regulation Order (Appendix A).

The process for determining the annual carbon intensity benchmarks is detailed in Chapter VIII and Appendix C-1. Other proposed changes are identified in Table 2 below and include eliminating the current LCFS exemption for intrastate fossil jet fuel starting in 2028, expanding ZEV infrastructure crediting to the medium- and heavy-duty (MHD) sector, and adding hydrogen-based and electricity-based transaction types to be included in the third-party verification program for data reported under LCFS.

Additionally, amendments are proposed to further streamline existing requirements of the LCFS regulation and to update program tools and data.

Table 2 provides a summary of the proposed changes to the regulation. Staff began conceptually discussing many of these items through public workshops initiated in October of 2020, hosting nine workshops and two community meetings through August 2023. The pre-rulemaking public process is detailed in Chapter XI.

Table 2: Summary of Proposed Regulatory Amendments to the LCFS Regulation

Topic	Proposed Regulatory Updates
General	<p>Minor updates for typographical errors and specifications that do not materially affect requirements</p> <p>Update terminology for Data Management System</p>
Compliance, Program Benchmarks, and Credit Generation	<p>Strengthen the carbon intensity benchmarks both pre- and post-2030</p> <p>Include a step-down of the CI benchmark in 2025 and a mechanism to automatically strengthen the carbon intensity benchmarks based on defined market conditions</p> <p>Eliminate exemption for intrastate fossil jet fuel, beginning in 2028</p> <p>Modify crediting potential for zero-emission forklifts with lift capacities less than 12,000 lbs</p> <p>Allow all fuels to be added to buffer account, instead of only liquid fuels</p>
Equity-Focused Improvements	<p>Focus and increase investment requirements of residential base credit proceeds in ways that provide benefits for disadvantaged, low-income, rural, and tribal communities</p> <p>Extend and focus ZEV infrastructure crediting for light-duty vehicles in disadvantaged, low-income communities, or rural communities</p> <p>Expand ZEV infrastructure crediting to the medium- and heavy-duty sector to support ZEV infrastructure needed for medium- and heavy-duty ZEVs operating in heavily-impacted freight corridors</p>
Entities and Eligibility	<p>Include Multi-Family residences as Non-Residential</p> <p>Modify definition of fuel supply equipment (FSE) for electric transport refrigeration units</p>
Fuel Pathway Applications and CI Determination	<p>Update LCA modeling tools and emission factors</p> <p>Include a Tier 1 Calculator for hydrogen</p> <p>For projects breaking ground after December 31, 2029, add deliverability requirement for pipeline-injected biomethane and phase out pathways for avoided methane crediting by 2040 for biomethane used for transportation and 2045 for biomethane used for hydrogen production</p> <p>Add provisions for indirect accounting of low-CI hydrogen injected into hydrogen pipelines</p> <p>Add sustainability requirements for crop- and forestry- based feedstocks</p>

Topic	Proposed Regulatory Updates
Petroleum and Project-Based Credits	<p>Update crude oil Lookup Table</p> <p>Update the Oil Production Greenhouse Gas Emission Estimator (OPGEE) Model and process for future updates</p> <p>Phase out petroleum project credit generation by 2040</p> <p>Specify that direct air capture projects must be located in the United States to generate LCFS credits</p>
Verification Program	<p>Add third-party verification for hydrogen and electricity data types and deferral threshold considerations</p> <p>Require third-party validation of all applications for project-based crediting.</p> <p>Update deferral eligibility requirements to clarify that joint applicants are not eligible to defer verification</p> <p>Include meter calibration requirements for project and pathway applications</p>

II. The Problem that the Proposal is Intended to Address

In order to implement the 2022 Scoping Plan Update, California needs to reduce emissions by driving down fossil fuel demand in transportation, transitioning to zero-emission technology wherever feasible, and increasing the supply of low-carbon alternative fuels as quickly as possible. In this chapter, staff provides a description of the purpose of this rulemaking and how the proposed amendments to the LCFS support the State's climate and air quality targets. A description, purpose, and rationale for each of the proposed updates and revisions are provided in Appendix E.

To implement these objectives, staff is proposing a suite of amendments to the regulation to:

- Improve California's long-term ability to support the production and use of increasingly lower-CI transportation fuels and to improve the program's overall effectiveness;
- Update the annual carbon intensity benchmarks through 2030 and establish more stringent post-2030 benchmarks in alignment with the 2022 Scoping Plan Update;
- Increase the flexibility of the program to adjust for potential future market overperformance by including a mechanism that would automatically accelerate the compliance targets under certain conditions;
- Include a step-down in the near-term CI target to further support ambition;
- Incentivize fuel production and refueling infrastructure buildout needed to meet California's long-term climate goals and reduce dependence on petroleum fuels, including opportunities to leverage federal funding for low-carbon hydrogen production and ZEV fueling, and support the transition of biomethane fuel pathways for combustion out of transportation;
- Update standard values in the regulation, including emission factors, as well as life cycle assessment (LCA) modeling tools to use more detailed or recent data;
- Streamline implementation of the program; and
- Make minor updates for typographical errors and clarifying specifications.

A. Strengthen the Annual Carbon Intensity Benchmarks Pre- and Post-2030

Staff last revisited the annual carbon intensity benchmarks in 2018, following the approval of the 2017 Scoping Plan Update, which focused on achieving the 2030 SB 32 GHG reduction target. Through the 2018 rulemaking, the Board extended the carbon intensity benchmarks from a 10% reduction in 2020 to a 20% reduction in 2030 to align with SB 32 and the 2017 Scoping Plan Update. The climate policy landscape has continued to evolve since the 2018 rulemaking. In 2022, the Governor signed AB 1279, which requires an 85% reduction in anthropogenic GHG emissions below 1990 levels by 2045. The 2022 Scoping Plan Update lays out a path to achieve these targets and achieve carbon neutrality by 2045. Staff is proposing to update the LCFS program in response to current legislative direction and the 2022 Scoping Plan Update. Along with this high-level policy direction and technology-forcing emission standards and other policies adopted by the Board, low-carbon technology uptake is accelerating. Renewable diesel capacity has grown substantially and far exceeds what was previously modeled in 2018 when the current CI benchmarks were established. Electricity and hydrogen used as vehicle fuels have increased over 50% between 2019 and 2022 and are far outpacing the projections staff used to establish the existing CI benchmarks during the

previous 2018 rulemaking. This trend is expected to continue, as California implements the ACC II, ACT, ACF, Innovative Clean Transit, Cargo Handling Equipment, Ocean Going Vessels at Berth, Clean Miles Standard, Transport Refrigeration Unit, and In-use Locomotive regulations.

There is also much progress in the liquid and gaseous alternative fuel spaces. Biofuel production capacity has increased substantially in recent years, with many announcements nationwide and in California for new or expanded capacity. Momentum for alternative fuels is growing at the national level, as well. Biomethane supplies have also increased as more methane capture projects are developed.

Taken together, these trends suggest that the market is outpacing previous fuels and crediting projections used for the 2018 LCFS benchmark modeling and that re-evaluation of near-term targets is needed to accelerate action and plan beyond 2030. Staff recommends strengthening the pre- and post-2030 carbon intensity benchmarks to accelerate GHG reductions in transportation fuel. As part of this overall strengthening of the benchmarks, staff also recommends a near-term step-down of the 2025 benchmark and an acceleration mechanism to adjust the CI benchmarks if market conditions warrant.

Achieving California's mid- and long-term GHG and air quality goals will require a portfolio of low-carbon transportation fuels in amounts well beyond the current amounts. The transportation sector remains the largest contributing source of GHG emissions in the State inventory. The LCFS has been an effective measure for increasing the use of low-carbon alternatives to fossil fuels in California by providing significant economic benefits to the credit-generating entities who participate in the program, including municipal transit agencies, alternative fueling facilities, equipment service providers, fuel producers, and project developers across the United States and abroad. For example, the 2020 California GHG Emissions Inventory²⁵ shows that California continues to stay below its 2020 target for emissions. The data shows a decline in emissions from transportation, supported by the LCFS, which is driving increasing use of alternative fuels in the transportation sector.

The proposed amendments are expected to reduce life cycle GHG emissions of transportation fuels consumed in California by about 558 million metric tons in carbon dioxide equivalent (MMTCO_{2e}) cumulatively from 2024 to 2046 as compared to business as usual (see Chapter IV of this Staff Report for additional discussion of the projected GHG benefits). Greater diversification of the State's fuel portfolio will also support California's ongoing efforts to improve ambient air quality by displacing demand for fossil fuels. Chapter V of this Staff Report summarizes the air quality and public health benefits of the proposed regulation.

The LCFS regulation defines a carbon intensity benchmark for each year. The current LCFS benchmark schedule was designed to help California achieve the statutory target of 40% GHG emissions reduction by 2030, in line with the 2017 Scoping Plan Update and SB 32. However, the 2022 Scoping Plan Update calls for an accelerated deployment of fuels and ZEVs in support of achieving a 48% reduction of GHGs by 2030 and 85% below 1990 levels by 2045.

²⁵ California Air Resource Board, *Latest GHG Inventory shows California remains below 2020 emissions target*. October 19, 2020. <https://ww2.arb.ca.gov/news/latest-ghg-inventory-shows-california-remains-below-2020-emissions-target>

Using market data and techno-economic models to evaluate a variety of transportation fuel pathways, staff conducted a scenario analysis that informed the pre- and post-2030 target and annual benchmarks for carbon intensity reduction through 2045. This analysis helps staff explore possible compliance outcomes and facilitates an improved understanding of LCFS economics and compliance feasibility for different policy choices in each scenario.

Staff developed the California Transportation Supply (CATS) model to evaluate the California fuel market and estimate an optimal fuel supply that may be delivered to California under various scenarios. Since CATS, and really no modeling tool, can fully capture all real-world conditions, the tool is primarily being used to compare results of different policy changes across the different scenarios. The CATS model is an optimization model that seeks to minimize the cost of supplying all defined fuel pools such that fuel demand constraints are met. The CATS model selects the fuel mixes likely available for California that minimize the cost of supplying all transport fuel demand in the State while meeting technology and policy constraints. The outputs from the CATS model do not constitute a forecast of credit prices, but rather how the market may evolve in response to different policy changes that may, or may not, be implemented.

The optimization model is constrained by a set of policies, technologies, and cost considerations that are intended to approximate current and future market conditions under different scenarios. Anticipated mobility demand each year is used to estimate energy demand by vehicle technology type (e.g., light-duty electric vehicle, gasoline vehicle, etc.), and the model then identifies a variety of fuel production pathways that could be optimally used to meet that demand given costs and policy considerations. Staff developed feedstock supply curves and feedstock to fuel conversion pathways for the model that are detailed in the California Transportation Supply (CATS) Model v0.2 – Technical Documentation.²⁶

Based on feedback received from stakeholders, staff evaluated a wide range of CI benchmark trajectories. Scenarios modeled both in-house by CARB and by external stakeholders indicate that a reduction of at least 30% by 2030 and 90% by 2045 is achievable and necessary to accelerate decarbonization of the transportation fuels sector and support the State's broader climate goals. Figure 6 shows staff's proposed benchmarks as compared to the benchmarks in the current regulation for the years 2024 through 2045. When considering the full period from 2024 through 2046, staff's proposal achieves 558 MMT more cumulative reductions relative to the current regulation. Chapter VIII and Appendix C-1 of this Staff Report provide additional details on the data sources and methodology that staff has relied on to evaluate feasible LCFS compliance scenarios.

²⁶ California Air Resources Board, *California Transportation Supply (CATS) Model v0.2 – Technical Documentation for August 2023 Example Scenario*. August 2023. https://ww2.arb.ca.gov/sites/default/files/2023-08/CATS%20Technical_1.pdf

Figure 6: Current and Proposed Annual Carbon Intensity Benchmarks

Additionally, the transportation fuels market is evolving quickly due to technological and economic breakthroughs, regulatory requirements, new federal incentives, and other jurisdictions implementing similar programs. This has resulted in rapid shifts in the market, particularly from rapidly growing ZEV market and conversion of fossil refineries to biofuel production, which have resulted in rapid and significant credit generation. To accommodate documented rapid advances in transportation fuel decarbonization that have already occurred, and which could occur again due to these rapid changes, the proposed amendments include both a near-term step-down in CI benchmark stringency in 2025, and an Automatic Acceleration Mechanism (AAM).

A step-down in stringency was strongly supported by feedback provided by stakeholders, particularly in response to February and May 2023 technical workshops. The step-down reflects the current effectiveness of the program, which suggests that the pace of CI reductions can be increased through the benchmarks.

Staff is proposing to include an AAM to increase the stringency of the CI benchmarks of the program when specific regulatory conditions are satisfied. Under the current staff proposal, the AAM would advance the upcoming year's CI benchmark, and all subsequent years by one year. The acceleration mechanism provides a clear signal regarding how and when the benchmarks would be adjusted. An AAM can support the deeper transportation sector decarbonization needed through mid-century by increasing regulatory clarity for the market, acting alongside existing provisions that also help to provide program certainty, such as the maximum credit price²⁷ and the Credit Clearance Market (CCM).²⁸

²⁷ Cal. Code Regs., tit. 17, § 95487(a)(2)(D).

²⁸ Cal. Code Regs., tit. 17, § 95485(c).

An AAM would operate to potentially increase program stringency, using regulatory criteria, to accommodate documented rapid advances in transportation fuel decarbonization. An AAM would operate in a way that is predictable and easy to understand, based on publicly available data, and would bolster market stability during periods where credit generation rapidly and consistently outpaces deficit generation. Similar to maximum price and CCM provisions, an AAM would play an important role in supporting LCFS implementation, deterring market manipulation, and providing the certainty necessary for the long-term investments required to meet the State's decarbonization goals.

Staff engaged extensively with stakeholders to develop an AAM, including holding a dedicated workshop for this topic in May 2023. An AAM would only be activated by specific market conditions defined in the LCFS regulations that result in a specified imbalance in the number of credits versus deficits over a certain time period. Under staff's proposal, the AAM would be triggered when the credit bank to average quarterly deficit ratio exceeds three and credit generation exceeds deficit generation based on the prior year's reporting. If triggered, the AAM would accelerate all subsequent CI benchmarks by one year.

B. Eliminate Exemption for Intrastate Fossil Jet Fuel

Staff is proposing to eliminate the exemption for intrastate fossil jet fuel from the LCFS regulation starting in 2028. The aviation sector has historically relied on jet fuel produced from fossil fuels, and fossil jet fuel is currently exempted from generating deficits in the LCFS program. However, to achieve the deep emissions reductions called for in AB 1279 and the 2022 Scoping Plan Update, California must reduce GHG emissions from aviation.

In California, intrastate jet fuel constitutes about 10% of total jet fuel consumption and is responsible for 2% of GHG emissions in the California transportation sector. As emissions from other vehicle types decline, this percentage is expected to increase. Alternative jet fuel (AJF) production has increased since it became an eligible LCFS opt-in fuel in 2019, and with 11.6 million gallons produced in 2022. This provision would be limited to flights that take off and land within the State of California.

Momentum is growing for AJF, an alternative liquid fuel that can displace fossil jet fuel without engine modifications, along with interest in zero-emission technologies for aviation. At the federal level, a tax credit of up to \$1.25 per gallon is available to sustainable aviation fuel (SAF) producers.²⁹ In alignment with the federal support available for SAF, Governor Newsom highlighted the need to transition to low-carbon alternatives in his July 2022 letter to the CARB Chair, in which he directed CARB to adopt a 20% clean fuels target for the aviation sector.³⁰ The 2022 Scoping Plan Update anticipates a major shift away from fossil jet fuel by 2045, including 20% zero-emission aviation.

²⁹ Internal Revenue Service. *Sustainable Aviation Fuel Credit webpage*. (Updated on January 31, 2023). <https://www.irs.gov/credits-deductions/businesses/sustainable-aviation-fuel-credit>

Several airlines have also announced GHG emission reduction targets, as well as multi-year agreements to source SAF for their operations. For example, United Airlines,³¹ Southwest Airlines,³² and American Airlines³³ have released plans to achieve carbon neutrality by 2050. Additionally, Alaska Airlines set new climate goals that include net-zero carbon emissions by 2040.³⁴ Finally, Delta Airlines has a goal to replace 10% of its fossil jet fuel with SAF by the end of 2030.³⁵ Production is ramping up to meet the increasing demand for low-carbon incentives. For example, multiple refineries in California are transitioning their existing facilities to produce bio-based alternative fuels, including AJF. AJF is a viable low-carbon alternative that can further reduce aviation carbon dioxide emissions and currently generates credits in the LCFS program. Adding fossil jet fuel as a required fuel under the program will build on the momentum in the aviation industry.

C. Expand Zero Emission Vehicle Infrastructure Crediting

During the 2018 rulemaking, the Board adopted the HRI and FCI provisions. These two crediting opportunities were designed to incentivize zero-emission light-duty vehicle (LDV) refueling infrastructure ahead of anticipated ZEV demand. The intent of these provisions was to help remove the “chicken-and-egg” issue of vehicle demand waiting on refueling development, and refueling infrastructure waiting on vehicle demand, by incentivizing rapid buildout of public refueling infrastructure. Dispensed fuel receives crediting in the LCFS, and these provisions added crediting for unused capacity at approved stations. The provisions have supported the buildout of dozens of hydrogen stations and thousands of fast chargers in California and play a key role in supporting the overall transition to ZEV technology, driven in large part by the ACC II regulation. New applications for these crediting provisions sunset at the end of 2025.

Staff is proposing amendments to expand the current ZEV infrastructure crediting provisions by adding crediting for MHD infrastructure and extending the LD crediting. As the State transitions to widespread ZEV deployment, it is imperative that all individuals in the State have access to cleaner technologies. Therefore, staff is proposing to continue the HRI and FCI incentivization for light-duty vehicle refueling in low-income, rural, or disadvantaged communities. This focused eligibility requirement aligns with identified priorities in the Clean Transportation Incentives Funding Plan³⁶, which provides funding for ZEVs deployed in these regions. Staff is also proposing to allow new light-duty FCI (LD-FCI) applications be located

more than 10 miles away from the nearest fast charger to help fill refueling gaps in the State. These provisions are designed to accelerate deployment of ZEV infrastructure in regions that support equitable access to low-carbon technology. The provisions would be limited to 0.5% each of deficits from the prior quarter.

California's ZEV goals are not limited to LDVs. The Innovative Clean Transit,³⁷ Advanced Clean Truck,³⁸ and Advanced Clean Fleet³⁹ rules, which have all been adopted since 2018, along with the Clean Truck Partnership,⁴⁰ will drive a rapid transformation to ZEV technology in the MHD sector in the very near future. As noted earlier, transitioning to ZEVs is critical for achieving California's climate and air quality targets, and California's path is established in the ACT and ACF regulations and the Clean Truck Partnership. Incentivizing early build-out of ZEV infrastructure will support the transition to MHD ZEVs required by the ACF regulation. ACF fleet turnovers begin in 2024 and transition drayage fleets to ZEV technology the fastest of any vocation, but this transition is contingent upon availability of refueling infrastructure for successful operation of these vehicles. Staff expects that LCFS support for ZEV truck refueling infrastructure will help provide significant air quality improvements to communities adjacent to major ports, distribution centers, and freight corridors.

To achieve fleet turnovers within this timeframe, refueling infrastructure suitable for MHD trucks must be available to maintain operations and provide certainty of fueling availability to truck and fleet owners. Staff is, therefore, proposing to create a version of the HRI and FCI provisions that incentivize MHD ZEV refueling infrastructure during the early years when refueling demand is low. Similar to the light-duty (LD) provisions, the MHD provisions will provide LCFS credits for the unused refueling capacity at eligible stations and sites, which will naturally phase out as more vehicles become operational and vehicle refueling demand increases. LCFS ZEV fueling infrastructure credits for the MHD sector will play a key role in supporting California's ZEV goals, and in particular the technology transition under the ACF regulation. Staff is proposing that MHD-HRI and MHD-FCI infrastructure must be sited within one mile of a ready or pending Federal Highway Administration Alternative Fuel Corridor—for hydrogen or electricity, respectively—where the majority of truck refueling is expected to occur, or adjacent to existing truck parking, to accommodate overnight charging. Locating ZEV refueling stations within one mile of major freight corridors and at existing truck parking is

expected to bring cleaner air for communities living adjacent to these areas currently heavily impacted by diesel truck pollution.^{41,42}

Unlike the existing LD-HRI and LD-FCI provisions, which support only public infrastructure, staff is proposing to extend eligibility for the MHD-HRI and MHD-FCI provisions to private infrastructure as well. Staff focused on public infrastructure for the existing LD infrastructure crediting provisions because the LD market lacked a robust publicly available refueling network. The MHD sector is fundamentally different and needs significant support to meet the refueling needs of both trucks utilizing public refueling infrastructure and private fleet refueling. Truck fleets rely heavily on both public and private refueling based on the duty cycles and vocations of the vehicles. Stakeholders have expressed that private refueling should also receive an incentive from the MHD infrastructure crediting provisions to support the early capital costs of installing ZEV refueling infrastructure. Private infrastructure has the advantage of being designed for a known refueling demand and can be sized accordingly to minimize costs, but still faces steep initial costs associated with the initial buildout of the infrastructure. In addition, fleets may transition their vehicles to ZE technology over the course of several years and will likely need support during the interim years while their fleet ramps up to the full capacity the refueling infrastructure was designed for. Due to the different levels of support needed for private refueling infrastructure compared to the public infrastructure without a known refueling demand, staff is proposing to provide half as many credits for private refueling infrastructure as public per charger or station. As with the existing infrastructure crediting provisions, staff is proposing to limit total credits available to the charging and hydrogen refueling provisions to 2.5% of prior quarter deficits, to provide a sufficient incentive without inflating overall credit supply.

D. Biomethane Crediting

Methane is a harmful short-lived climate pollutant (SLCP) that has an outsized impact on climate change in the near term. The United Nations Environment Programme's Global Methane Assessment⁴³ advises that achieving the least-cost pathways to limit warming to 1.5°C requires global methane emission reductions of 40% to 45% by 2030 alongside substantial simultaneous reductions of all climate forcers, including CO₂ and SLCPs. Action to reduce these powerful emissions sources today will provide immediate benefits—both to human health locally and to reduce warming globally—as the effects of our policies to transition to low-carbon energy systems and achieve carbon neutrality further unfold.

Biomethane⁴⁴ has played a role in contributing to the overall decrease in carbon intensity of the transportation fuel pool. With support from the LCFS and Renewable Fuel Standard (RFS)

⁴⁴ When methane is derived from biogas, it is referred to as biomethane.

programs, in 2022 compressed natural gas (CNG) represented 5% of total MHD fuel demand and renewable natural gas (RNG) was 97% of the CNG fueling in California.⁴⁵ However, CNG transportation fuel demand is only about 3% of overall natural gas demand in California, and achieving deep GHG reductions will have to include displacing fossil gas in sectors of the economy beyond transportation.⁴⁶ Capturing methane from California's methane sources (e.g., landfills, dairies, and wastewater) is critical for achieving California's climate targets, including the targets identified by SB 32, SB 1383, and AB 1279. The 2022 Scoping Plan Update reinforces the message that while there is clearly a role for biomethane in decarbonizing California's energy use in the long term (particularly as a feedstock for renewable hydrogen production), biomethane used as an end-use vehicle fuel will decline as ZEVs penetrate the market, and this resource should be transitioned to other sectors. Biomethane can play a key role in decarbonizing stationary sources or other energy applications, and the 2022 Scoping Plan Update identifies additional end uses in the industrial, commercial, and residential sectors; production of hydrogen; and electricity generation by displacing the need for fossil gas. For the fuel to transition to other sectors in the long term, the existing market signals will need to transition accordingly to avoid stranded assets and the closure of methane capture projects. With this background, staff is proposing changes for pathways related to biomethane as a transportation fuel under the LCFS program. These changes would continue to incentivize the methane reductions needed in the next decade, while aligning with the 2022 Scoping Plan Update to shift biomethane to the production of renewable hydrogen or for use in other sectors by 2045.

Phase Out of Pathways for Biomethane Combustion Crediting

For projects that break ground after December 31, 2029, staff is proposing to phase out pathways for crediting biomethane used in CNG vehicles after December 31, 2040. Pathways for biomethane used to produce renewable hydrogen would be eligible to receive credits until December 31, 2045. This concept aligns with the overall transition to non-combustion transportation technology highlighted in the 2022 Scoping Plan Update, as well as the shifting of biomethane resources to hydrogen production. In addition, staff is proposing two other mechanisms related to biomethane used as a transportation fuel, highlighted below.

Pathways for Avoided Methane Crediting

For projects that break ground after December 31, 2029, staff is proposing that pathways for avoided methane crediting be available through 2040 for biomethane used as a transportation fuel, and through 2045 for biomethane used to produce hydrogen.

Deliverability Requirements

Currently, the LCFS regulation allows for indirect accounting of biomethane when injected into the North American natural gas pipeline. In 2022, a total of about 153 MMBtu of RNG was

⁴⁵ California Air Resources Board, *LCFS Quarterly Data Spreadsheet*. (Updated on July 31, 2023). <https://ww2.arb.ca.gov/resources/documents/lcfs-data-dashboard>

⁴⁶ California Air Resources Board, *Advanced Clean Fleets Resolution 23-13*. April 27, 2023. <https://ww2.arb.ca.gov/sites/default/files/barcu/board/res/2023/res23-13.pdf>

reported to the LCFS for credit generation, with the majority coming from RNG resources injected into the North American natural gas pipeline outside of California.

Adding a deliverability requirement would help to ensure that California is making progress on the State's methane reduction targets.⁴⁷ For projects that break ground after Dec 31, 2029, staff is proposing to require deliverability starting January 1, 2041 for pathways that include biomethane used in CNG vehicles or starting January 1, 2046 for biomethane used as an input to hydrogen production. In particular, staff proposes to align with the deliverability policy for biomethane in the California Energy Commission's Renewables Portfolio Standard (RPS) program (Public Utilities Code section 399.12.6) and the California Public Utilities Commission 1440 program. Specifically, the concept is to require demonstration that eligible biomethane is carried through common carrier pipelines that physically flow within California or toward end use in California. Such pipelines must flow toward California 50% of the time on an annual basis, as defined by the current RPS eligibility guidebook.^{48,49} This requirement encourages and rewards reducing methane emissions by injecting biomethane that displaces existing natural gas use in California, rather than rewarding biomethane outside of California that does not displace existing natural gas use in California or have any other connection to California. Biomethane fuel pathways that break ground before January 1, 2030 would not be subject to the deliverability requirements, which would encourage rapid buildout of biomethane capture projects this decade and supports the need to reduce methane emissions. The proposed deliverability requirements also would not apply to biomethane matched to hydrogen fuel pathways participating in the LCFS program.

E. Project-Based Crediting

The 2022 Scoping Plan Update identifies a general trend away from fossil fuel consumption in California and highlights the need to invest in low-carbon fuels to replace petroleum consumption in transportation. However, this transition will not happen overnight, and California must continue to reduce emissions from existing legacy fuel production facilities in the near term while fossil fuel demand persists. Staff is proposing changes to the project-based crediting provisions to align with the 2022 Scoping Plan Update to reduce GHG emissions across the economy while recognizing the broader trend away from fossil fuel production in tandem with demand.

Phase Out of Petroleum Project Crediting

Staff is proposing to phase out crediting of petroleum projects by 2040. The program currently supports projects for credit generation from crude using innovative methods, low-complexity/low-energy-use refineries, refinery investment, and renewable hydrogen refinery investment. Staff's proposal to phase out crediting of these projects by 2040 is consistent with projected reductions in demand for petroleum fuels, while also recognizing

⁴⁷ Only methane emissions occurring within California are included in the State's GHG inventory.

⁴⁸ California Energy Commission, *Renewables Portfolio Standard Eligibility Guidebook, Ninth Edition*. Publication Number: CEC-300-2016-006-ED9-CMF-REV. 9-10. January 2017.

<https://efiling.energy.ca.gov/getdocument.aspx?tn=217317>

⁴⁹ Staff is not proposing to include the requirement in the RPS eligibility guidebook to demonstrate direct environmental benefits to California as part of this amendment.

verifiable GHG reductions at existing fuel production facilities. Carbon capture and sequestration (CCS) projects are highlighted as an important strategy in the 2022 Scoping Plan Update for achieving the AB 1279 targets, and staff proposes to exclude them from this phase-out proposal.

Incorporate Location Requirements for Direct Air Capture Projects

Staff is proposing updates to the treatment of DAC with sequestration projects. In the 2018 rulemaking, the LCFS program made DAC with sequestration eligible for project-based CCS credits. DAC is an emerging technology that has the potential to remove large amounts of CO₂ already in the atmosphere and could aid in achieving California's long-term climate goals. It will continue to need support to be built to scale and to be deployed more broadly.

In an effort to align with federal incentives being provided for DAC projects, and to support the ongoing technology development needed to reduce future DAC deployment costs, staff is proposing to limit LCFS credit generation eligibility of DAC with sequestration projects to those located in the United States. This proposal better supports national efforts to deploy DAC projects and helps achieve national and State emission reduction goals. This limitation would not apply to DAC-to-fuel applications submitted as Tier 2 alternative fuel pathways, as the final fuels from these pathways must be supplied to California to be eligible for LCFS credits.

F. Crop-Based Biofuels Sustainability Criteria

In recognition that demand for crop-based biofuels can indirectly cause land use change globally, the LCFS regulation currently accounts for land use change emissions associated with crop-based biofuels assuming they are grown on pre-existing agricultural land. The LCFS regulation uses land use change emissions estimates by feedstock which were last assessed between 2013-2015 through an extensive expert workgroup. The existing regulatory provisions make fuel pathways from crop-based feedstocks more carbon intensive and disincentivizes sourcing biofuel feedstocks from crops with higher land-use change risks. The inclusion of land use change emissions in LCFS life cycle methodologies result in stronger incentives for waste-and-residue-based feedstocks, which are not associated with land use change impacts, relative to crops. As a result, the majority of biomass-based diesel in the LCFS has historically come from waste feedstocks like used cooking oil, animal fat and inedible distiller's corn oil. The same general trend holds true for sustainable aviation fuel, which utilizes the same feedstocks as biomass-based diesel. While the majority of biomass-based diesel is still derived from waste oil, the use of crop-derived, biomass-based diesel has increased in recent years. Additionally, the CI impact of direct land conversion is not currently assessed in LCFS pathways, commodity feedstocks are not tracked to their points of origin, and there is no prohibition on bringing new land into agricultural production in order to grow biofuel feedstocks. A rapid increase in oil crop demand for biofuel production could potentially add pressure to convert forested land or other land types into biofuel crop production.

To reduce the risk that rapid expansion of biofuel production and biofuel feedstock demand could result in deforestation or adverse land use change, CARB staff are proposing additional guardrails on the use of crop-based feedstocks for biofuel production. Specifically, CARB staff are proposing to require pathway holders to track crop-based and forestry-based feedstocks to their point of origin and require independent feedstock certification to ensure feedstocks are not contributing to impacts on other carbon stocks like forests. CARB staff are also proposing to remove palm-derived fuels from eligibility for credit generation, given palm oil has been

demonstrated to have the highest risk of being sourced from deforested areas.⁵⁰ Palm-derived fuel transactions have not been reported under the program or received any credits to-date.

G. Other Proposed Amendments

Additional proposed changes are summarized in Table 2 and detailed in Appendix E. Some of these changes serve to align with State goals and the 2022 Scoping Plan Update, namely modifying crediting potential for zero-emission forklifts and allowing indirect accounting for low-CI hydrogen injected into hydrogen pipelines. Other changes serve to simplify and streamline application and reporting requirements to encourage greater participation and improve administrative efficiency.

Electric Forklifts

As mentioned earlier, California is rapidly transitioning to ZEV technology in the transportation sector. In addition to on-road vehicles, this goal also applies to off-road equipment, including electric forklifts. The LCFS program has a role to play in implementing the ZEV turnover goals in Executive Order N-79-20. Given the scale of equipment turnover and technological transformation needed to achieve the State's goals, LCFS credits should be used in end-uses that need the most additional support to transition away from fossil fuel consumption. As part of this evaluation to understand where the transition is necessary for the forklift fleet, staff has re-evaluated the forklift baseline.

Battery-electric forklifts have been eligible for LCFS credit generation since the 2015 readoption. Much of the forklift inventory in the State has successfully transitioned to non-combustion technology, in line with State goals. This success story provides an opportunity for the LCFS program to re-evaluate the level of crediting appropriate for battery-electric forklifts. Accordingly, staff is revising the baseline for battery-electric forklifts by incorporating the 2010 status of forklift electrification into the baseline, and is proposing a 50% reduction in the Energy Economy Ratio for zero-emission forklifts with lift capacities less than 12,000 lbs. However, since larger forklifts were 100% fossil in the baseline, forklifts with lift capacities greater than 12,000 lbs. would remain at the established forklift Energy Economy Ratio.

Additionally, staff is proposing removing the estimation methodology used for reporting electricity for forklifts and requiring direct metering for all transactions. The requirement for

metering will improve data accuracy and enable transactions verification while also aligning forklift reporting with all other reported electricity crediting.

Allow Indirect Accounting for Low Carbon Intensity Hydrogen Injected into Hydrogen Pipelines physically connected to California and Expansion of Indirect Accounting for Low Carbon Intensity Electricity for Hydrogen Utilized as a Transportation Fuel.

The 2022 Scoping Plan Update calls for a significant increase in the production of low-carbon hydrogen to displace fossil fuels. The Scoping Plan scenario projects a significant growth of renewable and low-CI hydrogen production, particularly for its use as a transportation fuel and for hard-to-electrify end uses. Given the nascent market and federal incentives to scale production, staff is proposing book-and-claim of low-CI hydrogen to support the 2022 Scoping Plan Update energy transition goal by overcoming bottlenecks in hydrogen production and supply. Currently, low-CI hydrogen must be physically delivered to its end-use for purposes of LCFS accounting. This provision was included before the 2022 Scoping Plan Update was completed, which showed the need for significant increased demand for this fuel in the transportation sector and the additional infrastructure necessary to produce and deliver hydrogen fuel. This framework is impractical for large-scale production of low-CI hydrogen that is sent to several off-takers through shared hydrogen pipelines. Book-and-claim of pipeline-injected hydrogen increases the flexibility of the program by allowing matching of low-CI hydrogen to transportation end uses, including use as a vehicle fuel for hydrogen fuel cell electric vehicles, and hydrogen used in the production of low-carbon transportation fuels such as renewable diesel and AJF. Staff proposes to expand the existing book-and-claim provisions to include low-CI hydrogen injected into the pipeline network that is physically connected to California to be credited under the LCFS as a transportation fuel or to produce alternative fuel for transportation. Staff will evaluate the need to remove book-and-claim for hydrogen in future rulemakings as the renewable hydrogen market matures.

In order to leverage available federal incentives and ensure the program is supporting low-carbon hydrogen, staff is proposing to align book-and-claim eligibility with the hydrogen production incentive eligibility under the Inflation Reduction Act. Specifically, staff is proposing well-to-wheel CI thresholds of less than or equal to 55 g/MJ for gaseous hydrogen and less than or equal to 95 g/MJ for liquid hydrogen. Staff is proposing to exclude hydrogen derived from fossil gas from book-and-claim eligibility unless low CI hydrogen is produced using book and claim of biomethane or with CCS and used as a transportation fuel.

In further support for low CI hydrogen production, staff is proposing allowing for dedicated power purchase agreements (PPAs) for low CI electricity to be used to indirectly match to lower the emissions intensity for both process electricity as well as for hydrogen production. The use of PPAs for this purpose is limited to hydrogen utilized as a transportation fuel. The low CI electricity must be new or expanded capacity, must be delivered to the local balancing authority where the hydrogen is produced, and must be matched on a quarterly basis. These requirements will help ensure against resource shuffling where existing renewable electricity is potentially redirected to hydrogen production and backfilled with non-zero electricity.

Other Amendments

A number of amendments are proposed to simplify and streamline application and reporting requirements in order to encourage greater participation and improve administrative efficiency. For example, the LCFS currently incorporates by reference Tier 1 CI Calculators designed to

streamline the fuel pathway application review and validation process for pathway types for which CARB staff have extensive experience evaluating. These calculators have predefined input fields for entering site-specific data and well-defined CI calculations. Staff is proposing to update the existing Tier 1 calculators to make them more user-friendly by streamlining inputs, updating emission factors, and changing the layout of the calculators. Staff also proposes to create a new Tier 1 CI calculator for hydrogen. The LCFS regulation also contains Temporary and Lookup Table pathways with fixed carbon intensity values that streamline participation for certain fuels. Using data gained from certifying hundreds of fuel pathways since the 2018 rulemaking, staff proposes to make revisions to the list of temporary pathways contained in Table 8 of the regulation. Staff is proposing to update the Lookup Table CI values for the following fuel pathways:

- California Reformulated Gasoline Blendstocks for Oxygenate Blending (CARBOB),
- Ultra Low Sulfur Diesel (ULSD),
- Compressed Natural Gas,
- Propane, and
- California Grid Electricity.

Additionally, staff is proposing to allow hydrogen production facilities (including renewable hydrogen) not co-located with refineries but supplying hydrogen directly to the refineries to implement eligible GHG reduction projects. Staff is also proposing to streamline reporting requirements to allow quarterly or annual submission of project reports, as is currently permitted for Refinery Investment Projects and Renewable Hydrogen Refinery Credit Projects. In addition, staff is proposing to update the displacement emission factor for innovative crude projects using solar electricity to align with the updated Emissions & Generation Resource Integrated Database (eGRID) emission factor for California grid electricity, for consistency with the treatment of electricity as a process energy for other fuel pathways.

Successful greenhouse gas reduction programs require a system to monitor, report, and verify data to maintain the integrity of the reduction program. Currently, the LCFS supplements the existing work of CARB staff with a verification system that requires regulated entities of certain credit generating types to retain the services of independent third-party verifiers. Fuel pathways are currently validated by third-party verifiers prior to CARB approval, and staff is proposing to apply this requirement to project-based crediting applications as well to align and streamline the approach between the two provisions with the accompanying benefits of validation for project-based crediting applications. Additionally, staff is proposing to align the verification requirements for electricity crediting types with other verification provisions. With the expected expansion of electrification in the transportation sector, staff is proposing to add verification requirements, which would newly require entities to verify their annual reports for the following transaction types:

- EV Charging Transaction Types;
- Electric Transport Refrigeration Units (eTRU), Electric Cargo Handling Equipment (eCHE), and Electric Power for Ocean-going Vessel (eOGV) Fueling;
- Forklift Electricity/Hydrogen Fueling;
- Fixed Guideway Electricity Fueling; and
- Fuel Cell Vehicle (FCV) Fueling transaction types, not limited to hydrogen from book-and-claim biomethane.

The current regulation requires CARB to regularly update the OPGEE Model and the Crude Lookup Table. CARB held two workshops in 2021 and 2022 to request feedback on the updated OPGEE model to the public. The model was subsequently updated based on stakeholder feedback and staff recently finalized the OPGEE model update. Staff used the updated OPGEE model to update the 2010 baseline crude CI, as well as the Crude Lookup Table, and proposes to incorporate the latest OPGEE model by reference into the regulation.

Staff is also proposing changes to the allocation and uses of base credits representing non-metered residential EV charging. The scope of these changes include:

- Changing the scope of the statewide Clean Fuel Reward from a light-duty rebate to a medium and heavy-duty rebate;
- Altering the minimum base credit contribution required to fund the Clean Fuel Reward along with the specific utility requirements for funding the program;
- Expanding the proportion of credit proceeds required to be invested in disadvantaged, low-income, rural, and tribal communities (holdback equity credits); and
- Enhancing the pre-approved projects eligible for funding of holdback equity credits.

The Clean Fuel Reward will change from a universal new light-duty EV rebate to be focused on new and used rebates for medium- and heavy-duty trucks that are exempted from the Advanced Clean Fleets regulation. This rebate will jumpstart the transition for a harder to transition segment of the truck sector that is not otherwise covered by other CARB regulations. The proportion of residential base credits will change to reflect this change in rebate from 60% of total base credits to 40% with a corresponding increase in “holdback credits.” As a result of this increase in holdback credits, staff is proposing increasing the requirements for investments in equity communities for the IOUs to 75% (from 50%) to match the requirements set by the Public Utilities Commission. Staff is also proposing new pre-approved categories for investment of holdback equity proceeds.

III. The Specific Purpose and Rationale of Each Adoption, Amendment, or Repeal

California Government Code section 11346.2(b)(1) requires a description of the specific purpose for each proposed adoption, or amendment, the problem the agency intends to address with the proposed LCFS regulation, and the rationale for determining that each proposed adoption and amendment is reasonably necessary to both carry out the purposes of CARB staff's proposed LCFS regulation and to address the problems for which it is proposed.

The overarching purpose of the proposed LCFS regulation is to decarbonize transportation through increasing the supply of low-carbon alternative fuels. The problems that LCFS needs to address are described above in Chapter II. Appendix E: Purpose and Rationale for LCFS Amendments presents the summary of each proposed amendment and describes its purpose and rationale for its role in increasing low-carbon alternative fuel supply.

IV. Benefits Anticipated from the Regulatory Action, Including the Benefits or Goals Provided in the Authorizing Statute

CARB anticipates that the proposed amendments will have the following general benefits to California businesses and individuals:

- Reduced GHG emissions near and long-term. The LCFS is specifically designed to reduce GHG emissions in the transportation sector, which is responsible for nearly half of GHG emissions in California. This will contribute to California's efforts to address climate change.
- Increased use of lower CI fuels and alternative fueled vehicles including renewable diesel, biomethane, and lower CI electricity and hydrogen for ZEVs. In addition to reducing GHG emissions, this will in many cases lower levels of localized air pollutants, which are the cause of many deleterious health effects on California residents, especially in priority communities and communities of color.
- Greater opportunities for California businesses to invest in the production of low-CI fuels and other credit generating opportunities.
- Reduced dependence on fossil fuels through decarbonizing the transportation fuel sector and supporting a diversified transportation fuel pool.

In the following sections, staff describes the estimated benefits of the proposed amendments to California businesses, small businesses, and individuals.

A. Summary of Emission Benefits

1. Greenhouse Gases

Staff expects the proposed amendments to reduce GHG emissions relative to the baseline by 558 million metric tons in carbon dioxide equivalent (MMTCO₂e) from 2024 through 2046. It is important to note that because the LCFS calculates emission reductions on a full life cycle basis, the GHG emission reductions occur both in California and out-of-state.

These GHG reduction estimates are derived from CATS outputs of the fuel quantities and average annual CI associated with each fuel, as well as GHG reductions associated with oil and gas extraction emissions.

2. PM_{2.5} and NO_x

The proposed amendments would affect air quality through four main categories: 1) changes in tailpipe emissions for on-road and off-road vehicles, 2) changes in aircraft emissions at airports, 3) changes in emissions at stationary sources from fuel production, and 4) changes in upstream emissions associated with oil and gas extraction where quantified.

Cumulatively from 2024 to 2046, the proposed amendments achieve reductions of 4,281 tons of PM_{2.5} and 25,586 tons of NO_x as compared to the business-as-usual baseline.

Chapter V provides a detailed summary of the air quality benefits of the proposed amendments.

B. Greenhouse Gas Reduction Benefit - Social Cost of Carbon

The benefit of GHG reductions achieved by the proposed amendments can be estimated using the social cost of carbon (SC-CO₂), which provides a dollar valuation of the damages caused by one ton of carbon pollution and represents the monetary benefit today of reducing carbon emissions in the future.

The U.S. Council of Economic Advisors and the Office of Management and Budget convened an Interagency Working Group on the Social Cost of Greenhouse Gases (IWG) to develop a methodology for estimating the SC-CO₂. The methodology relies on a standardized range of assumptions and can be used consistently when estimating the benefits of regulations across agencies and around the world.⁵¹ Staff used the current IWG-supported SC-CO₂ values to consider the social costs of actions taken to reduce GHG emissions. This is consistent with the approach presented in the 2022 Scoping Plan Update, is in line with U.S. Government Executive Orders including 13990 and the Office of Management and Budget Circular A-4 of September 17, 2003.^{52,53}

The IWG describes the social cost of carbon as follows:

“The social cost of carbon (SC-CO₂) for a given year is an estimate, in dollars, of the present discounted value of the future damage caused by a 1-metric ton increase in carbon dioxide (CO₂) emissions into the atmosphere in that year, or equivalently, the benefits of reducing CO₂ emissions by the same amount in that year. The SC- CO₂ is intended to provide a comprehensive measure of the net damages – that is, the monetized value of the net impacts – from global climate change that result from an additional ton of CO₂.

These damages include, but are not limited to, changes in net agricultural productivity, energy use, human health, property damage from increased flood risk, as well as nonmarket damages, such as the services that natural ecosystems provide to society. Many of these damages from CO₂ emissions today will affect economic outcomes throughout the next several centuries.”⁵⁴

February 2021. https://www.whitehouse.gov/wp-content/uploads/2021/02/TechnicalSupportDocument_SocialCostofCarbonMethaneNitrousOxide.pdf

⁵² California Air Resources Board, *2022 Scoping Plan for Achieving Carbon Neutrality*. 27-28. November 16, 2022. https://ww2.arb.ca.gov/sites/default/files/2022-12/2022-sp_1.pdf

⁵³ Office of Management and Budgets. *Circular A-4*. September 17, 2023.

<https://www.transportation.gov/sites/dot.gov/files/docs/OMB%20Circular%20No.%20A-4.pdf>

⁵⁴ National Academies of Sciences, Engineering, and Medicine, *Valuing Climate Damages: Updating Estimation of Carbon Dioxide*. National Academies Press, Washington DC. 2017. <https://nap.nationalacademies.org/catalog/24651/valuing-climate-damages-updating-estimation-of-the-social-cost-of> <https://nap.nationalacademies.org/catalog/24651/valuing-climate-damages-updating-estimation-of-the-social-cost-of>

The SC-CO₂ is year-specific and is highly sensitive to the discount rate used to adjust the value of the damages in the future due to CO₂. The SC-CO₂ increases over time as systems become more stressed from the aggregate impacts of climate change and future emissions cause incrementally larger damages. A higher discount rate decreases the value today of future environmental damages. This analysis uses the IWG standardized range of discount rates from 2.5 to 5% to represent varying valuation of future damages. Table 3 shows the range of IWG SC-CO₂ values (Consumer Price Index adjusted) used in California's regulatory assessments which reflect the societal value of reducing carbon emissions by one metric ton.⁵⁵

Table 3: SC-CO₂ Discount Rates (in 2021\$ per Metric Ton of CO₂)

Year	5% Discount Rate	3% Discount Rate	2.5% Discount Rate
2020	\$16	\$57	\$85
2025	\$19	\$63	\$93
2030	\$22	\$68	\$100
2035	\$25	\$75	\$107
2040	\$29	\$82	\$115
2045	\$31	\$88	\$122
2050	\$36	\$94	\$130

The GHG reductions due to the proposed amendments are calculated in CO₂e which includes reductions in carbon, methane, and other GHGs. As the CI of a fuel is based on a life cycle assessment of GHG emissions from the use of a fuel converted to CO₂e units, there is not a simple way to assess the breakdown of emissions reduction by GHG (i.e., CO₂, methane, or other GHG) due to the proposed amendments.

As there is no Social Cost of CO₂e, there is not a straightforward metric to estimate the benefits of the proposed amendments. If all GHG reductions under the proposed amendments are assumed to be carbon dioxide reductions, the cumulative estimated benefits from the proposed amendments would range from approximately \$14 billion to \$61 billion (in 2021\$). In Table 4 staff calculated the avoided SC-CO₂ values (2021\$) by applying values in Table 3 to the annual GHG emissions change.

⁵⁵ United States Government Interagency Working Group on Social Cost of Greenhouse Gases, *Technical Support Document: Social Cost of Carbon, Methane, and Nitrous Oxide Interim Estimates under Executive Order 13990*. 2021. https://www.whitehouse.gov/wp-content/uploads/2021/02/TechnicalSupportDocument_SocialCostofCarbonMethaneNitrousOxide.pdf

Table 4: Avoided Social Cost of CO₂ from Proposed Amendments 2024-2046

Year	GHG Emission Reductions (MMT)	5% Discount Rate	3% Discount Rate	2.5% Discount Rate
2026	13	\$254	\$852	\$1,250
2030	20	\$438	\$1,368	\$1,997
2034	29	\$716	\$2,149	\$3,065
2038	34	\$921	\$2,670	\$3,775
2042	33	\$1,008	\$2,794	\$3,939
2046	21	\$680	\$1,841	\$2,550
Total	558	\$14,544	\$43,045	\$61,099

It is important to note that the SC-CO₂, while intended to be a comprehensive estimate of the damages caused by carbon globally, does not represent the cumulative cost of climate change and air pollution to society. There are additional costs to society outside of the SC-CO₂, including costs associated with changes in co-pollutants and the social cost of other GHGs including nitrous oxide. The IPCC has stated that the Interagency Working Group on the Social Cost of Greenhouse Gases (IWG) SC-CO₂ estimates are likely underestimated due to the omission of significant impacts that cannot be accurately monetized, including important physical, ecological, and economic impacts.⁵⁶

As mentioned, the SC-CO₂ calculation incorporates GHG emission reductions associated with methane reductions from the regulation. The LCFS supports CARB's work to meet Short Lived Climate Pollutant (SLCP) targets set by Senate Bill 1383 (Lara, Chapter 395, Statutes of 2016) by incentivizing dairies to capture and convert methane-rich biogas into transportation fuels (compressed natural gas, hydrogen, and electricity). Methane is a potent climate pollutant with a Global Warming Potential 25 times higher than CO₂. CARB staff used the SC-CH₄ values provided by the IWG, adjusted to 2021\$, shown in Table 5 to estimate the avoided social cost of in-state methane converted to fuel. These values are consistent with the 2021 IWG interim numbers but adjust for inflation using the California Consumer Price Index. Staff use conversion factors from the Livestock Offset Protocol⁵⁷ and U.S. Energy Information

⁵⁶ United States Environmental Protection Agency, *Social Cost of Carbon Fact Sheet*. December 2016. https://www.epa.gov/sites/default/files/2016-12/documents/social_cost_of_carbon_fact_sheet.pdf

⁵⁷ California Air Resources Board, *Compliance Offset Protocol Livestock Projects*. November 14, 2014. <https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2014/capandtrade14/ctlivestockprotocol.pdf>

Administration⁵⁸ to calculate the methane emission reductions associated with in-state dairy biogas volumes from the California Transportation Supply (CATS) model outputs, resulting in a conversion factor of 0.020 metric tons of methane per million British thermal unit (0.020MT/MMBtu).

Table 5: Social Cost of Methane Discount Rates (in 2021\$ per Metric Ton of CH₄)

Year	5% Discount Rate	3% Discount Rate	2.5% Discount Rate
2020	\$739	\$1,641	\$2,188
2025	\$889	\$1,915	\$2,462
2030	\$1,039	\$2,188	\$2,735
2035	\$1,231	\$2,462	\$3,146
2040	\$1,368	\$2,735	\$3,556
2045	\$1,641	\$3,146	\$3,830
2050	\$1,778	\$3,419	\$4,240

Table 6 presents a sampling of years of avoided social cost of instate methane, and the cumulative total avoided social cost instate from 2024 to 2046, from the proposed amendments. The cumulative estimated benefits from the proposed amendments would range from approximately \$6 billion to \$16 billion (in 2021\$).

C. Health Benefits

The proposed amendments to the Low Carbon Fuel Standard regulation would reduce fine particulate matter (PM_{2.5}) and oxides of nitrogen (NO_x) emissions, resulting in health benefits in California. CARB analyzed the value of health benefits associated with 12 health outcomes, most of which were added or updated through CARB's recent expansion of the health analysis⁵⁹: cardiopulmonary mortality, acute myocardial infarction, lung cancer incidence, asthma onset, asthma symptoms, hospitalizations for cardiovascular illness, hospitalizations for respiratory illness, hospitalizations for Alzheimer's disease, hospitalizations for Parkinson's disease, cardiovascular emergency department (ED) visits, respiratory ED visits, and work loss days.

These health outcomes have been identified by U.S. EPA as having a causal or likely causal relationship with exposure to PM_{2.5} based on a substantial body of scientific evidence.^{60,61} U.S. EPA has determined that both long-term and short-term exposure to PM_{2.5} plays a causal role in premature mortality, meaning that a substantial body of scientific evidence shows a relationship between PM_{2.5} exposure and increased risk of death. This relationship persists when other risk factors such as smoking rates, poverty, and other factors are taken into account. U.S. EPA has also determined a causal relationship between non-mortality cardiovascular effects (e.g., acute myocardial infarction) and short- and long-term exposure to PM_{2.5}, a likely causal relationship between non-mortality respiratory effects (including worsening asthma) and short- and long-term PM_{2.5} exposure, and a likely causal relationship between non-mortality neurological effects and long-term PM_{2.5} exposure.

CARB staff evaluated health impacts associated with exposure to PM_{2.5} and NO_x emissions from the proposed amendments. NO_x includes nitrogen dioxide, a potent lung irritant, which

⁵⁹ California Air Resources Board, *California Air Resources Board Updated Health Endpoints Bulletin*. 2022. https://ww2.arb.ca.gov/sites/default/files/2022-11/California%20Air%20Resources%20Board%20Updated%20Health%20Endpoints%20Bulletin%20-%20Edited%20Nov%202022_0.pdf

⁶⁰ United States Environmental Protection Agency, *Integrated Science Assessment for Particulate Matter*. December 2019. <https://cfpub.epa.gov/ncea/isa/recordisplay.cfm?deid=347534>

⁶¹ United States Environmental Protection Agency, *Estimating PM_{2.5}- and Ozone-Attributable Health Benefits*. March 2021. https://www.epa.gov/sites/default/files/2021-03/documents/estimating_pm2.5-_and_ozone-attributable_health_benefits_tsd.pdf

can aggravate lung diseases such as asthma when inhaled.⁶² However, the most serious quantifiable impacts of NO_x emissions occur through the conversion of NO_x to fine particles of ammonium nitrate aerosols through chemical processes in the atmosphere. PM_{2.5} formed in this manner is termed secondary PM_{2.5}. Both directly emitted PM_{2.5} and secondary PM_{2.5} are associated with adverse health outcomes. As a result, reductions in PM_{2.5} and NO_x emissions are associated with reductions in these adverse health outcomes.

CARB staff's analysis of health outcomes from the proposed amendments is limited to fuel changes incremental to the baseline. The baseline includes implementation of technology changes expected from implementation of the on-road light duty (ACC II) and on-road heavy duty (ACT and ACF) regulations, and therefore the conservative LCFS analysis does not reflect the health benefits of transitioning to zero emission vehicles. However, the proposed amendments to the LCFS are expected to play a key role in supporting implementation of these vehicle-focused regulations, by reducing the cost of electricity and hydrogen used as vehicle fuels, supporting installation and operation of charging and hydrogen refueling stations, and promoting investment in transportation electrification in disadvantaged, low-income and rural communities. Although not quantified in the health outcomes analysis conducted by CARB staff, the LCFS program remains a key tool in supporting the transition to ZEV technology and the concurrent air quality and GHG benefits.

1. Incidence-Per-Ton Methodology

CARB uses the incidence-per-ton (IPT) methodology to quantify the health benefits of emissions reductions in cases where dispersion modeling results are not available. A description of this method is included on CARB's webpage. CARB's IPT methodology is based on a methodology developed by U.S. EPA.^{63,64}

Under the IPT methodology, it is assumed that changes in emissions are approximately proportional to changes in health outcomes. IPT factors are derived by calculating the number of health outcomes associated with exposure to PM_{2.5} for a baseline scenario using measured ambient concentrations and dividing by the emissions of PM_{2.5} or a precursor. The calculation is performed separately for each air basin using the following equation:

Equation 1: Incidence-per-ton calculation

$$IPT = \frac{\text{number of health outcomes in air basin}}{\text{annual emissions in air basin}}$$

⁶² United States Environmental Protection Agency, *Integrated Science Assessment for Oxides of Nitrogen – Health Criteria*. January 2016. <https://cfpub.epa.gov/ncea/isa/recordisplay.cfm?deid=310879>

⁶⁴ Fann, N., Baker, K. R., Chan, E. A., Eyth, A., Macpherson, A., Miller, E., & Snyder, J. *Assessing human health PM_{2.5} and ozone impacts from US oil and natural gas sector emissions in 2025*. Environmental Science & Technology, 52(15), 8095-8103. July 13, 2018. <https://pubs.acs.org/doi/full/10.1021/acs.est.8b02050>

Multiplying the emissions reductions from the proposed amendments in an air basin by the IPT factor then yields an estimate of the reduction in health outcomes achieved by the proposed amendments. For future years, the number of outcomes is adjusted to account for population growth. CARB's current IPT factors are based on a 2014-2016 baseline scenario, which represents the most recent data available at the time the current IPT factors were computed. IPT factors are computed for the two types of PM_{2.5}: primary PM_{2.5} and secondary PM_{2.5} of ammonium nitrate aerosol formed from precursors.

2. Reduction in Adverse Health Impacts

CARB recently initiated an expanded health analysis to include additional health endpoints in order to provide a more comprehensive analysis of the benefits of the agency's plans and regulations. A description of the updated and new health outcomes was provided in CARB's Updated Health Endpoints Bulletin, released November 2022. This expansion was based on U.S. EPA's Technical Support Document for the Final Revised Cross-State Air Pollution Rule Update for the 2008 Ozone Season NAAQS and is associated with U.S. EPA's Environmental Benefit Mapping and Analysis Program – Community Edition version 1.5.8.⁶⁵

CARB staff estimates that the total number of cases statewide that would be reduced (from 2024 to 2046) from implementation of the proposed amendments are as follows:

- 364 (201 - 519) fewer cases of cardiopulmonary mortality;
- 74 (54 - 94) fewer cases of hospitalizations for cardiovascular illness;
- 97 (-37 - 227) fewer cases of cardiovascular ED visits;
- 41 (15 - 109) fewer cases of nonfatal acute myocardial infarction;
- 11 (0 - 22) fewer cases of hospitalizations for respiratory disease;
- 219 (43 - 457) fewer cases of respiratory ED visits;
- 27 (8 - 45) fewer cases of lung cancer incidence;
- 852 (818 - 884) fewer cases of asthma onset;
- 73,433 (-35,816 – 178,171) fewer cases of asthma symptoms;
- 53,427 (45,055 – 61,482) fewer cases of work loss days;
- 174 (133 - 212) fewer cases of hospitalizations for Alzheimer's disease;
- 25 (13 - 36) fewer cases of hospitalizations for Parkinson's disease;

These reductions in adverse health cases are expected to be seen across all ages in the State. Children in particular will benefit from the reduced cases of asthma onset and symptoms due to the proposed amendments. This may lead to better health outcomes in these children when they become adults since studies have shown that childhood asthma puts individuals at

greater risk for respiratory disease and lower respiratory function in adulthood.^{66,67} Adults are also expected to benefit from the proposed amendments due to fewer lost work days, nonfatal acute myocardial infarctions (heart attacks), lung cancer incidences, and reduced cardiopulmonary mortality. Seniors may benefit from reduced cases of hospitalizations for not just cardiovascular and respiratory diseases, but also neurological conditions (Alzheimer's and Parkinson's diseases). And there will be fewer ED visits for both cardiovascular and respiratory diseases across all ages in the population.

Table 7 shows the air basin distribution of avoided health endpoints for the proposed amendments for 2024 through 2046 in California, relative to the baseline.

3. Uncertainties Associated with the Mortality and Illness Analysis

Although the estimated health outcomes presented in this report are based on a well-established methodology, they are subject to uncertainty. Uncertainty is reflected in the 95% confidence intervals included with the central estimates in Table 7. These confidence intervals take into account uncertainties in translating air quality changes into health outcomes.

Other sources of uncertainty include the following:

- The relationship between changes in pollutant concentrations and changes in pollutant or precursor emissions is assumed to be proportional, although this is an approximation.
- Emission reductions are reported at a state level and do not capture local variations.
- Future population estimates are subject to increasing uncertainty as they are projected further into the future.
- Fuel use projections from the CATS model are estimates based on technoeconomic analysis, which approximates but does not capture all real-world conditions.
- Baseline incidence rates can experience year-to-year variation.

4. Monetization of Health Benefits

The reductions in adverse health impacts described above can be assigned monetary values so the health benefits can be directly compared to other costs and savings associated with the proposed amendments. These values are derived from economics studies and are based on the expenses that an individual must bear for air pollution related health impacts such as medical bills and lost work, or willingness to pay metrics, which in addition to capturing the direct expenses of the health outcomes also capture the value that individuals place on pain and suffering, loss of satisfaction, and leisure time. For more information on the methodology used to determine the monetary value of health outcomes, see Appendix C-1. The value per incident is shown in Table 8 below.

Table 8: Valuation per Incident for Avoided Health Outcomes (2021\$)

Category	Endpoint	Value Per Incident (2021\$)	Valuation Methodology	Notes
Premature Mortality	Premature Mortality	\$12,483,845	WTP	Shown at 2021 income levels. The estimate will grow annually proportional to income growth using U.S. EPA's central estimate for income elasticity of 0.40, and income growth forecast from BenMAP-CE.

Category	Endpoint	Value Per Incident (2021\$)	Valuation Methodology	Notes
Hospitalizations and ER Visits	HA, Parkinson's Disease	\$15,520	COI	Direct cost of hospitalization incident.
Hospitalizations and ER Visits	HA, Respiratory-2	\$11,815	COI	Direct cost of hospitalization incident.
Hospitalizations and ER Visits	HA, Alzheimer's Disease	\$14,539	COI	Direct cost of hospitalization incident.
Hospitalizations and ER Visits	HA, Cardio-, Cerebro- and Peripheral Vascular Disease	\$18,696	COI	Direct cost of hospitalization incident.
Hospitalizations and ER Visits	ER visits, All Cardiac Outcomes	\$1,403	COI	Direct cost of ER visit.
Hospitalizations and ER Visits	ER visits, respiratory	\$1,057	COI	Direct cost of ER visit.
Health Endpoint Onset/Occurrence	Incidence, Asthma	\$53,753	COI	Present value of lifetime healthcare cost and productivity losses using a 3% discount rate.
Health Endpoint Onset/Occurrence	Asthma Symptoms, Albuterol use	\$253	WTP for symptoms + COI for Albuterol use	Willingness to pay plus cost of albuterol.
Health Endpoint Onset/Occurrence	Incidence, Lung Cancer	\$30,377	COI	Direct medical cost of lung cancer. Cost discounted to present value at 3%.
Health Endpoint Onset/Occurrence	Acute Myocardial Infarction, Nonfatal	\$94,334	COI	Present value of 3 years medical cost and earnings lost over a 5-year period. Using a 3% discount rate.
Health Endpoint Onset/Occurrence	Work Loss Days	\$204	COI	Based on county-level median daily wages.

The statewide valuation of health benefits from 2024-2046 are shown in Table 9. The total statewide health benefits derived from criteria emissions reductions is estimated to be approximately \$5 billion, with \$4.9 billion resulting from reduced premature cardiopulmonary mortality and \$85 million resulting the reductions in other adverse health impacts. The spatial distribution of these benefits across the State follows the distribution of the health impacts by

air basin as described in Table 7. These monetized benefits from all COI based endpoint valuations are included in the macroeconomic modeling.

Table 9: Statewide Valuation from Avoided Health Outcomes (million 2021\$)

Avoided Health Incident	2026	2030	2034	2038	2042	2046	Total

Total Valuation	141	129	206	284	268	273	4,977

D. Benefits to Typical California Businesses

LCFS incentives may encourage California firms, as well as other firms doing business in California, to invest early in innovative, low-CI fuel technologies and develop mature businesses earlier than firms not participating in the California market. Early investment may result in competitive advantages to these businesses as other state, federal, or international jurisdictions adopt similar carbon intensity standards.⁶⁸ The proposed amendments will also

⁶⁸ Currently Oregon, Washington, British Columbia, Canada, Brazil, and the European Union have LCFS-like policies in place.

help promote a wider range of clean fuels and vehicles for California businesses to choose from, including vehicles operating on electricity, hydrogen, and biomethane.

The proposed amendments also benefit California fuel providers that have compliance obligations under the Cap-and-Trade Program. As the LCFS reduces the CI of fuels, it changes the composition of the State's transportation fuel mix and dependence on traditional petroleum-based fuels. CARB designed the LCFS and Cap-and-Trade Programs to complement one another. Investments made to comply with one of the programs may result in reduced compliance requirements for the other program. Increased use of low-carbon fuel due to the LCFS will reduce fuel suppliers' GHG emissions covered by the Cap-and-Trade Program, reducing the Cap-and-Trade Program compliance obligation of these firms. Similarly, selling cleaner fuels or investing in emission reduction projects at California refineries and oil fields to comply with the Cap-and-Trade Program may also generate credits under the LCFS.

Cumulatively, from 2024 through 2046, the proposed amendments are estimated to increase total revenue for credit generating businesses as compared to the baseline scenario by \$149 billion, of which approximately \$128 billion is estimated to accrue to California businesses.

See Chapter VIII and the Standardized Regulatory Impact Analysis (Appendix C-1) for further discussion of benefits to typical California businesses.

E. Benefits to Small Businesses

Staff defines small businesses as independently owned businesses located in California, with 100 employees or less and annual revenues under \$10 million.

In addition to the benefits already discussed for California businesses, CARB estimates that small businesses will see benefits from the proposed amendments. Many of California's biodiesel producers, hydrogen producers, electric charging stations, hydrogen stations, and natural gas stations are small businesses. Staff identified the following small businesses in California, which represented 16% of the LCFS parties registered in the LCFS in September 2021:

- Three biodiesel providers
- Six natural gas (CNG and LNG) fueling station operators
- 21 electric charging station operators
- One propane provider

In total, these small businesses generated approximately 119,000 LCFS credits in 2021, which provided an estimated \$22 million in credit revenue as estimated using the 2021 average LCFS credit price of \$188.

The proposed amendments will increase the demand for low-CI fuels and are anticipated to increase the prices for LCFS credits relative to the baseline, thereby increasing revenue to these small businesses. In addition, larger potential revenue resulting from the proposed amendments may allow other small businesses to enter the market. Therefore, staff kept the 2021 credit total of 119,000 as a static proxy for future small business credit generation.

V. Air Quality

A. Baseline Assumptions

The economic and emissions impacts of the proposed amendments are estimated against a baseline scenario. As the proposed amendments retain the market flexibility of the current LCFS, it is not possible to predict the exact path or fuels used for future compliance.

The LCFS is a flexible policy tool to reduce emissions by encouraging the development and use of low-carbon transportation fuels to meet increasingly stringent annual carbon intensity benchmarks, similar to the Renewable Portfolio Standard for the electricity sector. The LCFS interacts with many different State and federal regulations. Estimating the baseline fuel demand requires accounting for compliance with existing regulations and standards, changes in fuel consumption as the fleet turns over to vehicles that meet more stringent emission standards, and the expected price of fuels in the future.

The baseline reflects the changing transportation fuel mix from implementation of State and federal laws and regulations that impact future on-road transportation fuel demand that existed or had been adopted as of Summer 2023, which include the ACF regulation, and both the existing ACC II and ACT regulations. The baseline also includes the newly signed Clean Truck Partnership. The baseline does not include any light-duty vehicle transportation fuel demand reductions that would result from successful implementation of vehicle-miles traveled (VMT) reductions. The baseline energy demand for medium- and heavy-duty sectors includes the same vehicle sales and population growth, VMT, and zero-emission technology assumptions currently reflected in CARB's latest version of its emission inventory tool, Emission FAcT or 2021 (EMFAC2021). The light-duty vehicle energy demand is calculated using a combination of vehicle populations and growth modeled for the 2022 Scoping Plan Update, VMT from the Department of Motor Vehicles, and fuel efficiencies from EMFAC2021.

The most important policies that drive change in fuel demand and/or carbon intensity that are represented in the baseline are the following:

- Low Carbon Fuel Standard: Under the current LCFS, a 20% reduction in average fuel CI will be achieved by 2030. This target then remains constant for years 2030 and beyond.
- Advanced Clean Cars II: ACC II requires 100% of new vehicle sales to be zero-emission or plug-in hybrid electric by 2035 for manufacturers producing passenger cars, trucks, and SUVs.
- Advanced Clean Trucks: ACT requires truck manufacturers to sell ZEVs as an increasing percentage of their annual California sales from 2024 to 2035. By 2035, zero-emission truck/chassis sales must be 55% of Class 2b – 3 truck sales, 75% of Class 4 – 8 straight truck sales, and 40% of truck tractor sales.
- Advanced Clean Fleets: ACF requires trucking fleets to turn over their fleets to ZEV technology starting in 2024, with specific transition timelines based on fleet types. The ACF rule includes an end to combustion truck sales in 2036.
- U.S. Environmental Protection Agency's (U.S. EPA) Renewable Fuel Standard: The U.S. EPA's RFS mandates minimum volumes of renewable fuels, which are required to be blended into transportation fuels. Staff assumes that the RFS will continue to operate, providing monetary incentive for biofuels such as ethanol, biodiesel, renewable diesel, renewable natural gas, and electric vehicle

deployment. While the U.S. EPA recently proposed mandated volumes for the RFS program through 2025, the program does not expire or sunset in 2025. In addition, the costs and supply variability provided across scenarios yield estimates and ranges that can account for the uncertainty in the post-2025 RFS.

- U.S. EPA Revised 2023 and Later Model Year Light-Duty Vehicle Greenhouse Gas Emission Standards and National Highway Traffic Safety Administration (NHTSA) Corporate Average Fuel Economy standards for Model Years 2024-2026 Passenger Cars and Light Trucks: These regulations require vehicle manufacturers to comply with new GHG vehicle emission standards and fuel economy standards through 2026. U.S. EPA and NHTSA have also separately proposed more stringent GHG vehicle emission and fuel economy standards, respectively, for later model years.
- Inflation Reduction Act of 2022: This bill revised Section 45 of the Internal Revenue Code to establish and/or increase the tax credits available for production of low-carbon fuels and CO₂ capture and storage/sequestration.
- California Phase 2 GHG Standards for On-Road Medium- and Heavy-Duty Vehicles: This regulatory program primarily establishes greenhouse gas (GHG) emissions standards for new medium- and heavy-duty vehicles and engines.
- The requirements of Clean Energy, Jobs, and Affordability Act of 2022⁶⁹ that dictates retail electricity be supplied by zero-carbon sources equal to 90% of supply in 2035, 95% in 2040, and 100% by 2045, with State agencies required to procure 100% zero-carbon electricity in 2035.
- The longer-term requirements of the 100 Percent Clean Energy Act of 2018⁷⁰ that requires electricity be supplied by zero-carbon sources by 2045. This requirement will affect the CI of electricity.

B. Total Emissions Benefits

The proposed amendments will reduce GHG emissions and smog-forming and toxic air pollutants from the transportation sector by shifting to low-CI fuels which, in many cases, also release fewer pollutants when combusted than fossil fuels. Reductions in GHG emissions and improvements in California air quality under the proposed amendments are anticipated to result in fewer damages due to climate change and in health benefits for California individuals. These health benefits result in cost savings to individuals, businesses, and government agencies due to fewer premature mortalities, fewer hospital and emergency room visits, and fewer lost days of work. When combusted, transportation fuels emit harmful pollutants, which this proposal would help to eliminate. These pollutants include NO_x and fine particulate matter (PM_{2.5}). NO_x is a precursor to ozone and secondary particulate matter formation. Exposure to ozone and to PM_{2.5}, which are inhalable particles with diameters that are generally 2.5 micrometers and smaller, is associated with increases in premature death, hospitalizations,

⁶⁹ California Legislature, *Senate Bill 1020 Clean Energy, Jobs, and Affordability Act of 2022*. Signed September 16, 2022. https://leginfo.legislature.ca.gov/faces/billNavClient.xhtml?bill_id=202120220SB1020

⁷⁰ California Legislature, *Senate Bill 100 California Renewables Portfolio Standard Program: emissions of greenhouse gases*. Signed September 10, 2018. https://leginfo.legislature.ca.gov/faces/billTextClient.xhtml?bill_id=201720180SB100

visits to doctors, use of medication, and emergency room visits due to exacerbation of chronic heart and lung diseases and other adverse health conditions.

The baseline includes the technology changes that are expected from implementation of on-road light-duty (ACC II), on-road heavy-duty (ACT and ACF), and off-road (At-Berth and TRU) regulations. In the Standardized Regulatory Impact Analysis (Appendix C-1), staff analyzed the benefits from the proposed changes to the LCFS regulation incremental to the baseline. Those benefits from the proposed changes to the LCFS regulation incremental to the baseline include quantification of the upstream emissions benefits of reduced California oil and gas extraction, which staff estimates will come from reduced demand for petroleum fuels in the future. During the COVID-19 pandemic and the stay-at-home orders, there was a drastic reduction in demand for petroleum fuels as residents stayed home. Data collected under the Regulation for the Mandatory Reporting of Greenhouse Gas Emissions for 2020 and 2021 show a reduction in oil and gas sector GHG emissions relative to previous years driven primarily from the reduced demand for petroleum fuels that occurred during 2020.⁷¹ The 2022 edition of the AB 32 Annual GHG Inventory also shows a 13% reduction in oil and gas sector emissions from 2019 to 2020.⁷² As such, a reduction in GHG, criteria, and toxic emissions from oil and gas extraction is expected to result from corresponding petroleum fuel demand reductions, further expanding the benefits of this regulation. The methodology used to estimate the emissions impact and the incremental impacts of the proposed amendments (relative to the baseline) are detailed in Appendix C-1.

1. Greenhouse Gas Emissions Benefits of the Proposed Amendments

Figure 7 summarizes the annual life cycle greenhouse gas emissions reductions under the baseline and the proposed amendments scenario. Staff expects the proposed amendments to reduce GHG emissions relative to the baseline by 558 million metric tons in carbon dioxide equivalent (MMTCO₂e) from 2024 through 2046. It is important to note that because the LCFS calculates emission reductions on a full life cycle basis, the GHG emission reductions occur both in California and out-of-state.

These GHG reduction estimates are derived from the California Transportation Supply (CATS) outputs of the fuel quantities and average annual CI associated with each fuel, as well as GHG reductions associated with oil and gas extraction emissions.

⁷¹ California Air Resources Board, *Mandatory Greenhouse Gas Reporting 2021 Emissions Year Frequently Asked Questions*. November 4, 2022. <https://ww2.arb.ca.gov/sites/default/files/classic/cc/reporting/ghg-rep/reported-data/2021mrrfaqs.pdf>

⁷² California Air Resources Board, *California Greenhouse Gas Emissions for 2000 to 2020 Trends of Emissions and Other Indicators*. October 26, 2022. https://ww2.arb.ca.gov/sites/default/files/classic/cc/inventory/2000-2020_ghg_inventory_trends.pdf

Figure 7: Annual GHG Emissions of Baseline and Proposed Amendments

2. Criteria Pollutant Emission Benefits of Proposed Amendments

The proposed amendments would affect air quality through four main categories: 1) changes in tailpipe emissions for on-road and off-road vehicles, 2) changes in aircraft emissions at airports, 3) changes in emissions at stationary sources from fuel production, and 4) changes in upstream emissions associated with oil and gas extraction where quantified.

Fossil fuels contain benzene, toluene, ethyl benzene, and xylenes (BTEX compounds), which can be emitted to the air and contaminate soil and water. Gasoline engine exhaust contains benzene, 1,3-butadiene, formaldehyde, and acetaldehyde. Diesel engine exhaust contains diesel particulate matter, which is a toxic air contaminant. Generally, all exhaust from the combustion of hydrocarbon fuels contains benzene as a product of incomplete combustion (PIC). Staff expects reductions in these criteria pollutants and toxics due to decreased use of fossil fuels in regions with heavy use of motor vehicles and diesel engines, such as big population centers (e.g., South Coast) and areas with heavy truck use (San Joaquin Valley), and regions with commercial airports. Converting from fossil jet fuel to alternative jet fuel yields significant benefits, averaging an annual reduction of 346 tons of NO_x and 28 tons of PM_{2.5} from the proposed amendments.

Reducing criteria pollutants and toxic emissions from fuel combustion in line with California's air quality goals requires deploying ZEVs and ensuring the availability of fueling infrastructure to support ZEV deployment. In the Standardized Regulatory Impact Assessment (SRIA), CARB staff estimated air quality benefits attributable to the proposed amendments. The emissions analysis includes expected reductions in emissions from upstream oil and gas extraction that would be expected to result from corresponding petroleum fuel demand reductions. First, staff estimated upstream extraction-based criteria pollutant emission changes associated with reduced petroleum demand. To estimate the emission benefits of reduced upstream oil extraction, staff focused on the proportion of demand reduction associated with fossil diesel declines expected from the LCFS proposal, given that staff expects diesel demand may persist longer than gasoline demand in California and future in-state extraction reductions may be limited by the pace of diesel demand reductions. The reductions shown in Table 10 also include estimated changes in emissions that occur from changes in renewable fuel use in vehicles, feedstock and fuel transport, and changes in renewable fuel production.

In summary, the proposed amendments achieve reductions of PM2.5 and NOx through 2046, shown in Table 10. These emissions reductions are driven in part by increased use of renewable diesel and alternative jet fuel, which displace fossil diesel and fossil jet fuel. As noted earlier, emissions reductions from phasing down oil extraction and refining operations in tandem with petroleum demand reductions are included in this analysis. In total, the proposed amendments achieve reductions of 4,281 tons of PM2.5 and 25,586 tons of NOx in aggregate through 2046.

Table 10: NOx and PM2.5 Emission Changes under the Proposed Amendment Scenario (tons per day)

Year	NOx (tpd)	PM2.5 (tpd)
2024	-0.4	-0.1
2025	-2.2	-0.3
2026	-2.2	-0.3

2045	-3.6	-0.7
2046	-3.7	-0.8

VI. Environmental Impact Analysis

CARB is the lead agency for the proposed regulation and has prepared an environmental impact analysis (EIA) pursuant to its certified regulatory program (title 17, CCR, sections 60000 through 60008) to comply with the requirements of the California Environmental Quality Act (CEQA). CARB's regulatory program, which involves the adoption, approval, amendment, or repeal of standards, rules, regulations, or plans for the protection and enhancement of the State's ambient air quality has been certified by the California Secretary for Natural Resources under Public Resources Code section 21080.5 of CEQA (title 14, CCR, section 15251(d)). Public Resources Code section 21080.5 allows public agencies with certified regulatory programs to prepare a "functionally equivalent" or substitute document in lieu of an environmental impact report or negative declaration, once the program has been certified by the Secretary for the Resources Agency as meeting the requirements of CEQA. CARB, as a lead agency, prepares a substitute environmental document (referred to as an "Environmental Impact Analysis" or "EIA") as part of the Staff Report to comply with CEQA (title 17, CCR, section 60005).

The Draft EIA for the proposed amendments is included in Appendix D. The Draft EIA provides a programmatic environmental analysis of an illustrative, reasonably foreseeable compliance scenario that could result from implementation of the proposed amendments.

For the purpose of determining whether the proposed LCFS regulation would have a potential adverse effect on the environment, CARB evaluated the potential physical changes to the environment resulting from reasonably foreseeable compliance responses.

Reasonably foreseeable compliance responses associated with the proposed amendments include the following responses, which could result in changes to the existing physical environment: modifications to cultivation volume and transport of feedstock; changes to location and types of feedstock; new or modified processing facilities for feedstock and finished fuel production; increased transportation of finished alternative fuels to blending terminals or retail fuel sites; construction and operation of new facilities to produce renewable diesel, renewable gasoline, AJF, and renewable propane; construction of biomass gasification and pyrolysis systems for hydrogen and renewable natural gas production; construction of new anaerobic facilities to digest manure from dairies, sewage from wastewater treatment plants, and organic waste diverted from landfills; construction of infrastructure to collect biogas and produce methane; construction of stand-alone and bolt-on cellulosic processing units for renewable fuels production; increase in collection of yard waste or removal of forest litter and agricultural residues; construction of electrolysis units and substitution of renewable natural gas for fossil gas in production of hydrogen; construction of solar and wind electricity generation projects; modification to existing or new industrial facilities to capture CO₂ emissions; construction of new infrastructure such as pipelines, wells and other surface facilities; construction and operation of additional refueling hydrogen stations and EV charging stations; modifications to electricity distribution and transmission infrastructure; modifications to existing crude production facilities to accommodate solar and wind electricity, solar heat, and/or solar steam generation; electrification of equipment and installation of renewable

electricity and battery storage systems at petroleum refineries and alternative fuel production facilities; expansion of public transit systems; and land use changes and changes to fuel-associated shipment patterns.

While many impacts associated with the compliance responses identified for the proposed amendments could be reduced to less-than-significant levels through conditions of approval applied and mitigation measures to project-specific development, the authority to apply that mitigation lies with land use agencies or other agencies approving the development projects, not with CARB. Consequently, if a potentially significant environmental effect cannot be feasibly mitigated with certainty, the EIA takes a conservative approach and identifies the impact as significant and unavoidable while disclosing the impact for CEQA compliance purposes. As such, reasonably foreseeable compliance responses associated with the proposed amendments could result in potentially significant and unavoidable environmental impacts. Table 11 summarizes the potential environmental impacts of the proposed amendments.

Table 11: Summary of Potential Environmental Impacts

Impact Number	Resource Area Impact	Significance
1-1	Short-Term Construction-Related and Long-Term Operational-Related Impacts on Aesthetics	Potentially Significant and Unavoidable
2-1	Short-Term Construction-Related and Long-Term Operational-Related Impacts on Agriculture and Forest Resources	Potentially Significant and Unavoidable
2-2	Agricultural and Forest Resource Impacts Related to Feedstock Cultivation	Potentially Significant and Unavoidable
3-1, 3-2	Short-Term Construction-Related and Long-Term Operational-Related Impacts on Air Quality	Potentially Significant and Unavoidable
3-3	Short-Term Construction-Related and Long-Term Operational Impacts from Odors	Less than Significant
4-1, 4-2	Short-Term Construction-Related and Long-Term Operational-Related Impacts to Biological Resources	Potentially Significant and Unavoidable
5-1	Short-Term Construction-Related and Long-Term Operational-Related Effects to Cultural Resources	Potentially Significant and Unavoidable
6-1, 6-2	Short-Term Construction-Related and Long-Term Operational-Related Impacts to Energy Resources	Less than Significant
7-1	Short-Term Construction-Related and Long-Term Operational-Related Impacts to Geology and Soils	Potentially Significant and Unavoidable

Impact Number	Resource Area Impact	Significance
7-2	Long-Term Operational-Related Impacts to Geology and Soil Associated with Land Use Changes	Potentially Significant and Unavoidable
8-1	Short-Term Construction-Related and Long-Term Operational-Related Impacts to Greenhouse Gas Emissions	Beneficial
9-1, 9-2	Short-Term Construction-Related and Long-Term Operational-Related Impacts Related to Hazards and Hazardous Materials	Potentially Significant and Unavoidable
10-1, 10-2	Short-Term Construction-Related and Long-Term Operational-Related Impacts to Hydrology and Water Quality	Potentially Significant and Unavoidable
11-1	Short-Term Construction-Related and Long-Term Operational-Related Impacts on Land Use	Potentially Significant and Unavoidable
11-2	Long-Term Operational Impacts on Land Use Related to Feedstock Production	Potentially Significant and Unavoidable
12-1	Short-Term Construction-Related Impacts to Mineral Resources	Less than Significant
12-2	Long-Term Operational-Related Impacts on Mineral Resources	Potentially Significant and Unavoidable
13-1, 13-2	Short-Term Construction-Related and Long-Term Operational-Related Impacts to Noise and Vibration	Potentially Significant and Unavoidable
14-1	Short-Term Construction-Related and Long-Term Operational-Related Impacts to Population and Housing	Less than Significant
15-1	Short-Term Construction-Related and Long-Term Operational-Related Impacts to Public Services	Less than Significant
16-1	Short-Term Construction-Related and Long-Term Operational-Related Impacts to Recreation	Less than Significant
17-1, 17-2	Short-Term Construction-Related and Long-Term Operational-Related Impacts to Transportation	Potentially Significant and Unavoidable
18-1	Short-Term Construction-Related and Long-Term Operational-Related Impacts on Tribal Cultural Resources	Potentially Significant and Unavoidable
19-1	Long-Term Operational-Related Impacts to Utilities and Service Systems	Potentially Significant and Unavoidable
20-1	Short-Term Construction-Related and Long-Term Operational-Related Impacts on Wildfire	Less than Significant

Staff prepared a Notice of Preparation and made it available for review and comment for 30 days, per the CEQA Guidelines (Cal. Code Regs., tit. 14, § 15082(b)). The comment period for the Notice of Preparation began on February 13, 2023 and ended on March 15, 2023. Written comments on the Draft EIA will be accepted starting January 5, 2024 through February 20, 2024. The Board will consider the Final EIA and responses to comments received on the Draft EIA before taking action to adopt the proposed amendments. If the proposed amendments are adopted, a Notice of Decision will be posted on CARB's website and filed with the Secretary of the Natural Resources Agency for public inspection (Cal. Code Regs., tit. 17, § 60004.2(d)).

VII. Environmental Justice

State law defines environmental justice (EJ) as the fair treatment and meaningful involvement of people of all races, cultures, incomes, and national origins with respect to the development, adoption, implementation, and enforcement of environmental laws, regulations, and policies (Gov. Code, § 65040.12, subd. (e)(1)). The advancement of state and federal law on environmental justice was greatly influenced by the Principles of Environmental Justice.⁷³ Environmental justice includes, but is not limited to, the following:

- The availability of a healthy environment for all people;
- The deterrence, reduction, and elimination of pollution burdens for populations and communities experiencing the adverse effects of that pollution, so that the effects of the pollution are not disproportionately borne by those populations and communities;
- Governmental entities engaging and providing technical assistance to populations and communities most impacted by pollution to promote their meaningful participation in all phases of the environmental and land use decision making process; and
- At a minimum, the meaningful consideration of recommendations from populations and communities most impacted by pollution into environmental and land use decisions (Gov. Code, § 65040.12, subd. (e)(2)).

The Board approved its Environmental Justice Policies and Actions (Policies) on December 13, 2001, to establish a framework for incorporating environmental justice into CARB's programs consistent with the directives of State law. These policies apply to all communities in California but are intended to address the disproportionate environmental exposure burden borne by low-income communities and communities of color. Environmental justice is one of CARB's core values and fundamental to achieving its mission for all Californians.

CARB continues to integrate environmental justice into its rulemaking, policy development and other key decision-making and implementation activities, including the LCFS. In October 2022, the Board laid out a Vision for Environmental Justice and Racial Equity that reaffirms the Board's goal to create and implement policies, regulations and programs that address environmental justice and provide tangible and immediate gains for historically oppressed people.⁷⁴

With the passage of AB 32, CARB was charged with developing a Scoping Plan that outlines how California will achieve its climate goals and to update it every five years. The Board was also required to convene an Environmental Justice Advisory Committee (EJAC) to advise the Board during the development and subsequent updates of the Scoping Plan, and any other

⁷³ Delegates to the First National People of Color Environmental Leadership Summit, *The Principles of Environmental Justice (EJ)*. 1991. <https://www.ejnet.org/ej/principles.html>

⁷⁴ California Air Resources Board, *Vision for Environmental Justice and Racial Equity*. October 24, 2022. <https://ww2.arb.ca.gov/sites/default/files/2023-04/CARB%20Vision%20Racial%20Equity%20Final%20ENG.pdf>

pertinent matter in implementing AB 32. The EJAC consists of representatives of communities in the State with significant exposure to air pollution, including disadvantaged communities with minority or low-income populations. Four iterations of the Committee have been convened. The first EJAC advised on the initial 2008 Scoping Plan, the second was convened in March 2013 to advise the Board on the 2013 Scoping Plan Update, the third in 2015 to advise on the 2030 Target Scoping Plan Update, and the fourth in 2021 to advise on the 2022 Scoping Plan Update.⁷⁵ More than five dozen of the EJAC's recommendations were incorporated into the 2022 Scoping Plan Update.

In September 2022, Governor Newsom issued Executive Order N-16-22, which directs California agencies and departments developing or updating strategic plans from 2023 to 2026 to reflect the use of data analysis and inclusive practices to more effectively advance equity and respond to identified disparities with changes to the organization's mission, vision, goals, data tools, policies, programs, operations, community engagement, tribal consultation policies and practices, and other actions as necessary to serve all Californians. The Order also directs departments to gather input from disadvantaged and underserved communities as part of this process.

A. Uplifting Equity

CARB hosted 11 public workshops to discuss potential future changes to the LCFS program since 2020, including two community-oriented meetings in May and June 2023. Environmental justice advocates have attended all the workshops and provided verbal or written feedback on behalf of their organizations and community members. LCFS staff has also met with advocates throughout the informal pre-rulemaking process and the EJAC approved a resolution with recommendations for the LCFS program in August 2023.⁷⁶ The input of advocates and community members has helped staff refine many proposed LCFS amendments.

The central goals of the LCFS program are to reduce greenhouse gas emissions from the transportation sector and improve air quality by incentivizing the production of zero- and low-carbon energy fuels and infrastructure. Environmental justice advocates and community members have shared support for these fundamental goals throughout the public process and there is an ongoing recognition that many frontline communities are located adjacent to ports, rail, and major freight paths such as freeways. This section highlights program design features and proposals that align with EJ requests.

The LCFS program has been successful at increasing the supply of alternative fuels in California, helping to double the volume of low-carbon fuel consumption in just 10 years and displacing over 25 billion gallons of petroleum fuels with low-carbon fuels since 2011. Staff is proposing to increase the stringency of the program with measures that will enable an even

⁷⁵ Environmental Justice Advisory Committee, *AB 32 Environmental Justice Advisory Committee Charter*. 2023. <https://ww2.arb.ca.gov/sites/default/files/barcu/board/books/2023/032323/23-3-4ejaccharter.pdf>

⁷⁶ Environmental Justice Advisory Committee, *Draft Recommendations to the California Air Resources Board (CARB) on the Low Carbon Fuel Standard Regulation Updates*. August 28, 2023. <https://ww2.arb.ca.gov/sites/default/files/2023-08/EJAC%20DRAFT%20Low%20Carbon%20Fuel%20Standard%20Recommendations%20Version%202%20082823.pdf>

faster transition to zero- and low-carbon fuels, where greater benefits should accrue for frontline communities:

1. A 'step down' in the CI reduction target in 2025 from the current 13.75% to 18.75%;
2. A change in the 2030 CI reduction target from 20% to 30% with a target of 90% CI reduction in 2045;
3. An acceleration mechanism that will automatically trigger a set increase in the CI reduction target if certain specified market conditions are met.

Raising the carbon intensity reduction requirement of transportation fuel through the LCFS incentivizes the use of increasingly lower carbon fuel and is consistent with the EJAC's 2022 Scoping Plan recommendation to increase the stringency of the LCFS program.⁷⁷ Credits for low-carbon fuels will support the mobile source regulations that are driving the transition to zero-emission vehicle (ZEV) technology, such as the Advanced Clean Cars II and Advanced Clean Fleets regulations. The step-down will also help send a near-term signal to prompt investment in cleaner fuels.

As California moves toward a zero-emission transportation future, the LCFS is crucial in supporting the transition from fossil-based fuels. The program also supports other regulations in California that encourage or require the use of renewable diesel, such as the Innovative Clean Transit and In-use Locomotive regulations. Since legacy fleets, locomotives and airplanes will operate for decades more before they are completely replaced with zero-emission technology, it's important that the transportation fuel used during this time is increasingly lower-carbon and reduces the negative health impacts from the combustion of fossil-based fuels. The growing displacement of fossil-based fuels with renewable biofuels, supported by LCFS credit revenue, continues to improve air quality through the reduction in particulate matter and NOx emissions, as explained in Chapter IV. This is especially important in communities located near major transportation corridors and around airports and ports where legacy fleets will continue to operate.

In line with EJ recommendations, LCFS staff is proposing to expand incentives for electrification zero emission vehicles to accelerate the transition to electric and hydrogen-powered vehicles by extending light-duty vehicle infrastructure crediting and introducing a new medium- and heavy-duty vehicle (MHD) infrastructure credit.⁷⁸ Staff proposes to accept applications for public light-duty refueling infrastructure past the current end-date of December 31, 2025, with the provision that all new Fast Charging Infrastructure (FCI) and Hydrogen Refueling Infrastructure (HRI) applications for light-duty vehicles must be in low-income, disadvantaged or rural communities or more than 10 miles from the nearest fast charger to maximize coverage. For MHD FCI and HRI refueling infrastructure, staff is proposing to add capacity credits for up to 10 years of crediting to support the transition to zero emission technology in trucking fleets. This policy will incentivize the development of MHD refueling

⁷⁷ Environmental Justice Advisory Committee, *Environmental Justice Advisory Committee 2022 Scoping Plan Recommendations*: NF44 & NF54. 15-16. September 30, 2022.

infrastructure for battery-electric and hydrogen fuel cell-electric trucks and support the trucking industry's transition to ZEVs, reducing emissions and criteria pollutants across the State and in communities heavily impacted by freight travel.

Staff is proposing changes to the allocation and use of base credits generated by utilities from non-metered residential electric vehicle charging that will go farther in reducing emissions in communities near freight corridors. Under the Staff Proposal, the Clean Fuel Reward program will change from a new light-duty EV rebate to rebates for new and used medium- and heavy-duty zero emission trucks that are exempted from the Advanced Clean Fleets regulation. This will help accelerate the transition for this hard-to-transition segment of the trucking sector that is not covered by other CARB regulations. The proportion of residential base credits will change to reflect this change in rebate from 60% of total base credits to 40% with a corresponding increase in "holdback credits." As a result of this increase in holdback credits, staff is proposing to increase the requirements for investments in equity communities from 50% to 75% for investor-owned utilities, as well as proposing new pre-approved categories for investment of these credits. These new categories reflect priorities from the 2022 Scoping Plan Update as well as community input and include re-skilling and workforce development for transportation electrification, and transportation projects identified in AB 617 Community Emission Reduction Plans.

CARB staff are also proposing additional guardrails on the use of crop-based feedstocks for biofuel production. These changes will help to reduce the risk that rapid expansion of biofuel production and biofuel feedstock demand could result in deforestation or adverse land use change, a concern that was raised multiple times during the LCFS and Scoping Plan Workshops from EJ and environmental organizations.

Staff is also proposing to include deficit-generating fossil jet fuel for intrastate flights in the LCFS, beginning in 2028. This proposal aligns with the 2022 Scoping Plan Update toward decarbonizing the aviation sector, and with EJAC's recommendation to further integrate opt-in sectors into the regulation.^{79,80} The use of alternative jet fuels, which generate credits under the LCFS, will achieve particulate matter emissions reductions that benefit communities living near airports. Adding fossil jet fuel as a deficit generator also strengthens the signal to invest in zero-emission aviation technology, as modeled in the 2022 Scoping Plan Update in the 2040s.

B. Conclusion

Many elements of the Low Carbon Fuel Standard support key environmental justice-related recommendations, including the reduction of fossil fuel use, promotion of cleaner fuels, and the incentivization of charging and fueling infrastructure in disadvantaged communities. LCFS

⁷⁹ Recommendation NF54 in the Environmental Justice Advisory Committee 2022 Scoping Plan Recommendations.

⁸⁰ Environmental Justice Advisory Committee, *Draft Recommendations to the California Air Resources Board (CARB) on the Low Carbon Fuel Standard Regulation Updates*. August 28, 2023.

<https://ww2.arb.ca.gov/sites/default/files/2023-08/EJAC%20DRAFT%20Low%20Carbon%20Fuel%20Standard%20Recommendations%20Version%202%20082823.pdf>

complements other State policies as part of a suite of policies in California's portfolio of strategies to support reducing petroleum dependence by 94% by 2045.

VIII. Standardized Regulatory Impact Analysis

This section summarizes the economic impact of the Proposed Regulation as presented in the Standardized Regulatory Impact Analysis (SRIA), which can be found in Appendix C-1, as well as on the Department of Finance website. CARB responses to comments received from the Department of Finance can be found in Appendix C-3.

A. Changes Since the Release of the Standardized Regulatory Impact Assessment

The proposed amendments have been updated since the release of the SRIA on September 8, 2023. The changes and their potential impacts on the economic analysis are found below.

1. Verification Costs

Staff updated the verification cost estimates to include the expected costs to companies that own/operate between 1 and 10 fueling supply equipment (FSE), provisions for deferred verification for companies generating less than 6,000 credits per year, and less intensive verification requirements for fuel reporting entities reporting only electricity transactions. This change resulted in approximately \$2.25 billion less verification costs over the lifetime of the regulation.

a) Direct Costs

The total net cost of the proposed regulation from 2024 to 2046 is estimated to be approximately \$32 billion, with total direct costs of approximately \$160.5 billion and total revenue from LCFS credit sales of approximately \$128.4 billion. Direct costs of the amendments include the cost of compliance to in-state high carbon fuel producers that generate deficits (e.g., Direct costs of the amendments include the cost of compliance to in-state high carbon fuel producers that generate deficits (e.g., petroleum refiners), changes in statewide high carbon-intensity fuel expenditures of \$7 billion, and the cost of third-party verification for electric and hydrogen fuel supply equipment, which were not previously subject to verification before these proposed amendments, of \$5.5 billion. petroleum refiners), changes in statewide high carbon-intensity fuel expenditures of \$7 billion, and the cost of third-party verification for electric and hydrogen fuel supply equipment, which were not previously subject to verification before these proposed amendments, of \$5.5 billion. The highest annual cost occurs in 2039 with an estimated direct cost of \$11.1 billion.

2. REMI Modeling: Correction to References and Update of Population Projections

The SRIA incorporated Department of Finance’s economic and population projections of U.S. Real Gross Domestic Product, income, and employment,⁸¹ as well as California civilian employment by industry,⁸² released with the 2023-2024 May Revision to the Governor’s Budget on May 12, 2023 and Department of Finance demographic forecasts for California population forecasts updated in July 2021.⁸³ The text of the SRIA accurately describes the use of the July 2021 population projections in the SRIA’s macroeconomic analysis, but the footnote reference number 86 in the SRIA erroneously references the July 2023 interim population projection. Footnote 86 of the SRIA should instead read:

California Department of Finance, *Demographic Research Unit. Report P-3: Population Projections, California, 2010-2060* (Baseline 2019 Population Projections; Vintage 2020 Release). 2021.

After the completion of the analysis, Finance released a population projection interim series informed by available 2020 Census data dated July 19, 2023.⁸⁴ The interim projection released July 2023 has been incorporated into the macroeconomic results presented in the Form 399 and the following sections.

The macroeconomic results presented in the SRIA were presented in a 2021-dollar value. Per the direction of Department of Finance in their SRIA Comment Letter, the Form 399 presents the results of the macroeconomic analysis in 2023-dollar values. The economic analysis contained in the sections below also use 2023-dollar values.

3. Social Cost of Methane

Staff updated the avoided social cost of methane to account for all pathways that have dairy biogas as their feedstock and to match the years between the CATS model outputs and Annual SC-CH₄ values. Staff also corrected the conversion factor cited in the text to align with the calculation which used 0.020 metric tons of methane per million British thermal unit (instead of “per British thermal unit”). This resulted in an approximate doubling of avoided social cost: the SRIA identified values between 3 billion to 9 billion (2021\$), the updated values are between 6 and 16 billion, depending on the discount rate selected.

4. Small Business Benefits

Staff corrected the number of biodiesel producers considered small businesses from two to three and changed the ratio of small businesses to reflect the number as compared to the California, not national, total companies in the LCFS. Per this correction, small businesses represented 16% of the LCFS parties registered in the LCFS in September 2021.

B. The creation or elimination of jobs within the State of California.

REMI Policy Insight Plus Version 3.0.0 is used to estimate the macroeconomic impacts of the proposed amendments on the California economy including changes to employment demands and output based on expected costs and benefits by industry.

Table 12 presents the impact of the proposed amendments on total employment in California across all industries. Employment comprises estimates of the number of jobs, full-time and part-time, by place of work for all industries. Full-time and part-time jobs are counted at equal weight. Employees, sole proprietors, and active partners are included, but unpaid family workers and volunteers are not included. The employment impacts represent the net change in employment, which consist of positive impacts for some industries and negative impacts for others.

The statewide employment impacts of the proposed amendments are estimated to have a slightly positive impact on employment (approximately +0.02% of California employment) through 2027, followed by a slightly negative impact on employment (approximately 0 to -0.03% of California employment) through 2046 (Figure 8). The positive impacts on employment primarily result from the credits generated by low-CI fuels. The demand for these credits leads to expansion in the industries producing these fuels. After 2040, the CATS model predicts the costs for DAC will be lower than the costs of obtaining credits directly from low-CI fuel producers. As a result, the latter years of the assessment are characterized by high production costs for high-CI fuel producers, but less benefits overall for low-CI fuel producers. Increases in production costs and reductions in credit revenue for low-CI fuel producers negatively affect employment projections, as producers must cut employment to compensate for overall profit losses. Overall, the changes in employment do not exceed 0.05% of baseline California employment in any one year during the regulatory horizon.

The analysis will not fully capture all employment benefits from the proposed amendments. For instance: specific employment benefits for direct air capture were not included in the analysis due to a modeling limitation, the specific fuel pathways' supply chains are not perfectly captured in the model but instead modeled at a more aggregate level, and credit revenue to the electricity industry may be spent in ways that were not modeled, such as increased zero-emission infrastructure or rebates to EV customers which could result in increases in construction or consumer spending larger than those shown in this analysis. Importantly, the analysis of employment benefits captures only the portion that would occur in California, which is a subset of overall employment benefits for low-CI fuel industries resulting from the proposed amendments.

Table 12: Total California Employment Impacts⁸⁵

Year	California Employment	Change in Total Jobs	% Change
2026	25,898,820	4,096	0.02%
2030	26,126,846	-5,301	-0.02%
2034	26,441,359	-3,448	-0.01%
2038	27,000,858	-911	0.00%
2042	27,527,827	-9,442	-0.03%
2046	28,102,362	-12,909	-0.05%
Average	26,711,377	-4,085	-0.01%

Figure 8 illustrates employment impacts by major sector. The services and manufacturing sectors receive the majority of job increases until 2040 when all sectors show a decrease in job growth. The services and manufacturing sectors are projected to have initial increases in employment as resources are invested in development of low-CI fuel technologies, and then experience a decrease in employment over the baseline after the first five years. The decrease in employment after 2040 corresponds to the more stringent CI targets that increase operational costs without increasing output, given the stringency of the CI targets and the increase in direct air capture crediting.

⁸⁵ After the completion of the SRIA analysis, Finance released a population projection interim series informed by available 2020 Census data dated July 19, 2023. The interim projection released July 2023 has been incorporated into the macroeconomic results presented in this Form 399.

Figure 8: Employment Impacts by Major Sector

Table 13 presents changes in employment for industries directly impacted by the proposed amendments. Losses in jobs are largest in the petroleum and coal products manufacturing industry and are caused by reduced demand for these high-CI fuels as demand increases for low-CI fuels and increased production costs from the deficits generated by fossil gasoline and diesel fuels, with an average annual loss of 1,168 jobs when compared to the baseline. Basic chemical manufacturing employment increases by an average of 429 jobs annually, driven by credits generated by hydrogen, renewable diesel, ethanol, and alternative jet fuels and additional demand for these fuels. The electrical power generation, transmission, and distribution industry is expected to increase jobs by 741 positions annually associated with credit generation from electricity projects. Overall, between 2026 and 2046, California employment grows by 2.2 million jobs, increasing from 25.9 million jobs in 2026 to 28.1 million jobs in 2046.

Overall California's employment continues to grow and averages 26.7 million jobs between 2024 and 2046. On average, across all industries the estimated job impacts are approximately 4,085 fewer jobs created when compared to the baseline, with over a quarter of those job losses coming from the petroleum sector. This net decline in employment, similar to the net cost of the Proposed Alternatives, is because all of the deficit generating businesses – and therefore the cost of the proposed amendments – are within California, while job growth associated with credit-generating businesses and revenues from low-CI fuel credits are distributed across the U.S. The decreases in employment for high-CI fuel producers is countered by increases in employment growth in industries that include producers of low-CI

fuels. These industries include basic chemical manufacturing, natural gas distribution, and electrical power generation, transmission, and distribution. For example, between 2026 and 2046, California employment grows by 2.2 million jobs, going from 25.9 million jobs in 2026 to 28.1 million jobs in 2046.

Table 13: Employment Changes of Proposed Regulation 2024-2046

Industry	Units	2026	2030	2034	2038	2042	2046	Average
Petroleum and coal products manufacturing (324)	Change in jobs	-665	-864	-1230	-1561	-1591	-1176	-1,168
Petroleum and coal products manufacturing (324)	Percent Change	-5.13%	-6.78%	-9.81%	-12.57%	-12.82%	-9.43%	-9.31%
Basic chemical manufacturing (3251)	Change in jobs	417	409	486	535	373	246	429
Basic chemical manufacturing (3251)	Percent Change	6.36%	6.06%	6.95%	7.43%	5.08%	3.28%	6.13%
Natural gas distribution (2212)	Change in jobs	37	28	21	-2	226	283	81
Natural gas distribution (2212)	Percent Change	0.27%	0.21%	0.17%	-0.02%	1.91%	2.47%	0.68%
Electric power generation, transmission, and distribution (2211)	Change in jobs	295	354	883	1,361	1,037	434	741
Electric power generation, transmission, and distribution (2211)	Percent Change	0.72%	0.92%	2.41%	3.87%	3.09%	1.35%	2.09%

C. The creation of new business or the elimination of existing businesses within the State of California.

The proposed amendments are not expected to directly result in business creation or elimination; specifically, the proposed amendments do not require any new businesses to be created nor do they require closure of any existing businesses.

However, the LCFS program has supported the creation or expansion of many businesses in California and the U.S., as shown by the hundreds of credit-generating participants in the program. The proposed amendments are anticipated to also support business creation or expansion in the areas of low-CI fuels. In industries that experience increased costs, the proposed amendments may also contribute to business contraction or eliminations. However, due to the variety of businesses that participate in the LCFS and the breadth of their business models, staff cannot predict a specific number of businesses created nor eliminated.

The macroeconomic modeling of the proposed amendments can also be used to understand some of the potential impacts to business creation and elimination. REMI Policy Insight Plus Version 3.0.0 is used to estimate the macroeconomic impacts of the proposed amendments on the California economy. Although the REMI model cannot directly estimate the creation or elimination of businesses, the model does estimate impacts to California jobs and output which can be used to understand some of the potential impacts to businesses. Reductions in output could indicate elimination of businesses within an industry. Conversely, increased output within an industry could signal the potential for additional business creation if existing businesses cannot accommodate all future demand. There is no threshold that identifies the creation or elimination of business.

The Statewide jobs and output impacts of the proposed amendments are small relative to the total California economy suggesting the proposed amendments will have a minimal impact on overall business expansion or contraction. The largest employment increase is estimated to be 0.02% for 2025 compared to the baseline. The largest employment decrease is estimated to be 0.05% for 2044 through 2046 compared to the baseline. Output is expected to decrease for the lifetime of the regulation compared to the baseline. The largest output decrease in the State is estimated to be 0.16% for 2040 through 2045. However, impacts to specific industries are larger or smaller as described in the previous sections.

D. The expansion of businesses currently doing business within the State of California.

The proposed amendments will increase the demand for low-carbon fuels, which provides an opportunity for businesses, both in-state and out-of-state, to increase revenue from the sale of low-carbon fuels in California. The sale of LCFS credits provides an additional revenue stream for these firms, enabling them to increase their market share and increase their competitiveness against high-CI fuels such as fossil gasoline or diesel.⁸⁶ In Table 15, staff monetized the value of the revenues generated by both in-state and out-of-state low-CI fuels. The value will vary based on the actual credit price.

Moreover, LCFS incentives may encourage California firms, as well as other firms doing business in California, to invest early in innovative, low-CI fuel technologies and develop mature businesses earlier than firms not participating in the California fuel market. Early investment may result in competitive advantages to these businesses as other state, federal,

⁸⁶ The LCFS incentive is incremental to incentives created by federal biofuel/low-carbon fuel policy, including the RFS.

or international jurisdictions adopt similar carbon intensity standards.⁸⁷ The proposed amendments will also help promote a wider range of clean fuels and vehicles for California businesses to choose from, including vehicles operating on electricity, hydrogen, and biomethane.

The proposed amendments also benefit California fuel providers that have compliance obligations under the Cap-and-Trade Program. As the LCFS reduces the CI of fuels, it changes the composition of the State's transportation fuel mix and dependence on traditional petroleum-based fuels. CARB designed the LCFS and Cap-and-Trade Programs to complement one another. Investments made to comply with one of the programs may result in reduced compliance requirements for the other program. Increased use of low-carbon fuel due to the LCFS will reduce fuel suppliers' GHG emissions covered by the Cap-and-Trade Program, reducing the Cap-and-Trade Program compliance obligation of these firms. Similarly, selling cleaner fuels or investing in emission reduction projects at California refineries and oil fields to comply with the Cap-and-Trade Program may also generate credits under the LCFS.

Table 14 summarizes the estimated increase in revenue to small and typical credit generating California companies⁸⁸ from the sale of LCFS credits due to the proposed amendments. To apportion credits between in-state and out-of-state businesses, staff used an assumed percentage for production in-state and out-of-state for each fuel type, which is detailed in Appendix C-1. Cumulatively, from 2024 through 2046, the proposed amendments are estimated to increase total revenue for credit generating businesses as compared to the baseline scenario by \$149 billion, of which approximately \$128 billion is estimated to accrue to California businesses.

Table 14: Estimated Increase in Revenue from LCFS Credit Sales under the Proposed Amendments Relative to Baseline (million 2021\$)

Year*	Typical California Businesses	California Small Business	Total California Businesses	Out-of-State Businesses	Total California and Out-of-State
2024	298	2	301	166	467
2025	4,108	19	4,127	1,326	5,454
2026	4,329	19	4,348	1,532	5,880
2027	4,019	15	4,034	1,290	5,325
2028	4,221	16	4,237	1,111	5,348
2029	4,016	15	4,031	951	4,982
2030	2,697	9	2,706	511	3,217

⁸⁷ Currently Oregon, Washington, British Columbia, Canada, Brazil, and the European Union have LCFS-like policies in place.

⁸⁸ "Typical credit generating California companies" are all California credit generators, excluding small businesses with less than 100 employees and earning less than 10 million in annual revenue.

Year*	Typical California Businesses	California Small Business	Total California Businesses	Out-of-State Businesses	Total California and Out-of-State
2031	4,769	15	4,784	732	5,516
2032	5,681	16	5,697	819	6,516
2033	6,033	16	6,050	735	6,785
2034	6,215	16	6,232	731	6,963
2035	6,426	16	6,443	635	7,078
2036	6,633	16	6,649	500	7,149
2037	8,895	22	8,918	708	9,625
2038	9,304	24	9,328	724	10,052
2039	9,733	26	9,760	765	10,525
2040	8,041	26	8,067	-	8,067
2041	8,827	26	8,853	1,353	10,206
2042	7,158	22	7,180	1,286	8,466
2043	5,676	19	5,695	1,244	6,939
2044	4,346	15	4,361	1,195	5,556
2045	3,357	12	3,370	1,245	4,614
2046	3,234	12	3,246	1,064	4,310
Total	128,017	399	128,416	20,623	149,040

* Years shown are samples from the regulatory period of 2024-2046. "Total" is the cumulative sum of revenues in all years from 2024 to 2046.

In addition to the benefits for California businesses, CARB estimates that small businesses will see benefits from the proposed amendments. Many of California's biodiesel producers, hydrogen producers, electric charging stations, hydrogen stations, and natural gas stations are small businesses. Staff identified the following small businesses in California, which represented 16% of the LCFS parties registered in the LCFS in September 2021:

- Three biodiesel providers
- Six natural gas (CNG and LNG) fueling station operators
- 21 electric charging station operators
- One propane provider

In total, these small businesses generated approximately 119,000 LCFS credits in 2021, which provided an estimated \$22 million in credit revenue as estimated using the 2021 average LCFS credit price of \$188.

The proposed amendments will increase the demand for low-CI fuels and are anticipated to increase the prices for LCFS credits relative to the baseline, thereby increasing revenue to these small businesses. In addition, larger potential revenue resulting from the proposed amendments may allow other small businesses to enter the market. Therefore, staff kept the 2021 credit total of 119,000 as a static proxy for future small business credit generation.

E. Significant Statewide Adverse Economic Impact Directly Affecting Business, Including Ability to Compete

The Executive Officer has made an initial determination that the proposed regulatory action would not have a significant statewide adverse economic impact directly affecting businesses, including the ability of California businesses to compete with businesses in other state, or on representative private persons.

F. The competitive advantages or disadvantages for businesses currently doing business within the State

The proposed amendments will increase the demand for low-carbon fuels, which provides an opportunity for businesses, both in-state and out-of-state, to increase revenue from the sale of low-carbon fuels in California. Indeed, California has continued to reduce emissions, and emissions per capita, while observing robust economic growth. Table 15 shows the potential LCFS credit revenue for several low-carbon fuels in 2025, 2030, 2035, 2040, and 2045. To allow comparison across fuels, the potential revenues are expressed as an equivalent gallon of either gasoline (GGE) or diesel (DGE) that the low-CI fuel displaces. The sale of LCFS credits provides an additional revenue stream for these firms, enabling them to increase their market share and increase their competitiveness against high-CI fuels such as fossil gasoline or diesel.⁸⁹ In Table 15, staff monetized the value of the revenues generated by both in-state and out-of-state low-CI fuels. The value will vary based on the actual credit price.

⁸⁹ The LCFS incentive is incremental to incentives created by federal biofuel/low-carbon fuel policy, including the RFS.

Table 15: Value Added from LCFS Credit for Low Carbon Fuels under the Proposed Amendments

Fuel	Average CI Value (gCO ₂ e/MJ)	2025	2030	2035	2040	2045	Units
<i>Proposed Amendments Estimated Credit Price*</i>		\$221	\$76	\$138	\$221	\$105	\$/MT
Corn Ethanol**	55	0.66	0.13	-0.12	-0.77	-0.55	\$/gge
Electricity**	64	5.39	1.52	1.54	0.52	-0.37	\$/gge
Hydrogen**	-79	7.20	2.25	3.40	4.31	1.38	\$/dge
Biodiesel**	40	1.37	0.35	0.28	-0.15	-0.42	\$/dge
Renewable Diesel**	44	1.25	0.31	0.20	-0.27	-0.48	\$/dge
Landfill NG	45	0.96	0.22	0.08	-0.41	-0.51	\$/dge
Dairy NG	-293	11.01	3.68	6.35	9.64	4.26	\$/dge

* The following EERs were used for this calculation: 2.5 for hydrogen, 3.4 for electricity, and 0.9 for landfill NG and dairy NG.⁹⁰

** Hydrogen CI shown is the average of all hydrogen pathways as of August 2023 in the CATS model. Electricity CI is the average value from SP projections from 2023-2046. Corn ethanol CI is the average of projections from 2023-2046 as of August 2023 in the CATS model. Biodiesel and renewable diesel CIs are the average of waste and virgin oil pathway CIs as of August 2023 in the CATS model.

Moreover, LCFS incentives may encourage California firms, as well as other firms doing business in California, to invest early in innovative, low-CI fuel technologies and develop mature businesses earlier than firms not participating in the California fuel market. Early investment may result in competitive advantages to these businesses as other state, federal, or international jurisdictions adopt similar carbon intensity standards.⁹¹ The proposed amendments will also help promote a wider range of clean fuels and vehicles for California

⁹⁰ “Energy Economy Ratio (EER)” means the dimensionless value that represents the efficiency of a fuel as used in a powertrain as compared to a reference fuel. EERs are often a comparison of miles per gasoline gallon equivalent (mpge) between two fuels.

⁹¹ Currently Oregon, Washington, British Columbia, Canada, Brazil, and the European Union have LCFS-like policies in place.

businesses to choose from, including vehicles operating on electricity, hydrogen, and biomethane.

The proposed amendments also benefit California fuel providers that have compliance obligations under the Cap-and-Trade Program. As the LCFS reduces the CI of fuels, it changes the composition of the State's transportation fuel mix and reduces dependence on traditional petroleum-based fuels. CARB designed the LCFS and Cap-and-Trade Programs to complement one another. Investments made to comply with one of the programs may result in reduced compliance requirements for the other program. Increased use of low-carbon fuel due to the LCFS will reduce fuel suppliers' GHG emissions covered by the Cap-and-Trade Program, reducing the Cap-and-Trade Program compliance obligation of these firms. Similarly, selling cleaner fuels or investing in emission reduction projects at California refineries and oil fields to comply with the Cap-and-Trade Program may also generate credits under the LCFS.

Because the proposed amendments are designed to increase the competitiveness of low-CI fuels in California, California businesses that produce low-CI fuels may become more competitive. Petroleum fuel producers will face increased compliance costs under the proposed amendments. California sectors that rely heavily on fossil transportation fuel may also face higher prices, resulting in a potential competitive disadvantage relative to out-of-state entities that are not subject to the LCFS. However, as sectors transition to lower CI transportation fuels, they will realize lower operational costs and increased competitiveness associated with a more diverse liquid fuel pool and/or vehicle efficiency gains associated with transitioning to zero emission vehicles. Staff analysis of costs associated with this transition suggest that the cost per mile driven will decline by 42% between 2022 and 2046. Although LCFS credits help support increased deployment of zero emission vehicles by providing funding for both zero emission infrastructure and vehicle purchases, this analysis does not claim the vehicle-side benefits of increased zero emission vehicle deployment because those benefits have previously been attributed to the implementation of CARB's vehicle regulations. Additionally, any potential impact of the proposed amendments on the competitiveness of California businesses will likely be reduced as more low-carbon fuel policies similar to California's LCFS are adopted across North America. Oregon, Washington, and British Columbia all have similar clean fuels programs to California's program, and several other states are considering their own programs.

G. The increase or decrease of investment in the state

Private domestic investment consists of purchases of residential and nonresidential structures and of equipment and software by private businesses and nonprofit institutions. It is used as a proxy for impacts on investments in California because it provides an indicator of the future productive capacity of the economy.

The proposed amendments require implementing processes that substitute low-carbon sources of energy, such as waste oils and renewable electricity, in place of fossil fuel sources. The proposed amendments, and the LCFS more broadly, are structured to encourage ongoing innovation and improvement in reducing the carbon intensity of transportation fuels as well as investment in innovative direct air capture and carbon capture, utilization, and sequestration approaches. Over the past decade, the LCFS has resulted in approximately 650 Tier 2 fuel pathway certifications under the current CA-GREET3.0 model, which includes more complex and innovative production methods than are represented by more conventional pathways. The proposed amendments are expected to continue to incentivize investment in low-carbon fuel

production. The proposed amendments will also lead to an overall higher price for LCFS credits relative to the baseline, which will send a signal for research, development, and deployment of innovative technologies and fuels that support California's long-term GHG emissions reduction goals.

The economic modeling utilized for the economic analysis is not structured to capture these types of innovation in the transportation fuel market and focuses on the direct impacts of the proposed amendments. Given the limitations of the model and the fact that some of the benefits of the proposed amendments likely have an unquantifiable impact on innovation in the transportation fuels sector, as modeled, the proposed amendments result in slight annual private investment decreases of \$11 million on average. The difference in private investment for the proposed amendments is modest and does not exceed 0.10% of baseline investment across the analytical time period for any one year and averages no percentage change over the regulatory horizon (Table 16).

Table 16: Change in Private Investment

Year	Private Investment (2023M\$)	Change (2023M\$)	% Change
2026	631,710	-28	0.00%
2030	684,020	-386	-0.06%
2034	739,174	99	0.01%
2038	811,556	684	0.08%
2042	882,928	102	0.01%
2046	957,233	-752	-0.08%
Average	766,518	-11	0.00%

H. The incentives for innovation in products, materials, or processes

As mentioned above, the proposed amendments will incentivize research, development, and deployment of innovative technologies and fuels that support California's long-term GHG emissions reduction goals and displace fossil fuels.

All fuel producers will have an increased incentive to innovate and deploy new methods that reduce the CI of their fuels. The proposed amendments will additionally provide long term price stability for LCFS credits, which is essential for low-CI fuel producers to make investments in long-term capital projects and research and development.

I. The benefits of the regulation to the health and welfare of California residents, worker safety, and the state's environment.

The proposed amendments are designed to reduce toxic air contaminant, criteria pollutant, and GHG emissions by decrease the carbon intensity of California's transportation fuel pool and reducing dependence on petroleum fuel. Cumulatively, from 2024 to 2046, the proposed amendments are expected to reduce statewide transportation emissions by approximately 4,281 tons of PM2.5 and 25,586 tons of NOx relative to the baseline. The total statewide valuation of avoided health outcomes from 2024 to 2046 is approximately \$5 billion. These reductions in toxic air contaminants and criteria pollutant emissions may improve safety for workers, particularly at freight hubs, where substitution of renewable diesel for fossil diesel will reduce exposure to harmful air pollution. For detailed information on health and emissions benefits of the proposed regulation, see Chapter IV.

The proposed regulations provide credit generating revenue to California businesses of \$128.4 billion over the lifetime of the regulation. The total monetized benefit from credit revenue and avoided health outcomes of the proposed amendment is \$133.4 billion.

As Californians transition away from fossil fuels and into more energy efficient ZEVs and lower-carbon fuel alternatives, CARB staff estimates that the fuel costs Californians pay to travel will also decrease, resulting in billions of dollars in savings on fuel costs each year. The regulations CARB has adopted (e.g. ACC II, ACF/ACT) in combination with the LCFS will help to increase the deployment of vehicles with higher fuel efficiency (e.g. BEVs/FCEVS) and reduce the costs of the alternative fuels into the future.

CARB staff estimates the amount of money Californians spend on transportation costs across all vehicle classes could be up to 42% lower in 2045 than compared to the amount of money spent on transportation in 2021. This translates into an annual savings of over \$20 billion⁹² in fuel expenditures in 2045 alone. Each year between 2025 and 2045 CARB estimates the annual fuel cost savings will increase as Californians transition away from fossil gasoline and diesel expenditures and increase their use of more efficient vehicles and the use of low-carbon fuels. In 2021, expenditures on fossil gasoline and fossil diesel made up approximately 93% of the State's total transportation fuel costs, and on a per mile basis gasoline and diesel combined cost Californians approximately \$0.20 per mile. In 2045, with implementation of CARB's vehicle regs and LCFS, California will have significantly reduced the amount of fossil gasoline and diesel used in California. CARB staff estimated that in 2045, over 75% of the State's transportation fuel expenditures will go to non-fossil alternative fuels like electricity, hydrogen, and low-carbon biofuels, and that Californian's will be paying \$0.12 per mile traveled, for an overall 42% savings in fuel costs per mile statewide (see Figure 9 and Table 17). For the light duty sector, the savings will be even more pronounced, with costs going from \$0.19 per mile to \$0.08 per mile by 2045, an over 50% reduction in costs as the light-duty sector transitions away from fossil fuels and becomes mostly ZEVs supplied by electricity and hydrogen.

⁹² These costs savings were not reflected in the SRIA because the economic modeling conducted for the SRIA was limited to calculating the direct costs associated with the purchase of LCFS credits.

The SRIA for this rulemaking (Appendix C-1) included Table 22 which provided a potential cost-pass through for select fossil fuels. However, this metric was incomplete as it looked only at fossil fuels and did not capture all of the transportation fuels that will be available in response to these regulatory updates. The fuel cost per mile metric described above incorporates the costs for all transportation fuels into one metric and provides a more comprehensive and accurate metric of costs to California consumers. Furthermore, retail fossil fuel prices are strongly influenced by many factors beyond LCFS credit prices (e.g., global events, holiday weekends, seasonal fluctuations, refinery disruptions and decisions about production that affect supply, refinery pricing decisions, seasonal fuel blends, taxes) and fossil fuel producer pricing strategies are complex and reflect local and regional market conditions. Few of these factors are determined by government entities, including the State of California. Between 2017 and 2022, the retail price of gasoline fell as low as \$3.08 and rose as high as \$5.41, and similarly for diesel, the retail price ranged between \$3.07 and \$6.02.⁹³ Predicting how LCFS credit price changes impact these complex pricing strategies and the per gallon gasoline and diesel prices paid at the pump in the future by consumers is beyond the scope of this work.

Instead of providing a per gallon price, the SRIA included a narrow analysis on retail fossil fuels as an estimate of the upper bound of possible consumer price impacts based on the carbon content of fuel, without consideration for the complex fossil fuel pricing strategies or the availability and impact of other competing fuels (e.g., biofuels, electricity, hydrogen, etc.) on fuel prices. The SRIA took a very conservative approach- assuming, for example, that maximum possible costs of the program compliance would be passed through to fossil fuel consumers while no benefits of program credits (e.g., for completing fuels) would be passed through as savings to consumers. Importantly, the SRIA did not represent the actual cost pass-through that would happen in the real world. Actual costs of pass-through depends on how much fossil fuel is still in use, the supply of clean fuel, and credits in the market. In addition to having a narrow and incomplete focus on fossil fuel cost impacts, the SRIA was a point-in-time analysis that represented policy decisions that are different than this regulatory proposal and it is no longer an up-to-date assessment to reference in the context of current proposed changes to the Program. As laid out above, fossil fuel in use and deficits under the Program will go down over time as the zero-emissions vehicle (ZEV) population increases. Clean fuels will increase as the program becomes more stringent and a stronger market signal is supported and the costs of some of the lowest carbon fuels will fall over time as the technology to produce and use these fuels is deployed. Federal incentives and funding will also help support clean fuel production and deployment at lower costs. Finally, the program has a price ceiling to ensure credit prices do not go unchecked. This further ensures that the cost pass-through is managed and unnecessary costs of the program are not passed on to consumers.

In short, just as LCFS credit prices have not shown any historical correlations with retail gasoline prices, there is no expectation that a more stringent Program would lead to higher

⁹³ United States Energy Information Administration, *Annual Retail Gasoline and Diesel Prices* (Updated on July 31, 2023). https://www.eia.gov/dnav/pet/pet_pri_gnd_dcus_sca_a.htm

fossil fuel transportation costs for Californians in view of the combination of factors detailed above that can impact retail gasoline prices.

Figure 9: California's Fuel Expenditures by Type

Average cost-per-mile for all fuels	\$0.21	\$0.17	\$0.12

IX. Evaluation of Regulatory Alternatives

Government Code section 11346.2, subdivision (b)(4) requires CARB to consider and evaluate reasonable alternatives to the proposed regulatory action and provide reasons for rejecting those alternatives. This section discusses alternatives evaluated and provides reasons why these alternatives were not included in the proposal. As explained below, no alternative proposed was found to be less burdensome and equally effective in achieving the purposes of the regulation in a manner that ensures full compliance with the authorizing law.

The primary objectives of the proposed LCFS regulation include the following:

1. Improve California's long-term ability to support the production and use of increasingly lower-CI transportation fuels and to improve the program's overall effectiveness;
2. Update the annual carbon intensity benchmarks through 2030 and establish more stringent post-2030 benchmarks in alignment with the 2022 Scoping Plan Update;
3. Increase the flexibility of the program to adjust for potential future market over-performance by including a mechanism that would automatically accelerate the compliance targets under certain conditions;
4. Include a step-down in the near-term CI target to further support ambition;
5. Incentivize fuel production and refueling infrastructure buildout needed to meet California's long-term climate goals and reduce dependence on petroleum fuels, including opportunities to leverage federal funding for low-carbon hydrogen production and ZEV fueling, and support the transition of biomethane fuel pathways for combustion out of transportation;
6. Update standard values in the regulation, including emission factors, as well as life cycle assessment (LCA) modeling tools to use more detailed or recent data;
7. Streamline implementation of the program; and
8. Make minor updates for typographical errors and specifications of intent.

A. Alternatives to the Regulation

CARB solicited public input regarding alternatives to the proposed amendments. This solicitation was presented and discussed at a workshop held on November 9, 2022.⁹⁴ In the

⁹⁴ California Air Resources Board, *Low Carbon Fuel Standard Public Workshop: Concepts and Tools for Compliance Target Modeling*. November 9, 2022. <https://ww2.arb.ca.gov/sites/default/files/2022-11/LCFSPresentation.pdf>

solicitation, staff requested that alternatives be submitted by December 2, 2022. Several stakeholders responded to the solicitation by proposing alternatives.

Staff analyzed two regulatory alternatives to the proposed amendments and analyzed two additional concepts, which are discussed in detail Section B. Both regulatory alternatives increase the stringency of benchmarks beyond the baseline since more low-CI fuels are entering the market than previously expected, and CI reductions are outpacing the current benchmark schedule. They both reach a 90% benchmark reduction in 2045 but have different rates of change in the interim years in order to provide analysis on the comparative cost and benefits of more rapidly declining benchmarks in early years as compared to later years.

While the overall benchmark schedule of the first alternative (based off proposals and stakeholder feedback) is more stringent than the baseline, it is less stringent than the proposed amendments and has a 3% step-down, achieving a 28% CI reduction in 2030. The second alternative (based off proposals and stakeholder feedback) is more aggressive than the proposed amendments and achieves a CI reduction target of 35% by 2030, after a 5% step-down and a linear compliance trajectory from 2025 to 2030. Both alternatives reach the same 90% CI reduction in 2045 as the proposed amendments but have different compliance curves from 2025-2045 to account for the difference in their 2030 targets, as shown in Figure 10 and Table 18. Although the scenarios reach the same end-goal of 90% CI reduction in 2045, Alternative 1 is the least stringent through 2030, while Alternative 2 reflects the higher costs of front-loading the stringency of the CI targets through 2030.

Figure 10: Carbon Intensity Compliance Curves for Each Alternative

Table 18: CI Target Benchmark Percent Reduction for the Proposed Amendments and Alternatives

Year	Proposed Amendments	Alternative 1	Alternative 2
2024	12.5%	12.4%	12.4%
2025	18.75%	16.8%	18.6%
2026	21.0%	19.0%	21.9%
2027	23.25%	21.3%	25.2%
2028	25.5%	23.5%	28.5%
2029	27.75%	25.8%	31.7%
2030	30.0%	28.0%	35.0%
2031	34.5%	32.7%	39.0%
2032	39.0%	37.4%	43.0%
2033	43.5%	42.1%	47.0%
2034	48.0%	46.8%	51.0%
2035	52.5%	51.5%	55.0%
2036	57.0%	56.2%	59.0%
2037	61.5%	60.9%	63.0%
2038	66.0%	65.6%	67.0%
2039	70.5%	70.3%	71.0%
2040	75.0%	75.0%	75.0%
2041	78.0%	78.0%	78.0%
2042	81.0%	81.0%	81.0%

Year	Proposed Amendments	Alternative 1	Alternative 2
2043	84.0%	84.0%	84.0%
2044	87.0%	87.0%	87.0%
2045	90.0%	90.0%	90.0%
2046	90.0%	90.0%	90.0%

1. Alternative 1

Compared to the proposed amendments, Alternative 1 has a less stringent CI compliance curve before 2030. It then accelerates to meet the same 90% carbon reduction in 2045 but is more stringent than the baseline. Compared to the proposed amendments, this scenario is less stringent in the early years when aggressive CI reductions are expected to be more expensive and challenging to meet because some renewable fuel production has yet to reach economies of scale. Figure 11 shows the resultant low-CI fuel volumes.

Alternative 1 is more easily attainable given current supplies of low-CI fuels and requires fewer additional low-CI fuels in early years. Accordingly, Alternative 1 includes several policy mechanisms that have the effect of limiting the number of credits created from existing low-CI pathways. For example, Alternative 1 includes a complete phase out of light-duty battery electric forklifts from the program. Alternative 1 also includes a limit on total credits from diesel fuels or sustainable aviation fuel produced from virgin oil feedstocks. Figure 11 and Figure 12 depict the alternative fuel volume and total fuel mix for Alternative 1.

Figure 11: Low-CI Fuel Volumes in the Alternative 1 Scenario

Figure 12: Fuel Mix – Alternative 1 Scenario

a) Costs

Alternative 1 has total costs of \$162 billion, approximately 1% more than the proposed amendments. The main reason is that diesel fuel is a larger part of the fuel mixture and continues generating large amounts of in-state deficits through 2046. This is because renewable diesel produced from virgin oil feedstock is phased out, waste oil feedstocks are used to produce alternative jet fuel, and more fossil diesel is needed to fuel the remaining vehicles with internal combustion engines. Credit revenues to low-carbon fuel producers in California are \$126 billion, 2% less than the proposed amendments.

Table 19: Estimated Total Direct Costs to California of Alternative 1 to Deficit Generators and on Statewide Fuel Expenditures Relative to Baseline (million 2021\$)

Year	Verification Cost	Purchasing Credits	Statewide Fuel Expenditures	Total Cost	Total Revenues	Net Cost
2024	18	736	10	764	508	255

2046	503	4658	-70	5,091	3,595	1,496
Total	5,525	151,525	5,068	162,118	126,035	36,083

b) Benefits

i) Emissions

Alternative 1 reduces GHG emissions by 461 MMTCO₂e compared to the baseline scenario (as shown in Figure 13). This is approximately 18% fewer reductions than the proposed amendments. Accordingly, the social cost of carbon benefits for Alternative 1 from reduced CO₂e range from approximately \$12 to \$50 billion, values approximately 18% lower than the proposed amendments. Table 20 shows the change in NO_x and PM_{2.5} as compared to the baseline. Alternative 1 results in a reduction in cumulative NO_x emissions by 14,605 tons and a decrease in PM_{2.5} emissions by 1,508 tons. Compared to the proposed amendments, Alternative 1 increases NO_x emissions by an additional 10,981 tons and increases PM_{2.5} emissions by 2,773 tons. Alternative 1 has more NO_x and PM_{2.5} emissions than the proposed amendments because this scenario uses less renewable diesel than the proposed amendments.

Figure 13: Alternative 1 - GHG Emissions

Table 20: Alternative 1 – NOx and PM2.5 Emission Changes (tons per day)

Year	NOx (tpd)	PM2.5 (tpd)

ii) Health Benefits

Staff used the methods described in Chapter IV, to estimate avoided cardiopulmonary mortality, hospitalizations for cardiovascular illness and respiratory illness, and emergency room visits for respiratory illness and asthma that would be expected to result from implementing Alternative 1 when compared to the Baseline scenario. The results are presented in Table 21 for each California air basin. As shown in Table 22, Alternative 1 has a valuation of health benefits at \$1.58 billion compared to the proposed amendments with a valuation of \$4.98 billion, a difference of \$3.4 billion less in health benefits. The lower avoided health impacts of Alternative 1 are primarily associated with increases in PM_{2.5} over the baseline due to lower utilization of renewable diesel.

Table 21: Alternative 1 - Avoided Mortality and Morbidity Incidents from 2024 to 2046

Air Basin	SC	SCC	SJV	SFB	SD	Statewide
Cardiopulmonary Mortality	48 (27 - 67)	6 (3 - 8)	30 (17 - 43)	12 (6 - 17)	13 (7 - 18)	119 (66 - 168)

c) Economic Impacts

Alternative 1 is less stringent than the proposed amendments since Alternative 1 uses less stringent CI targets, which in turn result in a smaller credit market overall and lower compliance costs. Lower compliance costs translate to a smaller overall effect on the California economy, but at the cost of not achieving as many GHG emissions reductions.

The macroeconomic impact analysis results shown in Table 23 indicate that Alternative 1 would result in more positive impacts on gross state product (GSP), personal income, employment (Figure 14), output (Figure 15) and private investment when compared to the proposed amendments, but that the impacts would still on average be negative for GSP, employment, and output. This trend is expected, as Alternative 1 is the least stringent in the earlier years of the program and makes up for this early lag by accelerating the rate of CI reductions in the later years of the program to achieve the same endpoint as the proposed amendments, 90% CI reduction in 2046. In general, the California economic indicators decline more in later years as achieving higher CI targets becomes more difficult and costly.

Figure 14: Alternative 1- Employment Impacts by Major Sector (Jobs)

Figure 15: Alternative 1 - Change in Output by Major Sector (2023M\$)

d) Cost-Effectiveness

Alternative 1 has a cost effectiveness of \$78 per metric ton CO₂e, calculated as the net cost to California (relative to baseline) divided by the cumulative GHG reductions (relative to baseline). This is \$21 more per metric ton CO₂e than the proposed amendments, and results in 17% fewer GHG reductions.

e) Reason for Rejecting

Alternative 1 is rejected for several reasons. While all scenarios will ultimately achieve a 90% CI reduction by 2045, the Alternative achieves the fewest emissions reductions of the scenarios considered over the duration of the program, particularly in the near-term through 2030. As described in the 2022 Scoping Plan Update, near-term action is critical to achieving the Statewide 2030 GHG emissions reductions target, and this scenario does not support this goal. Alternative 1 also relies more heavily on fossil fuels and carbon dioxide removal technology than the proposed amendments. As a result, this Alternative does not achieve the same level of NO_x and PM_{2.5} emissions reductions as the proposed amendments and potentially exacerbates existing air quality challenges in the State.

2. Alternative 2

Alternative 2 has more stringent CI reduction targets from 2025 to 2030, then smaller increments until reaching 90% reduction in 2045, as compared to the proposed amendments (Table 18). As a result of the more stringent near-term CI targets, Alternative 2 results in higher credit prices and greater credit generation.

Increasing the pace of CI reductions in early years would require additional policies for credit generation to incentivize near-term investment. Alternative 2 does not include several of the credit limitations in the proposed amendments in order to free up supplies of low-carbon fuels to balance the market. Alternative 2 keeps the existing requirements for forklifts that are now commonplace and allows electric forklifts to continue to generate more credits into the future. In addition, Alternative 2 does not include a deliverability requirement for biomethane pathways that break ground after 2030. Lastly, Alternative 2 does not phase out crediting for biomethane pathways that break ground after 2030 – allowing those credits to continue to be generated for transportation use when the State is moving away from combustion technologies in the sector. Figure 16 and Figure 17 depict the alternative fuel volume and total fuel mix for Alternative 2.

Figure 16: Low-CI Fuel Volumes in the Alternative 2 Scenario

Figure 17: Fuel Mix – Alternative 2 Scenario

a) Costs

Alternative 2 costs approximately \$204 billion as compared to the baseline and 126% the cost of the proposed amendments. Credit prices in Alternative 2 are expected to be at the maximum allowable level for many years under this scenario. Credit revenues in California are \$190.8 billion as compared to the baseline and approximately 130% of the benefit of the proposed amendments, due to the increased stringency of the Alternative and the additional credits needed for compliance.

Table 24: Estimated Total Direct Costs to California of Alternative 2 to Deficit Generators and on Statewide Fuel Expenditures Relative to Baseline (million 2021\$)

Year	Verification Cost	Purchasing Credits	Statewide Fuel Expenditures	Total Cost	Credit Revenues	Net Cost

Total	5,525	190,870	7,413	203,809	166,638	37,170

b) Benefits

i) Emissions

Social cost of carbon benefits of Alternative 2 from the scenario's 643 MMTCO₂e reduction (Figure 18) range from approximately \$17B to \$71B, as compared to the baseline. This is an average 16% greater valuation than the proposed amendments, since GHG reductions occur earlier and are valued more highly in the near term, as shown by the discount values in Table 3. As shown in Table 25, Alternative 2 results in decreased cumulative NO_x emissions by 28,030 tons and a decrease in PM_{2.5} emissions by 4,367 tons. As compared to the proposed amendments, Alternative 2 results in additional reductions of 2,445 tons of NO_x and 86 tons of PM_{2.5}. NO_x and PM_{2.5} emissions decrease further than the proposed amendments before 2040 since more renewable diesel enters the market.

ii) Health Benefits

Staff used the methods described in Section IV to estimate avoided cardiopulmonary mortality, hospitalizations for cardiovascular illness and respiratory illness, and emergency room visits for respiratory illness and asthma that would be expected to result from implementing Alternative 2 when compared to the Baseline scenario. The results are presented in Table 26.

Alternative 2 has approximately a 11% higher valuation of health benefits at \$5.5 billion more than the baseline (Table 27), as compared to the proposed amendment at \$4.98 billion. The greater avoided health impacts of Alternative 2 are associated with additional decreases in both NO_x and PM_{2.5} over the baseline.

Table 26: Alternative 2 - Avoided Mortality and Morbidity Incidents from 2024 to 2046

c) Economic Impacts

Alternative 2 is more stringent than the proposed amendments since Alternative 2 includes more stringent CI targets, which in turn result in a larger credit market overall and greater deficit generation, leading to higher compliance costs. Higher compliance costs would lead to a larger overall effect on the California economy.

The macroeconomic impact analysis results shown in Table 28 indicate that Alternative 2 would result in more negative impacts on GSP, personal income, employment (Figure 19), output (Figure 20), and private investment growth when compared to the proposed amendments and the baseline due to the more stringent requirements.

Table 28: Summary of Economic Impact Indicators for Alternative 2

	GSP	GSP	Personal Income	Personal Income	Employment	Employment	Output	Output	Private Investment	Private Investment

Figure 19: Alternative 2 - Employment Impacts by Major Sector (jobs)

Figure 20: Alternative 2 - Change in Output by Major Sector (2023M\$)

d) Cost-Effectiveness

Alternative 2 has a cost effectiveness of \$58 per metric ton CO_{2e}. This is similar to the proposed amendments due to higher GHG reductions balanced against higher overall cost.

e) Reason for Rejecting

Alternative 2 was rejected for several reasons. First, the scenario is less feasible to achieve than the proposed amendments due to the more stringent near-term CI targets through 2030. Credit prices in this scenario are projected to be at or near the maximum and would quickly trigger advanced crediting requirements if low-carbon fuels are not produced at projected volumes. To achieve these near-term emission reductions, Alternative 2 also necessitates removing several important policy inputs in the proposed amendments, such as updates to the forklift crediting methodology and changing requirements for biomethane. Pursuing faster CI target reductions at the expense of these and other provisions would counteract the broader energy transition that is identified in the approved 2022 Scoping Plan Update. Lastly, the credit prices in Alternative 2 are higher than the proposed amendments and may place additional near-term burden on consumers of fossil fuels at the retail level.

3. Comparison of Costs and Benefit

Table 29: Comparison of Costs and Benefits of Proposed Amendments and Alternatives

	Revenue from LCFS Credit Sales (Million 2021\$)	Health Benefits*	Total Benefits	Total Costs (Million 2021\$)	Net Costs* (Million 2021\$)	Total GHG Reduction (MMT CO2e)	CE* (\$/MT CO2e)
Proposed Amendments	128,416	4,977	133,393	160,531	32,115	558	58
Alternative 1	126,035	1,583	127,618	162,118	36,083	461	78
Alternative 2	166,638	5,524	172,162	203,809	37,171	643	58

*Health benefits are not included in the net cost, nor in the cost-effectiveness metrics

B. Other Concepts

1. Comprehensive Environmental Justice Scenario

This scenario narrows LCFS crediting opportunities to reduce impacts from the production of lipid-based biofuels and manure-based fuels as well as prioritize direct greenhouse gas emissions in California. The scenario was proposed by CARB's Environmental Justice

Advisory Committee⁹⁵ and includes concepts recommended by environmental justice, environmental, health, animal rights, science-based advocacy, and political organizations.⁹⁶ Under this alternative, the following modifications would be made to the proposed LCFS regulation:

1. Eliminate avoided methane credits effective January 1, 2024.
2. Eliminate credit generation for pathways relying on the production of fuel from livestock and dairy manure for emissions reductions that otherwise would have occurred or were legally or contractually required to occur.
3. Cap the use of lipid biofuels (commonly known as crop-based fuels) at 2020 levels, about 855 million gallons, pending an updated risk assessment to determine phase out timelines for high-risk, crop-based feedstocks.
4. Prohibit enhanced oil recovery as an eligible sequestration method.
5. Do not issue LCFS credits for carbon removal projects such as Direct Air Capture.
6. Include intrastate jet fuel.

This scenario matches the proposed amendments with regard to the 2030 carbon intensity target. The provision to include intrastate jet fuel as a deficit generator is also aligned, though the proposed amendments provision begins in 2028 instead of 2025.

The 30% carbon intensity target in 2030, and the carbon intensity schedule generally, is not viable in this scenario due to the removal of substantial crediting pathways for both lipid biofuels and dairy biogas (both which are low-CI fuels). Due to limitations on lipid biofuels and dairy biogas, the Comprehensive EJ Scenario results in higher volumes of fossil diesel being used than any of the other scenarios evaluated. The limits on lipid biofuels, biomethane, and DAC also resulted in credit prices immediately reaching the maximum credit price in 2025 and remaining at the maximum levels for every year analyzed. Because credit generation is limited in this scenario, the modeling suggests that there would not be enough credits available for deficit holders to comply with the CI benchmarks. To resolve this modeling and compliance issue, CARB staff manually included additional banked credit supply into the modelling. Ultimately, this increase in banked credits is outside the bounds of the LCFS regulation as

⁹⁵ Environmental Justice Advisory Committee, *Draft Recommendations to the California Air Resources Board (CARB) on the Low Carbon Fuel Standard Regulation Updates*. August 27, 2023. <https://ww2.arb.ca.gov/sites/default/files/2023-08/EJAC%20DRAFT%20Low%20Carbon%20Fuel%20Standard%20Recommendations%20Version%202%20082823.pdf>

⁹⁶ Leadership Counsel for Justice and Accountability, Earthjustice, Animal Legal Defense Fund, Center on Race, Poverty & the Environment, Union of Concerned Scientists, Defensores Del Valle Central Para El Aire Y Agua Limpia, Santa Cruz Climate Action Network, Food & Water Watch, Center for Food Safety, Clean Water Action, California Environmental Voters, Asian Pacific Environmental Network, CleanEarth4Kids.org, 350 Ventura County Climate Hub, Communities for a Better Environment, Progressives for Democracy in America, Center for Community Action and Environmental Justice, Climate Action California, San Joaquin Valley Democratic Club, 350 Bay Area Action, Center for Biological Diversity, Central California Asthma Collaborative, Central Valley Air Quality Coalition, Center for Community Action Environmental Justice, Central California Environmental Justice Network, Physicians for Social Responsibility - Los Angeles, Valley Improvement Projects, and 350 Humboldt (may not be a comprehensive list).

there are no current or proposed regulatory mechanisms in the LCFS Regulation that would provide this level of additional banked credits. Figure 21 and Figure 22 depict the fuel volume and fuel mix for the Comprehensive EJ Scenario.

Figure 21: Low-CI Fuel Volumes in the Comprehensive EJ Scenario

Figure 22: Fuel Mix - Comprehensive EJ Scenario

a) Costs

The scenario costs approximately \$240 billion and brings in revenues of about \$155 billion, as compared to the Proposed scenario's cost of \$160 billion and revenues of \$128 billion. The net cost is \$85 billion, while the proposed amendment's net cost is \$32 billion. The large net cost of this scenario is associated with higher credit prices and the demand for 76 billion banked credits by 2030 and 288 million banked credits between 2024 and 2046, which far exceeds the available quantity even under the credit clearance market.

b) Benefits

This scenario results in NO_x reductions of approximately 27,341 tons, PM_{2.5} increases of 1,350 tons, and GHG reductions of 386 MMT. The criteria pollutant emission changes are primarily due to lower amounts of biofuels entering the market; PM_{2.5} increases are due to fossil diesel being used instead of renewable diesel. NO_x decreases as compared to the proposed amendments are primarily due to smaller volumes of biofuel consumed which leads to lower emissions from biofuel production and biofuel transportation. This scenario results in greater GHG emissions than the proposed amendments due to a combination of fossil fuels

replacing biofuels, and zero-CI hydrogen and electricity replacing carbon negative hydrogen and electricity produced using dairy biomethane.

i) Health Benefits

Staff used the methods described in Appendix C-1 to estimate avoided cardiopulmonary mortality, hospitalizations for cardiovascular illness and respiratory illness, and emergency room visits for respiratory illness and asthma that would be expected to result from implementing the Comprehensive EJ Scenario when compared to the Baseline scenario. The results are presented in Table 30.

The Comprehensive EJ Scenario has approximately a 140% lower valuation of health benefits at \$1,970 million less than the baseline, as compared to the proposed amendment at \$4.98 billion more than baseline. The greater health impacts of Comprehensive EJ Scenario are associated with additional increases in both NO_x and PM_{2.5} over the baseline.

c) Cost Effectiveness

The cost effectiveness is \$220/MT GHG reduction, approximately \$162/MT more expensive than the proposed amendments.

d) Reason for Rejecting

This scenario is rejected because, relative to the proposed amendments, it would produce fewer GHG emissions reductions, have worse health outcomes, have the highest costs of any scenario, and create significant LCFS regulatory non-compliance risks.

Additionally, the Comprehensive EJ Scenario is also not responsive to the direction in the 2022 Scoping Plan Update, as capturing methane from dairies is one of the primary measures for achieving the state's 2045 greenhouse gas reduction targets⁹⁷ and SB 1383 methane reduction target.⁹⁸ Ending avoided methane crediting in 2025 could stop the development of new anaerobic digester projects and also cause operating digestors to shut down if the operational expense is greater than the value of the gas and other incentives received by the dairies. Without anaerobic digesters, California would not be able to meet its SB 1383 methane reduction goals. Additionally, eliminating biomethane pathways used to produce hydrogen may unduly restrict the development of low-CI hydrogen supply that California needs in order to displace fossil fuels. Increasing the supply of low-CI renewable hydrogen is a key strategy identified in the 2022 Scoping Plan Update and supports MDV and HDV ZEVs.

And finally, Direct Air Capture (DAC) is a key component of CARB's plan to reduce greenhouse gas emissions and meet carbon neutrality by 2045.⁹⁹ Eliminating credits for DAC projects would eliminate one of the key incentives to deploy this technology, and jeopardizes the feasibility of achieving California's long-term decarbonization targets and the 2045 carbon intensity target proposed under this project.

2. Accelerated Decarbonization Scenario - More Stringent

This alternative is based on a scenario proposed by a coalition of stakeholders that accelerates decarbonization by increasing the stringency of the 2030 CI target and excluding proposed project amendments that limit or phase out credit generation opportunities for certain

⁹⁷ California Air Resources Board, *2022 Scoping Plan for Achieving Carbon Neutrality*. November 16, 2022. <https://ww2.arb.ca.gov/sites/default/files/2023-04/2022-sp.pdf>

⁹⁸ California Air Resources Board, *Analysis of Progress toward Achieving the 2030 Dairy and Livestock Sector Methane Emissions Target*. (Accessed on September 19, 2023). <https://ww2.arb.ca.gov/resources/documents/dairy-livestock-sb1383-analysis>

⁹⁹ California Air Resources Board, *2022 Scoping Plan for Achieving Carbon Neutrality*. 91-97. November 16, 2022. https://ww2.arb.ca.gov/sites/default/files/2022-12/2022-sp_1.pdf

pathways.¹⁰⁰ The coalition proposed a CI target in the range of 40% by 2030, whereas the Proposed Project has a 30% by 2030 CI target. To meet this accelerated target, the coalition proposed no limitations on the volume of crop-based fuels in LCFS, increasing the use of ethanol in gasoline to 15% by volume, no phaseout of avoided methane and no deliverability requirements for biomethane. In addition, the coalition proposed inclusion and crediting of new credit generation opportunities for climate-smart agricultural practices to incentivize lower-CI fuel production. Under this alternative, the following changes would be made to the proposed LCFS amendments:

1. Increase CI reduction target to 40% in 2030 (from the 30% proposed);
2. Eliminate sustainability criteria for crop-based biofuels; and
3. No limitations on forklift crediting
4. No phase out of avoided methane crediting for biomethane pathways; and
5. No deliverability requirements for book-and-claim of biomethane generated outside of California.

The recommended credit generation opportunities for agricultural practices were not included in this alternative because there is not yet a mechanism within the LCFS for quantifying, verifying, and including greenhouse gas emissions reductions or soil-carbon sequestration from changes in individual farm-level management practices in LCFS fuel pathways. The recommended increase in ethanol volume to E15 was also not included because separate California fuel regulations currently limit ethanol use in gasoline to 10% by volume and changing these fuel regulations is outside the scope of this LCFS rulemaking.

¹⁰⁰ ICF Resources LLC, *Analyzing Future Low Carbon Fuel Targets in California: Initial Results for Accelerated Decarbonization, Central Case*. Submitted to Auto-Acceleration Mechanism for the Low Carbon Fuel Standard Public Comment Docket. June 30, 2023. <https://ww2.arb.ca.gov/form/public-comments/submissions/4306>

Figure 23: Low-CI Fuel Volumes in the Accelerated Decarbonization Scenario

Figure 24: Fuel Mix – Accelerated Decarbonization Scenario

a) Costs

The scenario costs approximately \$194 billion and brings in revenues of about \$149 billion, as compared to the proposed amendment's cost of \$160 billion and revenues of \$128 billion. The net cost is \$45 billion, while the proposed amendment's net cost is \$32 billion. The larger net cost of this scenario is associated with higher credit prices and the demand for 40 billion banked credits by 2030 and 76 billion banked credits between 2024 and 2046, which far exceeds the available quantity even under the credit clearance market.

b) Benefits

This scenario results in NO_x reductions of approximately 27,531 tons (1,945 more tons reduced than the Proposed), PM_{2.5} decreases of 4,233 tons (47 more tons reduced than the Proposed), and GHG reductions of 847 MMT (289 MMT greater reductions than the Proposed). The criteria pollutant emission changes as compared to the proposed amendments are primarily due to higher amounts of renewable fuels used. This scenario results in fewer GHG emissions than the proposed amendments due to higher volumes of renewable diesel and low-CI hydrogen and electricity produced using dairy biomethane.

c) Cost-Effectiveness

The cost effectiveness is \$68/MT GHG reduction, approximately \$10/MT higher than the proposed amendments.

d) Reason for Rejecting

This scenario is rejected because it results in higher costs and increases the risk of LCFS regulatory non-compliance. This scenario also does not align with 2022 Scoping Plan's direction to reduce potential risks of crop-based biofuel impacts to forests and food-crops and to phase out pathways for low-CI combustion fuels used in the transportation sector, like biomethane, away from the transportation sector.

C. Small Business Alternative

The Board has not identified any reasonable alternatives that would lessen any adverse impact on small business, since staff do not expect small businesses to be directly impacted.

D. Performance Standards in Place of Prescriptive Standards

Government Code section 11346.2(b)(4)(A) requires that when CARB proposes a regulation that would mandate the use of specific technologies or equipment, or prescribe specific actions or procedures, it must consider performance standards as an alternative. The LCFS is a performance standard, and therefore this requirement is not applicable.

E. Health and Safety Code section 57005 Major Regulation Alternatives

CARB estimates the proposed regulation will have an economic impact on the State's business enterprises of more than \$10 million in one or more years of implementation. CARB will evaluate alternatives submitted to CARB and consider whether there is a less costly alternative or combination of alternatives that would be equally as effective in achieving increments of environmental protection in full compliance with statutory mandates within the same amount of time as the proposed regulatory requirements, as required by Health and Safety Code section 57005.

X. Justification for Adoption of Regulations Different from Federal Regulations Contained in the Code of Federal Regulations

There are no current federal regulations comparable to the LCFS regulation. The U.S. EPA implements a Renewable Fuels Standard (RFS) regulation that mandates the blending of specific volumes of renewable fuels into gasoline and diesel sold in the U.S. to achieve a specified ratio for each year (i.e., the renewable fuel standard). As defined, “renewable fuels” under the RFS superficially resembles the list of transportation fuels subject to the LCFS. However, there are a number of reasons why the RFS is not comparable to the LCFS.

Congress adopted the RFS in 2005 and recently strengthened and expanded it in June 2022. The RFS requires that 36 billion gallons of biofuels be sold annually by 2022, of which 21 billion gallons must be “advanced” biofuels and the other 15 billion gallons can be corn ethanol. The advanced biofuels are those that achieve at least 50% reduction from baseline life cycle GHG emissions, with a subcategory required to meet a 60% reduction target. These reduction targets are based on life cycle emissions, including emissions from land use changes. With the update to the RFS, standards for cellulosic biofuel, biomass-based diesel, advanced biofuel, and total renewable fuel were added for 2020 through 2022. U.S. EPA also established a 250-million-gallon “supplemental obligation” to the volumes finalized for 2022 and stated its intent to add another 250 million gallons in 2023.¹⁰¹ U.S. EPA is currently proposing volume requirements and percentage standards for 2023 through 2025.¹⁰²

The RFS volumetric mandate alone will not achieve the objectives of the LCFS. The RFS targets only biofuels and not other alternatives; therefore, the potential value of electricity, hydrogen, and natural gas are not considered in an overall program to reduce the carbon intensity of transportation fuels and would not align with the overall transition to zero emission technology defined in California’s regulations. In addition, the targets of 50% and 60% GHG reductions only establish minimum requirements for biofuels, without incentivizing continuous improvements. It assigns biofuels to a small number of fixed categories, without incentivizing innovations within categories. Finally, the GHG requirements do not apply to corn ethanol production plants that were existing and planned at the time of RFS adoption, thus providing no incentive for reducing the carbon intensity from these fuels.

By contrast, the LCFS regulates all transportation fuels, including biofuels and non-biofuels, with a few narrow and specific exceptions. Thus, non-biofuels such as electricity and hydrogen may play important roles in the LCFS program. In addition, the LCFS encourages greater

¹⁰¹ United States Environmental Protection Agency, *Final Volume Standards for 2020, 2021, and 2022*. (Updated on August 31, 2022). <https://www.epa.gov/renewable-fuel-standard-program/final-volume-standards-2020-2021-and-2022>

¹⁰² United States Environmental Protection Agency, *Proposed Renewable Fuel Standards for 2023, 2024, and 2025*. (Updated on February 2, 2023). <https://www.epa.gov/renewable-fuel-standard-program/proposed-renewable-fuel-standards-2023-2024-and-2025>

innovation than the federal program by recognizing and rewarding incremental improvements to the carbon intensity of biofuel supply chains and deployment of innovative technologies and other fuels with very low-carbon intensities.

If California were to solely rely on the RFS, the State would neither achieve the fuel carbon intensity goal called for in Executive Order S-01-07, nor the 2030 GHG reduction targets of SB 32 and AB 1279, nor support its ZEV regulations as the LCFS does, nor stimulate the innovation needed to support future dramatic GHG reductions from the transportation sector. The lack of infrastructure and clean fuels for medium- and heavy-duty vehicles could also put at risk the state's ability to meet its air quality targets under federal regulations. Because of these differences, the federal RFS regulation is complementary, but not comparable to staff's proposal.

Accordingly, the existing LCFS and proposed amendments are authorized by California law; and as explained in Chapter VIII, the cost of the LCFS regulations is justified by the anticipated and potential benefits to human health, public safety, public welfare, and the environment.

XI. Public Process for Development of the Proposed Action (Pre-Regulatory Information)

Consistent with Government Code sections 11346, subdivision (b), and 11346.45, subdivision (a), and with the Board's long-standing practice, CARB staff held public workshops and had other meetings with interested persons during the development of the proposed regulation. These informal pre-rulemaking discussions provided staff with useful information that was considered during development of the regulation that is now being proposed for formal public comment.

In this chapter, CARB staff provides a brief overview of the regulatory process and actions taken to develop the proposed amendments to the LCFS regulation.

Staff has been engaging with the public on potential future changes to the LCFS program for several years. Beginning in October 2020 and ending in August 2023 CARB staff conducted nine public workshops and two LCFS community meetings, in addition to numerous meetings with individual stakeholders to discuss concepts for potential amendments to the LCFS regulation and address various concerns. Notices for the workshops were emailed to subscribers of the "Low Carbon Fuel Standard Program" and "Fuels (General)" listservs at least two weeks in advance to give stakeholders ample time to attend and participate in the workshops. About 11,500 individuals or companies were notified for each workshop/hearing through the existing LCFS subscription lists. Details for public workshops and community meetings, including staff presentations were posted to CARB's LCFS Meetings and Workshop webpage¹⁰³ prior to the workshop. Staff presented concepts for public consideration during the workshops. Staff provided ample opportunity during the workshops for stakeholders to provide oral feedback and additional opportunity for stakeholders to provide written public feedback for at least two weeks following the workshops. This feedback played a key role in informing the proposed amendments and were also posted publicly on the LCFS Meetings and Workshop webpage. All workshops and community meetings were held virtually to allow for remote participation during the COVID-19 pandemic, which also allowed for wider participation. Staff also added community listening sessions, which has not been done before for the LCFS.

Meeting attendees included the following:

- Transportation fuel producers, providers, and importers,
- Environmental justice groups,
- Community members,
- Academia,
- Verification and certification bodies,
- Consultants, and

¹⁰³ California Air Resources Board, *LCFS Meetings and Workshops webpage*. (Accessed on November 30, 2023). <https://ww2.arb.ca.gov/our-work/programs/low-carbon-fuel-standard/lcfs-meetings-and-workshops>

- Other interested persons.

These individuals participated by reviewing written material (i.e., preliminary draft regulations and other supporting documentation), providing data, and participating in workshops and meetings. Public input was used to inform and refine staff proposals, such as developing the acceleration mechanism and expanding the infrastructure crediting provision to the MHD sector. Staff also released the CATS model, which was used to evaluate the California fuel market to assess the technological and economic feasibility of bringing low-carbon fuels to California under various scenarios, with associated technical information for public review and input. Because of public input, the pre-rulemaking public process assisted staff in developing a better proposal. This also provided input on developing alternatives, as required under the Standardized Regulatory Impact Assessment (SRIA) process.

Staff's approach to public engagement follows the precedent of previous LCFS rulemakings. Following approval of the previous 2017 Scoping Plan Update set the path of meeting California's 2030 climate goals and was approved in 2017. In 2018, staff updated the LCFS to align with the 2017 Scoping Plan Update and the 2030 climate target. In May 2022, the draft 2022 Scoping Plan Update was released to identify a path and policies to achieve carbon neutrality and was brought to the Board for its first Board Hearing in June 2022. This release provided a concrete goal and initiated a process with which staff could engage to begin considering the pre- and post-2030 targets. Although the 2022 Scoping Plan Update was not complete at the time, staff started exploring what the LCFS could do to support California's long-term carbon neutrality goal with stakeholders through workshops, while working closely with the Scoping Plan team to ensure the LCFS aligned with policy direction provided by the final Scoping Plan. The 2022 Scoping Plan Update was approved in December 2022, which provided high-level direction on where the LCFS program needs to go into the future. This direction played a role in developing and finalizing the potential amendments discussed with stakeholders during public workshops and community meetings.

Table 32 lists dates for the public workshops that were held to apprise the public about potential future changes to the LCFS program and other related developments.

Table 32: LCFS Public Workshops

Workshop	Date	Location	Time	Number of Feedback Letters Received
Workshop to discuss potential regulation revisions	Day 1: October 14, 2020	Virtual via GoToWebinar	Day 1: 9am – 12pm	135
Day 1: Potential amendments to LCFS and potential revisions to OPGEE model	Day 2: October 15, 2020		Day 2: 9am – 1pm	
Day 2: Stakeholder suggestions				

Workshop	Date	Location	Time	Number of Feedback Letters Received
Workshop to discuss guiding principles for potential future changes to LCFS program, including establishing post-2030 targets, phasing out petroleum projects, adding intrastate jet fuel, supporting hydrogen refueling infrastructure for MHD vehicles, and streamlining implementation	December 7, 2021	Virtual via GoToWebinar	9am – 12:30pm	106
Workshop to discuss potential changes to Crude Oil Carbon Intensity Estimation under the LCFS regulation	April 26, 2022	Virtual via GoToWebinar	9am – 10:30am	7
Workshop to discuss potential changes to the LCFS, including considerations for adjustments to compliance targets	July 7, 2022	Virtual via GoToWebinar	9am – 1pm	131
Workshop to discuss potential opportunities to streamline implementation and potential updates to emission factors, verification, and EV base credit methodology	August 18, 2022	Virtual via GoToWebinar	9am – 12pm	76
Workshop to discuss options for increasing stringency of the carbon intensity targets for 2030 and beyond, design of initial modeling scenarios, describe modeling approach, and soliciting alternatives	November 9, 2022	Virtual via GoToWebinar	9am – 1pm	155
Workshop to discuss potential credit generation opportunities that may affect carbon intensity targets, present preliminary fuel mix and cost outputs from CATS model, and present concepts related to streamlining implementation	February 22, 2023	Virtual via GoToWebinar	9am – 12pm (morning session) 12:30pm – 3pm (afternoon session)	154

Workshop	Date	Location	Time	Number of Feedback Letters Received
Workshop to discuss ways to design a mechanism that would accelerate the carbon intensity benchmarks if certain conditions are met.	May 23, 2023	Virtual via Zoom	9am – 12pm	43
Community meetings for community members to hear an overview of the LCFS program and provide input on potential future LCFS changes with CARB staff	May 31 and June 1, 2023	Virtual via Zoom	6pm – 8pm	16
Workshop to discuss LCFS modeling updates	August 16, 2023	Virtual via Zoom	9am – 11am	N/A

In addition, CARB staff participated in numerous stakeholder meetings sponsored by other parties, presenting information on the implementation of the existing program and exploring potential amendments.

During the original 2009 rulemaking process, staff created the LCFS website,¹⁰⁴ which has since been updated and improved, to increase public participation and enhance the information flow between CARB staff and interested parties. Since that time, staff has consistently made available online materials related to this rulemaking, including meeting presentations, preliminary draft regulatory language, and life cycle analysis models and tools used in assessing fuel and feedstock availability to inform the proposed carbon intensity benchmarks. The website also provides background information on the LCFS, workshop and meeting notices and materials, other GHG-related information, and links to other websites with related information. The website also includes feedback letters from stakeholders in response to staff's pre-rulemaking public workshops and community meetings that led to the proposed amendments.

California Low Carbon Fuel Standard Workshop

APRIL 10, 2024

Workshop Overview

- Morning, 9am-12pm
 - EJAC Presentation or Comments
 - Staff Presentation
 - LCFS support for CA climate, air quality, and ZEV goals
 - Rulemaking process and key concepts
 - Modeling updates and renewable diesel volume projections
 - Sustainability guardrails
 - Public comments (in-person and Zoom)
- Break, 12-1pm
- Afternoon
 - Public comments continued (in-person and Zoom)

Public Comments

- Process

- Comments will be taken by in-person attendees and virtually through Zoom
- 3 minutes per comment
- Staff will make every effort to call on commenters in the order they signal they would like to comment or raise the hand on Zoom

- Zoom Orientation

- “Raise Hand” to signal that you’d like make a comment
- Zoom phone participants may dial #2 to raise your hand
- Staff will inform Zoom phone participants when they are unmuted during public comment
- Dial *6 to mute or unmute

The Road to Zero Emissions

CARB has put a roadmap in place to drastically reduce our dependence on petroleum in the transportation sector by 2045.

AB
32

Requires we cut GHGs.
To reach goals, fuel use
must be cut by 94%.

How cuts happen?
Zero emission cars, trucks and fuels.

ACT

ACC

ACF

CARB rules that make that possible:
Advanced Clean Trucks, Advanced
Clean Cars, Advanced Clean Fleets

- ACT: Phases out sale of most fuel-powered trucks by 2035
- ACC: 100% ZEV sales requirement by 2035
- ACF: Requires that trucks in CA be zero emissions by 2045

LCFS

All together, these
actions will help us build
a cleaner, healthier
California for current
and future generations.

Governor Newsom creates
new oversight committee
to monitor oil companies

Makes fuel less polluting and encourages
production of cleaner alternatives

How it
works:

Dirty Fuel

Cleaner Fuel

Regulations Implement State Plans

- CARB's Core Long-term Planning Documents
 - State Implementation Plan (SIP) to achieve federal and state air quality goals
 - AB 32 Scoping Plan to achieve state climate targets
 - 2022 Scoping Plan Update builds on existing SIP to ensure alignment with air quality related actions
- ZEV regulations implement SIP and Scoping Plan
 - LCFS is included in analyses for ZEV regulations as part of economic support for ZEV deployment and operation
 - LCFS amendments proposed in 45-day package designed to support recently adopted ZEV regulations

LCFS Supports ZEV Regulations

- LCFS reduces costs of zero emission fuels, contributing to lower total cost of operation for ZEVs
 - Advanced Clean Cars II
 - Advanced Clean Trucks
 - Advanced Clean Fleets
- Other zero emission regulations
 - Shore power, cargo handling, forklifts, and transportation refrigeration units

LCFS Support for ZEV Regulations

Historical	Total credits (MT) Q1 2011 - Q3 2023	Value (\$) using avg. 2020-22 credit price
Dispensed electricity (non-residential EVSE)	6,300,000	\$1.07B
Dispensed hydrogen	190,000	\$3.98M
Sum of dispensed fuel	6,500,000	\$1.1B
Fast Charging Infra capacity credits	234,000	\$60M
HRI capacity credits	355,000	\$40M
Sum of HRI/FCI*	590,000	\$100M (credits even without dispensing fuel)
Proposed Amendments	Percent of total credits in 2045	Value (\$) using avg. 2020-22 credit price
Dispensed electricity	40%	\$3B
Dispensed hydrogen	5%	\$400M
Dispensed RNG, renewable diesel and biodiesel	0% (generates deficits)	NA

*HRI/FCI credit totals reflect current utilization. If fully utilized at 2.5% caps, ZEV infrastructure credit revenue could be 4-5x larger

LCFS Support for ZEV Infrastructure

Near-term aligned with ZEV Regulations

Proposed Amendments	Max credits (MT) at 2.5% each of deficits	Value (\$) using avg. 2020-22 credit price
HD HRI/FCI credits in 2030	2,100,000	\$357M
HD HRI/FCI credits in 2035	2,600,000	\$441M

Staff estimates that the proposed HD HRI/FCI provisions could pay for 1.5x the capital costs of **all** the fast chargers and hydrogen stations needed to meet the 2022 Scoping Plan vehicle populations, through 2030 and potentially through 2035

LCFS Long-term support for Alternative Fuels Aligned with ZEV Regulations

Proposed Amendments	Total Credits (net credits/deficits) 2025-2045	Value (\$) using avg. 2020-22 credit price
Dispensed electricity	606,000,000	\$103B
Dispensed hydrogen	34,000,000	\$5.8B
Dispensed renewable diesel and biodiesel	4,490,000	\$764M

Fossil fuels (gasoline and diesel) are deficit generators and do not generate credits in the LCFS. **Less than \$1 billion estimated for liquid non-fossil drop-in fuels between 2025 and 2045.**

LCFS Supports Transit & Clean Technology & Aligns with Other CARB Regulations

Historical	Total credits (MT)	Value (\$) using yearly average credit prices
Transit credits 2022	302,000	\$36M
Total transit credits (Q1 2011 through Q3 2023)	2,750,000	\$341M

Historical	Total credits (MT) Q1 2011 through Q3 2023	Value (\$) using avg. 2020-22 credit price
Fixed guideways	1,780,000	\$303M
Shore power for ocean going vessels at berth	1,100,000	\$188M
Cargo handling equipment	200,000	\$34M
Forklifts	5,900,000	\$1B
Transport Refrigeration Units	122,000	\$21M

Historical LCFS Credit and Retail Fuel Prices Counters Fossil Industry Narrative

Chart is created by CARB and updates a version provided in the paper referenced below.

"An assessment of observed market prices shows conclusively that the LCFS program price effect at the pump is not a significant driver of retail fuel prices in California."

[Executive Summary \(bateswhite.com\)](https://www.bateswhite.com/insights/publications/2022/06/lcfs-program-price-effect-at-the-pump-is-not-a-significant-driver-of-retail-fuel-prices-in-california)

LCFS Outcomes

12.6% reduction in the carbon intensity of California's transportation fuels

Over 25 billion gallons of petroleum fuels displaced by low-carbon fuels

60% of fossil diesel displaced by biomass-based diesel in 2023, resulting in PM and NOx benefits

\$4 billion annually to support low-carbon investments and \$341M cumulative for public transit

Supports many State programs and goals, including cars and trucks going to zero-emission vehicles

Financial assistance for vehicle purchases at the state and local level

45-day Rulemaking Package Posted

- Initial Statement of Reasons (ISOR) package publicly available on LCFS Rulemaking webpage^{*}
 - Staff Report/ISOR

Supplemental Information Posted

- Staff has posted supplemental information related to the staff report, as well as additional modeling information reflected in this workshop*
- Summary of items posted:
 - Underlying data for figures in ISOR
 - CATS modeling input sheets for all scenarios in ISOR
 - CATS modeling output sheets for all scenarios in ISOR
 - Air quality workbooks for Proposed scenario and EJAC alternative in ISOR
 - CATS modeling input sheets for scenarios represented in 4/10 workshop presentation
 - CATS modeling output sheets for scenarios represented in 4/10 workshop presentation

*Posted on LCFS webpage: <https://ww2.arb.ca.gov/resources/documents/supplemental-2023-lcfs-isor-documentation>

We Received A Diverse Set of Comments

- Strengthen carbon intensity targets and provide long-term price signals
- Maximize crediting opportunities
- Incentivize development of innovative fuels
- Reduce use of combustion fuels
- Eliminate biomethane from the program
- Continue support for biomethane and prevent stranding assets
- Limit or cap crop-based biofuels
- Expand the use of crop-based biofuel crediting
- Concentrate health and economic benefits in communities burdened by current transportation system
- Provide a mix of low-carbon transportation incentives to communities

Key Concepts for Rulemaking

- Increase the stringency of the program to displace fossil fuels
- Strengthen equity provisions to promote investment in disadvantaged, low-income, and rural communities
- Support electric and hydrogen truck refueling
- Increase the use of alternative jet fuel in the State
- Incentivize more production of clean fuels needed in future, such as low-carbon hydrogen
- Support methane emissions reductions and deploy biomethane for best uses across transportation and other sectors
- Consider guardrails on crop-based fuels

Other Considerations

- Needs of light-duty vehicle sector
- Needs of medium/heavy-duty sector
 - Different from LD sector, where VMT reductions can be complimentary
- Federal incentives
- Price-signals for investment
- Near and long-term air quality benefits
- Transportation costs
- Program administration and streamlining

45-day Proposed Regulatory Provisions

- Increase stringency by increasing CI reduction to 30% by 2030 and 90% by 2045 with near-term step-down in stringency
- Implement Automatic Acceleration Mechanism
- Eliminate Exemption for Intrastate Fossil Jet Fuel
- Expand Zero Emission Vehicle Infrastructure Crediting
- Apply Biomethane Deliverability Requirements and Phase Out Avoided Methane Pathways
- Add Crop-Based Biofuels Sustainability Criteria
- Improve Equity Provisions

LDVs - Fuel Demand based on Vehicle Population

- Based on implementation of CARB's ACC II regulation, **existing combustion vehicles persist out to 2045**—keeping demand for fossil liquid fuels
- % of combustion vehicles
 - 2025: 93%
 - 2030: 79%
 - 2040: 31%
 - 2045: 14%
- Faster turnover in light-duty sector than with trucking sector

HDFVs - Fuel Demand based on Vehicle Population

- Based on implementation of CARB's ACF/ACT regulations:
- **Existing combustion engines persist for years** due to slow turnover of heavy-duty trucks
- **Fossil diesel backfills biofuels when biofuel volumes are limited**
- % of combustion vehicles
 - 2025: 98%
 - 2030: 92%
 - 2040: 52%
 - 2045: 28%

Transportation Fuel Mix, 2022 Scoping Plan

- Fuels transition in 2022 Scoping Plan mirrors the combustion vehicle phaseout in ZEV regulations
- Major transition to electricity and hydrogen, with smaller but persistent role for liquid alternative fuels

Modeling Comparison: Fuel Volumes

Proposed Scenario Fuel Volumes

EJAC Scenario Fuel Volumes

Engine Technology Impacts Emissions

On-Road Vehicle Populations

On-road sector transitioning to cleaner new technology diesel engine (NTDE) vehicles faster than off-road sector

Off-Road Vehicle Populations

Emission Factors Used in AQ Analysis

- Different PM/NOx emission factors for RD and BD between older “legacy” and New-Technology Diesel Engines (NTDE)
- Both fuels reduce PM emissions, which is predominant driver of health analysis
 - Emission Factors based on 2011 Durbin et. al.
 - **2021 LED study confirmed reductions for legacy engines, the study also showed reductions for NTDEs, but were not statistically significant**
- Renewable Diesel
 - Older: NOx decrease
 - NTDE: No additional NOx benefit/impact
- Biodiesel
 - Legacy: NOx increase
 - NTDE: No additional NOx benefit/impact

Table 56: Biodiesel NOx and PM Emissions Relative to Conventional Diesel¹¹⁸

Engine Type	Biodiesel Saturation Level	NOx Emissions Change Relative to Conventional Diesel			PM Emissions Change Relative to Conventional Diesel ¹¹⁹		
		B5	B10	B20	B5	B10	B20
Non- NTDE	Low	1.1%	1.8%	4.0%	-4.7%	-8.9%	-19%
Non- NTDE	High	-0.2%	0.1%	1.5%	-4.7%	-8.9%	-19%
NTDE	Low	0.0%	0.0%	0.0%	-4.7%	-8.9%	-19%
NTDE	High	0.0%	0.0%	0.0%	-4.7%	-8.9%	-19%

Table 57: Renewable Diesel NOx and PM Emissions Relative to Conventional Diesel^{120,121,122}

Engine Type	NOx Emissions Change Relative to Conventional Diesel ¹²³		PM Emissions Change Relative to Conventional Diesel ¹²⁴	
	R20	R100	R20	R100
Non-NTDE	-2.9%	-10%	-4.0%	-30%
NTDE	0.0%	0.0%	-4.0%	-30%

2021 LED Study on RD/BD Blends - PM

LEGACY

- RD: Confirmation of PM **decreases** in legacy engines for RD relative to ULSD
- BD: Confirmation of PM **decreases** in legacy engines relative to ULSD

NTDE

- RD/BD: Confirmation of reduced PM emissions relative to ULSD, but not statistically significant

Table ES-5. Average PM emissions, and Percentage Differences and Statistical Comparisons Between the Test Biofuels and CARB Reference Fuel for the Off-Road Legacy Engine

Cycle	Fuel Type	PM Emissions (g/bhp-hr)	% Diff vs. CARB	p-value (t-test)
NRTC	CARB reference diesel	0.061	-	-
	R100	0.038	-38	0.00
	R65/B35	0.028	-53	0.00
	R50/B50	0.023	-63	0.00
D2	CARB reference diesel	0.052	-	-
	R100	0.038	-27	0.00
	R65/B35	0.025	-51	0.00
	R50/B50	0.022	-58	0.00

Statistically significant results are bolded and their percent differences are shown in red.

For the on-road NTDE, PM mass emissions in general were low and near background levels, and averaged less than 0.001 g/bhp-hr for all tests conditions and both cycles. As the PM standard for heavy-duty on-road engines is 0.01 g/bhp-hr, the PM emissions observed are for the most part at least 20-fold lower than the PM standard. The PM emissions for the different fuels generally did not show statistically significant differences, with the exception of the R50/B50, which had emissions that were lower than those for the CARB reference fuel at a marginally statistically significant level over the FTP cycle.

2021 LED Study on RD/BD Blends - NOx

LEGACY

- RD: Confirmation of NOx **decreases** in legacy engines relative to ULSD
- BD: Confirmation of NOx **increases** in legacy engines relative to ULSD

NTDE

- RD: No statistically significant difference between RD or ULSD for NOx in NTDE
- BD: NOx **increases** in NTDE relative to ULSD
 - SRIA assumes equivalency
 - Staff are conducting additional testing to collect more data

Table ES-2. NOx Emissions, and Percentage Differences and Statistical Comparisons Between Biofuels and the CARB Reference Fuel for the Off-Road Legacy Engine

Cycle	Fuel Type	Ave. NOx Emissions (g/bhp-hr)	% Diff vs. CARB	p-value (t-test)
NRTC	CARB reference fuel	2.09	-	-
	R100	1.98	-5.4	0.00
	R65/B35	2.07	-1.2	0.18
	R50/B50	2.13	1.8	0.05
D2	CARB reference fuel	2.01	-	-
	R100	1.91	-4.9	0.00
	R65/B35	2.01	0.0	0.97
	R50/B50	2.09	4.2	0.02

Statistically significant results are bolded and their percent differences are in red text.

Table ES-3. NOx Emissions, and Percentage Differences and Statistical Comparisons Between Biofuels and the CARB Reference Fuel for the On-Road NTDE

Cycle	Fuel Type	NOx Emissions (g/bhp-hr)	% Diff vs. CARB	p-value (t-test)
FTP	CARB reference fuel	0.11	-	-
	R100	0.12	4.8	0.34
	R65/B35	0.16	46.6	0.00
	R50/B50	0.17	49.5	0.00
RMC	CARB reference fuel	0.13	-	-
	R100	0.14	2.3	0.19
	R65/B35	0.15	14.2	0.00
	R50/B50	0.15	15.4	0.00

Statistically significant results are bolded and their percent differences are shown in red.

Biodiesel and Renewable Diesel Volumes

- Biodiesel and renewable diesel are distinctly different fuels
- Biodiesel volumes have not grown significantly for many years and declined in Q1-Q3 2023
- Renewable diesel makes up almost all of the growth in diesel alternatives

*Note: Q4 2023 volumes estimated using average of Q1-Q3 2023 reported data

45-Day Proposal

- 30% CI reduction by 2030, 90% CI reduction by 2045
- Fossil jet deficits
- Expand Zero Emission Vehicle Infrastructure Crediting
- Biomethane deliverability and pathways phase out
- Sustainability guardrails

GHGs

558 MMT CO₂e
reduction

Health

\$5B decrease in
costs in 2045

Costs

\$32B net cost
increase

Balances need
for investment
signal with need
for compliance

Criteria Pollutant Emissions of Fuels

- PM and associated health benefits of RD and BD use, relative to ULSD.
- NOx emissions depend on fuels and engine types.
 - RD shows NOx reductions, particularly in legacy engines.
 - BD has potential to increase NOx emissions, testing shows emissions depend on fuel blend and engine.
- CARB adopted Alternative Diesel Fuel (ADF) Regulation to ensure NOx equivalency.
 - ADF Regulation requires blends above B5 be mitigated.
- 2021 LED study used higher biodiesel blends than may be used in CA.
- CARB has commissioned further testing on BD and RD.

EJAC (EJ) Scenario

- 30% CI reduction by 2030, 90% CI reduction by 2045
- Fossil jet deficits
- Expand Zero Emission Vehicle Infrastructure Crediting
- End biomethane crediting
- Apply limits on biomass-based diesel
- No direct air capture credits

GHGs

386 MMT CO₂e
increase

Health

\$2B increase in
costs in 2045

Costs

\$85B net cost
increase

Needs more
credits for
compliance than
available

Other Options Staff Also Evaluated

- Less Stringent Near-Term CI Targets
 - 28% by 2030 with 3% step down in 2025
 - Phasing down biomethane crediting
 - Limits on crop-based diesel
- More Stringent CI Targets
 - 35% by 2030 with 5% step down in 2025
 - No additional crediting constraints

Greater need for fossil diesel, more GHG emissions, higher costs after 2030

Highest cost scenario

Questions Raised by External Modeling

- Areas that warrant additional staff evaluation:
 - Availability of non-biofuel credit generating opportunities, in particular prior to 2030.
 - Assumptions on future RD volumes and feedstock types/quantities to meet production needs
 - Effect of Auto Acceleration Mechanism on credit/deficit supply
 - Impact of fuel/feedstock combos switching from credit to deficit generating as CI benchmarks continue to decline and program becomes more stringent
 - Potential other alternative fuels to reduce fossil fuel use in legacy combustion vehicles

Updated Analysis for April Workshop

- Step-downs
- BD/RD tailpipe emission factor (N_2O and CH_4)
- Energy demand from PHEVs
- Updated MDV energy demand to reflect ACF's 15-day revision to vehicle stocks
- Biomethane representation
- Auto-adjustment mechanism
- Renewable diesel volumes
- Feedstock supply assumptions

Biofuels availability assumptions and emission factor updates

- Received feedback that staff proposal underestimates renewable diesel supply
- Updates to supply assumptions:
 - Refined supply curves for renewable diesel from virgin oils and waste oils
- CA-GREET4.0 updated to apply tailpipe emission factor for fossil diesel to biodiesel and renewable diesel carbon intensities

Baseline CI for ULSD

- In the ISOR amendment proposal package, staff incorporated a new baseline 2010 CI score for ULSD to reflect the updated value from CA-GREET4.0
- The change reflects increased tailpipe CH₄ and N₂O emissions factors for diesel combustion
- Stakeholders raised concerns that increasing the ULSD baseline 2010 value would result in significant additional crediting for diesel fuel replacements
- An adjustment in the RD/BD CI scores to reflect the same change to both is included in the modeling shown today
- Updating CA-GREET 4.0 to include the additional tailpipe emissions for RD/BD as well as ULSD will reduce the amount of additional crediting introduced from the increased baseline.

CATS Supply vs. Current Trends

- Total UCO available at \$2000 - 5.8 M tons
- Total Virgin Oil available at \$2000 - 8.4 M tons
- Improvements Shown
 - Tied inputs to trendline values, rather than single month data
 - Matched time period of analysis for waste oils to that of virgin oils

Diesel and Jet Fuel Pools – U.S. Production

- Liquid biofuels have not yet saturated the market
 - Diesel fuel pool: 60% biofuels in Q3 2023
 - Jet fuel pool: 3% biofuels (intrastate only) from most recent year of data
- Significant increases in domestic production capacity may bring more volumes to California

California Diesel Pool vs US Domestic Renewable Diesel Production Capacity

Sources:

LCFS Data from Quarterly Data Summary Spreadsheet

Domestic capacity data from EIA:

<https://www.eia.gov/todayinenergy/detail.php?id=55399>

Future Renewable Diesel Supply

- Domestic renewable diesel capacity exceeds California diesel pool with significant announced future capacity
- US EPA RVO for 2023-2025 is significantly lower than the announced domestic capacity
- High crude prices can compensate in part for lower RFS support, but are variable
- Creates uncertainty for modeling, given history of supply adjusting toward RVO for other fuels

Sources:

EIA, Feb 2, 2023. <https://www.eia.gov/todayinenergy/detail.php?id=55399>

EPA, June 21, 2023. <https://www.epa.gov/renewable-fuel-standard-program/final-renewable-fuels-standards-rule-2023-2024-and-2025>

Credit Generation for Virgin Oil Feedstocks Naturally Phases Out

Biomass-based Diesel Carbon Intensities and Diesel Compliance Targets (ISOR)

Scenarios Analyzed for Workshop

- 5% step-down, 7% step-down, and 9% step-down in 2025
 - All include 30% CI reduction by 2030 and 90% CI reduction by 2045
- 5% step-down in 2025 with Auto-Acceleration Mechanism triggered twice
 - Results in 39% CI reduction by 2030 and 90% CI reduction **two years earlier** in 2043
- All scenarios reflect updated modeling inputs

Updates to 45-Day Proposal

ISOR Proposed
5% Step Down and 30% in 2030

April 2024 Workshop
5% Step Down and 30% in 2030

Increased Step-downs

7% Step Down and 30% by 2030

- Bank Drawdown - 17 million between 2025 and 2046
- Total Electricity - 1,367,482 GWh
- Total Hydrogen - 5,367 MM kg
- Total Biofuel Volume - 75,118 MM GGE
- Total Fossil Volume - 212,082 MM GGE

9% Step Down and 30% by 2030

- Bank Drawdown - 27 million between 2025 and 2046
- Total Electricity - 1,367,482 GWh
- Total Hydrogen - 5,367 MM kg
- Total Biofuel Volume - 75,143 MM GGE
- Total Fossil Volume - 212,057 MM GGE

Illustrative Scenario - 5% Step Down with Two Automatic Accelerations

- Modeling doesn't directly simulate situations that would trigger AAM
- Staff "forced" modeling of two AAM triggering to illustrate impact by manually advancing CI benchmarks in 2028 and 2030.
- Minimum Bank Drawdown - 171 million credits
- Total Electricity - 1,367,482 GWh
- Total Hydrogen - 5,367 MM kg
- Total Biofuel Volume - 80,764 MM gallons
- Total Fossil Volume - 196,653 MM gallons

Modeling Comparison

	5% Step Down 30% in 2030*	7% Step Down 30% in 2030	9% Step Down 30% in 2030	5% Step Down Double AAM
Minimum Bank Drawdown**	3 million credits	17 million credits	27 million credits	171 million credits
Total Electricity	1,367,482 GWh	1,367,482 GWh	1,367,482 GWh	1,367,482 GWh
Total Hydrogen	5,367 MM kg	5,367 MM kg	5,367 MM kg	5,367 MM kg
Total Biofuel Volume	74,178 MM GGE	75,118 MM GGE	75,143 MM GGE	77,505 MM GGE
Total Fossil Volume	213,021 MM GGE	212,082 MM GGE	212,057 MM GGE	209,695 MM GGE

*Using updated input assumptions

** Bank Drawdown is cumulative between 2024-2046

Additional Analysis - Discussion

- Impacts of Different Step-Downs
 - 7% step-down increases biofuel availability relative to 5% step-down.
 - Modeling shows much smaller increases in biofuel volumes when moving from a 7% step-down to a 9% step-down
 - Both step-downs reduce credit generation per-gallon of biofuels
- Impacts of Automatic Acceleration Mechanism
 - Significant change in biofuel volumes relative to other options
 - Potential for significant changes in bank drawdown
 - Biofuels become deficit-generating sooner
- All options increase the potential for bank drawdown
 - Creates additional risk of credit shortages, particularly when CI reduction stringency increases in later years

Feedback Requested

- Short-term vs long-term market conditions – how should staff approach the increased stringency need? Is it a one-time near-term need or do stakeholders anticipate rapid and sustained decarbonization progress through the next 10+ years?
- Which approach can provide a smooth/sustained market signal to support deeper decarbonization in the 2030s?
- Should staff consider any changes to the trigger conditions for the AAM?

Crop-Based Biofuels Sustainability

Crop Sustainability

- Biofuel production must not come at the expense of deforestation or food production.
- CARB staff solicited feedback on crop-based biofuels sustainability concerns during past workshops
- Staff directed to investigate guardrails at the Sept 28, 2023 informational board hearing
- Staff 45-Day Proposal:
 - Require independent feedstock certification by a certification body approved by the Executive Officer
 - Built in timeline to develop those standards and approval processes by third party certifiers
 - Remove palm-derived fuels from eligibility for credit generation
- Also considering other changes

Topics for Discussion

- How has crop-based oil seed demand and production changed as biomass-based diesel (BBD) volumes increased?
- Does evidence show that BBD production is increasing crop-based oilseed demand and/or prices?
- Is the increase in BBD production resulting in deforestation and/or food system impacts?
- What guardrails should be included in the LCFS program?
- Given existing combustion engines persist, what liquid fuel options exist to meet demand and support GHG and air quality needs?
- Should E15 be considered to help reduce retail gasoline costs?

Recent Feedstock Trends in BBD

- Both waste-based and oilseed feedstocks have increased
- Rapid rise in 2021, mainly from increased soy usage
- From 2022-2023, waste-based feedstocks have risen more rapidly than oilseed feedstocks

Crop-based Oil Prices

- Rapid rise in oil prices in 2021 and 2022
- Many factors affected oil prices:
 - Pandemic supply disruptions/inflation
 - Lower production from Canada, US, Europe and Ukraine in 2021 of oilseed crops (canola and sunflower) increased soy demand
 - Russian/Ukraine war began in 2022 impacted sunflower oil supply
 - Increased US and international demand for biofuel production

Soy Oil Market Trends – U.S. Consumption

- Yield, crush capacity, and acres projected to increase. Exports decreasing.
- Soy oil uses – food (dressing/mayo), fuels (BD, RD, SAF), and bio-plastics
- Soy meal production also increases with oil production.
- Soy meal uses – livestock feed

Source:
USDA Foreign Ag Service:
<https://apps.fas.usda.gov/psdonline/app/index.html#/app/advQuery>

Data Trends and Guardrails

- CI incentives working to prioritize waste-based feedstocks
- BBD volumes increasing and likely to increase in the future given announced capacities
- Recent virgin oil trends suggest increasing investments and reduced exports are happening to increase virgin oil supply
- Based on current and future understanding of market conditions, it is uncertain if substantial increases in virgin oil fuel use in California will occur over long-term
- Guardrails still warranted to reduce risks of potential impacts from increased demand of virgin oils in CA LCFS and inform other clean fuels program design

Guardrails include multiple mechanisms

Priority	Approach / Strategy
Encourage use of waste-based feedstocks	<ul style="list-style-type: none">• CI scores reflect waste-derived fuels• Feedstock tracking for waste feedstocks• For other non-waste-based feedstocks, include GHG emissions coming from feedstocks production and transport. Also include impacts from potential land-use change (LUC)
Minimize/avoid deforestation risks from feedstock production and risks of impacting food prices/availability	<ul style="list-style-type: none">• Include LUC in CI scores• Eliminate any crediting for Palm Oil*• Require Sustainability Certification*• Prohibit crop or forestry feedstocks from land forested after 2008*• Consider increases in LUC for certain fuel/feedstock combos**• Additional detailed traceability, verification and/or enforcement of waste feedstocks to avoid fraud**
Reduce other impacts of agricultural practices in feedstock production	<ul style="list-style-type: none">• Require Sustainability Certification*

*45-day proposal

**Staff are continuing to evaluate these options

Provisions to Encourage Waste Based Feedstocks

- LCFS program accounts for land use change emissions associated with crop-based biofuels and incentivizes waste- and residue-based feedstocks (for which no indirect effects are assigned in LCFS)
- Majority of biomass-based diesel produced from waste feedstocks
 - Waste based feedstocks require are considered a “specified source feedstock”
 - Specified source feedstocks must provide chain-of-custody documentation, which traces feedstock to point-of-origin
- For non-waste feedstocks, carbon intensity score includes land-use change value
 - Land use change quantified in LCFS since 2011
 - Extensive multi-year land use change expert workgroup informed updates to land use change values in 2015 rulemaking*

Proposed Sustainability Language in 45-Day

- Would provide additional protections against deforestation and habitat loss from fuel feedstocks
- Crop or forestry feedstocks cannot come from land that was forested after January 1, 2008
- CARB would leverage existing certification programs
 - ISCC, RBS, REDcert, Bonsucro, etc. (Most already approved under EU Renewable Energy Directive)
 - Requires CARB approval and continuous oversight
- All crop- and forest-based feedstocks requires certification by January 1, 2028

What Sustainability Certifications Typically Include

- No cultivation occurred on areas that serve the purpose of nature protection
- Damage or deterioration of habitats is avoided
- Crops are grown on suitable soils and have good agricultural practices with respect to soil quality, soil contamination and soil erosion
- Fertilizer application does not contaminate the surface and ground water
- Responsible plant protection practices (insect treatments)
- Responsible waste management practices

Proposed LCFS Process in 45-day

- Feedstock providers interested in participating in the LCFS will select a CARB approved certification system
- Feedstock providers must meet all requirements to become certified under the selected program
 - Select a third-third party auditor
 - Auditor will confirm accuracy of registration information and conformance with certification program's sustainability requirements
- Successful process will result in issuance of traceable certificates
- LCFS pathways holders must provide certificates to CARB-accredited verifiers and CARB upon request

Sustainability Audit Process

- Auditors conduct the following tasks:
 - Perform site visit(s)
 - Confirmation of land use change date (before/after 2008)
 - Ensure cropping practices meet sustainability requirements
 - Review of management systems
 - Review of social practices (e.g., worker treatment)
 - Review compliance with, all applicable regional, national laws and international laws
 - Review economic sustainability of the applicant (e.g., farm)
- Auditor will require correction or changed before certificates are issued

Land-Use Change Values Under Staff Evaluation

- Under current reg language, applicants use LUC values from Table 6 if their feedstock is listed
- Table 6 values were estimated during CARB's 2015 GTAP analysis and reflect region-specific biofuel shocks (e.g., US soy, Brazilian sugarcane)
- Table 6 values may not be accurate for applicants sourcing feedstocks from outside 2015 analysis area
- Staff is looking into a mechanism to assign higher LUC values than Table 6 to high-risk crop-based feedstocks entering the LCFS as part of the pathway process

Biofuel	LUC (gCO ₂ /MJ)	2015 Analysis Area
Corn Ethanol	19.8	U.S.
Sugarcane Ethanol	11.8	Brazil
Soy Biomass-Based Diesel	29.1	U.S.
Canola Biomass-Based Diesel	14.5	North America
Grain Sorghum Ethanol	19.4	U.S.
Palm Biomass-Based Diesel	71.4	Indonesia/ Malaysia

Land Use Change Evaluation – Initial Concept

- As part of an individual fuel pathway, staff would evaluate and provide updated LUC values for a fuel and feedstock combination not covered by a Table 6 value
- LUC evaluation would be based on **empirical** sub-national production data
- Example of potential LUC data sources:
 - Remote sensing studies that attribute LUC to crop feedstock expansion at national or regional scales (e.g., academic research articles)
 - Satellite-based land use monitoring platforms (e.g., Global Forest Watch, Mapbiomas-Brazil) that provide annual tracking of LUC for commodity crop expansion
- Staff is seeking feedback on approach and potential data sources

Staff Summary

- 45-day proposal aligns with implementation needs of existing ZEV regulations
 - LCFS has supported private investment in ZEV infrastructure and fuels
 - It is not a government directed funding source like GGRF
- Transition to MDV/HDV ZEVS will take longer than transition to LDV ZEVs
 - Science supports the use of alternative fuels in the near-term to continue transition away from petroleum fuels and deliver GHG and AQ benefits, especially diesel
 - Reducing VMT does not reduce diesel demand in MDV/HDV and offroad
- Increased stringency brings additional GHG and air quality benefits, particularly for MHD, but need to balance multiple objectives when considering options for increased stringency.
 - Potential role of E15 to reduce costs at the pump for LD fuel use
- Biofuels market undergoing rapid changes and there is uncertainty on future volumes, guardrails to reduce risks are important.

Rulemaking Timeline

Public Comments

- Process

- Comments will be taken by in-person attendees and virtually through Zoom
- 3 minutes per comment
- Staff will make every effort to call on commenters in the order they signal they would like to comment or raise the hand on Zoom

- Zoom Orientation

- “Raise Hand” to signal that you’d like make a comment
- Zoom phone participants may dial #2 to raise your hand
- Staff will inform Zoom phone participants when they are unmuted during public comment
- Dial *6 to mute or unmute

Written comments can be submitted after the workshop at:

<https://ww2.arb.ca.gov/our-work/programs/low-carbon-fuel-standard/lcfs-meetings-and-workshops>

Notice of Public Availability of Modified Text and Availability of Additional Documents and/or Information

Proposed Low Carbon Fuel Standard Amendments

Public Hearing Date: November 8, 2024
Public Availability Date: August 12, 2024
Deadline for Public Comment: August 27, 2024

CARB has determined that additional modifications are appropriate for the proposed amendments and has developed the proposed modifications (15-Day Changes) as stated below in the “Summary of Proposed Modifications” section of this notice. The Attachments showing the specific proposed modifications to the text of the proposed regulation being made with these 15-Day Changes are shown in multiple ways in order to meet the requirements of the Administrative Procedure Act (APA) while also posting alternate/complementary versions that provide increased accessibility to view the modifications in multiple ways.

The Attachments are as follows:

Attachment A - Amendments to Sections 95481, 95482, 95483, 95483.2, 95484, 95485, 95486, 95486.1, 95486.2, 95486.3, 95486.4, 95487, 95488, 95488.1, 95488.3, 95488.5, 95488.6, 95488.7, 95488.8, 95488.9, 95488.10, 95489, 95490, 95491, 95491.1, 95491.2, 95495, 95500, 95501, and 95503, Title 17, California Code of Regulations

- Attachment A-1: Proposed 15-Day Modifications to Proposed Regulation Order (Proposed Sections for Amendments) (compared to version released for 45-day comments)
- Attachment A-1.1: ~Alternative format to Attachment A-1 (Proposed Sections for Amendments)~
- Attachment A-1.2: Proposed 15-Day Modifications to Proposed Regulation Order (15-Day Modifications and 45-Day Modifications combined and compared to existing regulatory text) in Alternative format
- Attachment A-2: Proposed 15-Day Modifications to Proposed Regulation Order (Proposed Sections for Adoption) (compared to version released for 45-day comments)
- Attachment A-2.1: ~Alternative format to Attachment A-2 (Proposed Sections for Adoption)~

The Attachments showing the specific proposed modifications to the text of the proposed regulation orders available for comment with this Notice are provided in the two formats denoted with the suffixes “-1,” “-1.1,” “-2,” and “-2.1.”

In the version denoted Attachments A-1 and A-2, the 45-Day Changes (proposed regulatory language as posted on December 19, 2023, are shown in “normal type.” The deletions and additions to the 45-Day Changes that comprise the 15-day Changes that are being made public and available for comment with this Notice are shown in ~~strikeout~~ to indicate deletions and underline to indication additions.

In the version denoted Attachments A-1.1 and A-2.1, the 15-Day Changes are provided in a tracked-changes format to meet the requirement for accessible electronic documents. The 45-Day Changes are incorporated into this version as plain, clean text because they are not being made available for public comment by this Notice. The Proposed 15-day Changes are shown in tracked changes and are made public with this Notice and available for comment. To review this document in a clean format, without underline or strikeout to show changes, that shows all the proposed regulations being considered for adoption, please select “Simple Markup” or “No Markup,” or accept all changes in Microsoft Word’s Review menu. You can also change the view to the initially proposed 45-Day Changes (originally proposed regulatory text prior to these proposed modifications) by selecting “Original” or rejecting all tracked changes. Additionally, “Advanced Track Changes Options” will allow for further options regarding color and other markings.

In the version denoted Attachment A-1.2, the existing, original regulatory language currently adopted into the California Code of Regulations (pre-45-Day Changes) is shown as plain, clean text, while the 45-Day Changes and the proposed 15-Day Changes are combined and shown in tracked changes. To review the net proposal in this document in a clean format (no underline or strikeout to show changes), please select “Simple Markup” or “No Markup” in Microsoft Word’s Review menu or accept all changes. You can also change the view to the original (originally proposed regulatory text prior to any proposed modifications, or 45-Day Changes) by selecting “Original” or rejecting all tracked changes. By progressing through the changes and comparing them with the 15-Day Changes, the public can see the net and stepwise changes being proposed in relation to existing law. Please refer to the versions denoted A-1 and A-2 to review the 15-Day Changes available for comment and its companion/alternate version A-1.1 and A-2.1 to view an accessible version showing the 15-Day Changes.

In the Final Statement of Reasons, staff will respond to all comments received on the record during the comment periods. The APA requires that staff respond to comments received regarding all noticed changes. Therefore, staff will only address comments received during this 15-day comment period that are responsive to this notice, documents added to the record, or the changes detailed in Attachments A-1.1 and A-2.1.

Summary of Proposed Modifications

Clarifications and error corrections were made to the Tier 1 calculators and Instruction Manuals in response to public comments.

The following summary does not include all modifications to correct typographical or grammatical errors, changes in numbering or formatting, nor does it include all of the non-substantive revisions made to improve clarity.

Modifications to Section 95481. Definitions and Acronyms.

1. In section 95481(a), staff proposes to add, delete, or modify a number of definitions, including but not limited to: “Alternative Jet Fuel,” “Feedstock First Collection Point,” “Feedstock First Gathering Point,” “Food Scraps,” “LCFS Data Management System,” “Organic Waste,” “Private LMD-FCI Charging Site,” “Private HD-FCI Charging Site,” “Private LMD-HRI Station,” “Private HD-HRI Station,” “Public LMD-FCI Charging Site,” “Public LMD-HRI Station,” “Recovered Organics,” “Renewable Diesel,” “Renewable Gasoline,” “Rural Area,” “Shared HD-FCI Charging Site,” “Shared HD-HRI Station,” and “Fossil Jet Fuel used for Intrastate Flight.”

Modifications to Section 95482. Fuels Subject to Regulation.

1. In section 95482(a), staff proposes to remove “Fossil Jet Fuel” from the list of transportation fuels that the LCFS applies to. Staff initially proposed to eliminate the LCFS exemption for fossil jet fuel as to intrastate fossil jet fuel. Staff estimated that the proposal would result in the generation of deficits for around 10% of fossil jet being used in California. Public commenters noted that the original proposal did not guarantee that airlines would procure and use alternative jet fuel as a compliance response to the deficits generated from fossil jet fuel. Aviation fuel suppliers who would generate deficits under the initial proposal could simply acquire credits to meet that compliance obligation. Staff remains committed to finding effective ways to reduce emissions from the aviation sector through the production and use of cleaner aviation fuels and other low-carbon alternatives to fossil jet fuel. CARB also recently released a [fact sheet](#) on partnering with federal and local agencies to address harmful air pollution at airports.
2. In section 95482(c), staff proposes to restore the existing exemption for all fossil jet fuel. This proposed modification is necessary to maintain consistency with the modification to subsection 95482(a) discussed above.
3. With the proposed addition of subsection 95482(h), staff proposes to remove LCFS credit generation eligibility for hydrogen produced using fossil gas as a feedstock, effective January 1, 2031. The 2022 Scoping Plan for Achieving Carbon Neutrality (2022 Scoping Plan Update)¹ identified a need for low-carbon, renewable hydrogen for the transportation sector (among other sectors) to displace fossil fuels in support of achieving the State’s greenhouse gas emission reduction goals. The 2022 Scoping Plan Update scenario did not include hydrogen produced from fossil fuels, with or without carbon capture as low-carbon, renewable hydrogen. Instead, it identified as low carbon and renewable hydrogen produced through steam methane reformation of biomethane,

¹ California Air Resources Board. 2022 Scoping Plan for Achieving Carbon Neutrality. November 16, 2022. https://ww2.arb.ca.gov/sites/default/files/2022-12/2022-sp_1.pdf

electrolysis, and biomass gasification. Staff is proposing to remove LCFS crediting eligibility for hydrogen produced from fossil fuels at the end of 2030 to align with the current operational timeline for projects funded under the hydrogen hubs grants, which will expand the supply of renewable hydrogen in California.²

4. With the proposed addition of subsection 95482(i), staff is proposing to provide credits for biomass-based diesel produced from virgin soybean oil and canola oil for up to 20 percent of annual biomass-based diesel reported on a company-wide basis. Biomass-based diesel from virgin soybean and canola oil in excess of 20 percent will be assessed the carbon intensity of the applicable diesel pool benchmark for that year, or the certified carbon intensity of the applicable fuel pathway; whichever is higher. California currently leads the nation in ZEV sales and stocks. As auto manufacturers comply with increasing ZEV sales requirements and as California prioritizes waste feedstocks and advanced decarbonization technologies, the State must ensure that other regions are able to also access increasing volumes of low-carbon alternative fuels. California expects that overall diesel demand will decline in the State over the coming decades due to the State's portfolio of ZEV and clean fuel policies. This proposed addition allows for California to displace up to 100% of the State's current fossil diesel demand with cleaner alternative diesel. The proposed addition also avoids sending a long-term signal for virgin soy or canola oil to serve California demand. For companies that already have a certified fuel pathway prior to the effective date of the amendments and for which the percentage of biomass-based diesel produced from virgin soybean oil or canola oil was greater than 20 percent of combined reported biodiesel and renewable diesel quantities for that company's 2023 LCFS reporting, this provision would take effect starting January 1, 2028, to provide time to adjust feedstock supply contracts as needed. All other companies would be subject to this requirement upon the effective date of the amended regulation.

Modifications to Section 95483. Fuels Reporting Entities.

1. In section 95483(a), staff proposes to remove fossil jet fuel from the list of liquid fuels. This proposed modification is necessary for consistency with the proposed modifications to subsections 95482(a) and 95482(c) discussed above.
2. In subsection 95483(a)(1)(C), staff proposes to remove the initially proposed narrower exemption for fossil jet fuel to be consistent with the proposal to restore the broader exemption in subsection 95482(c) discussed above.
3. In subsection 95483(c)(1), staff proposes modifications to allow the Executive Officer to assign a portion of base credits to Original Equipment Manufacturers (OEM) of electric vehicles, if model year 2024 ZEV sales for vehicle classifications subject to the Advanced Clean Cars regulation are less than 30 percent of new vehicle sales. Continued consumer facing support for the light duty vehicle sector is important to help achieve the state's air quality and climate goals as soon as possible. In subsection (c)(1)(B), staff proposes that the Executive Officer may direct up to 45 percent of base credits to OEMs. OEMs must spend base credit proceeds to support transportation electrification, including a number of eligible project types, such as rebates and incentives for individuals purchasing or leasing new or previously-owned EVs, installing

² ARCHES H2. *California's renewable hydrogen hub officially launches*. July 17, 2024. <https://archesh2.org/arches-officially-launches/>

EV infrastructure, marketing and outreach programs in California, or other projects approved based on specified regulatory criteria. Similar to the holdback equity requirements, OEMs may not spend more than 7% of total base credit funding on administrative costs. If the OEMs receive base credits, utilities will no longer be required to contribute to a Clean Fuel Reward program, and credits available for holdback equity projects are unaffected.

4. In subsection 95483(c)(1)(A)5., staff proposes to remove as unnecessary the specified date of January 1, 2025, for implementation of amendments to the holdback equity program requirements. Any proposed amendments to holdback equity program requirements adopted by CARB and approved by the Office of Administrative Law will be effective starting on the applicable effective date.
5. In subsection 95483(c)(1)(A)5.c., staff proposes to increase the percentage of administrative cost of holdback credit equity projects from 5% to 7%. This increase is necessary in order to ensure utilities have the sufficient staffing to expeditiously use holdback funds for equity purposes.
6. In subsection 95483(c)(1)(C)1.b., staff proposes to remove the demonstration requirement for generating incremental credits for smart charging. The required enrollment in an available Time of Use rate plan with the LSE serving the residence was designed to ensure fidelity for reporting purposes. But telemetries and other data collection methods that are now universally available for reporting to the smart charging pathway make the current requirement unnecessary.

Modifications to Section 95483.2. LCFS Data Management System.

1. In subsection 95483.2(b)(8)(B)6., staff proposes to correct the term “FSE” to “equipment” with regard to the registration requirements for electric forklifts, electric cargo handling equipment, electricity provided to ocean-going vessels at berth, and electric transport refrigeration units.

Modifications to Section 95484. Annual Carbon Intensity Benchmarks.

1. In section 95484(b)(2)(A), staff proposes to add the word “annual” as clarification that the deficit quantity relied upon as part of the auto adjustment mechanism trigger is a full year’s worth of deficits.
2. In sections 95484(d) through (f), staff proposes to modify the average carbon intensity benchmarks for gasoline and fuels used as a substitute for gasoline, diesel fuel and fuels used as a substitute for diesel fuel, and fuels used as a substitute for fossil jet fuel in Tables 1, 2, and 3, respectively, for various years. Specifically, staff is proposing to modify the near-term increase in stringency to a 9% CI reduction in 2025 from the 5% year-to-year increase included in the initial amendments proposal. Staff is proposing this increase in near-term ambition in light of the continued growth in low-carbon fuels and in response to stakeholder feedback requesting an increase in stringency to bring deficits and credits into balance. The compliance targets between 2025 and 2030 are adjusted in the 15-day modifications package to smooth the curve between the more ambitious 2025 compliance target and the originally-proposed 30% reduction in 2030, which staff are proposing to maintain. The proposed compliance target for 2025 will take effect for Quarter 1, 2025 reporting if the Proposed Amendments become effective prior to April 1, 2025, which marks the beginning of the Quarter 1 2025 reporting period. See

Attachment C to this notice for more discussion regarding the proposed compliance targets.

Modifications to Section 95486.1. Generating and Calculating Credits and Deficits Using Fuel Pathways.

1. In subsection 95486.1(a)(1), staff proposes to remove fossil jet fuel from the equation to calculate credits and deficits using fuel pathways. This proposed modification is necessary to maintain consistency with the modifications to subsections 95482(a) and (c) discussed above restoring the broader fossil jet fuel exemption.
2. In section 95486.1(a)(4), staff proposes to remove the pre-2011/post-2010 delineation for Fixed Guideway System crediting. This adjustment provides equal treatment to all fixed guideway systems for the purposes of LCFS crediting and improves LCFS support for transit services in California.
3. In section 95486.1(a), Table 5, staff proposes to update the EER values for electricity forklifts with lift capacity less than 12,000 pounds and hydrogen fuel cell forklifts with lift capacity less than 12,000 pounds. In 2010, the baseline year for the LCFS regulation, the population of forklifts with lift capacity less than 12,000 pounds was already one-half electrified. The proposed updated EER value for electricity forklifts with lift capacity less than 12,000 pounds takes into account both the electrified and non-electrified portions of that baseline forklift population. The revised EER takes the average of 1 (when comparing to electric forklifts) and the original EER of 3.8 (when comparing to combustion engine forklifts), and the analogous approach is applied to fuel cell forklifts.

Modifications to Section 95486.2. Generating and Calculating Credits for ZEV Fueling Infrastructure Pathways.

1. In subsection 95486.2(a)(1), staff proposes to sunset the application eligibility for HRI pathways. Applications for the HRI pathway will not be accepted once applications for the LMD-HRI and HD-HRI pathways are being accepted, starting with the effective date of the 2024 amendments.
2. In subsection 95486.2(a)(3)(A), staff proposes to modify the equation used to calculate whether HRI applications will continue to be approved, using data from the most recent quarter data are available, rather than the prior quarter. As credit generation occurs in the first quarter, is reported in the second quarter, and is issued in the third quarter, decisions in the third quarter are often made using first quarter data, not second quarter data.
3. In subsection 95486.2(a)(4)(E), staff proposes to clarify that an FSE must dispense hydrogen in a given quarter to generate HRI credits, consistent with the intent stated in the 2018 LCFS Final Statement of Reasons.
4. In subsection 95486.2(a)(6)(C), staff proposes to modify the reporting and recordkeeping requirements for HRI applications. Cost and Revenue data will be reported yearly, rather than quarterly, to reduce the reporting burden on HRI applicants without any loss of data.
5. In subsection 95486.2(a)(7), staff proposes to remove the section of the regulation describing the transition to light-duty hydrogen refueling infrastructure pathways. The proposed creation of section 95486.3 replaces this transition of the original HRI pathway

into light-duty HRI pathway. The original HRI pathway and proposed light- and medium-duty pathways will exist concurrently under the same 2.5 percent of deficits cap, as described in section 95486.3(a)(2).

6. In subsection 95486.2(b)(1)(B), staff proposes to sunset the application eligibility for FCI pathways. Applications for the FCI pathway will not be accepted once applications for the LMD-FCI and HD-FCI pathways are being accepted, starting the effective date of the 2024 amendments.
7. In subsection 95486.2(b)(1)(D), staff proposes to reduce the FSE minimum nameplate power rating to 50 kW. 50 kW chargers can more easily provide fast charging services in remote areas and other areas where the distribution system may currently bottleneck total available power for charging.
8. In subsection 95486.2(b)(3)(A), staff proposes to modify the condition for which FCI credits could generate credits. Limiting a single applicant to 20% of available credits ensures significant participation in the program by many applicants, allowing multiple technologies and business methods to benefit from the incentive.
9. In subsections 95486.2(b)(3)(B) and (C), staff proposes to modify the equation used to calculate whether FCI applications will continue to be approved, using data from the most recent quarter data are available, rather than the prior quarter. As credit generation occurs in the first quarter, is reported in the second quarter, and is issued in the third quarter, decisions in the third quarter are often made using first quarter data, not second quarter data.
10. In subsection 95486.2(b)(4)(F), staff proposes to clarify that an FSE must dispense electricity in a given quarter to generate FCI credits, consistent with the intent stated in the 2018 LCFS Final Statement of Reasons.
11. In subsection 95486.2(b)(6)(B), staff proposes to modify the reporting and recordkeeping requirements. Cost and Revenue data will be reported yearly, rather than quarterly, to reduce the reporting burden on FCI applicants without any loss of data.
12. In subsection 95486.2(b)(7), staff proposes to remove the section of the regulation describing the transition to light-duty fast charging infrastructure pathways. The proposed creation of section 95486.3 replaces this transition of the original FCI pathway into light-duty FCI pathway. The original FCI pathway and proposed light- and medium-duty pathways will exist concurrently under the same 2.5 percent of deficits cap, as described in section 95486.3(b)(2).

Modifications to Section 95486.3. Generating and Calculating Credits for ZEV Fueling Infrastructure Pathways for Light- and Medium-Duty Vehicles.

1. In section 95486.3(a), staff proposes to add a new section for HRI pathways for light- and medium-duty (LMD) hydrogen refueling stations. This section replaces previously proposed subsection 95486.2(a)(7) and includes the medium-duty portion of the previously proposed section “Medium- and Heavy-Duty Hydrogen Refueling Infrastructure (MHD-HRI) Pathways”. Combining the light- and medium-duty vehicles into a single HRI program simplifies credit calculation for the pathway and provides additional credit space for the heavy-duty vehicles in the HD-HRI program. The maximum HRI capacity of LMD-HRI stations is proposed to be increased to 2,000 kg/day in recognition of additional demand from medium-duty vehicles.

LMD-HRI stations are proposed to be categorized into public and private stations: public stations continue to be credited at one-half their HRI capacity, while private stations will be credited at one-quarter their HRI capacity. This provision allows private stations to participate in the program, while providing greater incentive to public stations, which likely face larger economic barriers to install and operate given that the refueling demand varies from day to day. Terminology is also updated throughout section 95486.3 to reflect the grouping of MD vehicles with the LD provision.

2. In section 95486.3(b), staff proposes to add a new section for FCI pathways for light- and medium-duty (LMD) charging sites. This section replaces previous proposed subsection 95486.2(b)(7) and includes the medium-duty portion of the previously proposed section “Medium- and Heavy-Duty Hydrogen Refueling Infrastructure (MHD-HRI) Pathways”. Combining the light- and medium-duty vehicles into a single FCI program simplifies credit calculation for the pathway and provides additional credit space for the heavy-duty vehicles in the HD-FCI program. The minimum nameplate capacity for LMD-FCI chargers is proposed to be returned to 50 kW to accommodate different charging demands from light- and medium-duty vehicles. LMD-FCI sites are proposed to be categorized into public and private sites: public stations continue to be credited at 20% of their FCI capacity, while private stations will be credited at 10% their FCI capacity. This provision allows private charging sites to participate in the program, while providing greater incentive to public sites for the same reason listed above for the LMD-HRI program.

Addition of Section 95486.4. Generating and Calculating Credits for ZEV Fueling Infrastructure Pathways for Heavy-Duty Vehicles.

1. In section 95486.4(a), staff proposes to modify the section for HRI pathways to apply exclusively to heavy-duty (HD) hydrogen refueling stations. This section was formerly numbered 95486.3(a) and included both medium- and heavy-duty (HD) hydrogen refueling stations. Several of the other proposed changes in section 95486.4 are designed to better-fit HD refueling needs, now that the MD vehicles are grouped with the LD provisions. Terminology is also updated throughout section 95486.4 to reflect the new grouping of MD vehicles with the LD provision.
2. In section 95486.4(a)(1), staff proposes to modify the HD-HRI pathway eligibility. The gross vehicle weight accessibility is raised to 14,001 lbs, as medium duty vehicles are now in a separate program. The distance requirement is limited to shared HD-HRI stations and extended to five miles from any ready or pending FHWA Alternative Fuel Corridor. Private stations’ distances to corridors are not relevant to the service they provide, while a distance of five miles from a corridor for shared stations provides adequate distance to ensure availability of utility services to stations while still supporting an easily-accessible hydrogen refueling network.
3. In section 95486.4(a)(3), staff proposes to modify the HD-HRI application approval process. Participation in the program by a single applicant is limited to 40% of the available credits, ensuring that multiple applicants can participate in the program. There are currently six participants in the HRI program.
4. In section 95486.4(a)(4), staff proposes to modify the requirements to generate HRI credits. Staff proposes to clarify in the regulation that only stations available to the public are subject to the accessibility requirements listed in section 95486.4(a)(4), and those stations must only accept fuel cards if the applicant accepts those same fuel

cards at other stations that they operate. Private and shared HD-HRI stations can decide the level of access and payment method that satisfies the service the private and shared HD-HRI stations provide. A shared HD-HRI station cannot be reserved for one HDV fleet for more than 12 hours each day, to ensure that private stations cannot be slightly adjusted to meet shared station requirements without meeting the intent of the shared station provisions. A fleet can continue to use the station after its reservation period is over, but not to the exclusion of other fleets sharing the site. An FSE must dispense hydrogen in a given quarter to generate HRI credits, consistent with the intent stated in the 2018 LCFS Final Statement of Reasons. The initial capital expenditure is specified to exclude on-site generation, land, working capital, and off-site facilities. The “Net CapEx” limit in this section is intended to reimburse the essential elements of a hydrogen refueling station.

5. In section 95486.4(b), staff proposes to modify the section for FCI pathways to apply exclusively to HD charging sites. This section was formerly numbered 95486.3(b) and included both MD and HD fast charging stations.
6. In section 95486.4(b)(1), staff proposes to modify the HD-FCI pathway eligibility. The gross vehicle weight accessibility is raised to 14,001 lbs, as medium duty vehicles are now in a separate program. The distance requirement is limited to shared HD-FCI sites and extended to five miles from any ready or pending FHWA Alternative Fuel Corridor. Private sites’ distances to corridors are not relevant to the service they provide, while a distance of five miles from a corridor for shared sites provides adequate distance to ensure availability of utility services to sites while still supporting the HD EV charging network.
7. In section 95486.4(b)(2), staff proposes to modify the HD-FCI application requirements. The limitation on number of chargers is removed, as the limit on total power is sufficient alone to ensure that FCI incentivization is spread across many sites. The total power is increased to 40 MW, as medium-duty vehicles are no longer grouped in this program and heavy-duty charging sites are anticipated to be of this size. Applicants may also use a smaller FCI power rating than the nameplate power capacity for pathway calculation to include more chargers in the program.
8. In section 95486.4(b)(3), staff proposes to modify the HD-FCI application approval process. Participation in the program by a single applicant is limited to 20% of the available credits, ensuring that multiple applicants can participate in the program. There are currently 33 participants in the FCI program.
9. In section 95486.4(b)(4), staff proposes to modify the requirements to generate FCI credits. Staff proposes to clarify in the regulation that only stations available to the public are subject to the accessibility requirements listed in section 95486.4(b)(4), and those stations must only accept fuel cards if the applicant accepts those same fuel cards at other stations that they operate. Private and shared HD-FCI stations can decide the level of access and payment method that satisfies the service the private and shared HD-FCI stations provide. A shared HD-FCI site cannot be reserved for one HDV fleet for more than 12 hours each day, to ensure that private sites cannot be slightly adjusted to meet shared station requirements without meeting the intent of the shared station provisions. A fleet can continue to use the site after its reservation period is over, but not to the exclusion of other fleets sharing the site. An FSE must dispense electricity in a given quarter to generate FCI credits, consistent with the intent stated in the 2018 LCFS Final Statement of Reasons. The initial capital expenditure is specified to exclude

on-site generation, land, working capital, and off-site facilities. The “Net CapEx” limit in this section is intended to reimburse the essential elements of a fast charging site.

Modifications to Section 95488. Entities Eligible to Apply for Fuel Pathways.

1. In subsection 95488(d), staff proposes to give the Executive Officer discretion to stop accepting applications for new fuel pathways for biomass-based diesel starting January 1, 2031, if the number of unique Class 3-8 ZEVs reported or registered with the sources listed exceeds 132,000 ZEVs or near-zero-emission-vehicles (NZEV) on December 31, 2029. This threshold was derived from the CARB Strategy for the State Implementation Plan and reflects full implementation of the State’s MHD ZEV regulations. The proposal does not phase out existing biomass-based diesel fuel pathways, which may still report under their previously-certified CIs.

Modifications to Section 95488.1. Fuel Pathway Classifications.

2. In subsection 95488.1(b)(1), staff proposes to remove Fossil Jet Fuel receiving a Lookup Table Pathway. This proposed modification is necessary for consistency with the proposed modifications to subsections 95482(a) and 95482(c) discussed above.
3. In subsection 95488.1(d)(4), staff proposes to add “alcohol to hydrocarbons” to the illustrative list of drop in fuels, in order to clarify that drop in fuels include hydrocarbon fuels (e.g., sustainable aviation fuel (SAF)) derived from alcohols. An alcohol to hydrocarbon pathway such as converting starch and cellulosic ethanol to jet fuel is one potential method of producing SAF.

Modifications to Section 95488.3. Calculation of Fuel Pathway Carbon Intensities.

1. In section 95488.3(b), staff proposes to specify a process by which the Executive Officer may correct the Tier 1 CI Calculators if necessary to conform the methodological consistency of the calculator to the CA-GREET4.0 model. This proposed change is necessary to facilitate modeling consistency and efficiency in the implementation of the simplified modeling tools.
2. In section 95488.3(d), Table 6, staff proposes to add specification of the geographic region to Table 6 identifying where land use change (LUC) carbon intensity was modeled for specific feedstock/fuel combinations. Table 6 LUC values were estimated through the GTAP and AEZ-EF modeling framework developed by CARB with input from an expert working group in 2010 and were updated during CARB’s re-adoption of the LCFS program in 2015. GTAP uses economic and trade data to model the land requirements—i.e., the amount of forest, pasture, and cropland converted—to meet an increase in biofuel demand. It estimates these market-mediated land conversions within a focal region (i.e., domestic LUC) and elsewhere (i.e., world-wide LUC), which are used as inputs for the AEZ-EF model to estimate the associated GHG emissions based on regional carbon stocks. LUC carbon intensity for feedstocks from regions other than the regions modeled may not be equivalent with the Table 6 values for those feedstocks shown. The LUC carbon intensity of a given crop feedstock may vary widely based on land use practices and local carbon stocks in the region where it is produced.

To reflect this variability, staff proposes to incorporate a mechanism to assign more conservative LUC carbon intensity values to feedstock/fuel combinations from regions with higher LUC risk. This proposal is informed by the increasing number of fuel pathway applications CARB has received involving crop-based feedstocks from regions

other than those previously modeled in 2015 that may not demonstrate equivalency with Table 6 values. Staff's proposal aims to provide more granularity to LUC carbon intensity values. For feedstock/fuel combinations from regions not listed in the updated Table 6, staff proposes to conduct an empirical assessment to determine a conservative LUC value based on historical land conversions for a given feedstock. The empirical/regional LUC carbon intensity of a given feedstock/fuel combination will be compared to its respective modeled/global LUC carbon intensity value in Table 6, and the more conservative value will be assigned, as regional LUC is a subset of total LUC.

Modifications to Section 95488.6. Tier 1 Fuel Pathway Application Requirements and Certification Process.

1. In subsection 95488.6(a)(3), staff proposes to reference sustainability requirements for fuel pathways utilizing biomass feedstocks or process energy. This proposed modification is necessary to support consistency with the proposed modifications to subsection 95488.9(g).

Modifications to Section 95488.7. Tier 2 Fuel Pathway Application Requirements and Certification Process.

1. In subsection 95488.7(a)(4), staff proposes to add a requirement to include documentation that sustainability requirements have been met for fuel pathways utilizing biomass feedstocks or process energy for applicable Tier 2 fuel pathway applications. This proposed modification is necessary to support consistency with the proposed modifications to subsection 95488.9(g).

Modifications to Section 95488.8. Fuel Pathway Application Requirements Applying to All Classifications.

1. In subsection 95488.8(g)(1)(A)3., staff proposes to include forest waste biomass feedstocks as a specified source feedstock. This provides greater specificity on feedstock eligibility requested by stakeholders and helps to promote forest waste biomass use from high-priority wildfire fuel reduction and forest restoration treatments.
2. In subsection 95488.8(g)(1)(A)4., staff proposes to clarify that only the organic portion of municipal solid waste diverted from landfill disposal is considered a specified source feedstock. Organic waste has always been the intent of this provision, and plastics to fuels are not incentivized by the program. Staff also proposes to delete text in the definitions that differentiated plastics from petroleum products. These two changes clarify that the plastic portion of MSW is treated as a fossil feedstock in any pathway analysis and ensures that plastics feedstocks from diverted waste are not incentivized for fuels.
3. In subsection 95488.8(i)(1)(A), staff proposes to remove unnecessary text related to hydrogen. The deleted text is unnecessary because the requirements for book-and-claim of low-CI electricity for hydrogen are covered in subsection (C).
4. In subsection 95488.8(i)(1)(C), staff proposes to add the word "electrolytic" to clarify the type of hydrogen production to which this subsection applies. Staff also proposes to harmonize the matching period for book-and-claim accounting for low-CI electricity for direct air capture projects or electrolytic hydrogen used as a transportation fuel, with the matching period for electricity used as a transportation fuel.

5. In subsection 95488.8(i)(2), staff proposes to modify deliverability requirements for book-and-claim accounting for biomethane. The modification adds a condition that if the Executive Officer approves a gas system map identifying interstate pipelines and their majority directional flow based on specified flow data by July 1, 2026, pathways for bio-CNG, bio-LNG, and bio-L-CNG combustion in vehicles would need to demonstrate physical flow to California after December 31, 2037.

Modifications to Section 95488.9. Special Circumstances for Fuel Pathway Applications.

1. In subsection 95488.9(f)(3)(A), for projects breaking ground before January 1, 2030, staff proposes to reduce the total number of crediting periods for avoided methane emissions crediting periods to two, rather than three. This proposed change aligns more closely with the end-dates for avoided methane pathways that break ground after December 31, 2029, which was proposed in the Staff Report³, while still providing an incentive to develop methane capture projects. The proposed modifications to the proposed credit true-up concept in subsection 95488.10(b) described below ensure sufficient return on investment for fuel pathways reporting using temporary fuel pathways during the pathway certification process.
2. In section 95488.9(g), staff proposes to add details to the proposal on biomass sustainability requirements. Staff proposes a phase-in approach for sustainability requirements that supports reducing any deforestation and other land conversion risks in the near term and increases the use of sustainably sourced biomass in the long term. In response to stakeholder requests for more specific definitions of sustainability criteria, staff propose criteria in subsections 95488.9(g)(1)(A) through (B). Third-party certification will still be required to demonstrate compliance with these criteria.

Staff proposes to require sustainability certification from point-of-origin up to the first gathering point which is now defined in section 95481(a). First gathering points may typically manage data for multiple farms or plots and staff proposes to focus on first gathering points as the point of regulation to make data collection and certification more feasible.

Proposed subsection 95488.9(g)(1)(A) encompasses the initial requirement from the 45-day proposal that crop- and forest-based feedstocks not be sourced on land that was forested after 2008. This requirement has been expanded to include protections for other carbon-rich and biodiverse ecosystems (e.g., native grasslands, wetlands) by requiring that all biomass used in fuel pathways be sourced from land that was cleared or cultivated prior to 2008. Staff's definition of biomass includes crop- and forestry-based feedstocks used for finished fuel or process energy. The other sustainability criteria outlined in subsection 95488.9(g)(1)(B) includes environmental best management practices that are included in many third-party certification schemes.

In response to stakeholder comments about the challenges of supply chain complexity, traceability, and certification requirements, staff proposes a phase-in approach to sustainability requirements as outlined in subsections 95488.9(g)(2) through (4). The first milestone beginning in 2026 is for fuel producers to collect and submit supply chain

³ California Air Resources Board, *Staff Report: Initial Statement of Reasons: Public Hearing to Consider the Proposed Amendments to the Low Carbon Fuel Standard*. December 19, 2023.
<https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2024/lcfs2024/isor.pdf>

data including spatial data of farm boundaries where feedstocks are sourced. Additionally, fuel producers must maintain an attestation letter signed by the fuel producer that assures feedstocks have not been sourced from lands that were converted after 2008.

The next milestone beginning in 2028 is for fuel producers to obtain third-party certification that, at a minimum, ensures feedstocks are not sourced on lands converted after 2008. Staff proposes that the list of certification schemes recognized by the European Union Renewable Energy Directive (EU RED), which contain no-deforestation/no-conversion requirements, be accepted for these purposes. Other certification schemes that meet the criteria listed in subsection 95488.9(g)(5) will also be considered for approval by the Executive Officer. The final milestone beginning in 2031 requires full sustainability certification of all biomass feedstocks or process energy by a third-party approved by the EO.

The proposed phase-in approach outlined above will be accompanied by matching consistency changes to recordkeeping and verification requirements in sections 95491.1 and 95501 respectively mentioned below.

Modifications to Section 95488.10. Maintaining Fuel Pathways.

1. In subsection 95488.10(a)(7), staff proposes modifications to the scope of the process when the verified operational CI is found to be greater than the certified CI of a fuel pathway, to specify that verified operational CIs that exceed the CI of temporary fuel pathways are subject to the same requirements and process as Tier1/Tier 2 fuel pathways, including credit invalidation and potential enforcement action.
2. In subsection 95488.10(b), staff proposes to expand the credit true up to include periods using temporary pathway CIs after annual verification. Staff received numerous comments from stakeholders highlighting the benefits of the credit true up of temporary fuel pathways. The proposal enables the eventual recovery of credits based on verified operational data, which may be especially beneficial for pathways which involve a large variation in the CI scores in the normal course of project operation. The modifications are expected to help streamline the application review process, alleviate or mitigate any business impacts associated with a delay in pathway certification and allows for recognition for the full amount of climate benefit of a fuel.

Modifications to Section 95489. Provisions for Petroleum-Based Fuels.

1. In section 95489(a), staff proposes to remove fossil jet fuel from the deficit calculation. This proposed modification is necessary for consistency with the proposed modifications to subsections 95482(a) and 95482(c) discussed above.
2. In section 95489(a), staff proposes to correct the California Baseline Crude Average and the Three-year California Crude Average carbon intensity values. This is a correction of errors in the 45-day package, and no new calculations have occurred.
3. In section 95489(a), staff proposes to update the Annual Crude Average carbon intensity value for 2022. This update is necessary to align the years for the annual crude average with the implementation timeline of these regulatory amendments.
4. In section 95489(b), staff proposes to remove fossil jet fuel from incremental deficits. This proposed modification is necessary for consistency with the proposed modifications to subsections 95482(a) and 95482(c) discussed above.

5. In section 95489(b), Table 9, staff proposes to modify the CI Lookup Table for Crude Oil Production and Transport. This is a correction of errors in the 45-day package, and no new calculations have occurred. This correction also aligns the years for the annual crude average with the implementation timeline of this regulatory amendment.
6. In section 95489(c)(1)(F), staff proposes to update the Emission Factor for the innovative crude credit calculation, aligning with the updated Emission Factors in proposed CA-GREET 4.0 model.
7. In subsection 95489(e)(1)(B), staff proposes to clarify that sequestration sites for CCS do not need to be on-site at the hydrogen production facility within the Refinery Investment Credit Program.
8. In subsection 95489(e)(1)(D)3., staff proposes to clarify that lower-CI process energy must be physically supplied to refineries within the Refinery Investment Credit Program. This is a clarification for eligible lower-CI process energy, and it is consistent with Section 95489(c)(1) in terms of the necessity of using process energy to be physically supplied to production facilities.

Modifications to Section 95491. Fuel Transactions and Compliance Reporting.

1. In section 95491(b)(2), staff proposes to define the process by which an entity that misses the quarterly reporting deadline may receive a percentage of the credits that would have been generated by a timely submission. Since this is a market program that needs timely data, an entity can only miss up to 3 days past the reporting deadline to receive any credits for the previous quarter.
2. In section 95491(d)(1), staff proposes to remove Fossil Jet Fuel from reporting requirements for the Quarterly Fuel Transaction Reports. This proposed modification is necessary for consistency with the proposed modifications to subsections 95482(a) and 95482(c) discussed above.
3. In subsection 95491(d)(3)(B)3., staff proposes to remove the requirement that entities reporting under a smart charging pathway retain records demonstrating that the fuel supply equipment was enrolled in a time of use rate plan during the reporting period, if offered by the load serving entity. This requirement is unnecessary and adds administrative burden to the smart-charging pathway, which has been underutilized since its adoption in 2018.
4. In subsection 95491(d)(3)(E), staff proposes to modify the reporting requirements for electric forklifts. The new metered reporting requirements are delayed to 2026 reporting to allow time for FSE owners to acquire metering equipment and implement metering procedures. Reporters can continue to use existing reporting methodologies for the 2025 reporting period.
5. In subsection 95491(e)(5)(A)4., staff proposes to add reporting requirements for OEMs receiving base credits. These reporting requirements are similar to reporting requirements under the holdback equity spending provisions, and require submission of a report documenting the monetary value of LCFS credit proceeds, detailed information about costs associated with each program, and a report of implemented projects.
6. In section 95491(h), Table 11, staff proposes to remove “Fossil Jet Fuel Blends” from the Quarterly and Annual Reporting Requirements checklist. This proposed modification

is necessary for consistency with the proposed modifications to subsections 95482(a) and 95482(c) discussed above.

7. In section 95491(h), Table 12, staff proposes to correct an error in the deadline for annual reports for Low-Complexity/Low-Energy-Use Refinery from the Annual Compliance Calendar.

Modifications to Section 95491.1. Recordkeeping and Auditing.

1. In subsection 95491.1(a)(2)(I), staff proposes to modify the record retention requirements for fuel pathway holders and applicants that utilize biomass feedstocks or process energy. This proposed modification is necessary to be consistent with the proposed modifications to subsection 95488.9(g).
2. In subsection 95491.1(c)(2), staff proposes to modify the monitoring plan requirements for fuel pathway holders and applicants that utilize biomass feedstocks or process energy. This proposed modification is necessary to be consistent with the proposed modifications to subsection 95488.9(g).
3. In section 95491.1(d), staff proposes to explicitly state that lack of a verification statement submitted by the deadline will result in Executive Officer investigation and possible enforcement action. Staff also proposes to clarify that the verification outcomes apply to all LCFS report types subject to verification.

Modifications to Section 95491.2. Measurement Accuracy and Data Provisions.

1. In subsection 95491.2(b)(2)(B), staff proposes to modify the missing data substitution methodologies to ensure that the methodologies in Table 13 are only used when they result in a reasonable or conservative data replacement; otherwise, an Executive Officer approved alternative method must be used.

Modifications to Section 95495. Authority to Suspend, Revoke, Modify, or Invalidate.

1. In subsection 95495(b)(2), staff proposes to use the term “LCFS data management system” rather than “LRT-CBTS” for sending a notice to a regulated party when determining a credit/deficit calculation, or that a certified CI is invalid. Determinations can be made for various reasons such that notifications may best align with different elements of the functionality designs for the LCFS data management system (AFP and LRT-CBTS). Therefore, it is most appropriate to specify the LCFS data management system instead of the LRT-CBTS.

Modifications to Section 95500. Requirements for Validation of Fuel Pathway Applications; and Verification of Annual Fuel Pathway Reports, Quarterly Fuel Transaction Reports, Crude Oil Quarterly and Annual Volume Reports, Project Reports, and Low-Complexity/Low-Energy-Use Refinery Reports.

1. In subsection 95500(c)(A), staff proposes to remove Fossil Jet Fuel used for intrastate flight for verification of quarterly fuel transaction reports applicability. This proposed modification is necessary for consistency with the proposed modifications to subsections 95482(a) and 95482(c) discussed above.
2. In subsection 95500(c)(F), staff proposes to remove redundant text regarding the requirement that fuel cell vehicle fueling for hydrogen produced from biomethane supplied using book-and-claim accounting be subject to quarterly fuels transactions verification.

Modifications to Section 95501. Requirements for Validation and Verification Services.

1. In subsection 95501(b)(4)(F), staff proposes to add biomass feedstocks or process energy to the verification services sampling plan requirements. CARB verifiers must include in their scope of verification services review of biomass feedstocks or process energy to be consistent with the proposed modifications under subsection 95488.9(g).
2. In subsection 95501(h), staff proposes to remove the condition that growth in total reported electricity reporting be less than 25% year to year to be eligible for less-intensive verification. This proposed change reflects the rapid anticipated growth in electric vehicle charging expected in California.

Modifications to Section 95503. Conflict of Interest Requirements for Verification Bodies and Verifiers.

1. In subsection 95503(b)(2)(A), staff proposes to modify the organizational and individual high potential conflict of interest conditions and expand the exclusion provision for high COI for verifiers who participate in other federal or state low carbon fuel programs. Accordingly, staff proposes to expand the inclusion provision for low COI. Over the past few years, low carbon fuel programs have been created for various states and federal agencies that have utilized, or plan on utilizing, third-party verifiers who have passed California's LCFS verifier accreditation training. For example, the U.S. Department of the Treasury, the State of Oregon, and the State of Washington are using LCFS verifiers for their programs. The regulation is proposed to be updated so that third-party verifiers who do auditing work for regulatory programs by other governmental agencies are not conflicted out and are still able to provide verification services for California's LCFS program.
2. In section 95503(c), staff proposes to modify the low conflict of interest conditions and expand the exclusion provision for high COI for verifiers who participate in other federal or state low carbon fuel programs. Accordingly, staff proposes to expand the inclusion provision for low COI. Over the past few years, low carbon fuel programs have been created for various states and federal agencies that have utilized, or plan on utilizing, third-party verifiers who have passed California's LCFS verifier accreditation training. For example, the U.S. Department of the Treasury, the State of Oregon, and the State of Washington are using LCFS verifiers for their programs. The regulation is proposed to be updated so that third-party verifiers who do auditing work for regulatory programs by other governmental agencies are not conflicted out and are still able to provide verification services for California's LCFS program.

In addition to the modifications described above, additional modifications correcting grammar, punctuation and spelling have been made throughout the proposed changes. These changes are nonsubstantive.

These modifications do not change implementation of the regulation in any way that change the conclusions of the environmental analysis included in the Staff Report because **the modifications consist of provision clarifications, minor revisions removing certain proposals, such as removing jet fuel as a required fuel, and updated modeling, which does not alter the compliance responses such that the significance determinations change.** These revisions have not shown any new, substantial environmental impacts, any substantial increases in the severity of an environmental impact, or any alternative or mitigation measure considerably different from those considered in the Draft EIA. Therefore,

no additional environmental analysis is required. Rather, the revisions update the project description, and in response to public comment, additional information has been added to the Draft EIA to analyze herd size as a compliance response and clarify the air quality and GHG analysis. As a result, CARB has determined this resulted in the addition of substantial new information compared to what was presented in the Draft EIA. Therefore, CARB has determined that recirculation of the project description and the air quality and GHG evaluations is warranted. CARB will be recirculating those sections and accepting new comments on only the portions of the Draft EIA included in this recirculation.

Additional Documents and Incorporated Document(s) Added to the Record

In the interest of completeness and in accordance with Government Code section 11347.1, subdivision (a), staff has also added to the rulemaking record and invites comments on the following additional documents.

These documents are available for inspection at the California Air Resources Board, 1001 I Street, Sacramento, California, 95814, between the hours of 9:00am to 4:00pm, Monday through Friday (excluding holidays). To inspect these documents please contact Chris Hopkins, Regulations Coordinator, at (279) 208-7347.

Agency Contacts

Inquiries concerning the substance of the proposed regulation may be directed to Dillon Miner, Staff Air Pollution Specialist, Alternative Fuels Section, at (279) 208-7437 or (designated back-up contact) Jordan Ramalingam, Manager, Alternative Fuels Section, at (916) 277-0499.

Public Comments

Written comments will only be accepted on the modifications identified in this Notice. Comments may be submitted by postal mail or by electronic submittal no later than the due date to the following:

Postal mail: Clerks' Office, California Air Resources Board
1001 I Street, Sacramento, California 95814

Electronic submittal: <https://ww2.arb.ca.gov/lispub/comm/bclist.php>

Please note that under the California Public Records Act (Gov. Code § 6250 et seq.), your written and verbal comments, attachments, and associated contact information (e.g., your address, phone, email, etc.) become part of the public record and can be released to the public upon request.

In order to be considered by the Executive Officer, comments must be directed to CARB in one of the two forms described above and received by CARB no later than the deadline date for public comment listed at the beginning of this notice. Only comments relating to the above-described modifications to the text of the regulations shall be considered by the Executive Officer.

If you need this document in an alternate format or another language, please contact the Clerks' Office at (916) 322-5594 or by facsimile at (916) 322-3928 no later than five (5)

business days from the release date of this notice. TTY/TDD/Speech to Speech users may dial 711 for the California Relay Service.

Si necesita este documento en un formato alterno u otro idioma, por favor llame a la oficina del Secretario del Consejo de Recursos Atmosféricos al (916) 322-5594 o envíe un fax al (916) 322-3928 no menos de cinco (5) días laborales a partir de la fecha del lanzamiento de este aviso. Para el Servicio Telefónico de California para Personas con Problemas Auditivos, ó de teléfonos TDD pueden marcar al 711.

Chair Liane M. Randolph
California Air Resources Board
1001 I Street
Sacramento, CA 95815

Comments of Powering America’s Commercial Transportation (“PACT”) on the Proposed Amendments to the Low Carbon Fuel Standard

Chair Randolph:

Powering America’s Commercial Transportation (“PACT”) appreciates the opportunity to provide comments in response to the California Air Resources Board (“CARB”) proposed 15-day changes to the Low Carbon Fuel Standard (“LCFS”) program, published August 12, 2024.

PACT stands ready to work with CARB and its sister agencies to support the industry in achieving the State’s Advanced Clean Trucks (“ACT”) and Advanced Clean Fleets (“ACF”) goals, through the accelerated rollout of M/HD fleets and its attendant infrastructure.

I. Introduction

PACT is encouraged to see CARB’s focus on medium- and heavy-duty (“M/HD”) charging, and its recognition of the unique nature of power, location, and site design of such charging stations. PACT strongly supports the creation of the MHD-FCI program and appreciates that the amended language reflects proposed changes that will serve to strengthen the program.

II. About PACT

PACT is a coalition dedicated to accelerating the development and deployment of reliable nationwide charging infrastructure for medium- and heavy-duty zero emission vehicles (“M/HD ZEVs”).¹ Our membership comprises stakeholders across the transportation electrification ecosystem, including leading truck manufacturers, charging infrastructure technology providers and developers, commercial fleets, fleet management companies, and utilities.² PACT is

¹ M/HD defined as...

² PACT membership comprises ABB E-mobility, Alpitronic, Amazon, BC Hydro, Burns & McDonnell, Chateau Energy Solutions, Daimler Truck North America, EV Realty, Forum Mobility, Geotab, Greenlane, InCharge, InductEV, J.B. Hunt Transport, Inc., Mortensen, Navistar Inc., Penske, Pilot Flying J, PittOhio, Prologis, Voltera, WattEV, Volvo Group North America, and Zeem Solutions.

committed to promoting productive cross-sector collaboration to advance policies and regulations that improve access to and reduce barriers for M/HD charging infrastructure.

PACT is engaged in multiple regulatory settings that have touchpoints to this LCFS rulemaking.

PACT's regulatory engagement includes:

- Party status to the California Public Utilities Commission ("CPUC") proceeding on the Rulemaking Regarding Transportation Electrification Policy and Infrastructure³ through which PACT submitted reply comments.⁴ Notably, utilities are responsible for implementing LCFS holdback credit programs which are the dual jurisdiction of CARB and the CPUC. PACT is exploring opportunities to provide LCFS strategy recommendations within this rulemaking, and envisions opportunities to further explore M/HD infrastructure investments.
- Party status to the CPUC proceeding on the Rulemaking to Establish Energization Timelines,⁵ through which PACT submitted opening and reply comments to the rulemaking,^{6,7} and opening comments⁸ on the Scoping Memo.⁹ PACT will also be submitting comments to the Proposed Decision to demonstrate continued engagement.¹⁰ Moreover, PACT is evaluating further engagement with state agencies, including with the California Energy Commission, on issues such as EV charging reliability and interoperability, as well as data collection (e.g., capacity mapping).

III. Summary of PACT's Comments on Proposed 45-Day Changes

PACT submitted comments during the 45-day period, encouraging CARB to improve the MHD-FCI provision of the LCFS program and maximize the potential benefits by:

³ Order Instituting Rulemaking Regarding Transportation Electrification Policy and Infrastructure (R. 23-12-008) Issued Dec. 20, 2023.

⁸ Opening Comments of PACT on the Assigned Commissioner's Scoping Memo and Ruling in the Order Instituting (Served and Filed May 3, 2024) <https://efile.cpuc.ca.gov/FPSS/0000206073/1.pdf>

⁹ Assigned Commissioner's Scoping Memo and Ruling (R. 24-01-19) Filed Mar. 28, 2024.

¹⁰ Proposed Decision Establishing Target Energization Time Periods and Procedure for Customers to Report Energization Delays (R. 24-01-18) Issued Aug. 12 2024.

<https://docs.cpuc.ca.gov/PublishedDocs/Efile/G000/M537/K633/537633346.PDF>

- ***Increasing the overall size of the MHD-FCI program.*** PACT recommended that the program be adjusted to increase the cap from 2.5% of previous quarter deficits to a minimum of 5% of previous quarter deficits and to provide equal treatment for public and private charging infrastructure.
- ***Expanding opportunities for utilities to use holdback credits for M/HD investments.*** PACT supported the staff proposal to expand LCFS rebates for drayage vehicles to include other M/HD or off-road vehicles and investments in grid-side distribution infrastructure and the staff proposal to require that at least 75% of such credits be invested in transportation electrification.
- ***Eliminating the geographical restrictions for crediting eligibility.*** PACT recommended that the 1-mile requirement be removed from the MHD-FCI program. PACT noted that should the Board find this proposal unacceptable, adjusting the requirement to 5 miles would be sufficient.
- ***Eliminating the FSE cap.*** PACT recommended eliminating the 10 FSE-per site cap in order to promote market flexibility and innovation.
- ***Adjusting the minimum nameplate power rating.*** PACT recommended removing the minimum nameplate rating to promote market flexibility and better align with existing and future business operations. PACT noted that should the Board find this proposal unacceptable, lowering the minimum requirement to 150 kW would be sufficient.

IV. Comments on Proposed 15-Day Changes

PACT appreciates that CARB has duly considered and incorporated several of the adjustments proposed in our 45-day comments, specifically:

- 088.1 ● ***Adjusting the geographical restrictions for crediting eligibility.*** PACT appreciates CARB's decision to adjust the distance requirement for HD-FCI sites. PACT is receptive to CARB's rationale that a distance of five miles from an FHWA Alternative Fuel Corridor for shared sites is relevant to the service these sites are intended to provide and that this is an adequate distance to ensure availability of utility services to sites while still supporting the HD EV charging network. Further, PACT appreciates CARB's decision to limit the distance requirement to shared HD-FCI thereby awarding developers and fleets the flexibility to select locations that accommodate their unique business needs
- 088.2 ● ***Eliminating the FSE cap.*** PACT is pleased to see that CARB has eliminated the 10 FSE-per site cap. This adjustment will promote market flexibility and innovation.
- 088.3 ● ***Adjusting the minimum nameplate power rating.*** PACT appreciates the adjustments that CARB has made regarding power requirements. Specifically, PACT supports CARB's decision to remove the limitation on the number of chargers and supplement that with a site-wide power cap. PACT supports the increase to 40 MW total power per-site and the flexibility for applicants to use a smaller FCI power rating than the power capacity for pathway calculation to include more chargers in the program. These amendments will

ensure, as CARB notes, that HD-FCI is incentivized across many sites and that individual sites can be designed in a manner that reflects the needs of the customer(s) they are built for or anticipate serving.

- 088.4
- **Updated definition of “rural.”** PACT supports CARB’s adjusted definition of “rural.” While the updated definition does not reflect the specific changes presented by CalETC and endorsed by PACT,^{11, 12} this revised definition is improved from the language that was originally proposed. PACT reiterates that this revised definition will create more opportunities for potential equity benefits as M/HD ZEVs operate in a variety of communities—not just urban areas—depending on the vehicle use case. In addition to potentially building a stronger alignment with the state’s overarching disadvantaged communities policies, this broader definition of “rural” may provide more “territorial” flexibility to the Electrical Distribution Utilities (“EDUs”) to use holdback credits (to invest in, for example, grid-side distribution infrastructure for M/HD ZEVs) in the areas where the EDUs anticipate the potential for the greatest equity impact.

088.5

PACT continues to support CARB’s decisions regarding holdback credits investments in M/HD ZEVs. This expanded list will encourage wider and more diverse utility investments in the transportation electrification sector. With respect to M/HD fleets and infrastructure, PACT continues to support the staff proposal to expand LCFS rebates for drayage vehicles to include other M/HD or off-road vehicles and investments in grid-side distribution infrastructure. PACT also continues to support the staff proposal to require that at least 75% of such credits be invested in transportation electrification.

PACT strongly supports several of the updates CARB is proposing in this 15-day comment period, and appreciates the responsiveness to PACT’s comments.

088.6

PACT continues to encourage CARB to consider increasing the overall size for the HD-FCI program. Specifically, PACT continues to encourage CARB to consider increasing the HD-FCI program cap from 2.5% of previous quarter deficits to a minimum of 5% of previous quarter deficits.¹³ As noted by the Joint MHD EV Infrastructure Parties, the 2.5% cap would not support the modest load projection of 2,900 MW of M/HD charging estimated by 2025. To meet California’s ambitious targets, fleets and FSE providers will need certainty that the available incentives will adequately scale to support the deployment of sufficient infrastructure. Increasing the cap will act as a means to further incentivize the buildout of infrastructure needed to support future M/HD ZEV adoption.

¹¹ CalETC, SUPPORT Proposed Amendments to the Low Carbon Fuel Standard Regulation, page 7

¹² Comments of Powering America’s Commercial Transportation (“PACT”) on the Proposed Amendments to the Low Carbon Fuel Standard, page 6

¹³ Comments of Powering America’s Commercial Transportation (“PACT”) on the Proposed Amendments to the Low Carbon Fuel Standard, page 4. Additional parties expressing support include Joint M/HD EV Infrastructure Parties, NRDC, Voltera.

088.7

Additionally, PACT continues to encourage CARB to consider creating credit parity between private and public infrastructure investments by equalizing the credits earned for both private refueling infrastructure and public refueling infrastructure, per charging station. To meet California's regulatory mandates, trucks refueling at private depots and trucks refueling at public stations will both need the necessary infrastructure to continue operations. Furthermore, with respect to meeting regulatory and air quality targets, the benefits provided by electric trucks do not depend on whether the charging infrastructure used is public or private. Whereas lowering credit eligibility for private charging would ultimately hamper California's ability to meet its own regulatory targets, establishing this suggested parity will help set uniform market signals, which in turn will better help achieve these goals. Additionally, offering equal crediting eligibility for private as public charging will bring the LCFS more in line with current operational needs, which are diverse across the M/HD sectors, and vary across many use cases and business needs. Equal treatment for public and private charging infrastructure will expand the anticipated climate and revenue benefits of the LCFS program and incentivize maximum participation.

V. Conclusion

PACT appreciates CARB's updates and its demonstrated commitment to considering public feedback. PACT stands ready to work with CARB on this and other matters.

Sincerely,
PACT

Subject Obligating jet fuel in the LCFS does not necessarily risk federal preemption

Comment

089.1

These new proposed amendments no longer obligate jet fuel as part of the low carbon fuel standard, a change from the original proposal to include jet fuel burned in flights that take off and land in California.

A subtext of this decision is that there is a risk of litigation due to possible federal preemption. As I blogged yesterday on Legal Planet

(<https://legal-planet.org/2024/08/26/california-pulls-back-on-sustainable-aviation-fuels/>), the airline industry has asserted that California is wholly preempted by various federal laws from mandating any sort of decarbonization of jet fuel.

But the industry overstates the risk of preemption, as a forthcoming CLEE legal analysis will document. There are three federal statutes at issue when it comes to aviation and federal preemption, which our report will detail. Despite their existence, California still has runway (ahem) to regulate jet fuel.

First, the Clean Air Act governs regulation of airplane engines and associated emissions. But in this case, California would not require airlines to change their engines or meet specific emissions standards. Instead, the low carbon fuel standard solely regulates the fuels as inputs. And when low-carbon biofuels blend with fossil jet fuel (the most common type of sustainable aviation fuel), no engine modifications are necessarily required.

Second, the Airline Deregulation Act prevents states and local governments from interfering with the national aviation market, if they take action "related to" prices, routes and services. A

mandate for blending lower-carbon fuels into fossil jet is on its face not "related" to these specific economic features of a national aviation market. But if the fuels requirement became stringent enough to significantly affect the prices consumers pay or where airlines schedule refueling or routes, there is likely an outer limit to what California can require on fuels without risking preemption. As a result, the board would need to craft the regulation carefully to avoid these significant impacts.

Finally, the Federal Aviation Act could preempt state laws on jet fuel if the agency set forth national requirements for low-carbon jet fuel, but to date it has not yet finalized any such rule. And in that absence, California has leeway to regulate.

(And if the concern relates to a separate potential challenge based on the "dormant" commerce clause of the U.S. constitution, where state action creates an unjustified and significant barrier to free trade among states, such a challenge to the low carbon fuel standard program was already rejected by the Ninth Circuit in 2019, with the US Supreme Court declining to review.)

The Air Resources Board's recent change in policy matters because aviation is arguably the hardest-to-decarbonize sector in our economy, and policy could help jumpstart solutions. No single technology otherwise currently exists to cover all of our aviation needs in the long term, despite progress on batteries, hydrogen, and potentially "e-fuels," which combine captured carbon with zero-emission hydrogen to create a synthetic, carbon-neutral fuel that can combust in current engines just like fossil fuel.

So in the short run, the Air Resources Board has an opportunity to

require airlines to blend in more low-carbon biofuels with fossil jet fuel, lowering the carbon content while sending a clear policy signal to the industry that research and investment must begin now on these longer-term solutions. This is what Governor Newsom required when he directed the Board in 2022 to "adopt an aggressive 20% clean fuels target for the aviation sector."

With its low carbon fuel standard, California is well positioned not just to offer more carrots to the airline industry to achieve these targets, but an actual stick to ensure compliance. At the same time, a legal pathway to achieve this goal and avoid preemption remains open, as our forthcoming report will discuss in more detail. Instead, by reversing course with this decision, the state now risks a delayed departure when it comes to more sustainable air travel.

Comments

Before the California Air Resources Board

on the

Proposed 15 day Amendments to the Low Carbon Fuel Standard Regulation

The Engine Technology Forum (“ETF”) is an educational association in the Washington DC area representing engine and equipment makers, fuel producers and suppliers. Members of ETF are leaders in advanced internal combustion engines, vehicles and equipment and their components as well as petroleum and renewable fuels. More information about us is available at www.enginetechforum.org.

We appreciate the opportunity to file these comments regarding the above captioned matter affecting the Low Carbon Fuel Standard (LCFS). As these comments were prepared under the extraordinary time constraints imposed by CARB, they are thus limited in scope and detail.

090.1 Given the complexity and substantial alteration of the original 45-day proposal late in this rulemaking process, CARB should provide for a minimum of an additional 15-day comment period. The current 15 day comment period effectively denies the public adequate opportunity to develop meaningful comments *and* reasonably assess the new and extensive proposals, including the proposed cap on the use of soy and canola oils and the proposed 2031 prohibition on hydrogen produced from fossil gas feedstocks. This could substantially impact the availability of hydrogen for use in both fuel cells and heavy-duty internal combustion engines.

CARB’s climate change goals are aggressive in both the level of reduction of greenhouse gases and accelerated time frame. The state is explicit in its view and policies that envision and effectively dictate nearly the entire transportation sector shifting from the use of internal combustion engines (ICE) and liquid and gaseous fuels to electrification.

Internal combustion engines (ICEs) running on gasoline, diesel or natural gas are the dominant power behind California’s economy today and are expected to continue to serve trucking and other sectors as the majority fuel type for decades to come, even as the state implements its policies that seek to transition only to zero emission vehicles (ZEVs). Even if most vehicles do shift to electric, there will be many heavy-duty vocational applications that will not transition to BEVs for a long time, if at all.

Asevidenced by consumer response, delaying, or downgrading electric vehicle investments and deferring introduction of new models announced by a number of vehicle manufacturers, the pace of electrification of the transportation sector (light, medium and heavy-duty vehicles) is proving to be uneven and uncertain. This elevates the importance and significance of having an effective and affordable low carbon fuels policy available for all sectors.

By most measures, California’s low carbon fuel program has been a success in reducing carbon emissions from the transportation sector through gradually reducing carbon intensity of the fuel pool. However, the proposed feedstock caps and “sustainability guardrails” on biofuel production impart a greater burden than benefit to Californians. Renewable fuel producers, petroleum

suppliers and fleets that must rely on ICEs using low carbon fuels to comply with the spirit of California's ZEV/near-ZEV transition will be most impacted.

The use of low carbon renewable fuels across this vast population of vehicles has contributed substantially to California's progress and current success in reducing greenhouse gas emissions. According to CARB's own data ([See](#) Figure 1, LCFS Dashboard), the program in its present form is exceeding expectations in reducing carbon intensity from transportation fuels.

However, these proposed amendments seem certain to deter further progress from renewable fuel producers and their suppliers while undermining the viability of transportation fuel providers. and driving up the cost of producing and supplying California's unique transportation fuels.

The proposed amendments disrupt the predictable and orderly transition of the fuels industry in a way that unnecessarily increases costs to the economy and discourages investment in renewable low carbon fuels. In its present form, it discourages improvements that could help California accelerate achievement of the continued progress toward the state's climate goals, and through its leadership, the contribution of other states in helping to achieve national climate goals.

The proposed amendments' increased stringency and diminished compliance tools will likely compromise technology neutrality by the elimination of pure market signals that incentivize the production of lower-CI fuels.

090.2

Acceleration of reduction in carbon intensity (CI) from 20% to 30% by 2030 with a 9% reduction for 2025.

On the one hand, the accelerated CI reduction would appear to support greater investment by renewable fuel producers. However, when combined with the proposed feedstock caps (see II below) raises concerns about the ultimate impact of the amendments on costs and adequate supply of low carbon fuels into the transportation fuel pool. It also seems to unfairly diminish the potential for ICEs using low carbon fuels against other decarbonization strategies.

We urge CARB to weigh the ability to implement more aggressive CI reduction targets with the actual feasibility of achieving them considering the proposed caps on soy and canola feedstocks as noted below.

090.3

ARB proposes to cap LCFS credits at 20 percent for biomass based diesel produced from soy and canola oils (Section 95482 (i)).

These caps on LCFS credits unfairly disadvantage biodiesel and renewable diesel fuel; the only viable, large-scale cost effective alternatives for the most difficult to decarbonize sectors like heavy-duty vocational trucks, off road equipment and marine and rail. [According](#) to CARB, biodiesel, and renewable diesel now account for 73% of California's diesel pool.

The proposed credit caps on biomass-based diesel produced from soy and canola oils inserts CARB influence into an otherwise market-driven approach. The net result is likely to be arbitrarily limiting the use of these more accessible and affordable feedstocks (soy and canola). According to the American Soybean Association, biofuel sourced from soybean and canola oil accounted for about 30% of the renewable diesel used in California in the first quarter of 2024.

CARB has not provided an ample explanation as to why a cap is needed. According to CARB's own estimate, under the more aggressive proposed CI reduction target, soybean oil based biofuel will become a deficit generating fuel as early as 2033. If instituted, the Automatic Adjustment Mechanism (AAM) soybean oil based biofuel will become a deficit generating fuel as early as 2030. An arbitrary cap is not needed as the program is designed to transition away from biofuels made from soybean oil.

In addition, the anticipated transition from the federal blender's tax credit to the clean fuel production credit will provide further financial incentives to expand the supply of waste-based biofuels. Reduced availability of tax credits for domestic produced soy and canola based biofuels will send a strong market signal to invest in waste-based biofuels as soon as early 2025.

There are likely to be unintended consequences of the proposed amendments. First, a time differentiation at this time between primary oilseed crops and oilseed crops of renewable biomass cultivated as an intermediate crop is needed. As an example, growers are already cultivating winter canola that is planted as an intermediate crop and not a primary crop. Intermediate crops, including winter canola provide lower carbon feedstocks to produce renewable biofuels and should not be subject to a cap. Second, by capping the LCFS credits for soy and canola at 20%, this may discourage investments in producing both biodiesel and renewable diesel fuel more sustainably. Given the close linkage of renewable diesel (feedstocks and production) with sustainable aviation fuel (SAF), it may also have the perverse effect of negatively impacting the cost of (SAF) if renewable diesel production is negatively impacted by the new limits.

Unfortunately, this truncated timeline prevents a more thorough and thoughtful analysis of these and other potential consequences of the proposed amendments.

ICEs will continue to play a dominant role in California and the US for decades to come and providing more time to assess the role of renewable fuels in reducing emissions is prudent as the state struggles with delays in meaningful penetration of ZEVs among the state's commercial fleet.

Thank you for the opportunity to provide these comments.

RE: Public Comment on Proposed Amendments to the Low Carbon Fuel Standards – 15 Day Public Notice

Executive Officer Cliff,

The undersigned organizations are writing to provide comments in response to the 15-day public notice for the proposed amendments to the Low Carbon Fuel Standards (LCFS). We appreciate the opportunity to offer our perspective on these amendments, particularly as they pertain to the treatment of forest biomass as a feedstock for low carbon fuels as provided in Title 17, CCR Sections 95488.8 and 95488.9, respectively. We have significant concerns regarding the proposed definitions and exclusions within the regulatory language.

091.1 **Narrowing of Feedstock Availability**

The proposed definitions notably narrow the scope of feedstock material availability by excluding industrial lands, which remain undefined, and limiting the sources of material to those derived solely from fuel reduction or restoration projects. These terms, "fuel reduction" and "restoration projects," are themselves undefined, further complicating their application. By excluding other silvicultural treatments, the proposed language unnecessarily restricts the types of forest management practices that can contribute to low carbon fuel production.

091.2 **Lack of Clear Definitions for "Non-Industrial" and "Industrial" Forestlands**

The absence of a definition for "non-industrial forestland" in the proposed amendments creates ambiguity, which conversely leaves all other sectors forestlands across the state undefined as well. Without a clear understanding of which lands would be considered "non-industrial", other public, private, NGO, or tribal landowners and managers do not have the ability to determine if material generated from these landscapes could also be considered acceptable feedstock. The lack of a clear definition hinders stakeholders' ability to understand and comply with the regulations, potentially leading to inconsistent application and enforcement.

091.3 **Limitation on Treatment Type**

Beyond the challenge of simply allowing participation to an undefined cohort of "non-industrial" forest landowners, additional challenges are brought forth by limiting the types of allowable forest treatments where feedstock could be derived. It is unclear whether the term "reduce risk" would encompass the broad suite of treatments being pursued across the landscape as we work toward achieving the established million-acre strategy, or only some subset of treatments that are considered risk reduction treatments. This ambiguity will further limit feedstock availability, notwithstanding the previous confusion cited due to the reference to nonindustrial landowners, despite a projects potential role in reducing wildfire risk and/or hazard.

091.4 **Exclusion of Timberlands from Wildfire Risk Reduction Efforts**

While the Initial Statement of Reasons suggests that these standards are intended to reduce wildfire risk, the exclusion of large portions of timberlands where innovative solutions could be employed contradicts this objective. Timberlands, especially those prone to wildfires, present a significant opportunity for the use of biomass feedstock, which could contribute to both fire hazard reduction and low carbon fuel production.

Misalignment with Deforestation and Conversion Concerns

The Initial Statement of Reasons also cites the need to avoid deforestation and land conversion as a justification for the proposed standards. However, lands excluded by these

amendments are primarily “timberland” (Ref. PRC section 4527) and are governed by the California Forest Practice Act and Rules. This regulatory framework ensures that timberlands cannot be deforested, as they must be restocked or meet stringent stocking standards following commercial activities or treatments. Excluding these lands from the scope of the LCFS program overlooks their potential contribution to low carbon fuel production while maintaining environmental sustainability.

Sustainable Management and Regulatory Oversight

The timberlands in question are managed sustainably under strict regulatory requirements. Excluding these lands from the scope of the LCFS amendments overlooks their potential contribution to low carbon fuel production while maintaining environmental sustainability.

091.5

Confusion Regarding Third-Party Certification Requirements

The Initial Statement of Reasons, along with the proposed amendments provided in the 15-Day rule text lack clarity on whether woody feedstocks must originate from lands that are third-party certified. Conflicting language within the rulemaking documents raises concerns about whether non-industrial landowners, who are less likely to hold third-party certifications, would be excluded from participating in the program. If this is the case, constriction on availability of feedstocks and reduce participation from non-industrial landowners would be a certainty given that very few non-industrial timberland owners hold and maintain third party certification.

091.4 cont

Conflict with the Governor’s Wildfire and Fire Resilience Task Force Goals

Finally, the proposed amendments appear to conflict with the goals of the Governor’s Wildfire and Fire Resilience Task Force, which seeks to find ways to utilize low-value materials from timberlands to reduce wildfire threats. By excluding significant portions of timberlands, the proposed amendments undermine efforts to address the critical issue of wildfire risk through the utilization of biomass feedstocks.

In conclusion, we urge the California Air Resources Board to reconsider the proposed amendments to the Low Carbon Fuel Standards in light of these concerns. The inclusion of industrial timberlands, clearer definitions, and a more inclusive approach to feedstock sourcing will be essential to achieving the dual goals of reducing wildfire hazard and promoting sustainable low carbon fuel production. Without careful consideration and addressing of these above concerns, these regulations would severely hinder the development of the necessary innovative infrastructure that may represent the scale of outlets for forest material that contribute to wildfire hazard across the state, thereby perpetuating the cycle of extraordinarily destructive impacts from wildfire, and continually contributing to airshed impacts across the state and beyond.

091.2 cont A recommended approach to taking a more inclusive approach to woody feedstock procurement to support Low Carbon Fuel would be to include the below recommended definition within Title 17, CCR 95488.8(g)(1)(A)3.

“Forest Biomass Waste” means residues that are 1) removed for wildfire mitigation, forest restoration projects, or the protection of public safety, or 2) small-diameter, non-merchantable residues, limited to forest understory vegetation, ladder fuels, limbs, branches, and logs that do not meet regional minimum marketable standards for processing into wood products.”

We appreciate the consideration of these comments and look forward to working with the California Air Resources Board on developing an LCFS program that will assist in ameliorating the wildfire and forest health issues within California.

Re: Support for California Air Resources Board Proposal to Retain Jet Fuel Exemption in Low Carbon Fuel Standard Program

093.1

In response to the revised Proposed Low Carbon Fuel Standard Amendments posted August 12th, 2024, we are writing to share our support for the recent California Air Resources Board (CARB) proposal to retain the jet fuel exemption under its Low Carb Fuel Standard (LCFS) Program. Delta Air Lines supports the withdrawal of the proposal to eliminate the jet fuel exemption and retain the existing opt-in approach for SAF under the CARB LCFS Program.

Delta is committed to reducing its climate impact and achieving net zero carbon emissions by 2050, and transitioning to SAF is core to this commitment. We have long recognized that scaling up the supply of SAF and achieving net-zero carbon emissions by 2050 can only happen by working collaboratively with governments and other stakeholders across sectors. Achieving this ambition for SAF will require new and additional policy incentives, streamlined permitting processes, and close collaboration among governments, the aviation industry, the fuels industry, environmental organizations, and others.

Aviation accounts for 2.6% of the U.S. greenhouse gas emissions but 5% of U.S. Gross Domestic Product (GDP) and 4.1% of California's GDP, thus exerting outsize economic impact relative to its share of emissions. U.S. civil aviation firms employ more than 380,000 California-based employees, with an overall economic impact of \$194 billion.¹ Aviation is critical to driving California's economy and its rank as the 5th largest economy in the world, enabling \$114 billion in annual trade flows and underpinning many of California's other significant economic drivers such as agriculture, tourism, manufacturing, banking, technology and small business.

California has established itself as an early leader in attracting investment, production, and use of SAF through the existing LCFS Program, which provides an opt-in credit for SAF that helps reduce the price difference between SAF and conventional jet fuel. Ensuring a healthy and vibrant aviation industry is essential to California's future, and leveraging CARB's early leadership on

¹ [The Economic Impact of Civil Aviation on the U.S. Economy, State Supplement, US Department of Transportation, November 2020](#)

SAF can enable California leadership in the emerging SAF production industry, creating new jobs and economic development opportunities.

In its April 10th, 2024 workshop, CARB re-stated that a principal objective of its regulatory proposal is to “Increase the use of alternative jet fuel in the State”. We share that objective as reflected in our company’s goals of utilizing 10% SAF by the end of 2030, meeting our SBTi medium term carbon intensity improvement target by 2035 and achieving net zero carbon emissions by 2050. Of course, as part of the US airline industry we also support the US government’s SAF Grand Challenge. Since 2019, we have executed numerous SAF offtake agreements, both short- and long-term, to help us achieve these goals. Delta and our fellow airlines have clearly demonstrated a strong, enduring market signal for affordable SAF. The challenge remains the supply of affordable SAF, not the absence of a market signal by airlines. We strongly believe that maintaining the existing exemption for jet fuel along with the opt-in model for SAF provides a strong foundation to achieve our mutual objectives.

The primary impediment to increased SAF production and availability in California remains the higher cost of SAF for producers and buyers relative to conventional jet fuel and renewable diesel. Whether or not jet fuel becomes a deficit generating fuel has no direct impact on whether SAF is produced or used. Eliminating the exemption on jet fuel would have no material impact on the availability or use of alternative jet fuel in California.

Our mutual interest is to increase SAF production, availability, and use, and the most effective way to accomplish this is to continue the positive, collaborative approach represented by the existing “opt-in” mechanism developed by CARB and the aviation community. We support CARB’s decision to withdraw the proposal to remove the exemption for jet fuel for intrastate flights, preserve the existing opt-in approach for SAF. We look forward to the opportunity to work with CARB and other stakeholders across the SAF ecosystem to explore solutions which build on the existing opt-in model of the LCFS Program. We recommend that CARB establish a joint CARB-industry working group with stakeholders across the emerging SAF ecosystem to explore alternative policy and voluntary proposals to rapidly increase SAF production, availability and use in California. We look forward to working with CARB on such measures to accelerate SAF deployment.

Sincerely,

**Re: SJI Renewable Energy Venture's Comments on the Low Carbon Fuel Standard (LCFS)
15-Day Amendments**

Dear Mr. Botill:

SJI Renewable Energy Ventures focuses on clean energy development and decarbonization via renewable energy production and energy management activities. Through these activities, we are committed to the nation's transition to a carbon-free economy and, accordingly, has developed a comprehensive clean energy plan that includes being a leader in the development of dairy digester projects in the United States. SJI works closely with the Environmental Protection Agency (EPA), California Air Resources Board (CARB), local dairy farmers, utilities, and surrounding communities to directly reduce greenhouse gas (GHG) emissions.

SJI Renewable Energy Ventures thanks CARB for the opportunity to take part in the many workshops and conversations during the development of the Proposed Amendments (Proposed Rule) and the Initial Statement of Reasons (ISOR). We respectfully submit the following comments on the 15-Day Amendments. Through the enhancement of the program's goals, CARB will be best suited to address GHG reductions from transportation fuels. The following comments will focus on increased program ambition and deliverability.

Increased Program Ambition

- 094.1 SJI Renewable Energy Ventures appreciates CARB's change from 5% to a more aggressive 9% stepdown in the 15-day package. This should move should help alleviate the current over supply in the credit bank. As mentioned in previous comments, stronger CI reduction targets is an essential element to driving down GHG emissions. Given the current LCFS credit surplus, seen over the last few years, we respectfully suggest an even larger step-down in the carbon intensity benchmark. This is critical to signal market support and increase investments.
- 094.2 Additionally, we respectfully recommend that CARB target at least a 35% CI reduction by 2030 and allow for the Auto Acceleration Mechanism (AAM) to be triggered based on 2025 data.
- 094.3

Deliverability Requirements

Book-and-Claim has allowed the LCFS to become one of the most successful decarbonization programs in the country. California has benefitted from the use of indirect accounting through national investments and participation in the LCFS. In return, the program has been highly successful at reducing GHGs, a goal we all support. SJI Renewable Energy Ventures respectfully requests CARB hold a separate process to address deliverability as it pertains to gas maps and the adoption of the California Renewable Portfolio Standard (RPS) language. Greater stakeholder engagement on the specific topic will produce the best possible policy.

Conclusion

SJI Renewable Energy Ventures appreciates the opportunity for continued participation throughout this rulemaking process. We remain committed to providing RNG to the California LCFS market and helping to reduce methane emissions, improve animal manure management in agricultural communities, and decarbonize California's transportation sector. We thank CARB for your continued work toward this end and look forward to any possible updates prior to November.

Sincerely,

Kyle Nolan

095.1 The unprecedented speed and magnitude of the expansion of renewable diesel used in California, increasingly made from soybean oil, is harming people, accelerating tropical deforestation, and undermining California's climate policies. **We call on the California Air Resources Board (CARB) to immediately cap the use of vegetable oil-based biofuels and to strengthen safeguards within the Low Carbon Fuel Standard (LCFS) to ensure that the use of biofuels does not directly or indirectly contribute to global food price shocks, agricultural expansion, and deforestation.** Capping the use of crop-based biofuels is neither radical nor unprecedentedⁱ, and is urgently required to align the LCFS with California's focus on transportation electrification and to ensure that California remains a leader in effective and responsible climate policies.

Fifteen years ago, in the midst of rapid expansion of corn ethanol, more than 170 scientists urged CARB to "include indirect land use change in the lifecycle analyses of heat-trapping emissions from biofuels and other transportation fuels."ⁱⁱ The Board listened to the science, and for more than a decade this and other policy decisions effectively prevented large increases in the use of crop-based biofuels in California. But these safeguards are no longer functioning effectively.

In the last few years California's consumption of renewable diesel has outstripped the sustainable sources of waste oils and fats, and is increasingly produced from soybean oil, some of it imported directly from South America.ⁱⁱⁱ California is on pace to consume 1.3 million metric tons of soybean oil for fuel in 2023, equivalent to 10 percent of global trade in soybean oil.^{iv} As California consumes more of the world's supplies of soybean oil, palm oil cultivation is expanding to replace soybean oil diverted from food to fuel use.

Three primary reasons the California LCFS requires an immediate cap on the use of vegetable oil-based fuels are:

095.2 **The global poor are at risk:** Use of vegetable oil for fuel contributed to a global food crisis in 2022. That year the World Food Price Index, published by the Food and Agriculture Organization of the United Nations, reached its highest level in a quarter century. Oils were the component of the index with the largest increase, with real prices up 84 percent compared to the 2014–2016 reference. Other factors were primarily responsible for this price spike, but despite the global food crisis, California consumption of renewable diesel increased by 47 percent in 2022 and more than 900

ⁱ Amendments to the Renewable Energy Directive of the European Union. 2023. [Link](#).

ⁱⁱ Scientists and Economists Letter on Indirect Land Use Change, 2009. [Link](#)

ⁱⁱⁱ Phillips 66 LCFS Tier 2 Pathway Application No. B0520. 2023. [Link](#)

^{iv} Soybean oil consumption projected based on data from CARB covering the first three quarters of 2023. Data on soybean oil trade from United States Department of Agriculture Foreign Agricultural Service. Oilseeds: World Markets and Trade. [Link](#).

thousand metric tons of soybean oil were used to produce renewable diesel for consumption in California. California should not be bidding against the global poor to fuel its trucks.

095.3 **Cropland continues to expand into sensitive ecosystems:** The expansion of soybean and palm oil (to replace soy oil used as fuel) is a major driver of tropical deforestation. Recent analysis finds that annual forest carbon loss in the tropics doubled during the early twenty-first century^v and that oil palm and soybeans are, respectively, the second and third largest drivers of deforestation after cattle.^{vi}

095.4 **Support for renewable diesel is diverting resources from transportation electrification:** Renewable diesel generated 40 percent of LCFS credits reported in the most recent quarter, and the large increase in credits from renewable diesel has depressed LCFS credit prices. Capping the use of renewable diesel and other fuels made from vegetable oil will focus more of the support provided by the LCFS on transportation electrification, which can be scaled up with clear climate benefits and without the harsh tradeoffs associated with vegetable oil and other crop-based fuels.

We therefore urge CARB to cap vegetable oil–based biofuels immediately in this rulemaking. Nothing short of a cap will effectively stem the widespread harms caused by the rapidly growing use of these fuels.

095.5 **Meaningful safeguards must effectively ensure that the use of vegetable oil or other crops for biofuels does not divert food to fuel uses or expand the footprint of agriculture.** California’s existing land-use safeguards within the LCFS rely on an estimation of land use change emissions developed using complex economic and land-use models. More than 15 years of research has not led to a consensus estimate of these emissions. A 2022 study from the National Academy of Sciences^{vii} describes the methodological problems arising from combining an attributional life cycle for fuel production with a consequential assessment of the climate impacts of fuel pathways or policies. A recent Model Comparison Exercise^{viii} conducted by the US Environmental Protection Agency highlights the deep uncertainty underlying the modeled climate benefits attributed to soybean oil–based biofuels. *In light of the methodological and modeling challenges with the current approach, more direct safeguards against excessive and damaging diversion of food to fuel use are required to effectively prevent bad outcomes.*

The data make clear that there is no surplus vegetable oil available in the United States, which is projected by the US Department of Agriculture to become a net importer of soybean oil.^{ix} In the global marketplace, as more soybean oil is redirected from food uses to fuel production, palm oil is the largest and fastest-growing source of vegetable oil substituting for it in global food markets.^x Because of this substitution, tracking the chain of custody of the oils used for fuel in California or banning the use of palm oil–based fuels is not an adequate safeguard. A cap on the total quantity of vegetable oil used for fuel is the most effective way to ensure California’s LCFS does not contribute to harmful outcomes. While the rapid growth of vegetable oil–based fuels in California is the immediate concern, policymakers in all jurisdictions should develop comprehensive safeguards to ensure current and future biofuel production does not harm people or the planet.

Form Letter 1 for Comment 96 for Proposed Low Carbon Fuel Standard Amendments (lcfs2024) - 15-1.

First Name: Devin

Last Name: Mogler

Email Address: devin.mogler@gpreinc.com

Affiliation: Green Plains Inc.

Subject: LCFS Amendment Comments

Comment:

Dear Board Members;

Green Plains Inc. (NASDAQ:GPPE) is a leading biorefining company focused on the development and utilization of fermentation, agricultural and biological technologies in the processing of annually renewable crops into sustainable value-added ingredients. This includes the production of cleaner low-carbon biofuels and renewable feedstocks for advanced biofuels. Green Plains is an innovative producer of Ultra-High Protein and novel ingredients for animal and aquaculture diets to help satisfy a growing global appetite for sustainable protein.

In general, Green Plains supports the LCFS program and these proposed amendments, with some notable exceptions. We support CARB's increase in the stringency of the program to reduce emissions and decarbonize the transportation fuel sector. Reduced credit values in recent years due to over-compliance with the program have to some extent slowed investments in renewable fuel production and research into new fuels. Greater certainty around credit values being supported would encourage investment from companies like ours, and improve access to and terms for credit to execute on these investments. We support both the near-term step-down in the CI benchmark in 2025, as well as the Automatic Accelerator Mechanism (AAM) as a means to drive continued innovation and development in the biofuels sector, and urge CARB to consider even more aggressive reductions, which we believe are achievable.

We oppose capping vegetable oil feedstocks for biodiesel and renewable diesel production, and strongly oppose including inedible distillers corn oil with other virgin vegetable oils. The renewable corn oil we produce is a low carbon intensity feedstock that is not fit for human consumption without further refining, and should not be included in any consideration of limiting these feedstocks. The recent surge in the importation of so-called "Used Cooking Oil" from China and elsewhere would likely be exacerbated if sustainable, traceable domestic feedstocks are limited, and there are questions around the authenticity of the "UCO," which some have alleged could include some quantities of virgin palm oil.

We oppose the continued exemption for intrastate fossil jet fuel, and urge CARB to reconsider the original proposal to eliminate this exemption. Airlines need to decarbonize and we are helping them to transition to new clean fuel alternatives. Today, our inedible distillers corn oil is a low-CI feedstock for producing SAF and

renewable diesel, and when carbon capture and sequestration of our biogenic carbon dioxide is deployed beginning in 2025, our decarbonized ethanol will be a scalable feedstock for airlines to utilize.

We applaud CARB rejecting an arbitrary cap on crop-based fuels. Regarding suggested changes to sustainability certification for crop-based fuels, we ask the board to carefully consider the reporting burdens and costs that could result from a new verification scheme. In general, we do not agree with the premise that U.S. crops displace grasslands, forests and wetlands, but recognize concerns of stakeholders and the desire for greater certainty.

The crops we process into low carbon biofuels and feedstocks for advanced biofuels, primarily corn, is all grown on cropland that was not converted from wetlands, forests or grasslands in accordance with federal Renewable Fuels Standard requirements. Productivity of corn in particular on a bushel per acre basis has increased dramatically, so fewer acres of cropland are required each year to generate the same or greater volumes of production. Additionally, efficiency of crops has greatly improved, so necessary inputs of fertilizer and water on a per bushel basis continue to decline, benefitting soil health, water quality, and ultimately reducing the carbon-intensity of the feedstock and by extension the finished biofuels. Likewise, advances in agronomic practices and enhanced understanding of plant and soil ecosystems have expanded the adoption of climate smart agricultural practices such as conservation tillage and cover crops, ultimately keeping more carbon in the soil and reducing the carbon-intensity of the feedstock and finished biofuels.

That being said, we are not opposed to pathway holders being required to track our crop-based feedstocks to their point of origin, and have independent certification of same, so long as the tracking requirements are not too onerous or costly. As noted above, all of the corn we process into ethanol and inedible distillers corn oil has had to comply with prior converted cropland requirements under the federal Renewable Fuels Standard. Likewise, we urge CARB to review and revise the quantification methods for crop-based biofuels to better reflect yield, cultivation and land use practices of crops used to produce fuels that accurately accounts for advances already made and recognizes the potential climate benefits of field-based agronomic practices.

We appreciate CARB's consideration of these comments, and commend you for your ongoing commitment to strengthening the LCFS.

Regards,

Devin Mogler

Executive Officer
California Air Resources Board
1001 I Street
Sacramento, CA 95814

RE: Comments on Proposed 15-Day Changes to Proposed LCFS Regulation Order

Dear Dr. Cliff:

097.1

As the largest producer of renewable diesel in the United States and the single largest generator of credits under the California Low Carbon Fuel Standard (LCFS), Diamond Green Diesel LLC (DGD) strongly supports the increased step-down in the carbon intensity benchmarks as proposed in the August 12, 2024 15-day comment package.

As CARB staff have recognized, LCFS credit prices have plummeted in recent years, undermining investments necessary to stimulate continued expansion of the clean technology sector. Having recently invested approximately \$315MM to develop production facilities for sustainable aviation fuel (SAF), we are reassured to see CARB's increased commitment to setting targets that are realistic and attainable, yet ambitious enough to reenergize the LCFS credit market. This increase in ambition is particularly welcome in light of the current 15-day proposal, which eliminates the obligation on jet fuel.

097.2

We strongly urge CARB to approve the regulation on November 8th without further delay. Additionally, we request that once the rulemaking process is finalized, CARB staff provide clear guidance to address practical issues related to implementation of the sustainability guardrails and crop cap measures. We encourage staff to collaborate closely with the regulated community post-adoption to develop comprehensive guidance, ensuring that these new measures are implemented in a practical, efficient, and transparent manner.

Thank you for your continued work on the LCFS program and for considering our views on this important issue. If you should have any questions, please feel free to contact me at any time.

Sincerely,

Sandra Dudley
President

Comment 98 for Proposed Low Carbon Fuel Standard Amendments (lcfs2024) - 15-1.

First Name	Chris
Last Name	Gould
Email Address	Chris.Gould@CRC.com
Affiliation	Carbon TerraVault
Subject	Comments on the August 12, 2024 CARB Low Carbon Fuel Standard 15-Day Changes

Comment

Carbon TerraVault Holdings, LLC ("CTV") appreciates the opportunity to comment on the California Air Resources Board's ("CARB" or "the Board") proposed amendments to the Low Carbon Fuel Standard ("LCFS"), released on August 12, 2024 (the "15-Day Changes").

CTV believes that the proposed modifications to LCFS credit generation for hydrogen projects is inconsistent with the requirements of California's Administrative Procedure Act ("APA") as well as CARB's December 2022 Scoping Plan (the "2022 Scoping Plan"). CARB must not finalize the 15-Day Changes or CARB risks suppressing California's nascent low-carbon hydrogen industry in a manner that will inevitably increase the risk of stranding existing assets and projects.

098.1

Restricting LCFS credits to non-fossil hydrogen after 2031:

- Does not align with CARB's 2022 Scoping Plan;
- Inhibits economic incentives that will constrict supply and the California hydrogen sector;
- Ignores the State's technology-neutral approach to carbon reduction; and
- Sends a message to investors that California's regulatory agencies may arbitrarily change rules that negatively impact the investment landscape without notice laid out by the state's own legislation.

Please see the attached letter for details.

RE: Comments on the August 12, 2024 CARB Low Carbon Fuel Standard 15-Day Changes

Dear Chair Randolph and Members of the Board:

Carbon TerraVault Holdings, LLC (“CTV”) appreciates the opportunity to comment on the California Air Resources Board’s (“CARB” or “the Board”) proposed amendments to the Low Carbon Fuel Standard (“LCFS”), released on August 12, 2024 (the “15-Day Changes”).¹ CTV believes that the proposed modifications to LCFS credit generation for hydrogen projects is inconsistent with the requirements of California’s Administrative Procedure Act (“APA”) as well as CARB’s December 2022 Scoping Plan (the “2022 Scoping Plan”). CARB must not finalize the 15-Day Changes or CARB risks suppressing California’s nascent low-carbon hydrogen industry in a manner that will inevitably increase the risk of stranding existing assets and projects.

098.1 cont Restricting LCFS credits to non-fossil hydrogen after 2031:

- Does not align with CARB’s 2022 Scoping Plan;
- Inhibits economic incentives that will constrict supply and the California hydrogen sector;
- Ignores the State’s technology-neutral approach to carbon reduction; and
- Sends a message to investors that California’s regulatory agencies may arbitrarily change rules that negatively impact the investment landscape without notice laid out by the state’s own legislation.

Consistent with the 2022 Scoping Plan, California energy companies have planned for low carbon intensity (“CI”) hydrogen projects that mitigate carbon emissions by employing carbon capture and storage (“CCS”),² with the understanding that these projects would receive LCFS credits. The 2022 Scoping Plan calls for a broad approach to defining low-CI hydrogen projects to support a projected massive increase in demand for hydrogen in the future. Developing a pipeline of low-CI hydrogen projects with CCS is essential to meet state climate targets, which compels CARB to provide long-term incentives in support of this emerging industry. The 15-Day Changes, as proposed, would eliminate these financial incentives by 2031, materially jeopardizing the long-

¹ California Air Resources Board, Proposed 15-Day Changes, <https://ww2.arb.ca.gov/rulemaking/2024/lcfs2024>.

² E.g., [Elk Hills Hydrogen Project Press Release](#), California Resources Corporation (July 31, 2023).

term business justification for these projects and undercutting California's chance to be a leader in low-CI hydrogen production.

Moreover, finalizing such disruptive changes sends the wrong signal to investors with respect to support for low-CI hydrogen projects. The 15-Day Changes represent an unexpected and surprising proposal, exactly the kind that sends shocks through the investment and lending communities and ultimately risk provoking a sweeping retreat from investment in *any* type of low-carbon fuels because of fears of arbitrary and last-minute regulatory changes. CARB must abandon the 15-Day Changes and refocus its efforts on sending clear regulatory support for all types of low-CI hydrogen projects.

About Carbon TerraVault Holdings, LLC

Carbon TerraVault Holdings, LLC ("CTV"), a subsidiary of California Resources Corporation ("CRC"), provides services that include the capture, transport and storage of carbon dioxide for its customers. CTV is engaged in a series of CCS projects that inject CO₂ captured from industrial sources into depleted underground reservoirs and permanently store CO₂ deep underground. For more information about CTV, please visit www.carbonterravault.com.

About Carbon TerraVault Joint Venture

Carbon TerraVault Joint Venture ("CTV JV") is a carbon management partnership focused on carbon capture and sequestration development, and was formed between Carbon TerraVault, a subsidiary of CRC, and Brookfield Renewable. The CTV JV develops both infrastructure and storage assets required for CCS development in California. CRC owns 51% of the CTV JV with Brookfield Renewable owning the remaining 49% interest.

CTV JV is involved in several new clean energy initiatives. These include the Grannus Ammonia and Hydrogen Project, which expects to sequester 370,000 metric tons ("MT") of CO₂ annually and produce clean ammonia and hydrogen in Northern California. The project aims to be California's first clean ammonia and hydrogen facility producing an expected 150,000 MT per annum of clean ammonia and an expected 10,000 MT per annum of clean hydrogen. The Lone Cypress Hydrogen Project, in collaboration with Lone Cypress Energy Services, expects to sequester 205,000 MT of CO₂ per year from a new hydrogen plant and the production of an expected 65 tons per day of hydrogen.^{3,4} Lastly, the Yosemite Hydrogen Facility, in partnership with Yosemite Clean Energy, expects to sequester 40,000 MT of CO₂ per year from a new hydrogen plant expected to produce 24 tons per day of hydrogen, with plans for two additional facilities. These projects contribute to our sustainability goals to reduce carbon emissions and promote clean energy.

³ Lone Cypress CDMA Press Release, California Resources Corporation (Dec. 7, 2022).

⁴ CTV expects that the Lone Cypress Hydrogen Project will utilize a blended feedstock consisting of natural gas and RNG, subject to the availability of RNG.

Recommendations

As a California-based company committed to the energy transition, CTV supports CARB's overall goal of achieving carbon neutrality by 2045 and reducing greenhouse gas ("GHG") emissions by 2045 to a level that is 85% below 1990 levels. In its Statement of Reasons for the December 2023 proposed LCFS amendments, CARB stated that "[m]eeting this goal will require the deployment of greenhouse gas emission reduction strategies *at an unprecedented scale and pace*."⁵ However, we are concerned that many aspects of the 15-Day Changes unnecessarily restrict or prohibit established and proven strategies for reducing GHG emissions in connection with the production of low-CI hydrogen from generating LCFS credits. In particular, the 15-Day Changes as written would exclude low-CI hydrogen production using fossil gas with CCS from generating LCFS credits after 2030. By removing LCFS credit generation eligibility for hydrogen produced using fossil gas as a feedstock, the proposed amendments only support incentives for hydrogen produced using (1) electricity generated from renewable power sources and (2) renewable natural gas ("RNG") as a feedstock. Neither source can practically meet CARB's projected demand for low-carbon hydrogen production likely inhibiting the foundation of a meaningful low-carbon hydrogen industry in California. This proposal is inconsistent with the California APA and the CARB 2022 Scoping Plan and will ultimately frustrate the deployment of low carbon hydrogen projects in California.

As discussed in greater length below, the California APA compels that the 15-Day Changes actually be subject to a 45-day comment period. In any case, we respectfully request that prior to finalization of the 15-Day Changes, CARB must:

- **Reject the proposed Subsection 95482(h)**, which removes LCFS credit generation eligibility for hydrogen produced using fossil gas as a feedstock, effective January 1, 2031;
 - In the alternative, CARB should revise Subsection 95482(h) to (1) expressly allow for LCFS generation at hydrogen projects using fossil gas feedstocks *when paired with CCS*, and (2) permit existing LCFS credit generating facilities (*i.e.*, those generating credits before January 1, 2031) to be exempt.

These requests largely stem from regulatory inconsistencies and counterproductive consequences associated with the 15-Day Changes, including (1) potential deficiencies under California's APA, (2) misplaced assumptions regarding other feedstocks for hydrogen plants, (3) conflicts between the 15-Day Changes and CARB's 2022 Scoping Plan, (4) negative impacts to California's climate goals, and 5) harmful financial effects, including the risk of stranding assets.

California Resource Corporation's Concerns with the August 2024 15-Day Changes

1. CARB's 15-Day Changes Do Not Comply with California Administrative Law

The California APA requires that any substantial modification to a proposed rule must be available for public comment for a minimum of 45 days, unless the modification is "sufficiently

⁵ 2024 LCFS Amendments Staff Report: Initial Statement of Reasons at 4 (Dec. 2023) [hereinafter "Initial Statement of Reasons"] (emphasis added).

related” to the original proposal.⁶ Only if a modification is “sufficiently related” to the original proposed rule, such that a reasonable member of the directly affected public could have determined from the notice that these changes to the regulation could have resulted, can a California agency make the modification available for a 15-day public comment period.⁷ The 45-day public comment period—one of only a few ways the public can help shape rulemaking—is integral to allow the public sufficient time to consider and analyze new rules that could have drastic impacts on their business operations and efficiently convey this information to the agency.

The proposed addition of Subsection 95482(h) in CARB’s August 12, 2024 15-Day Changes to the proposed December 2023 LCFS amendments is not sufficiently related to those earlier proposed amendments and, as such, is deficient under the California APA. The inquiry into whether a modification is sufficiently related focuses on whether the change concerns “the same subject or issue” as the original proposed rule and whether the original proposed rule provided any “specific indication” of the changes that may be made.⁸ Here, commentors had no indication that CARB would propose to remove hydrogen produced using fossil gas from credit generation eligibility under the LCFS. This *drastic* change to Section 95482, completely removing an entire category of fuels from eligibility, is not sufficiently related to the previous proposal, which only proposed minor changes related to fossil jet fuel and biomass-based diesel fuel credits. The public could not have had any indication that a modification to hydrogen generation credits was under consideration, and thus, commentors are “hampered in effectively opposing those changes.”⁹ To rectify this APA deficiency, we ask CARB to set aside these 15-Day Changes or reissue the proposed changes under a 45-day public comment period.

2. Other Hydrogen Feedstocks Are Insufficient to Meet Projected Fuel Demands

The LCFS program can play a critical support role in the development of California’s low-carbon hydrogen economy. For example, strong market signals from the LCFS have supported increased production and use of biodiesel and other low carbon fuels.¹⁰ Even regarding CCS, a recent May 2022 study from the Stanford Center for Carbon Storage found that “LCFS is the single largest financial incentive for eligible CCS projects in California.”¹¹ But rather than send strong market signals or incentives in support of California’s growing low-carbon hydrogen industry, the 15-Day Changes send the opposite signal, likely harming both the low carbon hydrogen and CCS industries. By picking winners and losers at such an early stage in the energy transition, CARB is abandoning the technology-neutral approach outlined in its own 2022 Scoping Plan where it stated

⁶ Ca. Gov. Code § 11346.8(c).

⁷ 1 Cal. Admin. Code § 42.

⁸ *Wendz v. Ca. Dep’t of Edu.*, 311 Cal. Rptr. 3d 213, 246 (Cal. App. 1 Dist. 2023) (quoting *Small Refiner Lead Phase-Down Task Force v. United States E.P.A.*, 705 F.2d 506, 548 (D.D.C. 1983)). In *Wendz*, a case not dissimilar to the rulemaking proceeding at issue here, the California Court of Appeal found that a proposed Superintendent of Public Instruction rule that placed a cap on the number of members on a Regional Migrant Parent Advisory Council, which was later modified to prohibit alternate members, was not sufficiently related because the public did not have adequate notice that the agency might prohibit the use of alternate members. In that case, the Court of Appeal found this portion of the rule invalid because a 45-day notice was required for the modified proposal. *Id.* at 247.

⁹ *Id.* at 246.

¹⁰ CARB 2022 Scoping Plan at 191.

¹¹ SCCS Study at 32.

that “[t]he challenge before us requires us to keep all tools on the table.”¹² We believe that CARB should adopt this latter approach and reverse the restrictive course proposed in the 15-Day Changes. In particular, as part of this reversal, CARB needs to revise its proposal so that low-CI hydrogen projects—regardless of feedstock or technology—are eligible to receive LCFS credit generating opportunities.

The 15-Day Changes ignore the technical realities associated with the time to scale the deployment of hydrogen solely produced from RNG, renewable electricity, and other non-fossil sources. In this interim period, low-CI hydrogen produced with fossil gas and CCS is the only proven and scalable technology capable of meeting the demands of California’s expanding low-carbon economy.¹³ CARB itself acknowledged in its 2022 Scoping Plan, that “[t]here is a high degree of uncertainty around the availability of solar to support both electrification of existing sectors and the production of hydrogen through electrolysis.”¹⁴ More recently, California’s long reliance and proven history with fossil-based hydrogen production is referenced in the ARCHES White Paper which states that “California is home to the second-largest hydrogen economy in the United States, a predominately fossil-based system which has been in place for more than 60 years.”¹⁵ The fastest way to decarbonize existing hydrogen production in California is to incentivize the installation of CCS at these facilities by allowing hydrogen production using fossil gas with CCS to generate LCFS credits. Providing this support avoids the risk of stranding the assets that have made California a leader in the hydrogen industry for the past 60 years by creating a bridge to low-CI hydrogen production. However, the 15-Day Changes would have the opposite effect, undercutting support for the best pathway to rapid reductions in carbon intensity of California’s existing hydrogen industry.

The proposed amendment assumes that renewable electricity would be dedicated to hydrogen production versus used for other grid demands. This unnecessary competition over developing renewable electricity supplies can be avoided by revising the LCFS amendments to incentivize low-CI hydrogen with CCS as an alternate strategy while these other hydrogen generation technologies develop.

At least one unintended consequence of CARB’s proposal is that it could further delay decarbonizing the grid. Increased demand that will correspond with the electrification of the transportation sector and population growth will require maintaining adequate reliable baseload power generation such as natural gas-fired power plants even with the addition of new renewable generation capacity. These existing natural gas plants could be retrofitted to co-fire hydrogen, and incentivizing the production of low-CI hydrogen produced with fossil gas and CCS represents

¹² CARB 2022 Scoping Plan at 11.

¹³ Bracci, J., et al., *Fueling the California Mobility Market with Hydrogen from Natural Gas plus Carbon Capture and Storage*, Stanford Natural Gas Initiative and Stanford Center for Carbon Storage, May 2022, at 41 (“near-term techno-economic models still point to SMR-CCS being the cheaper hydrogen generation pathway to kickstart a clean hydrogen economy in California”) [hereinafter “SCCS Study”].

¹⁴ California Air Resources Board, 2022 Scoping Plan for Achieving Carbon Neutrality, at 88 (Dec. 2022) [hereinafter “CARB 2022 Scoping Plan”].

¹⁵ White Paper Overview, Alliance for Renewable Clean Hydrogen Energy Systems, at 6 (2024).

would provide additional support for the overall decarbonization of the state's electric grid in an orderly and least-disruptive manner.

098.3

Moreover, CARB may be overestimating the availability of RNG for use in hydrogen production within California. Separate from the 15-Day Changes related to hydrogen, the previously proposed December 2023 LCFS amendments would also effectively end LCFS crediting for RNG projects after 2040. Given that the RNG pathway is widely used to support the development of RNG projects across the country, this change will remove the primary financial incentive for new RNG projects in California and for producers to send RNG to California. This is because LCFS credits are critical to making RNG projects competitive with fossil gas given the comparatively low value of environmental credits available under the federal Renewable Fuel Standard ("RFS") and other state low-carbon fuel programs. Removing RNG crediting from LCFS may also result in producers sending RNG to Oregon and Washington to capture more value under those state low-carbon fuel programs. On August 13, 2024, the American Biogas Council confirmed these concerns in its press release regarding these proposed 15-Day Changes, stating that the amendments "may deter the [biogas] industry from bringing new supplies to the [LCFS] program later in the decade."¹⁶ Such an immediate reaction by the main RNG trade group should come as a warning to CARB of the long-term impacts of these proposed changes.

Demand for RNG outside of California is only expected to grow over the next several years, with New Mexico recently enacting a low-carbon fuel standard¹⁷ and the U.S. Environmental Protection Agency's expected eventual finalization of rules allowing RNG used in electricity generation to generate credits under the RFS. This will inevitably increase demand for RNG for non-hydrogen uses outside of California and could accordingly result in RNG supply shortfalls within the state. CARB's assumption that sufficient RNG may be available as a feedstock for low-CI hydrogen production does not appear to consider this factor.

Electricity demand is expected to grow substantially in California over the coming decades – driven by the anticipated demands of electrifying the transportation and industrial sectors and supercharged by increased demand from data centers. This massive surge in electricity demand would have to be met, at least in part, by natural gas power plants ostensibly supplied with RNG. In the meantime, the amendments introduced by the 15-Day Changes would mean power generators and hydrogen producers compete for these limited RNG supplies when there are other proven methods available to deliver low-CI hydrogen. This overall approach, however, would result in compound inefficiencies from the energy losses associated with this two-step process: (1) producing hydrogen via RNG and (2) burning the hydrogen in power plants.¹⁸ A more efficient approach would entail sending RNG directly to power plants to produce electricity, while leaving hydrogen production open to multiple technologies such as low-CI fossil gas paired with CCS.

3. CARB's 15-Day Changes are Inconsistent with the 2022 Scoping Plan

Assembly Bill (“AB”) 32 requires CARB to develop a Scoping Plan which lays out California’s strategy for meeting the state’s climate goals and update the Scoping Plan every five years.¹⁹ The 2022 Scoping Plan provides a detailed pathway to achieve targets for carbon neutrality and reduce anthropogenic GHG emissions by 85% below 1990 levels no later than 2045.

Hydrogen production plays a critical role in meeting these goals per the 2022 Scoping Plan. In order to achieve these ambitious climate targets, the 2022 Scoping Plan recognized that **1,700 times** the current hydrogen supply will be required by 2045.²⁰ AB 32 requires that any CARB scoping plan embrace “technologically feasible and cost-effective reductions in GHG emissions.”²¹ Production of hydrogen using fossil gas with CCS is feasible, cost-effective, delivers verifiable GHG emission reductions and displaces traditional more carbon intensive uses of fossil gas, when properly incentivized. The 2022 Scoping Plan follows the statutory directive because it does not call to exclude hydrogen produced using fossil gas with CCS from the LCFS, but the December 2023 LCFS amendments and the recent August 2024 15-Day Changes do not.

The massive scaling of low carbon hydrogen projects necessary to meet the goals of the 2022 Scoping Plan requires an “all of the above” approach to low-carbon hydrogen production. The most efficient and logical way to do that is to ensure that sufficient supportive financial incentives are in place. LCFS credits represent a potentially critical financial incentive for low or zero carbon hydrogen projects. In light of the 1,700-fold expansion in the state’s hydrogen supply called for by the 2022 Scoping Plan, CTV believes that CARB must be encouraging *all forms* of low-carbon hydrogen production as called for by the 2022 Scoping Plan. Any other approach would be arbitrary and capricious.

As highlighted above, the 2022 Scoping Plan calls for a flexible approach to supporting the development of low-carbon hydrogen.²² Specifically, the Plan makes the following key references to hydrogen and CCS:

“For the purposes of this Scoping Plan, ‘renewable hydrogen’ and ‘green hydrogen’ are interchangeable and are not limited to only electrolytic hydrogen produced from renewables.” (page 26)

* * * *

“CCS can support hydrogen production until such time as there is sufficient renewable power for electrolysis and an abundant water source.” (page 86)

* * * *

“If steam methane reformation is paired with CCS, the hydrogen produced could potentially be low carbon.” (page 88)

¹⁹ Cal. Code Regs. Title 17, § 38561.(a)-(h) (2023).

²⁰ CARB 2022 Scoping Plan at 8.

²¹ AB 32 § 38561.(a) “[CARB] shall prepare and approve a scoping plan, as that term is understood by the state board, for achieving the **maximum technologically feasible and cost-effective reductions** in greenhouse gas emissions (emphasis added).”

²² CARB 2022 Scoping Plan at 6.

These references were included in the final adopted version of the 2022 Scoping Plan despite multiple commenters calling on CARB to explicitly exclude CCS from its definition of hydrogen production eligible to generate LCFS credits. Adhering to the 2022 Scoping Plan requirements outlined in AB 32, CARB refused to take such a narrow approach and built flexibility into the final 2022 Scoping Plan. The August 2024 15-Day Changes, with the newly proposed Subsection 95482(h), inexplicably and radically depart from CARB's prior actions and as called for by the 2022 Scoping Plan. This change in the Board's direction seems arbitrary and capricious in light of the rulemaking record.

This abrupt change in CARB's stance towards low-CI hydrogen with CCS is further evidenced when compared to the Board's responses to public comments on the draft 2022 Scoping Plan. When a public commenter called for CARB to only support electrolytic hydrogen generation via renewable electricity, the Board responded by stating that:

[t]he 2022 Scoping Plan does not prescribe the energy source to produce hydrogen, and therefore, steam methane reformation paired with CCS could be considered in the near term to ensure a rapid transition to hydrogen and increase hydrogen availability until such time as electrolysis with renewables and biomass-based hydrogen can meet the ongoing need.²³

CARB further acknowledged that because "the build-out [of renewable power generation] takes time and is additive to the growth in demand associated with electrification across the economy, the state needs to keep options open for other methods to produce zero carbon hydrogen at the scale needed to meet the projected demand."²⁴ The 15-Day Changes, however, without explanation or support, seemingly ignore CARB's prior express statements supporting broad approaches to identifying low-carbon methods of hydrogen production that will meet state climate goals and should therefore be incentivized. The 15-Day Changes directly conflict with the 2022 Scoping Plan and all other prior signals of regulatory intent from CARB without more than a cursory explanation.

It is unrealistic to expect hydrogen produced from renewable energy will scale sufficiently by the end of the decade to develop the market size California seeks. Developers seek to maximize their investment, thus build financial models based on the ability to operate an electrolyzer as much as possible. As such, electrolyzers that use renewable energy to produce hydrogen need to be paired with energy storage capabilities to ensure maximum use of the equipment. Goldman Sachs, an investment bank that has conducted extensive market research in the hydrogen sector, notes that power prices need to be below US\$30/MWh to compete with hydrogen produced from natural gas combined with carbon capture and storage²⁵ (see chart below labeled "Exhibit 74": the bank refers to this production method as "blue" hydrogen). Current PG&E industrial consumer retail prices in Q1 2024 were ~US\$200/MWh. Lazard, an investment bank with extensive industry research, notes in June 2024 research (see chart below²⁶) that to ensure firm reliability when

²³ CARB 2022 Scoping Plan Response to Comments, Appendix B at 57.

²⁴ *Id.*

²⁵ Goldman Sachs. "The Clean Hydrogen Revolution," February 2022.

²⁶ Lazard. "Levelized Cost of Electricity," June 2024.

renewables are intermittent, the levelized cost of wind and solar in the California Independent System Operator (CAISO) region is between US\$123-177/MWh.

These price signals do not incentivize developers to build renewable generation, required storage and hydrogen electrolyzer equipment – and it is unlikely that these pricing dynamics will change sufficiently by 2031.

Exhibit 74: Overall, we estimate that for an electrolyzer of an efficiency of 64% and operating for 5,000 full load hours, an LCOE that is lower than c.US\$30/MWh is required to be at cost parity with 'blue' hydrogen, and lower than c.US\$20/MWh to be at cost parity with 'grey' hydrogen
Levelized cost of green, blue and grey hydrogen under different electrolyzer capex assumptions

Source: Goldman Sachs Global Investment Research

Levelized Cost of Energy Comparison—Cost of Firming Intermittency

The incremental cost to firm⁽¹⁾ intermittent resources varies regionally—as such is defined by the relevant reliability organizations using the current effective load carrying capability ("ELCC")⁽²⁾ values and the current cost of adding new firming resources

Source: Lazard and Robert Berger estimates and publicly available information.
Note: Total LCOE, including firming cost, does not represent the cost of building a 24/7 firm resource on a single project site, but, instead, the LCOE of a renewable resource and the additional costs required to achieve the resource adequacy requirement in the relevant reliability region based on the net cost of new entry ("Net CONE"). ISO ELCC data as of April 2024.
(1) Firming costs reflect the additional capacity needed to supplement the net capacity of the renewable resource (nameplate capacity "1" – ELCC) and the Net CONE of a new firm resource (capital and operating costs, less expected market revenues). Net CONE is assessed and published by grid operators for each regional market. Grid operators use a natural gas peaker as the assumed new resource in MISO (\$8.22/MWh-mc), SPP (\$8.56/kWh-mc) and PJM (\$10.20/MWh-mc). In CAISO, the assumed new resource is a 4-hour lithium-ion battery storage system (\$16.50/MWh-mc). For the PV + Storage cases in CAISO and PJM, assumed storage configuration is 50% of PV MW and 4-hour duration.
(2) ELCC is an indicator of the incremental reliability contribution of a given resource to the electricity grid based on its contribution to meeting peak electricity demand. For example, a 1 MW wind resource with a 15% ELCC provides 0.15 MW of capacity contribution and would need to be supplemented by 0.85 MW of additional firm capacity in order to represent the addition of 1 MW of firm system capacity.
(3) Reflects the average of the high and low of Lazard's LCOE v17.0 for each technology using the regional capacity factor, as indicated, to demonstrate the regional differences in project costs.
(4) For PV + Storage cases, the effective ELCC value is represented. CAISO and PJM assess ELCC values separately for the PV and storage components of a system. Storage ELCC value is provided only for the capacity that can be charged directly by the accompanying resource up to the energy required for a 4-hour discharge during peak load. Any capacity available in excess of the 4-hour maximum discharge is attributed to the system at the solar PPA. PJM ELCC values are also provided for the 10% and 15% firming levels.

LAZARD

4. CARB's 15-Day Changes Negatively Impact California's Climate Goals

098.5

The California Climate Crisis Act (AB 1279) sets an ambitious goal, requiring the state to achieve net zero GHG emissions as soon as possible, but no later than 2045, and thereafter achieve and maintain net negative GHG emissions. CCS is critical to this endeavor; it is, importantly, a *viable* option to reduce emissions from sectors that are key contributors to California's total emissions.²⁷ It is also a "critical enabler" of various carbon dioxide removal pathways and a "strong complement" to other decarbonization strategies.²⁸ In California specifically, CCS has the potential to play "a key role" in the removal of unabated carbon emissions, with potential geologic sequestration capacity in the state estimated to be between 35 to 425 gigatons of CO₂e in saline aquifers and five gigatons of CO₂e in the largest oil and gas basins.²⁹ This could provide storage capacity for up to 1,000 years.³⁰

CARB itself has acknowledged the essential role that CCS must play in achieving California's ambitious climate goals. In fact, CARB has stated that "there is no path to carbon neutrality without carbon removal and sequestration," as indicated not just by the 2022 Scoping Plan Update but also by the IPCC's Climate Change 2022: Mitigation of Climate Change report.³¹ The 2022 Scoping Plan is the main regulatory document governing how CARB will approach progress toward, and the meeting of, the state's ambitious climate aims. Integral to such progress is the development of, and support of, CCS projects—without this tool, carbon neutrality will remain an illusory hope. CARB's LCFS 15-Day Changes, then, are entirely inconsistent with the state's 2022 Scoping Plan, completely disregarding prior acknowledgement of the absolute necessity of CCS, because of how they would disincentivize a proven method of low-carbon hydrogen production by prohibiting LCFS credits for hydrogen produced with fossil gas and CCS after 2030. CARB must return to embracing CCS as an integral part of its strategy to achieve the state's targets.

CCS represents a both foundational building block for meeting California's climate goals and as a bridge to support low-carbon hydrogen production until sufficient renewable power generation capacity exists to allow for large-scale hydrogen production using only renewable electricity. Even if, as CARB has recognized, the transportation sector is headed toward electrification, hydrogen produced with fossil gas and CCS will be a key component in any strategy to decarbonize hard-to-abate industries, such as heavy manufacturing (*e.g.*, steel and cement).³² Restricting economic support in the transportation sector will likely limit the ability for hydrogen producers to develop projects that will supply these other industries – and thus inhibit market development broadly. This role serves as a necessary bridge to 100% renewable-derived hydrogen, but it will be thwarted without the right long-term support under the LCFS.

5. CARB's 15-Day Changes Stymie Investor and Developer Confidence

098.6

For California to be a leader in the low-CI hydrogen industry and, moreover, to meet state climate targets, CARB must use the LCFS to incentivize low-carbon hydrogen production using all known proven methods, including hydrogen produced from fossil gas and CCS. LCFS credits are critical here.³³ To mitigate against the expenses of production, low-carbon hydrogen developers have come to rely on stacking multiple incentives, particularly following the passing of the Inflation Reduction Act in August 2022.³⁴ For CCS projects, the stacking of incentives relies not only on tax credits but also the LCFS credit.³⁵ Long-term support for these incentivizes is essential. However, by adopting the restrictive approach proposed in the 15-Day Changes, California-based CCS projects face undue capital and economic uncertainty, stymying development and, ultimately, the achievement of state decarbonization targets. Moreover, this unnecessary barrier to market and develop CCS projects will likely result in stranded assets, the very idea of which CARB has strongly rejected in the 2022 Scoping Plan³⁶ and acknowledged it must avoid in its Statement of Reasons provided with other recent LCFS amendments.³⁷ Finalizing the 15-Day Changes is inconsistent with and arbitrarily departs from CARB's prior expressly stated broad views on supporting hydrogen produced using CCS.

³³ See *supra* n.19 and n.20.

³⁴ See Hedreen, Siri, *Stacked Tax Credits Make Green Hydrogen Economic for First Time in US*, S&P Global Market Intelligence Webpage (last visited May 5, 2024), <http://tinyurl.com/ycxf5se3>.

³⁵ See Littlefield, Anna, et al., *Decarbonization of Ethanol: Pathways to Monetization Series Part One: Stacking 45Q with Voluntary Carbon Markets*, Colorado School of Mines: Payne Institute for Public Policy (Dec. 2023); see also SCCS Study at 2 (“These [federal] tax credits, combined with Low Carbon Fuel Standard incentives, offer a strong—and urgent—business case for commercial scale blue hydrogen projects in California.”); SCCS Study at 42 (“Existing federal and state policies—the 45Q and LCFS—are key in making blue hydrogen more cost-competitive[.]”).

³⁶ *Id.* at 9 “We must avoid making choices that will lead to stranded assets and incorporate new technologies that emerge over time.”

³⁷ With respect to RNG, CARB acknowledges that, for the fuel to transition to more sectors in the long term, “the existing market signals will need to transition accordingly to avoid stranded assets and the closure of methane capture projects.” Initial Statement of Reasons at 30 (Dec. 2023). The same idea is applicable to CCS projects if projects are forced to cease mid-development due to the lack of financial incentives, support and access to capital.

Conclusion

As more fully explained above, CARB must revisit various provisions of its proposed 15-Day Changes to the LCFS regulations that exclude projects producing hydrogen from fossil gas and CCS from LCFS credit generation after 2030. Revisions to the 15-Day Changes are necessary to ensure consistency with the 2022 Scoping Plan and, importantly, to recognize the importance of low-CI hydrogen in meeting the state's ambitious climate goals. To that end, we respectfully ask CARB to reconsider the inclusion of the proposed Subsection 95482(h) in light of the concerns detailed above. Failure to do so would not meet CARB's obligations under the California APA.

CTV appreciates the opportunity to comment on the August 12, 2024 LCFS 15-Day Changes. We thank CARB for its consideration and look forward to continued dialogue and public workshops on this matter.

Respectfully submitted,

A handwritten signature in black ink that reads "Chris Gould". The script is fluid and cursive, with the first letters of "Chris" and "Gould" being capitalized and prominent.

Dear Chair Randolph and Members of the Board,

099.1

The San Francisco Bay Area Rapid Transit District (BART) appreciates the opportunity to comment on the proposed amendments to the Low Carbon Fuel Standard (LCFS) program published on August 12, 2024. BART applauds CARB staff's proposal to remove the pre-2011/post-2010 delineation for Fixed Guideway System crediting thus recognizing that electric rail – no matter when it was constructed – significantly reduces Vehicle Miles Traveled (VMT) and emissions. BART also supports the amendments that will strengthen the price of LCFS credits because BART relies on revenues from the sales of those credits to help fund its system.

BART owns and operates an electrified fixed-guideway transit system, along with electric vehicle charging at its parking facilities. We have participated in the LCFS as an opt-in entity since 2016. The LCFS program is a powerful tool to meet the state's climate goals by incentivizing use of fuels with lower carbon intensity and switching to modes of travel such as public transit. The LCFS is one of California's best instruments to get passengers out of cars and reduce VMT.

Almost 160,000 passengers ride BART each weekday and over 75,000 daily on weekends. We operate in five counties -- San Francisco, San Mateo, Alameda, Contra Costa, and Santa Clara -- with 131 miles of track and 50 stations. The vast majority of BART trains are electric, with 100% of its electricity supplied by zero-carbon resources including solar, wind, and hydroelectric generators. Every weekday of 2023, BART prevented 47,117 car trips and reduced California greenhouse gas (GHG) emissions by 608,036 lbs. CO₂e.

099.1 cont

We strongly support the staff's proposal to provide equal treatment to all fixed guideway systems for the purposes of LCFS crediting. Transit systems all over the state are facing severe fiscal issues and the additional LCFS credits are vital to help rail agencies continue to provide service with diminished local funding sources. Given the very small percentage of total LCFS credits that fixed guideways generate, this change will have no discernible impact on credit prices while significantly helping with BART's current fiscal difficulties.

BART also supports the proposed amendments that will strengthen the price of LCFS credits such as increasing the stringency of the program and capping certain kinds of biomass. The recent steep decline in credit prices has noticeably impacted BART's budget, which is still hundreds of millions of dollars in deficit. Transit systems around the

country have not recovered from the COVID passenger decline, with the Bay Area being most impacted. BART is coping with severe fiscal issues facing a substantial budget shortage beginning in fiscal year 2027.

Public transit is essential to California's achievement of its climate goals. BART applauds CARB staff's proposals that will support transit across the state including the equal treatment for all fixed guideway systems and the amendments that will strengthen the price of LCFS credits.

Sincerely,

Yuliya Shmidt

Re: Proposed Amendments to the Low Carbon Fuel Standard Regulation

Dear Chair Randolph and Honorable Board Members:

SDG&E appreciates this opportunity to comment on the Low Carbon Fuel Standard ("LCFS") regulation and provide feedback for CARB Board member consideration. SDG&E supports many provisions in the 15-Day Changes¹ including, as discussed in comments filed through the California Electric Transportation Coalition in February 2024 on the 45-day amendments. However, SDG&E continues to have significant concerns and recommends changes to the 15-Day Changes to provide clarity and address serious operational challenges.² These modifications are discussed below and reflected in the Appendix. Specifically:

- 100.1 • **Electric Distribution Utility ("EDU") Definition:** The current EDU definition in Section 95481 is drastically outdated, relying on 2017 electric sales, and should be modified to 1) rely on 2022 annual electric sales and, 2) accordingly, recalibrate EDU sizing.
- 100.2 • **Pre-Approved Holdback Project List:** Bifurcating equity and other project types in Section 95483(c)(1)(A)(5) unnecessarily complicates rather than streamlines the list of pre-approved projects. The two lists should be consolidated, with a 75% equity requirement.
- 100.3 • **Base Credits to Original Equipment Manufacturers ("OEMs"):** CARB must resolve ambiguity regarding the potential carveout in Section 95483(c)(1) for OEMs by:
 - Ensuring that any reallocation of base credits will protect EDU holdback funding
 - Establish guardrails around the Executive Officer's discretion via a one-time option by March 15, 2025, and Board oversight.
- 100.4 • **Administrative Cost Caps:** CARB should maintain the cap for both the holdback projects and the statewide rebate program at 10%, as this is currently accepted by both CARB and the CPUC. There is no data to support lowering the cap to 7%.

¹ See "15-Day Changes," posted August 12, 2024, at: <https://ww2.arb.ca.gov/rulemaking/2024/lcfs2024>.

² SDG&E has also signed onto comments on the 15-Day Changes filed separately and concurrently with the California Electric Transportation Coalition; the Joint California Utilities; and Southern California Gas Company.

1) Definition of Electric Distribution Utilities in Section 95481 *Definitions and Acronyms* Must Be Updated to Reflect the Most Current Electric Sales

Currently, SDG&E overpays into the statewide Clean Fuel Reward (“CFR”) program relative to the base credits it receives. SDG&E requests that CARB revise the definition of Electric Distribution Utility (“EDU”) in Section 95481 “Definitions and Acronyms” to rely on 2022 electric sales, rather than 2017 data. This change ensures that SDG&E is defined as medium investor-owned utility (“IOU”) and have a comparable contribution to the statewide program as similarly sized utilities. In the Initial Statement of Reasons released December 19, 2023,³ CARB staff states, “San Diego Gas & Electric is re-defined to have a comparable contribution to the statewide program to similarly sized public utilities.” However, this change was not in the proposed regulation. CalETC identified this discrepancy in 45-day comments submitted on February 20, 2024. The 15-Day Changes still fails to update the EDU definition.

Under the regulation, “The EDU or its designee is the credit generator for base credits for the portion of residential EV charging assigned to that EDU by the Executive Officer.”⁴ Each EDU’s assignment of base credits is calculated according to Section 95486.1(c)(1), which results in SDG&E receiving a similar portion of base credits as the Los Angeles Department of Water and Power (“LADWP”) – a medium publicly owned utility (POU). However, under the current regulation and as written in the 15-Day Changes, SDG&E is defined as a large IOU and contributes 67% of LCFS credit proceeds to the Clean Fuel Reward program. Therefore, while SDG&E receives equivalent base credits as a medium POU, SDG&E remits the same proportion of revenues to the statewide program as a large IOU.

Since base credits are directly attributable to EV charging, the EDU definition is aligned with electric sales. As in the current regulation, the 15-Day Changes defines a large IOU or POU as having annual load served as equal to or more than 10,000 Gigawatt-hours (“GWh”) in 2017, while a medium IOU or POU has 700 to 10,000 GWh. However, this data is outdated and should be updated to reflect the most currently available data to show “the estimated electricity use in kWh of non-metered residential plug-in electric vehicles assigned to an EDU for the reporting period.”⁵ The annual sales reflected for 2022 in the California Energy Commission’s 2023 Integrated Energy Policy Report (“IEPR”) Planning Forecast highlight the discrepancy:

EDU	2022 Electric Sales	Definition under LCFS
PG&E	88,602 GWh	Large IOU
SCE	97,680 GWh	Large IOU
SDG&E	17,867 GWh	Large IOU
LADWP	21,842 GWh	Medium POU
SMUD	10,662 GWh	Medium POU

³ See Appendix E: Purpose and Rationale of Proposed Amendments for the Low Carbon Fuel Standard Requirements (“ISOR”), at p. 15. Available at:

https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2024/lcfs2024/lcfs_appe.pdf.

⁴ Section 95483(c)(1)(A)

⁵ Section 95486.1(c)(1)(A)

Therefore, SDG&E urges CARB to update the thresholds for electric sales to align with the most recently available historical data (2022) published by the CEC. SDG&E proposes changes to the 15-Day Changes in the Appendix.

100.2 cont

2) The Two Holdback Project Lists in Section 95483(c)(1)(A)(5) *Restrictions on Use of Holdback Credits Should Be Consolidated into a Single List*

The current regulation⁶ identifies a single list of projects that the EDUs may fund through holdback credit proceeds, with targets for equity. The ISOR indicates staff's intent to enhance the list of pre-approved projects to include the priorities set from the Scoping Plan as well as community input.⁷ While SDG&E agrees that the list in pre-approved equity projects is enhanced, the 15-Day Changes introduces a second non-equity list categorized as "Other Holdback Projects" as Section 95483(c)(1)(A)(5)(b).

SDG&E recommends that the two lists be consolidated into one and that project spending be considered towards the EDUs' equity allocation compliance requirements if it benefits the communities and individuals defined in the equity holdback section. To ensure that the utilities are only deploying projects that CARB supports for equity communities and individuals, SDG&E recommends that the single project list must be used for equity projects and may be used for non-equity projects in addition to other non-equity projects that further transportation electrification in California as defined by 95491(e)(5). This approach is more straightforward, minimizes opportunity for conflicting interpretations, and provides certainty on expectations around CARB's priorities while still allowing flexibility for utilities to propose non-equity programs that are best suited to their specific service areas and customers.

SDG&E proposes revisions to the 15-Day Changes in the Appendix to reflect these comments.

100.3

3) *Ambiguity Regarding the OEM Carveout in Section 95483(c)(1) Residential EV Charging Must be Resolved*

The 15-Day Changes introduces an optional carveout of residential base credits for Original Equipment Manufacturers ("OEMs"). Specifically, "The Executive Officer may direct up to 45% of base credits to eligible OEMs, if the share of new zero emission vehicle sales for model year 2024 zero emission vehicles certified under California Code of Regulations, title 13, section 1962.2 is less than 30 percent."⁸ If the Executive Officer directs base credits to eligible OEMs, the 15-Day Changes stipulates that the requirements of section 95483(c)(1)(A)2 – *i.e.*, for opt-in EDUs to contribute a minimum percent of base credits for residential EV charging (or net base credit proceeds) toward a Clean Fuel Reward program – no longer apply. There are several challenges that must be resolved to avoid negative consequences.

⁶ Section 95483(c)(1)(A)(6)(a)

⁷ ISOR, at pp. 14-15.

⁸ 15-Day Changes, at Section 95483(c)(1)(B)

a) **Any base credits allocated to OEMs come from the EDU minimum percent CFR contribution and preserve EDU holdback allocation**

SDG&E believes that CARB's intent is that any base credits that would be allocated to OEMs would essentially take from the minimum percent of base credits for residential EV charging (or net base credit proceeds) that would have otherwise been remitted to the statewide program. However, the plain language of the 15-Day Changes stipulates otherwise. Specifically, "If the Executive Officer assigns a portion of base credits to OEMs pursuant to section 95483(c)(1)(B), **the EDUs are assigned the remaining base credits**" (emphasis added).⁹ This wording indicates that the Executive Officer would assign 45% of the entire pool of base credits to OEMs and then divide the remaining 55% among the EDUs.

Further, the 15-Day Changes provides that, "If the Executive Officer directs base credits to eligible OEMs, the requirements of section 95483(c)(1)(A)2. do not apply."¹⁰ Simply put the requirements for the EDU contributions to the CFR do not apply. However, this section contains the requirements for EDU contribution to the statewide program:

EDU Category	% Contribution
Large Investor-owned Utilities	50%
Large Publicly-owned and Medium Investor-owned Utilities	25%
Medium Publicly-owned Utilities	10%
Small Publicly-owned Utilities and Small Investor-owned Utilities	0%

While these requirements would cease to apply as currently written in the 15-Day Changes, they provide a level of clear proportionality that is absent from the OEM carveout.

This scenario could significantly decrease the allocation of base credits for EDUs that currently remit less than 45% of their credit proceeds to the statewide program. For example, small POUs and small IOUs currently have 0% contribution to the statewide program and, therefore, holdback 100% of LCFS revenues; the 15-Day Changes suggests that their allocation of base credits could be reduced. This is a critical nuance in language that can significantly reduce EDU holdback funding rather than simply redirect CFR funding. If the intent is to allocate CFR funding to the OEMs, SDG&E recommends stating that clearly in the language so that no EDUs are adversely impacted by the OEM carveout.

Therefore, CARB should (1) establish in the regulation that individual and aggregate utility holdback credits will not be reduced as a result of this directive, and (2) clarify in the regulation

⁹ 15-Day Changes, at Section 95483(c)(1)(A)

¹⁰ 15-Day Changes, at section 95483(c)(1)(B).

that in redirecting credits to the OEMs, the Executive Officer would allocate only that portion of the credits dedicated for CFR according to the table in section 95483(c)(1)(A)(2), but not to exceed 45% of the total base credits. SDG&E proposes such clarifications in Appendix A.

b) The Executive Officer should have deadlines for initiating the allocation of base credits to OEMs

As written, the 15-Day Changes enables the Executive Officer to direct base credits to OEMs at any time. Should the final order allow the Executive Officer the discretion to allocate base credits to OEMs, SDG&E recommends that the regulation stipulate a deadline to allow certainty and cost-effectiveness for the statewide rebate program. Otherwise, the EDUs risk developing, funding, and administering a program only to have it lost funding upon the Executive Officer's decision to redirect base credits to OEMs. This concern is especially acute considering the shift in the statewide program's complete focus from light-duty to medium- and heavy-duty EVs. SDG&E recommends that the 15-Day Changes be revised to allow the Executive Officer to issue a one-time decision no later than the March 15, 2025. See the Appendix for proposed changes.

100.4 cont

4) The Current 10% Cap on Administrative Costs Should be Preserved in Section 95483(c)(1)(A) Base Credits to EDUs

The 15-Day Changes maintains a reduced cap of 5% on administrative costs to support the Clean Fuel Reward program¹¹ and 7% for holdback credit projects.¹² SDG&E recommends that the 15-Day Changes preserve the cap on administrative costs for both the holdback projects and rebate program at 10%, as this is currently accepted by both CARB and the CPUC.

Based on how utilities currently track and report program administrative costs, the reduction of allowable administrative costs for utility holdback programs from 10% to 7% in the proposed amendments will make it extremely difficult, if not impossible, to administer these programs. Smaller utilities may only be able to implement a portfolio of small programs that will never benefit from the economies of scale that larger programs achieve. Meanwhile, CPUC shift in policy away from utility-specific ratepayer-funded programs, with a sunset of December 31, 2026, for these programs, places the larger IOUs in a similar predicament. While there is an option in the Regulation that allows the utilities to exceed the administrative cost caps with advanced approval from the Executive Officer, this is likely to create administrative challenges for CARB and utility staff if each utility must make a request each year that they expect to exceed the proposed 7% cap.

SDG&E recommends that, for medium and large EDUs, the cap on equity holdback administrative costs should revert to 10% as allowed in the current regulation. Please see the Appendix for all proposed revisions.

¹¹ 15-Day Changes, at Section 95483(c)(1)(A)(4)

¹² 15-Day Changes, at Section 95483(c)(1)(A)(5)(c)

SDG&E appreciates the opportunity to provide comments on this important 15-Day Changes. If you have any questions, please do not hesitate to contact me at any time.

Sincerely,

A handwritten signature in black ink, reading "Alex Moffat". The signature is written in a cursive, flowing style.

Proposed text additions are in bold and underlined (**abcd**)

Appendix A Proposed Revisions

SDG&E proposes the following modifications to the 15-Day Changes (additions in underline and deletions in ~~strikeout~~ format; numeration follows that of the 15-Day Changes):

100.1 cont

Section 95481. Definitions and Acronyms.

“Electrical Distribution Utility” means an entity that owns or operates an electrical distribution system, including:

1. a public utility as defined in the Public Utilities Code section 216 (referred to as an Investor-Owned Utility, or IOU); or
 - A. “Large Investor-owned Utility” means an IOU with annual load served equal to or more than ~~10,000~~25,000 Gigawatt-hours (GWh) in ~~2017~~2022;
 - B. “Medium Investor-owned Utility” means an IOU with annual load served of less than ~~10,000~~25,000 GWh and equal to or more than ~~700~~15,000 GWh in ~~2017~~2022;
 - C. “Small Investor-owned Utility” means an IOU with annual load served equal to or less than ~~700~~15,000 GWh in ~~2017~~2022.
2. a local publicly-owned electric utility (POU) as defined in Public Utilities Code section 224.3;
 - A. “Large Publicly-owned Utility” means a California POU with annual load served equal to or more than ~~10,000~~15,000 Gigawatt-hours (GWh) in ~~2017~~2022;
 - B. “Medium Publicly-owned Utility” means a California POU with annual load served of less than ~~10,000~~15,000 GWh and equal to or more than ~~700~~5,000 GWh in ~~2017~~2022;
 - C. “Small Publicly-owned Utility” means a California POU with annual load served of less than ~~700~~5,000 GWh in ~~2017~~2022. or (C) an Electrical Cooperative (COOP) as defined in Public Utilities Code section 2776

100.2 cont

Section 95483(c)(1)(A)(5). Restrictions on Use of Holdback Credits.

5. *Restrictions on Use of Holdback Credits.* Documentation of adherence to the following restrictions must be included in the annual report submitted pursuant to section 95491(e)(5)(A).
 - a. *Holdback Credit **Equity** Projects.* At least 75 percent of holdback credit proceeds must be used to support transportation electrification for the primary benefit of or primarily serving disadvantaged communities and/or low-income communities and/or rural areas or low-income individuals eligible under California Alternative Rates for Energy (CARE) or Family Electric Rate Assistance Program (FERA) or the definition of low-income in Health and Safety code section 50093 or the definition of low-income established by a POU’s governing body or a community in which at least 75 percent of public school students in the project area are eligible to receive free or reduced-price meals under the National School Lunch Program, or a community located on lands belonging to a state or federally recognized California Indian tribe. These projects may include:

- i. Electrification of drayage trucks as well as other medium-, heavy-duty, or off-road vehicles including school and transit buses.
 - ii. Investment in public EV charging infrastructure and EV charging infrastructure in multi-family residences.
 - iii. Investment in electric mobility solutions, such as EV sharing and ride hailing programs.
 - iv. Additional rebates and incentives for low-income individuals beyond existing local, federal and State rebates and incentives for: purchasing or leasing new or previously owned EVs; installing EV charging infrastructure in residences; and offsetting costs for residential or nonresidential EV charging.
 - v. Promoting use and additional incentives for use of public transit and other clean mobility solutions, via charging equipment or infrastructure for the following categories:
 - I. EV sharing and ride hailing programs,
 - II. Electrification of public transit and school buses, including battery swap programs, and
 - III. Use or ownership of neighborhood electric vehicles, eBikes, eScooters, eMotorcycles, and other micromobility solutions.
 - vi. Re-skilling and workforce development for transportation electrification and electric vehicle infrastructure applications, developed in coordination with the California Workforce Development Board or local workforce development agencies.
 - vii. Investments in grid-side distribution infrastructure necessary for ~~medium- and heavy-duty~~ EV charging.
 - viii. Transportation electrification projects that are identified in, or consistent with, a Community Emission Reduction Plan created in response to AB 617.
 - ix. Alternatively, EDUs, in coordination with local environmental justice advocates, local community-based organizations, and local municipalities, may develop and implement other projects that promote transportation electrification in disadvantaged and/or low-income communities and/or rural areas or for low-income individuals. These alternative projects are subject to approval by the Executive Officer. Applications submitted to the Executive Officer must include, and will be evaluated for approval based on, a complete description of the project, demonstration that the project promotes transportation electrification in disadvantaged and/or low-income communities and/or rural areas or provides increased access to electric transportation for low-income individuals, and evidence that the project was developed in coordination with local environmental justice advocates, local community-based organizations, and local municipalities.
- ~~b. Other Holdback Projects. Holdback projects that are not specified in subsection 95483(c)(1)(A)65.a. must follow the requirements specified in 95491(e)(5). Below are examples of pre-approved uses for these other holdback credit proceeds:~~**
- ~~i. Investments in grid-side distribution infrastructure necessary for EV charging.~~
 - ~~ii.~~ **x. Support for vehicle-grid integration with projects such as:**

I. Encouraging the optimization of EV charging through education in the following areas: peak demand, rate pricing, grid emergencies, potential power shutoffs, infrastructure deferral, renewable integration, and/or other signals and grid needs to provide grid and customer benefits.

II. Providing program incentives to encourage driver participation in monitored/managed charging, demand response, or vehicle-to-load / vehicle-to-grid applications.

III. Supporting the deployment and installation of bidirectional charging equipment.

IV. Other innovative approaches to promoting and managing EV charging and discharging that provides benefits to customers and the grid.

iii.xi. Hardware and software that decrease the cost of or avoid updates to infrastructure, including load management software or outlet splitting.

100.4 cont c. *Administrative Costs of Holdback Credit Equity Projects.* With the exception of EDUs with annual sales of less than 2000 GWh, a Administrative costs to support the ~~development~~ and implementation of holdback credit equity projects must not exceed ~~7~~10 percent of total spending on holdback credit equity projects annually unless the EDU contracts with a community-based organization, and the exceedance is approved in advance by the Executive Officer. The request for administrative cost exceedance for a calendar year must be submitted by September 30 of the prior year. The request must include, and will be evaluated for approval based on, a complete description of the equity projects planned by the EDU, an estimate of total administrative costs relative to total spending on the projects, and evidence that the community-based organization is a non-profit organization focused on serving disadvantaged and/or low-income groups. Within 30 days of receiving a request for higher administrative costs, the Executive Officer will inform the EDU of its decision in writing. If the request is

100.3 cont

Section 95483(c)(1). Residential EV Charging.

A. *Base Credits to EDUs.* The EDU or its designee is the credit generator for base credits for the portion of residential EV charging assigned to that EDU by the Executive Officer, except for any portion of base credits that the Executive Officer assigns to OEMs pursuant to section 95483(c)(1)(B). ~~If the Executive Officer assigns a portion of base credits to OEMs pursuant to section 95483(c)(1)(B), the EDUs are assigned the remaining base credits.~~ The EDU may authorize a third party to sell the EDU's credits. The EDU or its designee must meet the requirements set forth in paragraphs 1. through 5. below, and 95491(e)(5).

B. *Base Credits to OEMs.* No later than March 15, 2025, The Executive Officer may reallocate some or all of the EDUs' credits that would have otherwise been allocated to the Clean Fuel Rewards contributions, not to exceed direct up to 45% of base credits, to eligible OEMs, if the share of new zero emission vehicle sales for model year 2024 zero emission vehicles

certified under California Code of Regulations, title 13, section 1962.2 is less than 30 percent. If the Executive Officer directs base credits to eligible OEMs, the following provisions apply:

- i. Each EDU's base credits shall be reduced by no more than the percent contribution for the applicable EDU category as specified in section 95483 (c)(1)(A)2.
- ii. ~~¶~~ The requirements of section 95483(c)(1)(A)2 do not shall no longer apply.
- iii. No further contributions to the Clean Fuel Reward program shall be made, and the administrator of the Clean Fuel Reward program shall implement the windup procedures set forth in the statewide program Governance Agreement.
- iv. The OEM is the credit generator for base credits for the portion of residential EV charging assigned to that OEM by the Executive Officer pursuant to 95486.1(c)(1)(A).
- v. The OEM must meet the requirements set forth in paragraphs 1. through 3. below, and 95491(e)(5).

C. **OEM Eligibility.** The OEM must identify itself to the Executive Officer as eligible to generate base credits. The Executive Officer may revoke the eligibility of an OEM to generate base credits if it fails to sell base credits and spend the proceeds within three years of base credit issuance. An OEM must submit any request to change base credit generation eligibility status for base credit generation by the end of the first month of the prior quarter.

D. **Reporting Requirements.** The Executive Officer shall review the implementation of any OEM program and present a report to the Board annually, beginning January 1, 2027, with recommendations for continuing or decreasing allocations to the OEMs. Documentation of adherence to the following restrictions must be included in the annual report submitted pursuant to section 95491(e)(5)(A).

COMMENTS OF STEVE BERRY & TIM SEARCHINGER
REGARDING RENEWAL OF LOW CARBON FUEL STANDARD
(August 27, 2024)

Steven Berry, David Swenson Professor of Economics, Yale University
(steven.berry@yale.edu)

Timothy D. Searchinger, Senior Research Scholar, Princeton University
(tsearchi@princeton.edu)

We are an economist at Yale University and an environmental scientist at Princeton University and have written papers analyzing the emissions from biofuel use as well as economic land use models. Our shortform CV's are attached. Berry previously served as a consultant for CARB on economic issues related to the analysis of indirect land use change from biofuels. We offer the following comments.

101.1

There are compelling reasons to believe that biofuels are contributing significantly to global agricultural land expansion and associated greenhouse gas emissions. There is now a sound satellite study of cropland expansion, which finds that annual crops are expanding at a record rate of roughly 25 million acres per year (Potapov et al. 2021). FAO data would indicate expansion of an additional 2.5 million acres per year of perennial crops. This is net expansion, which is caused by growing global demand for agricultural products, including for biofuels.

According to the same study, global expansion is roughly double, but the roughly 20 million hectares of expansion of arable cropland is offset by roughly 10 million hectares of abandonment. Yet, even with this abandonment, the gross expansion causes additional carbon losses both because it is occurring heavily in carbon-rich lands and because the carbon losses are relatively immediate compared to the carbon gains from regrowing native vegetation. These shifts reflect the fact that agriculture is not only expanding on a net basis but also to some extent shifting, particularly into the tropics, in response to changing economics. These shifts reflect, in part, an outsourcing of agricultural production by countries in the global north, and are indicative of how demand in the global north, including for biofuels, helps to drive expansion and carbon losses in the Global South. (Pendrill et al. 2019) (T. Searchinger et al. 2022).

Oilseeds, which occupy roughly one quarter of global cropland, are major drivers of this expansion including soybeans and oil palm (Weisse and Goldman 2021). Since 2005, when global policy began to drive large increases in biofuels, biodiesel has contributed more than 40% of the increase in global demand for vegetable oil. As discussed in the attached paper regarding the GTAP model, there is strong econometric evidence that prices of vegetable oils and the major grains move in parallel in different parts of the world. This is no surprise. Any simple observation of a chart on global vegetable oil prices for different

101.1 cont vegetable oils in different parts of the world shows that their prices move closely in parallel. Global commodity traders ensure this parallel movement as they are engaged in global arbitrage. This means that vegetable oils have high substitutability at the margin. It means that increased demand for vegetable oil anywhere in the world and for any vegetable oil will tend to cause the same price response and therefore lead to similar expansion of vegetable oils. Not surprisingly, cropland will expand most where it is most economical to do so, namely in the Tropics and Neo-tropics. And vegetable oil expansion in the Global North will contribute to this cropland expansion further to replace displaced crops.

We therefore support proposed changes to the Low Carbon Fuel Standard that would impose caps on biodiesel production from virgin vegetable oil. As the above discussion indicates, this cap should be extended to all vegetable oils, including corn oil and sunflower oil, as increases in demand for any vegetable oil will cause comparable increases in demand for vegetable oil in general and will therefore elicit very similar market and land responses. There is no reason to exempt corn or sunflower oil from the cap.

101.2 More generally, in this rulemaking CARB should commit to an immediate and expeditious reevaluation of the way it estimates the climate costs of using land for biofuels.. When lifecycle analyses such as those used by CARB ignore the emissions of burning biofuels, they are implicitly offsetting these emissions by the carbon removed from the atmosphere by plant growth. This is the climate benefit. But it takes land to grow these plants, and not using this land for other purposes has a climate cost. The evaluation of biofuels is largely based on the valuation of this cost of dedicating the productive capacity of land to biofuel production. Today, indirect land use change estimated by a version of the GTAP is the only way CARB assigns a climate cost to the use of land. There are several reasons this needs prompt evaluation.

First, GTAP lacks an empirical basis, and builds in structural biases that guarantee low ILUC estimates. Many of its predictions are also contradicted by substantial bodies of empirical evidence. In summary:

- GTAP does not work with physical acres but only land revenues, which leads the model to create or destroy large quantities of land. Its economic components estimate a large ILUC, but modelers artificially readjust this estimate by a “hand of God” to conserve land area, which leads to the small ILUC. This kind of readjustment is inherently invalid. If the economic components of the model are correct, then the readjusted results are incorrect. If the economic estimates are physically impossible, then the model is invalid.
- Several invalid model features make it extremely difficult for the model to convert forests. “Unmanaged” forests do not exist in the model although they are the major concern with cropland expansion. The authors also chose a forest

area elasticity many times higher than the underlying study they cite, which causes forests to strongly resist conversion or immediately reappear elsewhere if converted in one location.

- Although the model has thousands of economic parameters, only a handful are based on any cited reference, none instrumented, and are then incorrectly applied to other products and in other regions. In addition, *every* elasticity is altered, often greatly, by a formula based on its share of a category of expenditure. That contradicts any underlying estimates, which are not based on expenditure shares. It also leads to bizarre results. For example, biofuels for fuel somehow lead to price decreases for electricity, which somehow lead to *less* electricity consumption.
- Without empirical basis, the model is programmed to prevent international land use change, which is where agricultural expansion occurs. It does so by using arbitrary assumptions to constrain trade in agricultural products. The resulting predictions are provably wrong because this leads the model to predict large price differences for crops in different parts of the world, which do not occur in reality. Because global prices of grains and vegetable oils are highly linked, changes in demand will have global effects leading to heavy cropland expansion in the Tropics, where it is cheapest.

Because CARB's emissions estimates are dependent on GTAP, it lacks an empirical basis for encouraging their use. Faced with this evidence, an argument can be made that CARB should immediately stop incentives for at a minimum crop-based biofuels. At a minimum, CARB should undertake a quick review.

101.3

Second, as also discussed in the attached paper, the ILUC estimates generated by GTAP are only around 10% of the average carbon losses from vegetation and soils that have occurred to generate the cropland used to produce the quantity of corn used in corn ethanol or the quantities of vegetable oil used in any form of biodiesel or renewable diesel. (Timothy D. Searchinger et al. 2018). (These calculations adjust generously for by-products and co-products.) In other words, if the additional corn or vegetable oil used for biofuels is replaced on the average type of land used to generate these products globally and at the average global yields, the land use emissions will be roughly ten times the ILUC estimates used by CARB. If the ILUC emissions are even around 20% of this average, the emissions reductions estimated by CARB will disappear. In the absence of compelling economic evidence that the sources of supply will be overwhelmingly lower than the global average land use source to the present date, these biofuels cannot credibly be viewed to lower emissions.

Third, even if the GTAP model were correct, the resulting policy is morally indefensible. As revealed even in the publication by the GTAP authors (Hertel et al. 2010), but also shown separately in (T.D. Searchinger et al. 2015), the ILUC number for ethanol is much lower because GTAP estimates much of the food diverted to biofuels is not replaced due to higher crop prices. As shown in the latter paper, the literal physical source of the emissions reduction is people and livestock around the world eat less carbon and therefore emit less carbon dioxide in their respiration. Global food prices primarily affect consumption by the global poor. California's implicit policy, by using GTAP, is therefore to obtain greenhouse gas reductions by increasing global food prices so that the global poor consumed less. This is an indefensible position.

Finally, the use of economic models to estimate ILUC does not actually estimate the true climate costs of devoting land to biofuels. In effect, the ILUC estimate seeks to ask what are the climate effects if California enacts expensive policies to make greater use of land for biofuels but there are no policies in the world to use land to achieve climate benefits in any other way. The true costs reflect the lost opportunity to use land in other ways to benefit the climate. These are the opportunity costs, and in economic terms, opportunity costs are costs, and that principle applies equally to climate effects as money or use of any other asset.

Land is an extremely valuable asset, with fixed global quantity, for the climate. The world needs both more food and more carbon storage. The proper measure in evaluating the costs of diverting land from food production is the quantity of carbon that could reasonably be saved by continuing that food production. And even if that food production were treated as surplus, the appropriate measure would be the quantity of carbon that could be removed from the atmosphere by reforesting "surplus" cropland. As discussed in the GTAP paper and in (T. D. Searchinger, Beringer, and Strong 2017), these alternative uses of land are vastly more valuable than using land for biofuels, even cellulosic biofuels. The best uses of U.S. corn land for climate purposes are to produce corn, but even if they were established in forest, they would reduce carbon for decades far more than biofuels. And the world faces challenges even of siting solar power. On three quarters of the world's land, solar power will generate more than 100 times the useable energy, and when used to transport cars in electric engines, will generate more than 300 times the motion. On low productivity land, the ratio extends into the thousands. Overall, the world has no substitute for the use of well-watered land for food, forests and other carbon-rich native habitats. But the world has far more efficient alternatives for the generation of energy.

The academic literature has been moving broadly to recognize that the climate uses of land must be evaluated using some form of opportunity cost (see list in Appendix A). CARB should do so as well. And once it does so, it will conclude that the dedication of the productive capacity of land to produce biofuels is a poor use of land and has adverse effects on the climate.

Evaluating the Economic Basis for GTAP and Its Use for Modeling Biofuel Land Use

Steven Berry, Timothy Searchinger, and Anton Yang
(March 19, 2024)¹

Increased biofuel use requires crops, producing crops requires cropland, and producing cropland causes losses of carbon from vegetation and soils. In a typical lifecycle context for products other than biofuels, carbon accounting attributes to each product the emissions from each input, including some of the emissions of fixed inputs to each output if they are significant. For example, some of the emissions of producing a car factory are assigned to each car. Following this straightforward approach, some of the carbon emissions of producing cropland should be assigned to each gallon of biofuel. This standard lifecycle approach makes the emissions from biofuels high because, as discussed below, the average emissions to generate a hectare of cropland greatly exceed the reduced emissions from gasoline or diesel that result from 30 years of biofuel production on that hectare.

In determining the emissions from the use of cropland for biofuels, however, governments have sometimes relied instead on complex, global economic models to estimate how much carbon will be lost from land conversion that occurs to replace crops diverted from food to biofuels, known as indirect land use change, or “ILUC”. These models can claim fewer emissions than the past average carbon losses for a crop for a variety of reasons: claims that some or much food is not replaced, claims that higher food prices lead farmers to produce more food on the same land, or for some reason, claims that the land converted to generate each additional ton of crop loses less carbon than the global average. In general, these models claim to show how biofuel demand will reallocate land in each part of the world through not just global but national or regional market pricing mechanisms, sometimes claiming to factor in interactions with the entire global economy.

GTAP is one model used to estimate ILUC, with one version used by the California Air Resources Board (CARB) and changed versions used as inputs to the GREET model at the U.S. Department of Energy. In both versions, estimated ILUC carbon losses from a gallon of corn ethanol and soybean biodiesel are extremely low, meaning there is little carbon cost for

diverting even vast areas of prime farmland to biofuel production. To serve this function, the GTAP model must be scientifically credible. This report evaluates GTAP's economics. It finds that GTAP lacks a credible economic foundation. GTAP is particularly unable to credibly evaluate land use changes.

- Of thousands of economic parameters, only a small number claim to have any direct, empirical basis. Of these, few of the cited empirical studies make any use of credible techniques for distinguishing correlation from causation and, most fundamentally, supply from demand. Regardless, these parameters are all or nearly all misapplied to data, regions, and functional forms that differ fundamentally from the original empirical results and therefore lose any statistical validity. GTAP is doing the equivalent of using parameters estimated of how the effectiveness of a drug varies by weight to estimate how its effectiveness varies by height. In effect, these parameters are claimed to predict changes in supply and demand that they do not.
- GTAP's basic economic structure is particularly unsuited to the analysis of land use change because its economic components do not reallocate land among different uses, such as pasture or forest to cropland, but instead destroy or create large quantities of physical land. These physically impossible changes in land area are then arbitrarily adjusted back to respect the actual finite quantity of land. Such "hand of God" adjustments are inherently invalid. In GTAP, these adjustments also radically reduce the ILUC results and even shrink the share of land use change from GTAP's version of forests.
- We also find that the purely assumed functional form of the GTAP model, to which parameters are misapplied, inherently leads to limited conversion of forests and low ILUC. As one example, the functional form leads GTAP to select incorrect parameters from the one underlying study that GTAP uses to estimate the "elasticity" of conversion of cropland to forest and forest to cropland. This deliberately overestimated elasticity has the effect of overestimating the economic resistance of forests to conversion by cropland, leading to limited conversion of forests. Related features also cause forests to instantly reappear in new areas. In some cases, the structural form leads to bizarre results.
- The model's structural form also cannot allow conversion of unmanaged land, which is much of the world's carbon-rich land. It also contains no notion of a standing forest that can exist for multiple reasons – there is only land that exists to produce wood. These assumptions not only force the model to ignore a major direct source of potential land use change, unmanaged land, but work backward to limit the model's loss of managed forests and even of grasslands.

- GTAP uses an outdated trade model that is designed to capture patterns of trade in manufactured goods. Applying this model to agricultural products artificially limits the predicted effects of US policy on world land use.
- We also review how additional, empirically unsupported decisions added to the model since the first version used for CARB have further reduced the estimated ILUC. As an example, the model makes a pure assumption, without any supporting economic analysis, that most new cropping area will be supplied not by expansion of cropland but by cropping existing cropland more frequently. This assumption also contradicts actual experience in the U.S.

Benchmarking ILUC

Global cropland for annual crops is expanding at an increasing rate: according to a recent, high-quality satellite-based study, annual cropland is increasing at a net rate of 10 million hectares per year (and a gross rate of roughly twice that) (Potapov et al. 2021), roughly equal to the annual harvested cropland area of Iowa. Although data limitations impede analysis of net changes in pasture area, satellites show that expansion of pasture is an even larger direct source of deforestation than cropland (Weisse and Goldman 2021).

To determine a useful benchmark for ILUC, we can ask on average how much carbon has been lost from vegetation and soils to produce the crops that go into one gallon (or one megajoule) of each biofuel. Following both national and California policy, we can then amortize, i.e., divide, this carbon loss over 30 years of biofuel production. This calculation generates an ILUC if the crop, such as corn diverted to biofuels, is replaced by the same quantity of corn on new cropland with the average global yield and with the average carbon losses that have occurred from previous cropland expansion for corn. This is the same approach taken generally for all inputs in lifecycle analyses, including for other inputs used for corn.

As shown in Table 1 (and estimated in Searchinger et al. 2018), this theoretical ILUC is 200 gCO₂/MJ for corn ethanol and 330 gCO₂/MJ of biodiesel. That number, which excludes the production emissions from use of fertilizer and fossil fuels, is roughly 3-4.5 times the direct fossil fuel savings from the use of the biofuel. By this benchmark, the GTAP ILUC estimate used by CARB is only around 10% of these average emissions in generating cropland to produce corn and soybeans. That estimated ILUC is also only around 25% of the carbon that could be sequestered by allowing U.S. corn land to grow forest (assuming carbon sequestration at 3tC/ha/year). (See Table 1). The GTAP versions incorporated into the GREET model are even lower. Implicitly, they are claiming that all the cropland in Iowa can be diverted to biofuel production -- or to any other use -- with almost no effect on global land use elsewhere and almost no resulting climate consequences.

The GTAP estimates are also far below estimates of some other recent economic model estimates. In (Lark et al. 2022), the authors found that ILUC emissions in the U.S. alone were 39

grams CO₂/MJ without counting international ILUC emissions. These high domestic emissions alone are particularly significant because international responses are likely to be higher. In Merfort et al. (2023), the authors estimated an ILUC of 92 grams CO₂/MJ for ethanol from high-yielding energy crops.

Table 1: Comparison of GTAP ILUC Estimates with Biophysical Carbon Costs

	Average global carbon loss to produce crop	Land use cost of not reforesting land at 3tC/hectare at U.S. yields	GTAP California ILUC estimate	GTAP-BIO ILUC estimate used by GREET	Exhaust pipe emissions from gasoline or diesel
Grams CO ₂ /mega joule					74
Corn ethanol	200	83	22	7.8 – 14.3	
Soybean biodiesel	330	179	27	9.1-12.1	

Biofuel figures are "land use cost" figures measured by the different methods excluding production emissions and excluding the portion of land attributable to co-products. Sources: Column 1 (Searchinger et al. 2018), column 2, author's calculations, column 3, CARB emissions estimates, column 4, GTAP results incorporated into GREET model outputs.

There are sound reasons to believe economic responses will not cause ILUC to be substantially less than those associated with the average loss of carbon in the past to create the requisite quantity of cropland. Rigorous econometric studies have shown that shocks to agricultural supply translate into similar price changes for crops around the world (Roberts and Schlenker 2013). This relationship means that increases in demand for biofuels in one region will cause similar price increases in different parts of the world and thereby stimulate cropland expansion wherever it is cheapest to do so. Although robust econometric studies are limited, where they are available, they have found that cropland expansion is highly sensitive to crop prices in carbon-rich parts of the world, such as Brazil in general and the Amazon in particular, particularly over a few years (Souza-Rodrigues 2019) (Sant'Anna 2024). These same rigorous studies have found that increased crop yields in response to higher prices play a much smaller role in replacing crops than agricultural expansion. Overall, these econometrically rigorous studies support the conclusion that cropland expansion in the parts of the world where cropland is expanding is the dominant way the market replaces crops diverted to biofuels.

The global, land use models that project substantially lower ILUC emissions than the benchmark do so for one or a combination of three reasons, all of which particularly contribute to GTAP's low ILUC estimates.

- First, a model may estimate that much of the food diverted to biofuels is not replaced because higher food prices depress consumption. New cropland is not therefore needed to replace much of the food. In the original GTAP estimates of ILUC from corn ethanol for CARB, roughly half of the food calories are not replaced. (Hertel et al. 2010)(T.D. Searchinger et al. 2015).

- Second, a model may claim that higher prices induce farmers to increase output per acre on existing agricultural land: This can occur by increasing crop yields, by intensifying pasture, or by increasing double-cropping or other forms of “cropping intensity. These effects also play a major role in GTAP (Malins, Plevin, and Edwards 2020) (Hertel et al. 2010) (Searchinger et al. 2015). In recent modeling, for example, the model predicts that 80% or more of additional cropping area in most regions is supplied not by new cropland but by growing crops on existing cropland more frequently (Malins, Plevin, and Edwards 2020).
- Third, the model may claim that converting land for new cropland releases little carbon. In recent GTAP runs for corn ethanol, 89% of the new cropland comes from grassland, with only 11% from forests (Table 1) (Taheripour, Zhao, and Tyner 2017) (Table 1). As discussed in Malins et al. (2020), some new versions of GTAP used for GREET also claim that converting much of this pasture to cropland gains soil carbon.

These functions may interact. In GTAP, for reasons discussed below, farmers directly convert overwhelmingly grassland rather than forest. In turn, livestock producers do not then significantly convert forests to replace grazing land either because GTAP projects reduced meat consumption or high livestock intensification.

The ILUC calculation depends in essence on the ratio of the three different responses to increased prices: agricultural land expansion, intensification, and food demand reductions. This means that all three responses must be soundly estimated to produce a scientifically useful ILUC estimate and errors in estimating any of these responses even in a single region could generate substantially flawed results.

Specific recent GTAP modifications that lead to a low ILUC

GTAP was originally used by the California Air Resources Board to establish an ILUC in 2010 but has undergone subsequent revisions. This section discusses specific parameter decisions made regarding GTAP, critiqued in Malins, Plevin, and Edwards (2020), and to which some GTAP modelers responded in Taheripour, Mueller, and Kwon (2021). These decisions by themselves will generate extremely low ILUC estimates in three ways:

- by increasing the “intensification” effect of cropland, so new cropland is not needed to replace crops;
- by increasing the intensification effect on pasture, so if pasture is converted to cropland, conversion of forest to pasture is not needed to replace the meat or milk;
- through adjustments to ensure that even more cropland expansion comes out of grassland not forest, plus assumptions that estimate conversion of much grassland

to cropland causes little loss of carbon. Both changes reduce the carbon losses from expanding cropland.

Although the major contribution of this paper is to focus on the underlying model, we discuss first the issues raised by these recent changes because of their ability to greatly lower ILUC and because they help illustrate how a model can generate low ILUC estimates. We agree with the critiques in Malins et al., and we add some relevant additional observations.

1. Double cropping or other increases in cropping intensity

A major feature introduced into the model is an elasticity that ensures that at least 80% of the increase in cropping area in most regions, including the U.S., results not from expansion into native lands but from cropping the same cropland more frequently (Malins, Plevin, and Edwards 2020). Such a change is modeled as an increase in “cropping intensity.” This can occur, for example, by increasing the acres that produce two crops in a year, known as “double cropping.” Because doing so reduces the need for new cropland; an 80% increase in cropping intensity reduces ILUC by 80% (relative to the estimate without this effect).

As discussed in Malins et al., the GTAP authors have neither conducted nor cited any economic analysis that estimates that increased demand causes increases in double cropping or otherwise increases cropping intensity. What the authors appear to have done is simply adopt elasticities tailored by region, which they feel match recent cropland trends in these regions. Even if there were a trend toward increased cropping intensity, that does not mean that increased demand for crops drives this trend, let alone by how much if it contributes at all.

One way to highlight the flaw in this analysis is to compare the author’s claim that 80% of U.S. cropping will be provided by increases in cropping intensity with the contrary evidence of what has happened. Although there appeared to be a small increase in double-cropping in the U.S. in the first years of the renewable fuel standard mandate, there has since been a significant decline. Double cropping over the last five years was roughly 40% lower than between 2007-2011 and among the lowest levels ever recorded in USDA data. For overall cropping intensity, which also factors in how often land is left fallow or crops fail, there has been no discernible U.S. trend for decades. (USDA data available at <https://www.ers.usda.gov/data-products/major-land-uses/major-land-uses/#Cropland>). (For the remainder of the world, poor data makes it impossible to determine even what the true trends really are.²) If nothing else, this data calls the authors’ assumptions into question.

But this change also helps illustrate the improper economic data-analysis methods that are frequently used in designing the GTAP model. The “method” here is to treat short-run observed changes in double-cropping as reflecting a large, long-run causal effect of crop prices

² As Malins et al. correctly observe, the data from the FAO that estimates a country’s area of cropland and that estimates its area harvested come from different sources using different methods. The limitations in our understanding of cropping intensity are discussed in Searchinger et al. (2019), which provides examples of how FAO statistics can conflict with results from satellite studies.

on double-cropping. Having now seen the recent data on double cropping, if they followed their own method, the GTAP modelers would presumably adjust and remove this double cropping effect for the U.S. But of course, the original decision was not based on any serious attempt to distinguish causal relationships in the data. In fact, none of this data tells us about the real effect of prices on double cropping in either direction. We discuss these issues more broadly below.

More broadly, these kinds of ad hoc adjustments turn modeling into mathematical forms of storytelling. But any number of stories could be told from the same snippets of information. For double-cropping, alternative potential stories include that the original increase in double cropping was driven by non-price factors. Alternatively, increases in cropping intensity could be explained as a short-term response to increased demand before cropland area expanded to meet demand at a lower cost. The large number of potential and contradictory story lines are why economics requires rigorous methods to tease out the effects of changes in demand or supply.

2. Demand-induced yield gains of cropland and pasture

The GTAP modelers have similarly incorporated a substantial price-induced yield effect. This was originally based on a claimed set of U.S. papers for corn and then applied to every crop and to every country in the world. The lead author here reviewed these papers for the California Air Resources Board and determined that the papers relied upon actually as a whole found no yield intensification effect after the 1960's (Berry 2011). In fact, as discussed in Malins et al., corn yields in the U.S. follow an intensely linear trend independent of price. Furthermore, applying this intensification effect to other crops and to other regions lacks any foundation at all as the physical and economic factors that determine the ratio between land expansion and intensification will vary greatly by country.

In revisions to the model, as discussed in Malins et al., a large intensification effect has also been applied to pasture. As a result, when cropland expands into pasture, little pasture expands into forest to replace the meat or milk. As quoted in Malins et al. (2020), the GTAP authors conceded that this estimate does “not have an empirical basis.”

We add that this is a particularly significant, pure assumption. Expansion of pasture into forest is the main direct source of global deforestation (Weisse and Goldman 2021). Although lacking economic rigor, several papers have found statistical associations in Brazil between conversion of pasture to cropland and knock-on expansion of pasture into forest (Lapola et al. 2013)(Lapola et al. 2010) (Arima et al. 2011). A rigorous, econometric study has shown that increases in beef prices have a strong effect on deforestation in the Brazilian Amazon (Araujo, Costa, and Sant' Anna 2020), which implies a significant knock-on effect if pasture is converted to cropland elsewhere. Other unjustified model features, discussed below, lead GTAP to project that cropland will mainly expand into pasture. By assuming little need to replace the pasture, this pure assumption therefore has the effect of additionally assuming away much ILUC.

3. Cropland pasture

The introduction of a category of land called cropland pasture was one of the model features that leads the model to project even more conversion of pasture rather than forest. Cropland pasture is land that is occasionally cropped but is used for pasture, and it became the dominant GTAP-projected source of new cropland in both the U.S. and Brazil. This was not based on any kind of economic analysis but on an observation that as U.S. biofuel production rose, USDA was reporting a continuing decline in a land use category called cropland pasture. The primary effect of this change, given the GTAP structure, is to make it even more likely that cropland will expand into pasture rather than forest. (GTAP assumes that cropland will more likely switch from one cropland use to another than expand into new non-crop uses.) As Malins et al. observe, the GTAP-GREET versions of the model then further assume that this conversion increases soil carbon, contrary to virtually all other estimates of the effect of pasture conversion. This carbon assumption means that the cropland pasture assumption, as well as other elements of the model that lead cropland to expand into pasture rather than forest, cause even larger reductions in ILUC.

As discussed in both Malins et al. (2020) and Lark et al. (2022), this trend in cropland pasture is as likely based on definition changes and measurement inconsistencies as real changes, as USDA has cautioned. Malins et al. also observe that the GTAP authors employed no economic estimates to differentiate any changes in cropland pasture due to biofuels from trend line changes. And they observe that there is no international category of cropland pasture.³ We agree with these critiques and add two observations.

First, the GTAP authors claim that the FAO category of “temporary pastures and meadows” is the global equivalent of cropland pasture, so they can apply it in Brazil (Taheripour, Mueller, and Kwon 2021). Even if this were true, in Brazil this category of land use has had a steady increase, not decrease, during the rise of biofuels, increasing in area by 20% from the average of 2003-05 average to the of 2019-2021. As in the case of double cropping, this is an example of how pure “story telling” goes awry, and why economic methods are needed instead to determine the effect of demand on land use changes.

³ In Taheripour, Mueller, and Kwon (2021), the GTAP authors claim that the decline in cropland pasture was based on USDA data and large enough to accommodate increased land for biofuels even assuming losses to alternative uses. But this claim does not address the critiques. The GTAP authors did not perform an economic analysis to determine if increased demand leads to a decrease in cropland pastures. Moreover, if the data on cropland pasture is fundamentally flawed, it could not be used for economic analysis. There might be some trend in behavior, but not knowing the true quantity of cropland pasture, it would not be possible even to try to determine its causal factors. As stated in Lark et al. 2022: “[T]he source of cropland-pasture data in the United States is the 5-year interval Census of Agriculture, where the category is a subjectively interpreted aggregate variable that has undergone significant definition changes (Bigelow and Borchers (2017)) and measurement inconsistencies (USDA 2019; 2002) across time, further rendering it inappropriate for LUC assessment.”

Second, the claim that converting cropland pasture to cropland increases soil carbon is not merely empirically unsupported but flawed conceptually because it is based on a failure to distinguish fluctuations in price from a structural shift in demand. This claim assumes that cropland pasture is marginal cropland that rotates in and out of cropping, which depresses its carbon stock relative to land used consistently as pasture (Taheripour, Mueller, and Kwon 2021). However, due to fluctuations in price, there will always be “frictional” cropland, i.e., land that is cropped in some years and not others. Even at a higher level of demand for crops due to the growth of ethanol, there will continue to be fluctuations in prices, so there will continue to be land cropped only in some years. There could be other structural economic changes that alter cropland pasture area, but there is no conceptual reason to believe, let alone econometrically established evidence, that the quantity of frictional cropland will decrease due to the rise of biofuels or other increases in demand.

GTAP’S Economic Foundation

This section goes beyond the specific, recent modeling choices discussed in *Malins et al.* to evaluate the GTAP model more generally. This part first explores the parameters and economic structure of the model. It finds that these lack an economic foundation. We then focus on the specific modeling of land use. We find that ILUC is reduced both by pure assumptions that dictate the structure of the model and particularly its land use components.

In both parts of this discussion, we show some results from running the 2010 version of GTAP-Bio. This is the only reasonably well-documented version of GTAP-Bio, and it is the version applied, with some adjustments, to generate the ILUC estimates for crop-based biofuels originally incorporated into regulations by CARB. Among our findings, we find that the basic structure of the model, by itself, can lead to odd and hard-to-explain results. One such flaw is that the economic equations in GTAP lead the model to destroy or create large quantities of land, which the model handles via a bolted-on adjustment factor that brings total land area back to its original level. In doing so, the model greatly reduces ILUC and the role played by deforestation.

This “hand of God” nonprice adjustment also contradicts the core rationale for using GTAP to study ILUC. The GTAP community often argues that some global equilibrium price model is necessary to evaluate ILUC. Both the climate benefits and costs of biofuels, including ILUC, are indeed driven entirely by the mechanisms of price changes. But GTAP’s behavioral responses to price changes do not allocate actual, physical land. The resulting ad hoc nonprice adjustments contradict the entire rationale for using GTAP in the first place. Whatever its other qualities, GTAP is therefore particularly inappropriate for estimating land effects.

1. Basic Structure of Model

At its essence, GTAP is a model for estimating shifts in supply and demand. For demand, it estimates how much changes in price for one good, whether corn, electricity, or various services, cause shifts in its consumption. (In economics, this is known as an “own-price” effect, often expressed as an “own-price elasticity.”) GTAP also estimates how this change affects the consumption of other goods. For example, if the price of corn increases, and its consumption for food and feed declines, GTAP estimates what (and to what degree) other crops or foods replace those losses. (These are known as “cross-price” effects, often expressed as a “cross-price elasticity.”) Price changes can affect consumption and production in a multitude of ways. For example, if corn prices increase, not only may livestock producers shift to other feeds, but the price of livestock products will increase, causing food consumers to shift to other foods and potentially to reduce their consumption of food overall, buying more of other goods. GTAP purports to predict all these effects.

The same adjustments occur on the supply side as producers of goods shift from one input to another. For example, if the demand for one form of energy increases, producers may not only shift to another form of energy but also reduce their energy consumption overall and shift a little to alternative inputs. GTAP purports to measure both the decline in consumption of each input whose prices increase and the shift to other inputs. GTAP purports to project these shifts, which are the core of the model, in a highly disaggregated ways: by country or groups of countries, by multiple agroecological zones (AEZs) within countries, and by product.

To do this, GTAP creates a hierarchical “tree” structure of layers, or “nests” of equations. Lower level nests result in aggregate products that are inputs to higher level nests. For example, a lower nest has the cropland used for different crop types, which compete with each other for use of cropland. The aggregate of these different uses of cropland generate a total cropland area, which is included in a higher level nest. At this higher level, cropland overall competes for the uses of total land with other uses of land, particularly grassland used for livestock and wood-producing land (GTAP’s proxy for forests). Throughout the model, GTAP modelers group goods and inputs based on an intuition of which are likely to compete more directly with each other.

Within each nest, responses to price changes are based on two factors. First, there is a “substitution parameter”, a single number, which is supposed to determine in general how likely it is that the quantity of goods produced, or the inputs used increase or decrease as a result of changes in price. We call this the “nest parameter.”⁴ However, this parameter by itself does not determine the sensitivity of change, i.e., the elasticity of supply or demand. Instead, as discussed more below, this elasticity depends both on that parameter and on a product’s share

⁴ In the literature, in ways that vary across the components of the model, this parameter might be called the “CES substitution parameter” or the “CET transformation parameter” or the “elasticity” parameter. The terms CES and CET refer to the restrictive functional forms of the model. The CES is somewhat modified in the consumer demand portions of the model, adding some additional flexibility, especially with respect to income.

of the total revenue of all products, or all inputs, within that nest.⁵ For example, the elasticity of cropland area within each agroecological zone, i.e., the extent to which the area of cropland varies with a 1% change in price, depends on both the nest parameter and on the share of total rent cropland provides of all land uses in that agroecological zone. The revenue shares and the nest parameters are the only factors determining the substitution among products in the nest when the price of one product changes.

As a result, all supply and demand elasticities are determined by a single nest parameter for all products within a nest, and by the share of revenue or cost of each product within that nest.⁶ This formula is chosen for its computational tractability not for its empirical reality. (As discussed below, it contradicts the limited economic analyses cited by the modelers to justify their choice of nest parameters.) This choice is understandable as a research strategy, but it does not produce a model that can be treated seriously as a policy tool.

2. Absence of economically estimated parameters

The first problem is that even if the overall formula were empirically grounded, its legitimacy still depends on thousands of necessary nest parameters. GTAP only even claims to base a handful of these parameters directly on *any* empirical economic analysis.

For the parameters that are claimed to have an empirical basis, none appear to be derived using modern econometrics. There is a very large literature on how to properly estimate demand and supply elasticities, including cross-price effects. It is the strong consensus of the economics profession that such estimates require changes in demand conditions (“instruments”) to estimate supply, and vice-versa. For a famous application to biofuels, see Roberts and Schlenker (2013). For the consensus around this broad idea, see papers ranging from Wright (1928) to Berry and Haile (2021). To our knowledge, none of the thousands of parameters in GTAP is based on a high-quality application of consensus econometrics.

For others, although some reference may be made for an elasticity parameter, this parameter is nearly always based on analysis of a particular product in a particular location. GTAP’s general approach is to apply the same parameters to quite different products or inputs and in multiple or all regions. In some cases, whole categories of parameters are set by pure assumption to a fixed fraction (such as one-half) of some other set of parameters.⁷

⁵ As discussed more in Appendix B and disregarding a potential expansion of all products within a nest, the precise formula is the nest parameter multiplied by 1 minus the revenue share. For example, if the nest parameter is .2 and the cropland has 60% of the total revenue, then the elasticity will be $.2 * (1-.6) = .08$. This means that a 100% increase in price will cause an 8% change in cropland area.

⁶ A parameter on an upper-level nest will then determine the percentage changes in the upper-level nests. Cost/expenditure/revenue shares play a similar role at the upper levels, interacting with the nest parameter to produce a set of computationally convenient results. At the upper level, the relevant price is a price index for the composite commodity.

⁷As examples, the elasticity of substitution in value-added-energy sub-production for many goods is the same for every region. The elasticity of substitution between domestic and imported goods is the same for firms and households, although it is not clear why demand and supply parameters should be equal. The relationship

The land use nest parameters illustrate these problems. To estimate the elasticity of cropland area, and therefore of cropland expansion, the GTAP authors originally relied on a single study, which we call *Lubowski*,⁸ focused exclusively on changes in the United States. The use of the *Lubowski* results is a “best case” for GTAP, because this is a respectable, although still imperfect, empirical study. This solely US-focused study generated highly different estimates for different land use transitions in different locations. GTAP boiled down these different elasticities to a single nest parameter for all transitions in all locations and applied this parameter to each type of land transition, in each agroecological zone, and in each of multiple countries or regions (Taheripour, Mueller, and Kwon 2021) (Hertel et al. 2010).

In reality, the relationship between cropland expansion and price will depend on widely different physical conditions in different locations, such as soil qualities, rainfall and slope, as well as economic factors such transportation costs, energy costs, property rights, and differential access to capital. *Lubowski* modeled detailed *plot-level* transitions, factoring in such variables as soil quality and prior land use. Not surprisingly, *Lubowski* found wide differences in the elasticities that should apply to different plots of land (as well as different elasticities for different types of shift in land uses as discussed below).

The land use nest parameter chosen by GTAP was intended to be an average of these different elasticities in the U.S. Given both the vast physical differences around the world, and the different economics of different land uses in different parts of the world, it would be an extraordinary coincidence if this U.S.-derived parameter could be validly applied to multiple regions and multiple countries.

This is not a correct way to do global analysis. It is economically consistent to use globally estimated parameters from global datasets to predict global responses. The biofuel analyses of Roberts and Schlenker (2013) illustrate how this can be done. GTAP-Bio 2010 instead uses local estimates from one country to distill a single parameter that is then applied to many different agroecological zones in many different regions where the parameter interacts with land use data from that zone and region. Doing so is virtually guaranteed to create invalid results as well as a spurious implication of specificity and precision where none is warranted.

Interestingly, the principal GTAP modelers decided in 2013 that applying the *Lubowski* parameter to the whole world was not justified, and they purported to “tune” this elasticity parameter to different regions. But they did not provide any economic analysis for any other

between sources of inputs and the domestic/imported allocation follows the so-called “rule of two.” For example, the so-called Armington CES for regional allocation of imports of gasoline is 4.2 and the domestic/imported allocation is one half of that. The CES elasticity of import demand for oil across sources is 10.4, and the CES elasticity between domestic and imported goods is one half of that, and so forth.

⁸ Versions of roughly the same empirical study design were published in several versions with different policy applications including (Lubowski 2002), (Lubowski, Plantinga, and Stavins 2006) (Lubowski, Plantinga, and Stavins 2008).

country or region. Instead, they appeared to still use the U.S. parameter as a kind of global, middle benchmark, although it was not. Then, after surveying regions with more or less cropland expansion, the authors subjectively raised or lowered their nest parameter from this benchmark in different regions. They did so without the use of any standard econometric method, most particularly without any attempt to determine if observed land transitions are caused by price changes as opposed to changes in any other determinants of demand and supply. The lack of economic basis is so extreme that the modelers informally chose price elasticity parameters without making use of any systematic data on prices.

Among the resulting alterations, it appears that the GTAP modelers lowered the cropland expansion parameter and therefore elasticity in the U.S. to 10% of the value ascribed to *Lubowski*. Although this U.S.-derived parameter remains the *only* land use change parameter for which the GTAP authors claim to have *any* econometric support, they picked a new U.S. value that contradicted that basis.

Model parameters matter. The lack of empirical support for GTAP is therefore disqualifying all on its own.

In a recent commentary, some GTAP authors claimed that without econometrically derived parameters, it is appropriate to “use a calibration/tuning process to proxy the missing parameters” (Taheripour, Mueller, and Kwon 2021). If there is strong econometric support for a model and its key parameters, it might be appropriate to use a sensitivity analysis to test an unknown parameter. But this model lacks virtually any parameters that are derived from appropriate econometric method applied to appropriate data variation. In this case, appropriate data would include variation in prices, quantities, and in demand side factors that shift demand curves, tracing out land supply. Moreover, the authors are not even using any combination of statistics and data to even roughly “fit” a price-quantity relationship— itself an inappropriate technique. As in the case of double cropping, they appear to be picking parameters to fit a narrative.

3. The role of revenue shares, which leads to misapplication of these parameters, and contradiction with their underlying economic analyses

Even if some or all the parameters used in the model had some empirical basis, GTAP changes their meaning by misusing them to project wildly different relationships. That is because, as discussed, all the demand and supply elasticities in GTAP, which govern the supply and demand changes, are determined also by the share of costs or revenues each product or input has within each “nest.” This feature was presumably selected because this cost share data is relatively easily available, which may be fine for a research project, but not in a serious policy realm. Its use to determine elasticities, which has large consequences, both lacks an empirical basis and contradicts the limited economics cited by the modelers.

A cake recipe can help illustrate both how a revenue share formula works and why it cannot in general be used to replace empirical estimates of how demand or supply for specific

products or inputs varies with price. Baking a cake may require flour, milk, butter, eggs, granulated sugar, powdered sugar, chocolate or vanilla, salt, sprinkles, and baking powder. Increased use of some of these ingredients may be able to partially compensate if others increase in price, but that will depend not only on the price of each but on the physical role each plays. For example, a baker might be reasonably willing to substitute powdered sugar for granulated sugar. But given the special need for baking powder, it is unlikely that increasing its cost would cause bakers to use less per cake baked. That is particularly true given the modest contribution to the total costs of a cake of a tablespoon or two of baking powder. With a high enough price increase, it is conceivable that a baker might substitute more egg white to generate the rising effect, but other ingredients probably cannot be substituted at all.

As this example illustrates, demand and supply responses in general depend on a variety of functional attributes and consumer preferences that are specific to those products, inputs, and various alternatives. Consumers will more readily substitute green beans for broccoli than lard. Producers will more readily substitute internet-based news for a newspaper than a massage, although all may be characterized as services. In none of these examples is the overall share of the cost necessarily a single factor let alone a determinative factor in determining these substitutions.

However, under the basic structure of the GTAP model, if the ingredients for a cake are put into the same nest, and the price of baking powder rises, the percentage share of each other cake ingredient will determine what is substituted. As a result, if the price of baking powder rises, GTAP would predict that consumption of baking powder will decline and will be replaced by at least some of *all* the other ingredients. Moreover, the ratios of quantities of the other ingredients replacing baking powder will be based solely on their cost shares. As a result, milk, butter, and chocolate would likely be the largest replacements, in proportion to their cost shares, even though their functional roles are distinct.⁹

Cakes are not specifically in GTAP, but this revenue-share (or cost-share) function is key to determining the elasticity of demand or supply for all products and all inputs. For example, if demand for cropland and therefore its price increases, the quantity of cropland expansion will depend on a nest parameter, but also on its revenue share. And in general, the level and type of substitute inputs (the diversion ratios) will depend exclusively on their relative revenue shares.

Appendix C uses the energy sector to illustrate how this structure leads to non-credible, results. For example, as modeled, the ethanol mandate leads to a large price increase for gasoline, producing a decline in the aggregate consumption of gasoline and ethanol. It also causes substantial declines in household electricity use, and consumption of natural gas, coal and oil for uses other than for transportation. The bizarre feature is that consumption of these other energy sources declines even though their prices decline, which should lead to their increased consumption. As explained in the Appendix, these results, which contradict economic

⁹ The formal way to discuss these “patterns of substitution” is as a “diversion ratio,” as in the land “diverted” from alternative uses to corn land when the return to corn land increases. See Conlon and Mortimer (2021). In the CES/CET functions of GTAP, within-nest diversion ratios do not depend at all on any parameter, but only on revenue/expenditure shares.

sense and do not seem to have actually occurred, are driven by the structural form of the model, i.e., in the expenditure share assumption together with the multi-level tree structure of the nests.

This theory that revenue or expenditure shares determine elasticities also *contradicts* the few economic analyses cited to generate parameter inputs and results in invalid use of their parameters. Again, GTAP claims that the elasticities governing shifts between cropland, pasture and forest – the prices at which land shifts from one use to another --- are based on each land use’s share of the total revenue of all land uses within each agroecological zone. To provide parameters for these shifts, the authors rely exclusively on *Lubowski*. However, that study found that elasticities vary with soil and prior land use, not with AEZ level revenue shares.

An analogy helps to explain the nature of the error. Consider a careful, data-based study of a health treatment that finds success varies with weight. The results might imply that the treatment should only be applied to higher weight people. Now consider a new researcher who has constructed a model that, without evidence, varies treatment success with height. This researcher could (but should not) fit an average treatment effect to people of all heights that matches the average effect found for people of all weights. This researcher could then say, “my model uses the results of the earlier treatment/weight study,” but that would be misleading. The interactions with height were purely invented. This new model could not validly be used to advise people to obtain treatment based on their heights.

As described more precisely in Appendix B, the GTAP modelers have engaged in this kind of statistically invalid effort to convert elasticities found using one kind of relationship to project changes based on entirely different relationships, i.e., changes based on revenue share. This is true for shifts among land but also true for all, or nearly all, other statistical relationships in the model.

How the Model Structure and Assumptions Lead to Physical Impossible Economic Projections and Low ILUC Estimates

This section focuses specifically on the effects of this model structure and choice of parameters on the land functions in GTAP. This function plays a key role in determining how much cropland expands and whether that expansion occurs into pasture or forest.

1. GTAP economic functions commonly destroy or create land, and GTAP then uses an artificial constraint to adjust land area in ways that greatly reduce ILUC and further lower conversion of forests.

Because land area is fixed, a land use model needs to be able to determine if cropland expands and how much of this land area comes from each alternative land use, such as pasture and forest. GTAP, however, does not actually base its economic function for allocating land on physical land areas and as a result it can (and will) create or destroy land.

The reason is that the competition between different land uses, such as cropland, grasslands, and managed forest, is represented by their share of their combined revenue within an agroecological zone. When there is a shock to the system, such as more demand for cropland for biofuels, roughly speaking, not the physical areas but the revenue from changes in pasture and managed forest need to match the revenue increase from cropland. Because each acre has a different rent, the physical areas do not match. Depending on the different price changes and other characteristics in different agroecological zones, the model “creates” physical land or “destroys” it. As shown in Appendix A, this features results in vast discrepancies. The changes in total land area are several times larger than the projected changes in cropland area.

One fundamental problem with GTAP is therefore that a viable economic model of land use change cannot create or destroy total land. This is not an insignificant technical discrepancy. The economic theory of the model is that substitutions depend on revenue shares. If the resulting model claims that land is created or destroyed, the economics are incorrect.

The second problem is how the remainder of the model responds to these economic claims. To deal with this problem of fictionally created or destroyed land, GTAP modelers have added a pure adjustment factor, which reduces or increases the area of pasture and forest automatically to match the real physical area. Such an arbitrary adjustment does not make the model economically valid. If a model claims that individual incomes increase in total vastly more than the total national income increases, it is not a sign of a valid model that the model then imposes an adjustment to reduce individual incomes proportionately to match the national income.

In addition, the adjustment factor applied by GTAP generates results that are inconsistent with its economics and result in less forest conversion and a lower ILUC. In Appendix A, we show the results before and after final adjustment of the GTAP model for the U.S. using the 2010 model version of GTAP-Bio for corn ethanol:

- As shown in Table A3, the economic projections in the model in the U.S. are for a total of 7,952 million tons of CO₂ emissions from land use change, but these shrink to 536 million tons with the adjustment (7% of the “economically” estimated ILUC).
- While the economic portion of the model projects that 54% of the non-cropland converted to cropland comes from forest, Table A2 shows this share shrinks to 34% after the adjustment. In other words, the adjustment does not just reduce total ILUC area, but it also sharply reduces the relative contribution of forests to supplying new cropland.
- In several agroecological zones, including AEZ7, which has the largest U.S. quantity of cropland expansion, the model shifts the forestry results and transforms a large decline in forestry area into an increase.

To summarize, the structure of the economics of the model produces physically impossible results. Even if the economics were reliable, the imposed adjustment factor generates an inconsistent result and lower ILUC.

2. GTAP cannot allow conversion of unmanaged land, and thereby forces intensification and demand reduction versus agricultural land expansion.

Previous commentary on GTAP has noted that it cannot model and does not allow conversion of unmanaged land. Unmanaged land can be a large part of a country's agricultural region, and its conversion is a major focus of global agricultural land expansion. Making unmanaged available for conversion would roughly double the potential area of forest that could be converted in GTAP (Plevin et al. 2022). It is difficult to imagine how a model that does not allow conversion of unmanaged land can be used to calculate ILUC. Not surprisingly, using a different model, modelers have found that incorporating unmanaged land leads to a substantially larger ILUC (Plevin et al. 2022).

The significance of this gap in GTAP will even more depress ILUC because the lack of unmanaged land also leads to more limited conversion of grassland and managed forest. In effect, grasslands and managed forest exist in GTAP only to supply livestock or wood products. Yet under GTAP, if increased crop prices were to encourage cropland conversion of these lands, livestock products and wood products cannot be alternatively supplied by expansion into unmanaged land. If cropland begins to expand into grassland, the only options are: (a) for livestock production to be intensified to replace the meat produced; (b) for meat consumption to decline, or (c) for pasture to replace "wood-producing land" not unmanaged land. In turn, for wood-producing lands, the only options are (a) intensification, which the model does not count as causing emissions, (b) a decline in wood consumption, or (c) for wood-producing lands to replace pasture elsewhere. Of these six options, five cannot cause ILUC emissions and one actually reduces ILUC emissions.

In effect, because the model does not allow people to bring more land into human use, the model will structurally favor cropland responses that do not cause ILUC. Then, because of the inability of wood production or livestock production to expand into more unmanaged land, the model will project increases in the profitability of grassland and managed forest. These price increases will further push back against cropland expansion according to essentially the same formula that causes cropland to expand. None of this is based on economic analysis but flows from the unwarranted assumption that only land with a rent can be converted and that its conversion depends on its revenue share.

In short, the model structure both makes it impossible for cropland to expand into unmanaged land, which is much of the concern with land use change, and artificially reduces the conversion of grassland and managed forest.

3. The revenue share formula requires parameter choices that reduce conversion of forest and conflict with the sole economic source of this parameter.

The *Lubowski* study, which is the sole, claimed economic basis for land conversion elasticities in GTAP, not surprisingly found that increases in cropland profitability had a far larger effect on conversion of noncropland than increases in the profitability of forest had on conversion of cropland to forest. In fact, the study found that even a doubling of the profitability of forest caused only “extremely small” changes in forest area (Lubowski 2002). (This can be seen visibly in Appendix B.) The reason is intuitive. Wood production and therefore forest “rents” are much lower than cropland rents (Lubowski 2002), so it takes much larger increases in the profitability of forestry to displace cropland than the price increases required of cropland to replace forest. As a result, any viable model, and specifically any model based on the results of *Lubowski*, should have lower elasticities for changes in managed forest area to changes in the profitability of forest than the elasticities the model has for changes in cropland area in response to changes in the profitability of cropland.

But GTAP requires that the same nest parameter that is used to estimate how much cropland expands into other lands with a change in price of cropland also controls how much other land expands into cropland with a change in the price of other land. To provide this single parameter, the GTAP authors chose a parameter that averages the elasticities of the different land uses. (Appendix B provides a more specific description.) As a result, GTAP deliberately chose a parameter that simultaneously understates the elasticity of conversion of cropland and overstates the conversion of cropland to forestry multifold. This means that relative to the findings of *Lubowski*, cropland will not expand as much in GTAP. It also means that GTAP will overestimate the rebound effect that curtails cropland expansion by overestimating the effect rising wood prices have on resisting cropland expansion.

In short, the functional form causes GTAP to fundamentally misuse the results in *Lubowski* leading to far less forest conversion than the *Lubowski* results imply and thereby to a misleadingly low ILUC.

4. Additional, incorrect assumptions about managed forests work together with the revenue-share structure to cause forests to instantly reappear elsewhere and to reduce net forest conversion.

Both the inability to convert unmanaged land to other uses, including wood production, and the misuse of *Lubowski*'s parameters lead to a strong need to preserve the existing area of managed forest to maintain wood production. Adding to this effect is the assumption that wood production lost due to conversion of managed forests cannot be replaced just by cheaply harvesting more wood from existing managed forests, resulting in additional carbon losses. In the real world, managed forests are growing, in significant part due to higher carbon dioxide fertilization and other aspects of climate change itself (Harris et al. 2021) (Pan et al. 2011) (Ruehr et al. 2023). Forests have abundant more wood that can be harvested, which means

that they can supply more wood – with a carbon cost not counted in GTAP – to replace any wood supplies lost by conversion of some managed forests to cropland.

These limitations of the GTAP structure work together not only to resist forest conversion but also to a “rebound” of agricultural land to forests. In other words, if some forests are converted to agriculture in one agroecological zone, new managed forests can reappear at the expense of agricultural land in another US zone. This is not based on any actual economic estimates – and is contradicted by the estimates in the *Lubowski* analysis that even a doubling of the profitability of forest has “extremely small” effects on forest area (Lubowski 2002).

5. How inappropriate modeling of international trade limits GTAP’s projection of U.S. biofuel consumption on world land use.

In Appendix D, we discuss the GTAP trade model. This model is based on a late 1960s idea that trade patterns in manufactured goods can best be explained by a “home bias” for domestic products. GTAP applies such a model to world agricultural trade. As explained in this Appendix, this structure goes against a large, high-quality, empirical literature that there is a well-integrated world market for homogeneous agriculture products, without home bias, limited only by transportation costs. An implication of this literature is that cross-country price differences for core agricultural commodities are severely limited by cross-country arbitrage, constrained only by (relatively low) transportation costs. GTAP does not impose this arbitrage constraint, instead allowing the modeled “home bias” to limit trade.

The empirically contradicted GTAP trade model forces much of the adjustment to U.S. biofuel policy to remain in the US. The model can predict very large changes in U.S. crop prices that are not matched by changes in other countries. This then forces much of the equilibrium adjustment onto predicted U.S. consumption and U.S. livestock intensification. A realistic model of world trade could easily predict that much more of the adjustment would take place outside of the US, particularly along active forest/crop boundaries, as in the well-measured empirical papers cited in the introduction.

Summary

In summary, we find that GTAP lacks an economic basis, is peculiarly unsuited to estimate changes in land use, and systematically and without economic foundation leads to low ILUC estimates:

- Of thousands of parameters, only a few are claimed to have any credible economic foundation for the products and locations to which they are applied. Even these parameters that are referenced by the model are misapplied. Most importantly, they are claimed to project economic changes based on revenue or cost shares,

which has large consequences, even though the original empirical studies made no such projections.

- The structure causes the model not to allocate land but to create or destroy large quantities of land relative to changes in cropland, which makes it not credible for analyzing land use change. A subsequent “hand-of-God” readjustment is required to conserve physical land area. This adjustment both greatly reduces ILUC estimates and reduces the role of deforestation – and therefore its high emissions – in contributing to additional cropland.
- The structure of the model, including its unsupported use of revenue and cost-shares, leads to low ILUC.
 - The structure prevents GTAP from allowing conversion of unmanaged land, which includes roughly half of all forests and is a major focus of global land use change. The inability to convert unmanaged land in turn leads the model to project increased profitability of managed forest and pasture, which limits their conversion to cropland.
 - The structure requires GTAP to select a single parameter for each nest, which resulted in a parameter that understates the expansion of cropland in response to price increases and vastly overstates the role that increased profitability of forestry has in resisting conversion to cropland or pasture.
 - The structure does not model standing forests and so requires an assumption that all “forestry land” is currently fully engaged in the production of wood. If forestry land is converted to cropland in one zone, this creates pressure to create forestry land in other zones to meet the continuing demand for wood. In the model, these new “forests” do not even need to grow and mature; rather they instantly appear.
- The trade model, borrowed from non-agricultural markets and without econometric support, underestimates the role that trade in agricultural goods leads to similar changes in crop prices across countries and thereby leads to large underestimates of the global land use change from U.S. changes in biofuels.
- More recent changes to the model, also without economic support, further lower ILUC in a variety of ways. One assumes, in contradiction to experience in the U.S., that most of the new cropping area is supplied by increases in double cropping or other cropping intensity. Another assumes a large, unjustified response of pasture-intensification to grassland conversion, which greatly reduces the need for pasture to expand into forest to maintain meat and milk production if other pasture is converted to cropland. A third change greatly reduces the carbon losses associated with conversion of pasture.

Many of these unjustified effects work together to generate an extremely low ILUC. Several effects cause the economic component of the model to select conversion of grassland rather than forest. The ad hoc adjustment at the end then further reduces the role of forest conversion relative to grassland. The pasture intensification function avoids the pressure to clear forest to replace pasture converted to cropland. After these factors combine to limit forest conversion, the claim that much of the grassland conversion to cropland increases soil carbon makes the remaining conversions carbon “cheap.”

In Taheripour et. al. (2021), the GTAP modelers do not claim to have significant econometric support for the model but contend, in effect, that it is appropriate to assume a model structure and most of the parameters and then adjust it to data. That is incorrect. Across the sciences, particularly those that cannot use direct experiments, there has been widespread attention to statistical abuses. Economics went through a credibility revolution in which even otherwise valid regressions were shown to be improper because they did not use “instruments” to separate correlations from causal effects (Angrist and Pischke 2010). But the calibration exercise the GTAP modelers are employing – many that involve ad hoc adjustments to parameters -- are not even making statistical errors because they are not using statistics to try to explain the effects of changed prices. They are at best assuming some stories to explain what is happening in the world and then altering parameters to fit their assumed stories. This effort is illegitimate: it is always possible to use different stories to explain the data, with different implications for the role of biofuels or any other source of increased demand.

Economics requires more. As shown, GTAP is generating results that project the lost carbon from land to generate additional crops for biofuels is only a very small fraction of the average carbon lost to produce these crops in the past. Only with these large reductions in ILUC can a model even project greenhouse gas reductions from these biofuels relative to using fossil shows. By contrast, as shown in Table 1, using this average carbon loss would indicate that crop-based biofuels do not come close to reducing greenhouse gas emissions from transportation over 30 years. This average from experience should not be disregarded absent sound economic evidence to the contrary.

Appendix A: GTAP-Bio's Projections of Changed U.S. Land Use and ILUC Projections with and Without Adjustments

This appendix shows results from the GTAP-Bio 2010 ethanol expansion policy experiment. The columns are U.S. agroecological zones (AEZs). The columns labeled "With Adjustment ..." are the reported land use changes. These are given in percentage terms in Table A1 and in physical terms in Table A2. The U.S. does not have the full set of AEZs, so while GTAP produces "percentage changes" for zones that do not exist in the U.S., they correspond to no physical change in land. The three columns labeled "economic predictions" are the values net of the ad-hoc adjustment. These are not equilibrium outcomes as defined in the model, but they are the "economic output" of the model, to which the adjustment is applied. In Table A1, we see that forestry and livestock land are arbitrarily reduced by the same number of percentage points. The cells in red represent cells where the adjustment causes projections of forest area decline by the economic model to turn into forest area increases after the adjustment. The table further shows how the model does not allow changes in unmanaged land.

Table A1.

Non-Market Ad-hoc Adjustment vs Economic Predictions in the GTAP-BIO Model (in % Change)

	With Adjustment in the Model				Economic Predictions				% Adjustment (Differences)

Note: The values in the table are presented in percentage terms.

Table A3 (on the next page) applies the GTAP land use changes in CO₂ emissions to the physical land changes in Table A2. These changes are dramatic. The "hand of God" adjustment turns large CO₂ emissions from forestry land destruction into small positive or negative changes in CO₂. For U.S. ILUC, the arbitrary adjustment factor has large effects on the predicted results.

Appendix B: How GTAP Transforms *Lubowski* Land Use Transformation Elasticities to GTAP Parameters and the Resulting Inconsistencies

The ways in which GTAP uses the estimated elasticities from Lubowski (2002) can be seen in graphs taken from the GTAP working paper (Ahmed, Hertel, and Lubowski 2009), which are reproduced below. Lubowski (2002) used a functional form that estimated different elasticities over different years, in other words, it estimated that land use conversions would occur more over time. The GTAP authors decided to use the estimated elasticity after 5 years. As can be seen in what the Ahmed paper labeled Figure 2, the percentage change in the area of forest in response to changes in forestry's own profitability is extremely small. By contrast, the response of cropland area to a percentage change in the price of cropland is many times larger. In other words, for the same percentage change in their own profitability, cropland should expand by a much larger percentage than forestry.

Figure 3 shows how GTAP translated this "own price" elasticity into the very different transformation elasticities used in GTAP, which we have called "nest parameters," and which the GTAP authors call CET values. These "nest parameters" contribute to but are not themselves elasticities in GTAP. Those elasticities depend both on the nest parameter and on the share of revenue each land use type has in each agroecological zone in each country or group of countries. The formula for the ultimate elasticity is this nest parameter multiplied by one minus the revenue share of that land use. For example, if the nest parameter is 0.2 and cropland in an AEZ has 60% of the revenue, the elasticity would be $0.2 * (1 - .6)$, which equals 0.08. Running GTAP for the U.S., the authors determined the average nest parameters values (CET values), for each of the three different land uses (cropland, pasture/range and managed forest). These are the CET values that result in the relevant elasticity predicted by *Lubowski* for that land use. Figure 3 shows that the matched nest parameters are very different for the different land uses, with particularly large differences between managed forestry and pasture or cropland. The authors chose a roughly average parameter of the three different land use types at the period of 5 years, or 0.2. They did so because the GTAP function requires that the same parameter be used for all items, such as all land uses, in the same nest.

As discussed in text, this approach has two fundamental flaws that both ensure the predictions of GTAP will not actually match those implied by *Lubowski* (2002), the claimed source, and that they will result in far less conversion of forest. One flaw is simply that the resulting CET value will result in wildly different elasticities for different land uses and in different agroecological zones and countries based on their different revenue shares. Yet *Lubowski* (2002) did not find that elasticities vary by revenue share. The GTAP function is therefore not just inconsistent but contradicts the findings in *Lubowski* even as it purports to base the model on *Lubowski*.

The second flaw is that this approach greatly overestimates the elasticity of managed forest, which leads to a strong underestimate of conversion of forest and underestimate of cropland conversion. The reason an excessive forestry elasticity also reduces cropland expansion is that the model predicts increases in the price of managed forest due to some loss

of forest area, and then, as forestry prices increases, this excessive elasticity will cause the model to over-resist net conversion of forest to cropland. As discussed in text, this excessive own price forest elasticity, which is far beyond the elasticity found in *Lubowski*, will also cause forests to expand in other agroecological zones at the expense of cropland.

Appendix C: Example and Discussion: Household Energy Consumption and the Counterintuitive Effects of the GTAP Model Structure

Examining projected changes in household energy consumption due to ethanol serves as a pedagogical exercise to understand the structure of GTAP, and illustrates how GTAP can generate counterintuitive results that likely bear little resemblance to reality. The result is most counterintuitive because the model projects household electricity consumption to fall, even as it projects declining electricity prices that should cause its consumption to increase. The reason lies in the choice of nesting structure for household energy and its interaction with the expenditure-share formula, which are hard for policy makers to understand.

The following figure displays the GTAP-Bio (2010) data on baseline household energy expenditure shares in the base year of the model.¹⁰ “Gasoline and Biofuel” is an aggregate created by a lower-level nest from a combination of gasoline and biofuels. As noted, quantities and types of energy substituted are determined by these expenditure shares and do not even depend on the nest parameter. This result means that the structure of the model will automatically create a large substitution effect if a policy changes the consumption of the gasoline-biofuel bundle.

Figure C1.

1. Gasoline & Biofuel is a combination in the GTAP model consisting of petroleum, ethanol, and biodiesel for household consumption.
2. The combination of coal and oil consumption take only less than 0.1% in the baseline data thus omitted here.

¹⁰ We frequently rely on the 2010 version of GTAP-Bio because it is by far the best documented version of the model. We have verified that most key features remain in place in a later CARB version of the model, although some components of the overall model are further elaborated by CARB.

The result of the GTAP ethanol policy simulation exercise is shown in the following figure. (It reveals market prices before taxes.)

Figure C3.

We see that the price of the gasoline-biofuel bundle is predicted to increase by over 20%. This causes the use of the combination of gasoline and biofuel to drop by more than 5%. Surprisingly, though, the consumption of household electricity and natural gas falls by more than half as much in percentage terms. One can see in the graph that these startling effects are not caused by a rising price for non-gasoline energy; in fact, they decline. We know of no attempt in the GTAP modeling community to validate their predictions that ethanol policy will cause the consumption of natural gas, fuel oil and electricity to decline without any price increase in these energy sources to motivate a decline.

It turns out that these odd results are caused by a combination of (1) the simplified way that GTAP models ethanol policy and (2) the use of a particular price index to model overall household energy consumption. The second effect, the use of special nest price indices, has important effects throughout the GTAP model.

On the first point, the modelers assume a target level of corn ethanol use (a more than 750% increase over pre-policy levels) and assume that this will be achieved via a consumption subsidy to corn ethanol. In the model, the subsidy is paid for via a tax on gasoline.¹¹ This is contrary to reality, but the modelers can only do simple policy exercises. They require that

¹¹ The choice of how to simplify a policy (and other exogenous factors) inside of GTAP is called the “closure” of the model. Discussion of model predictions are rarely related back to the decisions made about the closure, even though the choice of the closure can have large effects on policy outcomes.

government policy is budget-balanced, so the subsidy has to be offset by some tax. In the GTAP computation, the required taxes and subsidies are very large.

This artificial policy then interacts with the very structure of the model to create the odd (and very likely incorrect) results. In GTAP, a higher-level nest determines consumer expenditure on the dollar-valued “household energy bundle.” The consumption of this bundle is driven by a single price index. The percentage change in this price index is calculated as a weighted average of the percentage price changes across all the products in the nest. The weights are the fixed base-year expenditure shares displayed in the prior chart.

Since gasoline is a large part of the energy bundle, the predicted increased price of gasoline drives up this price index, as shown in the red bar of the last chart. Figure C3 shows see that the overall “price of energy” is now 10% higher. In the GTAP structure, this price increase causes a decrease in the fictional “energy composite,” which drives down the consumption of all energy. That sounds reasonable overall, but the strange result occurs because the GTAP structure simply distributes this declining energy consumption across all the energy products, even those with declining prices. It thereby causes consumption of these alternative energy products to decline even as decreases in their prices should motivate consumers to increase their consumption.

Appendix D. The GTAP Trade Model

As noted elsewhere in our report, there is strong empirical evidence of a moving cropland frontier in some places in the world. Given world trade in agricultural products, this means that diverting corn production to ethanol in the US will likely result in land use changes along these more active non-US land use frontiers. The GTAP model was originally built as a trade model, and it contains a complex model of these effects.

Over decades, the GTAP -BIO approach to trade has been rendered obsolete in the academic literature. New trade models (e.g. Eaton and Kortum (2002) and Adao, Costinot and Donaldson (2017)) are explicitly motivated by a desire to avoid the problems of models with thousands of poorly justified parameters. These new trade models feature product differentiation, imperfect competition and, above all, a key role for the effects of distance and market size (the empirically impressive “gravity” model of trade). This is very different from GTAP.

GTAP has parameters that reflect a strong “home bias” in consumption. This reflects, for example, the traditional tendency of French consumers to buy French cars while German consumers buy German, but not French, cars. The home bias effect is motivated by trade in manufactured goods and certain kinds of services. However, there is an important literature that rejects the idea of a large home bias for agricultural products. Shipping distance may still have a strong effect on fresh goods (although these are often shipped very long distances) but likely has much lower effects for non-branded bulk products like grain or food oil. It is difficult to believe that many consumers care intensely about the country-of-origin of the grain or food oil in processed foods.

In contrast to GTAP, Roberts and Schlenker (2013), published in the prestigious American Economic Review with 581 citations, uses rigorous econometric tests to show that Brazilian crop price responses to U.S. corn yield shocks are statistically indistinguishable from U.S. responses to U.S. shocks. This indicates a high degree of world market integration, consistent with the existence of large international companies who are in the business of agricultural commodity arbitrage. This empirical finding conflicts with the GTAP “home bias” assumption that restricts trade in agricultural commodities. Roberts and Schlenker also cite Fackler and Tastan (2008), who develop statistical procedures to test for market integration. They consider the market for soybeans, which they say is well-understood to be integrated. Their statistical tests confirm that “the United States/Brazil/Rotterdam markets appear to be fully integrated” in soybeans.

Berquist et al (2022) argues persuasively that credible policy analysis in agricultural policy cannot rely on GTAP style models (which are a subset of the more general traditional “CGE models”.) That paper criticizes GTAP-style models that “largely abstract from modeling the granular economic geography of farm production, consumption and trade costs” that are key to policy analysis. The paper properly distinguishes trade in homogenous goods like commodity crops from trade in manufacturing goods, for which variations in products like the

cars of Renault versus Volkswagen, create loyalties that slow shifts in trade. The paper showed how trade is still influenced by transportation costs that vary with distance, but once cross-location price differences are enough to overcome the transportation cost, new and expanded trade links can be created very quickly.

In (Villoria and Hertel 2011), the authors conceptually defend the GTAP trade model through analysis claiming that data does not prove an integrated world model of prices. Their analysis, which conflicts with papers cited above, is not convincing:

- It does not use any kind of exogenous shock ("instrument") to test market integration. The paper therefore of necessity confuses different supply and demand effects and cannot produce credible empirical results (Angrist and Pischke 2010); (Berry and Haile 2021), (Pearl 2009). By contrast, Roberts and Schlenker (2013) do make use of such shocks, which makes their results showing close price integration far more credible.
- The paper does not reference any modern trade literature.
- Although the paper rejects a theory of one global price, that does not justify use of the GTAP model, which just imposes a restriction for unknown reasons on the degree of shift in trade in response to prices. The alternative to account for differential prices is to factor the effect on prices of real, measured, transportation costs, which is an approach consistent with modern trade theory. The two approaches reach different results. A transportation cost model, with otherwise homogeneous goods such as soybeans, would impose maximum price differences between two points (with the difference being the transport cost). GTAP does not impose these maximum differences, which can result in unrealistic trade barriers because it can allow US prices to rise tremendously more than European or Brazilian prices.

Overall, there is a lack of evidence to support the GTAP approach to agricultural trade and a large well-cited literature that advocates very different approaches. These are important for ILUC. By artificially restraining trade effects in agriculture, GTAP is artificially restricting the effects of biofuel policy to the U.S. Because the crop/forest frontier is more settled in the U.S. than elsewhere, and because quickly expanding trade links are plausible, this trade feature will underestimate the world-wide land use changes.

RE: 15-day notice for comment on additional Low Carbon Fuel Standard proposed amendments announced on August 12, 2024

Dear Chair Randolph and CARB Board Members:

On behalf of the members of the American Coalition for Ethanol (ACE), I am writing in response to additional amendments proposed on August 12 by the California Air Resources Board (CARB) on the Low Carbon Fuel Standard (LCFS).

Crop-Based/Biomass Sustainability Criteria

102.1

The subject of sustainability criteria for crop-based biofuels is complex and consequential. ACE members do not believe CARB's broad yet cursory proposal, nor the brief discussion of this topic during the April 10 workshop or additional regulatory red tape proposed in the 15-day comment package of amendments, warrant implementation of such criteria within the context of the overall LCFS.

Rushing to implement such criteria could backfire. As we noted in our February 20 comment letter, the broad proposal to require pathway holders to track crop-based feedstocks to their point of origin and obtain independent third-party certification will discourage participation in the LCFS and hinder the goals of the program.

In general terms, we could support CARB's goal to ensure biomass and crop-based feedstocks used to produce low carbon fuels are not grown on land converted from forests, native grasslands or wetlands after 2008. However, the rushed approach CARB is taking without adequately defining or being transparent about what constitutes "sustainability" beyond the above-stated goal leaves us with more questions and concerns than answers. While CARB seemingly is attempting to dull the biting nature of this proposal by "phasing-in" the documentation and verification of certain feedstock supply chain data, the overall proposal still lacks adequate explanation and transparency about the underlying need or goal for sustainability criteria.

Instead, we recommend initiating a thoughtful stakeholder engagement process so all parties can better understand what CARB wants to accomplish through sustainability criteria. We believe this process can help surface the fact there are multiple existing protocols which can be relied upon to satisfy any real or perceived concerns related to ensuring the LCFS is not causing land use change (LUC) to forests, wetlands and native prairies.

102.2

One such protocol is the "R&D Greenhouse Gases, Regulated Emissions, and Energy Use in Technologies (GREET) 2023 Rev1 Technical Report" on indirect effects of biofuels completed by the U.S. Department of Energy to help establish the 40B GREET model for the 40B sustainable aviation fuel (SAF) tax credit. The Department of Energy engaged Purdue University to generate results on induced land use changes (ILUC), crop production, livestock production and rice production with its

GTAP-BIO model, and ICF to develop emission profiles of crop production, livestock production and rice paddy fields.¹

Argonne modified R&D GREET 2023 to create an updated version, R&D GREET 2023 Rev1, that addresses the lifecycle GHG emissions associated with seven SAF pathways for 40B use. The technical report includes updates to ensure the indirect effects of four SAF pathways using dedicated feedstocks (corn, soybean, canola and sugarcane) are covered. It can help inform questions CARB may have relative to indirect effects, including ILUC, from crop-based biofuels.

Second, the U.S. Department of Agriculture (USDA) has an existing and robust apparatus which, since 1985, has been enforcing certain requirements ensuring farmers meet conservation requirements on croplands in order to be eligible for federal farm programs administered by USDA's Farm Service Agency (FSA), Risk Management Agency (RMA) and Natural Resource Conservation Service (NRCS). Known as "conservation compliance," Congress charged USDA with this responsibility to ensure federal farm programs did not entice farmers to grow crops on highly erodible lands or convert wetlands for agricultural production.

Farmers who fail to abide by these rules are ineligible for federal farm programs including FSA loans and disaster assistance payments, NRCS and FSA conservation benefits, and federal crop insurance support.

USDA has 40 years of experience enforcing these provisions. Under federal regulation, farmers and affiliated persons must affirmatively attest (form AD-1026) that they will not plant or produce an agricultural commodity on highly erodible land without following an NRCS approved conservation plan or system, plant or produce an agricultural commodity on a converted wetland, or convert a wetland which makes the production of an agricultural commodity possible. Additionally, activities that may affect compliance such as removing fence rows, combining fields or conducting drainage activities must be pre-approved by USDA to ensure compliance.

USDA's FSA and NRCS are tasked with ensuring eligibility. Leveraging nearly 10,000 staff in state and county offices, NRCS is responsible for making the technical determinations of compliance at the farm level, and FSA's staff of nearly 7,000 state and county offices use this information to make program eligibility determinations for the covered programs. Farmers understand and accept this system. There is no need to re-invent the wheel. Instead, CARB should leverage USDA's existing enforcement infrastructure to verify desired sustainability criteria.

Speaking of federal fuel programs, third, as you know, the U.S. Environmental Protection Agency (EPA) is charged with enforcement of land use and total cropland acres relative to implementation of the Renewable Fuel Standard (RFS). This is yet another safeguard in place to prevent expansion of cropland for biofuel use.

102.3

Finally, ACE has previously written about a project we are engaged on with USDA's Regional Conservation Partnership Program (RCPP) to unlock corn ethanol access to LCFS markets and new tax

¹ <https://greet.anl.gov/files/greet-2023rev1-summary> April 2024. Development of R&D GREET 2023 Rev1 to Estimate Greenhouse Gas Emissions of Sustainable Aviation Fuels for 40B Provision of the Inflation Reduction Act. Michael Wang, Hao Cai, Uisung Lee, Saurajyoti Kar, Tom Sykora, and Xinyu Liu, Systems Assessment Center, Energy Systems and Infrastructure Analysis Division, Argonne National Laboratory

incentives based on the adoption of climate-smart agricultural (CSA) practices which reduce GHG emissions.

Specifically, in late 2021, NRCS provided ACE with \$7.5 million in RCPP funds to work with a member ethanol company (Dakota Ethanol, LLC) and farmers in the counties surrounding the facility to: (1) incentivize farmer adoption of CSA practices at scale, (2) partner with leading land-grant university scientists and Sandia National Laboratory to collect data to measure, verify and model resulting soil health and GHG benefits, and (3) use this data to help participating farmers access clean fuel markets and take advantage of other opportunities to monetize CSA practices.²

Since the launch of this South Dakota-based RCPP, ACE and our partners have successfully executed contracts with farmers in the seven counties surrounding Dakota Ethanol, LLC to adopt CSA practices on nearly 20,000 acres of cropland. Currently our technical team, led by South Dakota State University, is conducting ongoing verification of practices and we are making reimbursement payments to participating farmers. Soon our technical team will begin collecting soil samples and other relevant data to pressure test the agro-ecosystem models.

Based on this progress, earlier this year, NRCS invested an additional \$25 million for a larger 10-state RCPP led by ACE.³ The USDA funding will help hundreds of farmers adopt reduced and no-tillage, nutrient management and cover crops on nearly 100,000 acres across 167 counties surrounding 13 ethanol facilities partnering with ACE to implement the project in Illinois, Indiana, Iowa, Kansas, Minnesota, Missouri, Nebraska, Ohio, South Dakota and Wisconsin. The sites were strategically chosen to provide our project's scientific team with statistically significant data regarding the GHG effect of conservation practices in different soil types and climates.

ACE and our partners will accomplish three important objectives with this funding support from USDA. First, we will incentivize farmers in 10 states to adopt conservation practices. Three-fourths of the funding will go toward farmer adoption of practices. Second, our team of soil scientists and agronomists will monitor, measure and verify how the conservation practices adopted by the farmers reduce GHG emissions from corn production. The data they collect will be shared with the U.S. Department of Energy who will use it to pressure test existing models such as the GREET model to address real and perceived 'information gaps' which currently prevent farmers and ethanol producers from adequately monetizing climate-smart ag practices. Third, our ultimate objective is to empower ethanol producers and farmers with modeling and calculator tools to earn higher tax credits and premium prices in clean or low carbon fuel markets based on climate-smart ag practices. Our partners, including 13 ethanol companies and team of technical experts, are currently making plans to ensure farmers in the 167 counties are aware of their eligibility and we hope to execute contracts for initial conservation practices following the 2024 fall harvest.

While we may share CARB's goal for better understanding the GHG impacts farming practices have on crop-based biofuels, we disagree feedstocks such as corn must be tracked to their point of origin.

² <https://ethanol.org/ace-news/usda-announces-investment-in-effort-to-utilize-climate-smart-practices-to-secure-market-access-to-clean-fuel-markets-for-farmers-and-ethanol-producers>

³ <https://ethanol.org/ace-news/ace-announces-project-to-unlock-ethanols-access-to-new-markets-and-tax-credits>

Rather, GREET and other models CARB and other regulators use today to penalize corn ethanol for LUC and farm-level practices can be improved and modified to assign carbon credits based on climate-smart agriculture practices. Specifically, GREET currently estimates nitrous oxide emissions from fertilizer use, contains a module for estimating LUC penalties through the Carbon Calculator for Land Use Change from Biofuels (CCLUB), and features a relatively new Feedstock-Carbon Intensity Calculator (FD-CIC) module estimating soil carbon emissions and sequestration credits for practices such as conservation tillage and cover crops on corn production.

102.5

Capping Credits for Soy and Canola-based Biomass-based Diesel

CARB's August 12 surprise proposal to cap credits for biomass-based diesel produced from soy and canola oil to just 20% of a company's annual LCFS obligation also lacks transparency and rationale. It would appear this proposal does not apply to distillers corn oil (DCO) or used cooking oil (UCO) but once again, CARB needs to provide more information about the purpose and scientific need for such a radical proposal.

Agriculture and crop-based biofuels are poised to play an even more meaningful role in helping CARB achieve the more ambitious carbon intensity reduction targets set forth in your overall package of amendments, but proposals to limit or cap the volume of carbon credits which can be derived from crop-based biofuels would make it appear CARB is altogether abandoning the "performance-based" nature of the LCFS and simply picking winners and losers.

E15

102.6

While it is outside the scope of the proposed amendments to the LCFS, we were encouraged by discussion during the April 10 workshop about how E15 could help reduce retail pump prices. This is true. E15 typically costs 5 to 25 cents per gallon less than E10 and 40 cents to \$1.00 less than non-ethanol gasolines. E15 also has a higher octane rating, so allowing the sale of this fuel would give consumers the option to buy a higher quality product for less money. Moreover, 95% of all U.S. vehicles are approved to use E15 and nearly 3,400 retail sites offer E15 across 30 states.

We implore CARB to finally approve the use of E15 in California, noting that the Center for Environmental Research and Technology at the University of California Riverside found that replacing E10 with E15 in California will significantly improve air quality.⁴

Thank you for your time and consideration of these comments.

Sincerely,

A handwritten signature in black ink, appearing to read "B. Jennings", is written in a cursive style.

Brian Jennings, CEO
American Coalition for Ethanol

Re: Proposed 15-day Change Amendments to the Low Carbon Fuel Standard Regulation

Submitted to <https://ww2.arb.ca.gov/applications/public-comments>

Dear Chair Randolph and Honorable Board Members:

CalETC appreciates this opportunity to SUPPORT the Low Carbon Fuel Standard (LCFS) regulation and provide feedback for CARB Board member consideration. As discussed in detail below, CalETC largely supports the proposed draft regulation order ("draft order") August 12, 2024, version ("15-day changes"). However, we are urging CARB to make critical modifications to the regulation in order ensure that the utilities will be able to effectively administer the programs funded by LCFS proceeds. Attached to this letter is our February 20 letter which we are resubmitting as Appendix B and slightly changed recommended amendments in Appendix A. The changes we request are critical to ensuring the success of the LCFS program. Below we also provide additional justification for the recommendations in our February 20 letter.

CalETC is a non-profit association committed to the successful introduction and large-scale deployment of all forms of electric transportation including plug-in electric vehicles of all weight classes, transit buses, port electrification, off-road electric vehicles and equipment, and rail. Our board of directors includes Los Angeles Department of Water and Power, Pacific Gas and Electric, Sacramento Municipal Utility District, San Diego Gas and Electric, Southern California Edison, Northern California Power Agency, and the Southern California Public Power Authority. Our membership also includes major automakers, manufacturers of zero-emission trucks and buses, developers and operators of charging stations and other industry leaders supporting transportation electrification. CalETC supports and advocates for the transition to a zero-emission transportation future to spur economic growth, fuel diversity and energy independence, ensure clean air, and combat climate change. This letter is submitted on behalf of the CalETC board of directors and covers issues specific to the utility interests in LCFS. Also see our joint letter with the EV Charging Association for our comments on the non-utility provisions in the 15-day change package.

Over the past few years, the CalETC board has worked closely with the CARB LCFS staff to provide suggested amendments to the LCFS regulations. We appreciate the tremendous effort and accessibility of CARB staff during the extensive public process regarding this regulation.

Additional rational for our February 20 letter recommendations:

- 103.1 1. **Requesting a clearer list of eligible Holdback Programs.** The current list of proposed holdback projects is confusing. Utilities and their regulators need this list to be as clear as possible to help remove any ambiguity for staff and decisionmakers at CARB, CPUC, and Publicly Owned Utilities (POU). The Appendix to our February 20 letter provides our recommended amendments and detailed justification (See Appendices A and B to this letter). These recommendations also consider the needs of the dozens of medium and small EDUs in California that are at a very different stage of EV program implementation than the large EDUs. These recommended edits are necessary to make the project review and approval process simpler and to help the utilities implement equity projects:

Having one list instead of the current two lists improves clarity and allows for the implementation of more equity projects such as vehicle grid integration projects for low-income individuals and others who meet the equity definition.

- 103.2 *Allowing eMHDVs anywhere in California to clearly count as equity* is necessary as the current language is open to interpretation. Improving clarity here will allow projects supporting eMHDVs (e.g., grid side upgrades, panel upgrades, the eMHDV Clean Fuel Reward etc.) to count as equity. See Appendices A and B for more on this topic.

- 103.3 *Requiring large IOUs¹ to utilize their holdback credit revenues to fund a minimum of three program options* is necessary as there are increasingly diversified needs in transportation electrification over large service areas. Including this requirement to fund a minimum of three program options will help ensure that the large IOUs consider these diverse needs and will prevent a situation in which the large IOUs are compelled to spend all of their holdback funds on one program. The list of holdback expenditures is appropriately lengthy, in part, to meet the diverse and varied needs of priority communities and address equity. For example, the holdback list allows spending on light-, medium- and heavy duty EVs and off road EVs too. Proceeds also can be spent on projects for chargers, vehicle-grid integration, grid side upgrades, ridesharing, transit, EV rebates, micromobility, reskilling and workforce development and others. All of these are important projects. Requiring spending on at least three programs will ensure programmatic diversity and equity. CalETC proposes to limit this requirement to only the large IOUs as the other EDUs may not have enough funds to do three programs, especially with low credit prices. See Appendix A for recommended edits.

- 103.4 *The project list should preserve a narrowly focused project category for direct multilingual education, and outreach serving equity communities.* The preservation of this category is not intended to include general marketing or advertising. It is only intended to allow for multilingual education and outreach to equity communities for specific projects. The 15-day changes allow this for automaker programs, but not the EDU holdback programs. Deleting

¹ Under the proposed definitions, this would only include SCE and PG&E.

the multilingual education and outreach project category in the regulation will hurt efforts by many EDUs to reach hard-to-serve markets who speak little or no English, many of whom are low-income individuals. See Appendix A for recommended edits.

103.5 *The project list should explicitly allow for upgrades to electric panels*, which are prerequisites to transportation electrification for many customers living in older buildings that have not had recent updates. Upgrades to panels can have other benefits but are primarily to enable transportation electrification. Naming this clearly in the regulation will also help develop equity projects to serve low-income individuals with panel upgrades. See Appendix A for recommended edits.

103.6 For simplicity and clarity, *the project list should be consolidated under the recommended projects for electric mobility solutions* as there are two list items that appear to overlap regarding mobility alternatives. See Appendix A for recommended edits.

103.7 *The list of agencies that may be consulted in the creation of workforce development projects should be expanded to include other pertinent entities*, such as California Community Colleges, community-based organizations, and POU Governing Boards.

103.8 CalETC thanks CARB Staff for harmonizing the definitions of equity communities and individuals in the proposed amendments with those detailed in AB 841 and CPUC Decision D.20-12-027. However, the language requires a slight modification. AB 841 defines this as "a community located on lands belonging to a federally recognized California Indian tribe, " and *the proposed order should align with AB 841 in order to ensure simplicity*. Note the proposed amendments include term "state and federally recognized" instead of the AB 841 language.

103.9 *"Off Road Vehicle" should be defined in LCFS for clarity* because it is not obvious that vessels, aircraft, and other transportation or mobile sources qualify under that term. Off-road vehicle projects are needed in many areas including construction sites, factories, warehouses, seaports, railyards, airports and farms. Adding a definition will improve the clarity of the holdback program's list of eligible projects. See Appendix A for recommended edits.

103.10 2. **Requesting an increased cap on administrative costs for utility Holdback Programs and statewide Clean Fuel Rewards.** While we appreciate that CARB increased the administrative costs for electric distribution utility (EDU) holdback programs to seven percent, we do not support this change, and request 1) that the seven percent administrative cost cap for utility holdback programs be raised to ten percent and 2) the five percent administrative cost cap for the electric medium-and heavy duty vehicle Clean Fuel Reward be raised to ten percent. We note this recommendation is a simpler solution than the recommendations from our previous letter (see Appendix B):

a. As we explain in Appendix B, administrative cost caps are a complex issue. And this issue has not been workshopped. Given the complexity, we recommend maintaining

the current 10 percent administration cost cap on holdback programs and statewide Clean Fuel Reward. It is important to note that the CPUC has decades of experience in regulating billions of dollars in energy efficiency program portfolios and their requirements on administrative costs, marketing, education and outreach costs, and related costs are both thoughtful and strict. They require a ten percent administrative cost cap for energy efficiency programs which is appropriate for CARB's regulation of LCFS programs too. Additionally, as the EDU's LCFS programs grow in size and amount spent, we expect many projects will be added, and many additional partners (community-based, equity-oriented organizations) will be engaged. In that scenario, the EDUs may require a cap of more than 10 percent for holdback programs. Regarding examples on why a 10 percent administrative cost cap is needed for utility holdback programs please see August 27 letters to CARB from individual utilities. Also, the February 20 letter to CARB from CalETC ([Appendix B](#)) provides additional justification, and [Appendix A](#) in this letter on this topic is slightly different than our proposed amendments in our February 20 letter.

- b. The proposed statewide Clean Fuel Reward for electric medium and heavy duty EVs (eMHDVs) is a new program that should not be hampered by a five percent administrative cost cap especially since this market is complex with many submarkets and types of customers that will be hard to reach with rewards. We note that CARB's concerns about administrative costs were addressed when the CPUC authorized the utilities to implement the Clean Fuel Reward in 2019, finding that "a 10% cap of administrative funds is generally within the range of spending for other customer programs the utilities implement," and ordered SCE in Resolution E-5015 to "administer no more than 10% of the total Clean Fuel Reward program budget on administrative and marketing, education, & outreach spending, which must include all administrative spending related to the Clean Fuel Rewards program." The CPUC found that including ME&O in the 10% cap was reasonable for a program of this size; the potential scale of the Clean Fuel Reward is no larger today than it was in 2019, and the same rationale should apply today. In addition, the utilities should not have a lower cap (i.e., five percent) for this program than the automakers (i.e., seven percent) for a similar program for light duty EVs. An additional rationale for our recommendation is in [Appendix B](#).

- 103.11 3. **Clarifying that Publicly Owned Utilities must spend 50% of holdback funds on equity projects, consistent with the intent in the 45-day package.** Appendix E in the 45-day LCFS proposed order gives the rationale for 50%, and we understand that 50% allocation was CARB's intent. This change is necessary to eliminate the inconsistency. Moreover, maintaining a 50% equity spending requirement is appropriate for POUs, as further detailed in [Appendix B](#) to this letter.

103.12

4. Update the EDU definition based on 2022 sales data, clarifying that San Diego Gas & Electric Company is a “medium-sized” utility under the regulation for all the reasons listed in [Appendix B](#). Appendix E in the 45-day LCFS proposed order gives the rationale for San Diego Gas & Electric Company (SDG&) as a medium-sized EDU, and we understand that was CARB’s intent. In general, CARB should use GWh definitions consistent with the 2022 EDU annual sales data in the California Energy Commission’s 2023 Integrated Energy Policy Report’s Planning Forecast. This report makes clear that SDG&E is a medium-sized utility with a similar volume of sales as the Los Angeles Department of Water and Power. We recommend small POUs be defined as having less than 5,000 GWh annual sales. See proposed amendments in [Appendix A](#).

103.13

5. Exempt holdback programs administered by EDUs with less than 2000 GWhs of annual sales from a cap on administrative costs, or make them subject to a higher cap, such as 20%. While small EDUs can design and implement programs specifically tailored to their community needs, administrative costs for these EDUs may naturally result in a higher percentage of costs due to the small scale of programs and the utility’s limited staff resources, particularly if the definition of administrative costs is expanded. We do not support the alternative solution of having a process where small EDUs would seek an exemption (EO approval) due to the cost and time burden. Small EDUs have very different LCFS program needs due to their very small size and lack of budget and staff.

103.14

6. Make edits to the regulation that will assist smaller utilities, potentially allowing them to participate in LCFS. See the rationale for our proposal in [Appendix B](#) and proposed amendment in [Appendix A](#). Our proposal would support approximately twenty small rural utilities who cover about one percent of California to opt-into LCFS.
7. Modifying the utility reporting requirements to better track deployment of funds to impacted communities, align with the reporting framework required by the California Public Utilities Commission (CPUC), and simplify reporting for smaller utilities. See the rationale for our proposal in [Appendix B](#) and proposed amendment in [Appendix A](#). CARB and the CPUC currently measure equity in very different ways, and our proposal would harmonize with how this is done by the two agencies. In addition, our proposal benefits the POUs with a simpler, more practical way to report compliance with the LCFS equity provisions.

CalETC appreciates the opportunity to provide comments on this important regulation. If you have any questions, please do not hesitate to contact me at any time.

Best,

Appendix A (note: slightly different than CalETC's February 20th letter)

New or updated Defined Terms to be added to the Regulation's Definitions and Acronyms

~~[New term] "EDU Program Administrative Costs" are all costs associated with implementing LCFS-funded programs incurred by an EDU to pay for its staff, 3rd party implementers, non-incentive implementation costs (rebates processing, application verification, etc.) websites, application portals, and other direct program costs required to operate the program. EDU Program Administrative Costs do not include marketing, education and outreach costs.~~

[Updated term] "Clean Fuel Reward" is a statewide program established by EDUs to provide a reduction in price ~~on new light duty EV purchases or leases~~ for new and/or used commercial medium- or heavy-duty electric vehicles that are not subject to the High Priority and Federal Fleets requirements as specified in, title 13, California Code of Regulations, section 2015(a)(1) in California. The Clean Fuel Reward is funded exclusively through LCFS proceeds generated by EDUs from electricity fuel.

[New term] "Commercial vehicle" for the purposes of this program means any vehicle used by a business, public or governmental agency, or non-profit to carry people, property, or hazardous materials.²

~~"Rural Area" means a census tract with at least 75 percent of its population identified as rural non urban by the latest US Census data.~~

[New term] "Off road vehicle" is a piece of equipment that is moved over distances in order to transport goods or people from one physical location to another and is not primarily operated on roads established for automotive transport (e.g. fields, waterways, construction sites, airports, airways, etc.).

Recommendations for edits to the holdback program

5. *Restrictions on the Use of Holdback Credits.* Documentation of adherence to the following restrictions must be included in the annual report submitted pursuant to section 95491(e)(5)(A).
 - a. *Holdback Credit Equity Projects.* Effective January 1, 2022~~5~~, at least 75 percent in year one, 40 percent in year two, and 50 percent in subsequent years of holdback credit ~~proceeds~~ annual spending for large and medium investor owned EDUs and 50 percent of holdback credit annual spending for all other EDUs must be used to support transportation electrification for underserved individuals and

² HVIP FY22-23 Implementation Manual, Definitions, page 52 [HVIP-FY22-23-Implementation-Manual.pdf \(californiahvip.org\)](https://californiahvip.org)

communities. Any project from sections 95483(c)(5)(a)(i), (viii), or (xi) shall be considered a holdback credit equity project; all other projects described in this paragraph may be considered holdback credit equity projects provided they are for the primary benefit of or primarily serving disadvantaged communities and/or low-income communities and/or rural areas or low-income individuals eligible under California Alternative Rates for Energy (CARE) or Family Electric Rate Assistance Program (FERA) or the definition of low-income in Health and Safety code section 50093 or the definition of low-income established by a POU's governing body or a community in which at least 75 percent of public school students in the project area are eligible to receive free or reduced-price meals under the National School Lunch Program, or a community located on lands belonging to a ~~state and~~ federally recognizes California Indian tribe.

If an EDU fails to spend the required percentage on equity projects in a calendar year, the shortfall of spending, in dollars, will be added to their total equity spending requirement for the following year.

~~a.~~

~~b.~~ EDUs must use their holdback credits to implement additional projects that further transportation electrification efforts in California. Project costs may include incentives; infrastructure installation; administration; marketing, education, and outreach (ME&O); evaluation; and other cost categories as needed. Equity projects as defined in this paragraph must be selected from the options of projects listed in i-x below. Non-equity projects may be selected from the options on this list, or any alternative provided the EDU meets the requirements of 95491(e)(5) without further CARB approval. The large investor-owned utilities must implement at least three different holdback projects. Equity holdback project options are listed below: ~~These projects may include:~~

- ~~i.~~ Electrification and battery swap programs for school or transit buses.
- ~~ii.~~ Electrification of drayage trucks as well as other medium-, heavy-duty, or off-road vehicles including school and transit buses.
- ~~iii.~~ Investment in public EV charging infrastructure and EV charging infrastructure in multi-family residences.
- ~~iv.~~ Investment in electric mobility solutions, such as EV sharing and ride hailing programs.

- ~~v.~~ Multilingual marketing, education, and outreach designed to increase awareness and adoption of EVs and clean mobility options and including information about: the environmental, economic, and health benefits of EV transportation; basic maintenance and charging of EVs; electric rates designed to encourage EV use; and local, state, and federal incentives available for purchase of EVs.
- vi. *[Revised Subsection v. renumber as iii]* ~~Multilingual marketing, education, and outreach~~ community education events located within communities listed in 95483(c)(1)(A) designed to increase awareness and adoption of EVs and clean mobility options, and outreach in coordination with community-based organizations, including but not limited to neighborhood canvassing, community listening sessions, and needs assessments, focused in communities listed in 95483(c)(1)(A), to inform the development of projects and programs tailored to community needs. ~~including information about: the environmental, economic, and health benefits of EV transportation; basic maintenance and charging of EVs; electric rates designed to encourage EV use; and local, state, and federal incentives available for purchase of EVs.~~ Education and outreach do not include general marketing or advertising campaigns.
- ~~vii.~~
- ~~viii.~~ ~~iv.~~ Additional rebates and incentives ~~for low-income individuals~~ beyond existing local, federal and State rebates and incentives ~~including the Clean Fuel Reward~~ for: purchasing or leasing new or previously owned EVs; installing EV charging infrastructure in residences, including panel and service upgrades; ~~promoting use of public transit and other clean mobility solutions;~~ and offsetting costs for residential or nonresidential EV charging.
- v. Investing in, or promoting the ~~Promoting~~ use of, and additional incentives for use of public transit and other clean mobility solutions, via charging equipment or infrastructure for the following categories such as:

- I. EV sharing and ride hailing programs,
- II. Electrification of public transit and school buses, including battery swap programs, and
- III. Use or ownership of neighborhood electric vehicles, eBikes, eScooters, eMotorcycles, and other micromobility solutions.
- IV. Charging equipment or infrastructure for any of the above.
- vi. Re-skilling and workforce development for transportation electrification and electric vehicle infrastructure applications, developed in coordination with the California Workforce Development Board, ~~or~~ local workforce development agencies, a community-based organization, a California Community College, or a workforce strategy adopted by the Board of a POU.
- vii. Investments in grid-side distribution infrastructure necessary for ~~medium and heavy duty~~ EV charging.
- viii. Transportation Electrification projects that are identified in, or consistent with, a Community Emission Reduction Plan created in response to AB 617.
- ix. Support for vehicle-grid integration with projects such as:
 - I. Encouraging the optimization of EV charging through education in the following areas: peak demand, rate pricing, grid emergencies, potential power shutoffs, infrastructure deferral, renewable integration, and/or other signals and grid needs to provide grid and customer benefits.
 - II. Providing program incentives to encourage driver participation in monitored/managed charging, demand response, or vehicle-to-

load / vehicle-to- grid applications.

III. Supporting the deployment and installation of bidirectional charging equipment.

IV. Other innovative approaches to promoting and managing EV charging and discharging provide benefits to customers and the grid.

X. Hardware and software that decrease the cost of or avoid updates to infrastructure, including load management software or outlet splitting.

~~vii.~~xi. Alternatively, EDUs, in coordination with local environmental justice advocates, local community-based organizations, and local municipalities, may develop and implement other projects that promote transportation electrification in disadvantaged and/or low-income communities and/or rural areas or for low-income individuals. These alternative projects are subject to approval by the Executive Officer. Applications submitted to the Executive Officer must include, and will be evaluated for approval based on, a complete description of the project, demonstration that the project promotes transportation electrification in disadvantaged and/or low-income communities and/or rural areas or provides increased access to electric transportation for low-income individuals, and evidence that the project was developed in coordination with local environmental justice advocates, local community-based organizations, and local municipalities.

b. ~~*Additional Reporting Requirements for Holdback Credit Equity Projects.*~~ As part of annual reporting required pursuant to section 95491(d)(3)(A)5., EDUs must include a discussion on how their portfolio of holdback credit equity projects is consistent with the findings and recommendations of the SB 350 Low Income Barriers Study, Part B report prepared by CARB (rev. Feb. 2018), incorporated herein. This discussion must include, as applicable, a description of how the projects:

support increased access to clean transportation and mobility options; consider, and to the extent feasible, either complement or build upon existing CARB, other State, or local incentive projects to diversify and maximize benefits from statewide investments; demonstrate partnership and support from local community based organizations; and meet community identified clean transportation needs.

~~b. Other Holdback Projects. Holdback projects that are not specified in subsection 95483(c)(1)(A)6.a. must follow the requirements specified in 95491(e)(5). Below are examples of pre-approved uses for these other holdback credit proceeds:~~

~~i. Investments in grid side distribution infrastructure necessary for EV charging.~~

~~ii. Support for vehicle grid integration with projects such as:~~

~~I. Encouraging the optimization of EV charging through education in the following areas: peak demand, rate pricing, grid emergencies, potential power shutoffs, infrastructure deferral, renewable integration, and/or other signals and grid needs to provide grid and customer benefits.~~

~~II. Providing program incentives to encourage driver participation in monitored/managed charging, demand response, or vehicle to load /vehicle to grid applications.~~

~~III. Supporting the deployment and installation of bidirectional charging equipment.~~

~~IV. Other innovative approaches to promoting and managing EV charging and discharging that provides benefits to customers and the grid.~~

~~iii. Hardware and software that decrease the cost of or avoid updates to infrastructure, including load management software or outlet splitting.~~

b. Administrative Costs of Holdback Credit Equity Projects. With the exception of EDUs with annual sales of less than 2000 GWh, EDU Program administrative costs to support the ~~development and~~ implementation of holdback credit equity projects excluding start-up costs (those costs associated with setting up the program and incurred prior to issuing incentives), must not exceed 10.7 percent of total spending on holdback credit equity projects annually unless the EDU contracts with a community-based organization, and the exceedance is approved in advance by the Executive Officer. The request for administrative cost exceedance for a calendar year must be submitted by September 30th of the prior year. The request must include, and will be evaluated for approval based on, a complete description of the equity projects planned by the EDU, an estimate of total administrative costs relative to total spending on the projects, and evidence that the community-based organization is a non-profit organization focused on serving disadvantaged and/or low-income groups.

Within 30 days of receiving a request for higher administrative costs, the Executive Officer will inform the EDU of its decision in writing. If the request is rejected the Executive Officer will provide a rationale for the decision. If the rejection is due to insufficient information, the EDU may resubmit the request after addressing the deficiencies identified in the Executive Officer decision.

Recommended amendments on administrative cost

§95483(c)(1)(A)(4) Combined Administrative and marketing, education and outreach costs, excluding start-up costs (those costs associated with setting up the program and incurred prior to issuing rewards), to support any Clean Fuel Reward program funded by LCFS credit proceeds may not exceed 5.10 percent of LCFS credit proceeds contributed to the Clean Fuel Reward program annually, unless approved in advance by the Executive Officer.

§95483(c)(1)(A)(4)(a) A request to exceed 5.10 percent administrative and marketing education and outreach costs must be submitted by the administrator of the Clean Fuel Reward program to the Executive Officer by September 30 of the prior year.

Recommended edits to the definition of “Electrical Distribution Utility.”

§95481. Definitions and Acronyms

“Electrical Distribution Utility” means an entity that owns or operates an electrical distribution system, including:

- (1) a public utility as defined in the Public Utilities Code section 216 (referred to as an Investor-Owned Utility, or IOU); or
- A. “Large Investor-owned Utility” means an IOU with annual load served equal to or more than 10,000 25,000 Gigawatt-hours (GWh) in 2017 2022;
- B. “Medium Investor-owned Utility” means an IOU with annual load served of less than 10,000 25,000 GWh and equal to or more than 700 15,000 GWh in 2017 2022;

- C. “Small Investor-owned Utility” means an IOU with annual load served equal to or less than ~~700~~ 15,000 GWh in ~~2017~~ 2022.

or

- (2) a local publicly owned electric utility (POU) as defined in Public Utilities Code section 224.3;
- A. “Large Publicly owned Utility” means a California POU with annual load served equal to or more than ~~10,000~~ 15,000 Gigawatt-hours (GWh) in ~~2017~~ 2022;
- B. “Medium Publicly owned Utility” means a California POU with annual load served of less than ~~10,000~~ 15,000 GWh and equal to or more than 7005,000 GWh in ~~2017~~ 2022;
- C. “Small Publicly owned Utility” means a California POU with annual load served of less than ~~700~~ 5,000 GWh in ~~2017~~ 2022. Or
- D. (C) an Electrical Cooperative (COOP) as defined in Public Utilities Code section 2776

Recommended amendments for a new Small EDU program

[New provision – exact location TBD] §95483(c)(1)(A) XXXX Proceeds from non-opt-in EDU base credits that were allocated to the Large EDUs beginning with the deposit of Q2 2019 credits through the deposit of Q2 2024 credits and the transferred to the Clean Fuel Reward program pursuant to section 95483 (c)(1)(A) may be transferred by the Clean Fuel Reward Program Administrator to small EDUs opted in to the LCFS program by March 31, 2025. Any base credit proceeds reallocated in this manner must be spent by the recipient small EDU in accordance with sections 95491 (e)(5) and 95483 (c)(1)(A). The Executive Officer must approve the Clean Fuel Reward Program Administrator’s plan for distribution of previously unallocated base credit proceeds prior to any transfers.

Appendix B- CalETC Board's February 2024 Letter

February 20, 2024

Honorable Chair Liane Randolph and Honorable Board Members California Air Resources Board
1001 I Street
P.O. Box 2815
Sacramento, CA 95812

Re: Proposed Amendments to the Low Carbon Fuel Standard Regulation

Submitted to <https://ww2.arb.ca.gov/applications/public-comments>

Dear Chair Randolph and Honorable Board Members:

CalETC appreciates this opportunity to SUPPORT the Low Carbon Fuel Standard (LCFS) regulation and provide feedback for CARB Board member consideration. As discussed in detail below, CalETC largely supports the proposed draft regulation order ("draft order"), however, we are urging CARB to make some modifications to ensure that the utilities will be able to effectively administer the programs funded by LCFS proceeds. These changes are critical to ensuring the success of the LCFS program.

CalETC is a non-profit association committed to the successful introduction and large-scale deployment of all forms of electric transportation including plug-in electric vehicles of all weight classes, transit buses, port electrification, off-road electric vehicles and equipment, and rail. Our board of directors includes Los Angeles Department of Water and Power, Pacific Gas and Electric, Sacramento Municipal Utility District, San Diego Gas and Electric, Southern California Edison, Northern California Power Agency, and the Southern California Public Power Authority. Our membership also includes major automakers, manufacturers of zero-emission trucks and buses, developers and operators of charging stations and other industry leaders supporting transportation electrification. CalETC supports and advocates for the transition to a zero-emission transportation future to spur economic growth, fuel diversity and energy independence, ensure clean air, and combat climate change. This letter is submitted on behalf of the CalETC board of directors and covers issues specific to the utility interests in LCFS.

Over the past few years, the CalETC board has worked closely with the CARB LCFS staff to provide suggested amendments to the LCFS regulations. We appreciate the tremendous effort and accessibility of CARB staff during the extensive public process regarding this regulation.

I. Executive Summary of CalETC Utility Comments

CalETC requests specific changes to the draft order to ensure that the utilities will be able to effectively administer programs funded by LCFS proceeds. These changes include: (1) ensuring that the cap on administrative costs for both holdback programs and the statewide California Clean Fuel Reward (CCFR) program is clearly defined and set at a reasonable amount; (2) simplifying and clarifying the language in the proposed regulation pertaining to utility “holdback” (holdback) programs; (3) clarifying that Publicly Owned Utilities must spend 50% of holdback funds on equity projects, as opposed to 75%; (4) clarifying that San Diego Gas and Electric is a “medium-sized” utility under the regulation; (5) making edits to the regulation that will assist smaller utilities, potentially allowing them to participate in LCFS; (6) modifying the utility reporting requirements to better track deployment of funds to impacted communities, align with the reporting framework required by the California Public Utilities Commission (CPUC), and simplify reporting for smaller utilities; (7) requesting that the regulation allow the Executive Officer to approve certain modifications to the CCFR that can improve program responsiveness and efficacy; and (8) requesting implementation assistance on the Credit Clearance Market (CCM). All of these modifications are discussed in Section II, below.

CalETC supports many provisions in the draft order including, but not limited to: (1) the current program design with utilities generating the “base” LCFS residential credits; (2) the provision of more credits to the utility holdback programs; and (3) the establishment of a statewide medium-and-heavy-duty electric vehicle rebate program for new and used vehicles. A detailed description of the rationale behind CalETC’s support positions is included in Section III, below.

II. CalETC Requests the Following Important Changes to the Draft Order

CalETC respectfully requests that the following changes be made to the Draft Order:

(1) CalETC opposes the proposed 5% cap on administrative costs for both holdback programs and the statewide California Clean Fuel Reward and recommends that the cap remain at 10%

Based on how utilities currently track and report program administrative costs, the reduction of allowable administrative costs for utility holdback programs from 10% to 5% in the proposed amendments will make it extremely difficult, if not impossible, to administer these programs. Given their focus on addressing the most underserved individuals and communities, utility holdback programs are necessarily more expensive to operate than broad, unrestricted incentive programs given higher levels of customer support and additional expenses like income verification needed to ensure the funding is reaching the people that most need it. Additionally, smaller utilities may only be able to implement a portfolio of small programs that will never benefit from the economies of scale that larger programs achieve. While there is an option in the Regulation that allows the utilities to exceed the administrative cost caps with advanced approval from the Executive Officer, this is likely to create administrative challenges for CARB and utility staff if each utility must make a request each year that they expect to exceed the proposed 5% cap.

CalETC acknowledges, however, that there may be differences in how CARB Staff and the electrical distribution utilities (EDUs) interpret “administrative costs” as this is not a defined term in the Regulation. While CARB Guidance 20-03 does provide some insight into what might be considered administrative costs, it appears to be inclusive only of the utility’s administrative staff costs (salary, benefits, training, travel, etc.) and does not mention other program-specific costs that have typically been reported as “administrative costs” in past and current utility LCFS programs to CARB and the CPUC . These include critical program activities such as third-party administrative costs, rebate processing fees, applicant and income verification costs, website licenses and fees, and other direct, but non-incentive, program costs. It has been customary for the IOUs to report all these additional costs as “administrative costs” to both CARB and the CPUC in their annual LCFS reports based on the history of discussion in various CPUC Decisions and their experience with other customer programs.³

So, while it may be possible to implement utility Holdback programs with a 5% administrative cost cap under the narrow definition considered in Guidance 20-03, CalETC recommends that, with the exception of small EDUs that have annual electricity sales of less than 2000 GWh, the cap on equity holdback administrative costs should revert to 10% as allowed in the current Regulation, and that the definition should be expanded to include all associated program administrative costs, with the exception of start-up costs and education and outreach costs. Start-up costs, defined as set-up costs that occur before any incentives can be paid, are already excluded from the CCFR. Because costs before program launch are almost 100% administrative, it is nearly impossible to meet any administrative cap in the year a program is being set up. For small EDUs, CalETC proposes that they are not subject to a cap on administrative costs. To this end, CalETC has proposed a definition of EDU Program Administrative Costs in Appendix B that should be included in the Definitions and Acronyms section of the Regulation.

For small EDUs, CalETC proposes that they are not subject to a cap on administrative costs, or are subject to a higher cap, such as 20%. While Small EDUs are able to design and implement programs specifically tailored to their community needs, administrative costs for these EDUs may naturally result in a higher percentage of costs due to the small scale of programs and the utility’s limited staff resources, particularly if the definition of administrative costs is expanded. The 2000 GWh exemption makes sense as a natural break in utility sizes when looking at 2022 CEC data on total electricity sales. While there is a process for EO approval of administrative costs exceeding 10%, the process would place yet another administrative burden on small EDUs to go through the process annually and require additional LCFS Staff time. Furthermore, the process requires a contract with a community-based organization, which is limiting. Many small EDU equity projects incorporate partnerships and collaboration with a CBO without a formal contract.

To further illustrate how other program operating costs are different than the definition of administrative costs in Guidance 20-03, consider the investor-owned utilities (IOUs) energy efficiency program portfolios, which have administered billions of dollars of incentive funds

³ See D.14-12-083, D.20-12-027, and CPUC Resolution E-5015.

throughout the state with oversight from the CPUC, are operated under guidelines established in the Energy Efficiency Policy Manual⁴. As shown in the Table below, Appendix C of the Energy Efficiency Policy Manual lists the cost caps (hard requirements) and targets that the CPUC established for the operations of these programs.

Appendix C Table: Energy Efficiency Policy Manual APPENDIX C Cost Category Caps

Budget Categories	Cap	Target
Utility program administrative costs	10%	
Third-party / Gov't partnership administrative costs		10%
Marketing & outreach costs		6%
Direct implementation non-incentive (DINI) costs		20%
Evaluation, measurement & verification (EM&V) costs	4%	

In addition to being separate from ME&O costs, administrative costs, as defined in the Energy Efficiency Policy Manual, explicitly exclude third party implementer fees, and also exclude direct implementation non-incentive (DINI) costs (which include activities such as software licenses, rebate processing, contractor training, etc.). CalETC's request to expand the definition of administrative costs to include things such as third-party implementer costs and DINI costs while imposing a cap of 10% is more conservative than the requirements of the Energy Efficiency Policy Manual while still allowing the utilities the budgets needed to effectively operate their LCFS-funded programs.

CalETC has confirmed with CARB staff that ME&O costs for holdback are not included as part of administrative costs in any LCFS guidance document. In addition, as noted above, the CPUC does not include ME&O as part of administrative costs for other programs, including current LCFS programs. We recommend that ME&O should be excluded from administrative costs in the new LCFS regulation to reduce uncertainty and improve clarity. See Appendix B for our proposed amendments.

With this expanded definition of administrative costs, CalETC also recommends that the allowable cost cap for the statewide Clean Fuel Reward, which currently includes ME&O costs, be reverted to 10% from the 5% that is in the proposed regulation. While CARB Staff have expressed reasonable concerns that the potential size of the Clean Fuel Reward could allow for very large administrative and ME&O budgets, it should be noted that these same concerns were addressed when the CPUC authorized the utilities to implement the Clean Fuel Reward in 2019, finding that "a 10% cap of administrative funds is generally within the range of spending for other customer programs the utilities implement," and ordered SCE in Resolution E-5015 to "administer no more than 10% of the total Clean Fuel Reward program budget on administrative and marketing, education, & outreach spending, which must include all administrative spending related to the Clean Fuel Rewards program." The CPUC found that including ME&O in the 10% cap was reasonable for a program of this size; the potential scale of the Clean Fuel Reward is no larger today than it was in

⁴ Version 6 located at [6442465683-ee-policy-manual-revised-march-20-2020-b.pdf \(ca.gov\)](https://www.cpuc.ca.gov/6442465683-ee-policy-manual-revised-march-20-2020-b.pdf)

2019, and the same rationale should apply today. Further, we do not believe that either the Clean Fuel Reward or holdback programs will grow so large in the near term that the administrative costs will be too large. CARB will be doing another LCFS rulemaking in a few years and should closely monitor administrative costs and address if there is a problem.

Therefore, the proposed amendment's 5% cap should be rejected, and instead should revert to 1) the 10% allowable administrative costs for utility equity holdback programs, excluding startup costs and ME&O, as this is currently accepted by both CARB and the CPUC, 2) the 10% cap on allowable combined administrative and ME&O costs for the Clean Fuel Reward programs, as authorized in the current version of the LCFS Regulation and concurrent CPUC Resolutions, and 3) a more expansive definition of administrative costs that explicitly excludes ME&O should be added to the regulation. CalETC has provided recommended language for the relevant sections of the Regulation in Appendix B that implement these recommendations. Additional details on administrative costs should continue to be in an updated guidance document.

(2) CalETC recommends simplifying and clarifying the language in the proposed regulation pertaining to utility holdback programs

CalETC supports the staff's efforts to develop a recommended list in the proposed regulation of activities for holdback projects to make it easier for all stakeholders (e.g., the CPUC, CARB Staff, municipal utility governing boards, and utility program developers) to have a clear understanding of how CARB intends utility LCFS Holdback funds to be used. While we appreciate that many new project types have been included in the proposed amendments at the recommendation of CalETC and its members, several updates to the Holdback project list in the proposed amendments are needed for the sake of simplicity and to provide clarity on what is or is not considered a holdback equity project while also providing consistency of interpretation through the regulation itself.

The proposed amendments contain two lists: one which CARB Staff has indicated must be used for equity projects and another which are "good ideas" for non-equity projects. However, this makes it unclear if a utility could implement a project on the "equity" list – such as deploying charging stations at a multifamily property – as part of its non-equity project spending, and it also implies that a project on the "good ideas" list – such as optimized EV charging – could not be considered as counting towards a utility's equity spending requirements even if that project was directly reducing the energy bill of a low-income customer. Further uncertainty exists around the incentivization of medium- and heavy-duty (MDHD) vehicles: should projects supporting MDHD electrification only be considered equity projects if the vehicles are domiciled, or fueling located in, impacted communities, or always be considered equity projects since the pollutants from these vehicles disproportionately impact equity communities (i.e., disadvantaged rural, tribal and low-income communities) regardless of where they are domiciled or fueled?

CalETC recommends that the two lists be consolidated into one and that project spending be considered towards the utilities' equity allocation compliance requirements if it benefits the communities and individuals defined in the equity holdback section. To ensure that the utilities are only deploying projects that CARB supports for equity communities and individuals, CalETC

recommends that the single project list must be used for equity projects and may be used for non-equity projects in addition to other non-equity projects that further transportation electrification in California as defined by 95491(e)(5). This approach is more straightforward, minimizes opportunity for conflicting interpretations, and provides certainty on expectations around CARB's priorities while still allowing flexibility for utilities to propose non-equity programs that are best suited to their specific service areas and customers. CalETC also recommends that any project that furthers the deployment of electric MDHD vehicles be considered as an equity project, as the electrification of trucking almost always benefits low-income individuals and disadvantaged communities with criteria pollutant and GHG reductions even when the primary charging / ownership location is outside of the disadvantaged community, low-income community, tribal area, or rural area (See CalETC's comments on the definition of rural in bullet 8 below).

Additionally, CalETC recommends several smaller changes to the proposed regulation below with proposed amendments in Appendix B:

1. The regulation should include a requirement for large IOUs (SCE and PG&E in CalETC's comments below) to utilize their holdback credit revenues to fund a minimum of three program options as there are increasingly diversified needs in transportation electrification over large service areas. Including this requirement to fund a minimum of three program options will help ensure that the large IOUs consider the diverse needs of their customers and are not compelled by stakeholders to focus on a single project.
2. While we agree with the proposed regulation's deletion of broad-based ME&O (e.g., television and radio), the regulation, rather than Guidance Document 20-03, should clearly allow ME&O for specific projects.
3. The project list should explicitly allow for upgrades to electric panels, which are prerequisites to transportation electrification for many customers living in older buildings that have not had recent updates. Upgrades to panels can have other benefits but are primarily to enable transportation electrification.
4. For simplicity and clarity, the project list should be consolidated on the recommended projects for electric mobility solutions as there are two list items that appear to overlap regarding mobility alternatives.
5. The project list should preserve a narrowly focused project category for direct multilingual education and outreach serving equity communities. The preservation of this category is not intended to include general marketing or advertising. It is only intended to allow for multilingual education and outreach to equity communities.
6. The list of agencies that may be consulted in the creation of workforce development projects should be expanded to include other pertinent entities, such as California Community Colleges, community-based organizations, and publicly-owned utilities (POUs) Governing Boards.
7. CalETC thanks CARB Staff for harmonizing the definitions of equity communities and individuals in the proposed amendments with those detailed in AB 841 and CPUC Decision D.20-12-027. However, the language requires a slight modification. AB 841 defines this as

"a community located on lands belonging to a federally recognized California Indian tribe."⁵ The proposed amendments include "state and federally recognized".

8. The definition of "rural" needs to be updated as the U.S. Census Bureau no longer reports rural percentages for census tract population. The Census Bureau now defines rural as "all population, housing, and territory not included within an urban area."⁶
9. "Off Road Vehicle" should be defined for clarity because it is not obvious that vessels, aircraft, and other transportation qualify under that term. CalETC has provided recommended edits to this section of the proposed amendments in Appendix B to this letter.

(3) CalETC requests clarification that POUs must spend 50% of holdback funds on equity projects, as opposed to 75%

CalETC notes a discrepancy between the proposed LCFS requiring 75% of holdback funds for equity projects compared to Appendix E "Purpose and Rationale for Low Carbon Fuel Standards Amendments," which calls for 50% for POUs. We recommend that POUs have a 50% requirement for equity holdback. We understand there are almost 30 POUs that have opted into LCFS and potentially another fifteen could opt in. The POUs are very diverse and represent specific and limited territories within the State, with a wide variety of populations, EV densities, rural/urban splits, percentages of DACs and community needs. POUs are also uniquely in tune with local needs. Designing and implementing effective transportation electrification programs for low-income, rural and/or disadvantaged communities can be challenging, and the uptake and timing of projects is difficult to predict. In addition, there will be natural fluctuations in program spending year-to-year, and an annual requirement of 50% allows for better planning to maximize the impact of equity spending. In addition, we recommend the 50% equity requirement for the three small IOUs (instead of the 75% in the proposed LCFS). These small IOUs are not opted into LCFS, and a 75% equity holdback requirement creates practical challenges at start up that make it difficult for them to opt-in to LCFS.

(4) CalETC requests clarification that San Diego Gas and Electric is a "medium-sized" utility under the regulation

CalETC notes that the regulatory package has conflicting information regarding the size of San Diego Gas and Electric (SDG&E) and its requirements under CCFR and holdback programs. Specifically, in *Appendix E: Purpose and Rationale of Proposed Amendments for the Low Carbon Fuel Standard Requirements*, CARB staff states, "San Diego Gas & Electric is re-defined to have a comparable contribution to the statewide program to similarly sized public utilities." However, this change is not in the proposed regulation. In discussion with CARB staff, we understand that they intend to categorize SDG&E as the same size as Los Angeles Department of Water and

⁵ Bill Text: CA AB841 | 2019-2020 | Regular Session | Amended | LegiScan at 1601.(e)(5)

⁶ See <https://www.census.gov/programs-surveys/geography/guidance/geo-areas/urban-rural.html>

Power based on their similar total 2022 electricity sales (annual GWh). CalETC supports these two utilities having the same contribution to the CCFR in the final LCFS, as their size is very similar, and SDG&E is substantially smaller than the two large IOUs. This change will allow SDG&E to have more meaningful holdback programs.

CalETC may have further comments on the definition of EDUs based on annual GWhs in the future, as we understand that staff plans to propose amendments to these definitions (e.g., improved data, new thresholds for large, medium, and small EDUs) in an upcoming 15-day comment period.

(5) CalETC requests edits to the regulation that will assist smaller utilities, potentially allowing them to participate in LCFS

CalETC requests the LCFS include a program to encourage small EDUs who have not opted-into LCFS to do so and expand programs by small EDUs who have recently opted in. There are over 50 EDUs in California, and we understand from staff that about thirty have opted in to LCFS. Our proposal would support approximately twenty small rural utilities who cover about one percent of California.

We propose that the LCFS have new regulatory language that allows the CCFR Steering Committee to work with the Executive Officer to design one-time grants to incent the small, mostly rural EDUs that have not yet opt into the LCFS to opt-in and also to provide additional funding to EDUs that have recently opted in. The goal of the program would be to have almost all California utilities participate in the LCFS and provide holdback programs to provide better coverage in underserved areas.

Specifically, we request funding for our recommended program to come from funds that non-opt in EDUs have been providing to the CCFR since 2020 per Section 95486.1 (c) (1) (A) paragraph 2.⁷ Our informal survey of these small EDUs found that they often only have a handful or a few hundred EVs which is not enough to justify a program. Under our proposal, a start-up grant would be enough for a small EDU to start or expand a basic program to help their customers and CARB would provide approvals and oversight to the CCFR Steering Committee and Program Administrator. Our recommended amendment is in Appendix B.

(6) CalETC requests the regulation modify the utility reporting requirements to better track deployment of funds to impacted communities, align with the reporting framework required by CPUC, and simplify reporting for smaller utilities

CalETC appreciates the areas where CARB Staff have made efforts to harmonize the regulatory and reporting requirements of the LCFS Regulations with other regulatory bodies, such as the CPUC. One such area was increasing the equity allocation requirement of utility Holdback

⁷ All base credits for any EDU that is not eligible to receive base credits pursuant to this provision will be allocated to the Clean Fuel Reward program pursuant to section 95486.1(c)(1)(A) paragraph 2.

programs for the Large IOUs from 50% to 75%. Yet, while increasing the equity requirement to 75% appears to align with the CPUC's requirements in D.20-12-027, CARB and the CPUC currently measure this metric in very different ways. CARB counts percent of proceeds earned in a calendar year, which was clarified by guidance document 20-03 to include percent of proceeds either spent or encumbered (i.e., budgeted or set aside) to an equity program. The CPUC, however, counts spending that occurs during the calendar year, regardless of when the credits were earned. This is subtle but, as a result, the IOUs are often reporting entirely different data to demonstrate compliance to each agency in their annual reports⁸.

Tracking compliance against the percentage of annual proceeds creates many operational difficulties. For example, if the combination of on-road EV charging and credit prices-- both of which are beyond the utilities' control -- evolve over a year such that a utility generates double the proceeds it expected to generate, then a utility may be faced with two options to maintain compliance based on percent of annual proceeds: double the spending of its in-market programs or encumber those funds, without actually spending them, in some combination of those programs. The first may not be practical as it is difficult to increase operational capacity of a program in real time; the second achieves compliance but it does not necessarily allow the utility to assess where it should best allocate its holdback funds in the coming calendar year as they will have been encumbered to a specific program for the sake of compliance.

Tracking on how LCFS proceeds are actually returned to Californians, is a more effective metric to track how LCFS dollars actually flow to benefit underserved communities over time and is consistent with the metric used by the CPUC to ensure compliance⁹. However, in recognition that the balance between equity and non-equity spending may necessarily vary in a given year, the regulation should specify that any "underspend" in annual equity spending will carry over to the next calendar year(s) in the form of increased equity spending requirements.¹⁰ The recommended language has been provided in Appendix B as part of the updates to the holdback program section.

Compliance based on spend, when coupled with the rollover of any "underspending" on equity in a given year, also helps smaller utilities, by providing an option, to save up holdback proceeds for several years to accumulate a large enough bank to implement a program without "pre-deciding" how to allocate their funds into a program until they are ready to spend them, in addition to the option of saving up for large equity spending projects through the rollover provision. Further, compliance based on spend makes it easier to account for the reality of utility programs, which often have both equity and non-equity recipients, as the utilities can simply report how much of the annual spend went to each type of recipient in a calendar year, rather than managing set asides in intra-program budgets.

⁸ See Decision D.14-12-083 Ordering Paragraph 4, requiring reporting on annual expenditures.

⁹ Decision D.20-12-027 Ordering Paragraph 1

¹⁰ For example, if a large IOU spent \$10 million in one year, \$7.5 million of that would be required for equity. However, if only \$7 million was spent on equity (70%), the \$500,000 underspend would be added to the following year's compliance such that they would need to spend 75% plus \$500,000.

Therefore, CalETC recommends that the utility holdback project equity allocation requirements be updated to percent of annual spend rather than percent of annual proceeds. Further, CalETC proposes that if a utility underspends on equity projects in a given year, the amount that it underspends will be carried forward to the next year. This aligns the LCFS Regulation's requirements with the obligations that the CPUC has already placed on the IOUs, improves tracking of how LCFS funding is actually being deployed into impacted communities, and simplifies accounting for CARB, CPUC, and utility staff. CalETC has proposed language that would implement these recommendations in Appendix B to this letter as part of its other recommendations for updates to the holdback section.

(7) CalETC requests that the regulation allows the Executive Officer to approve certain modifications to the CCFR that can improve program responsiveness and efficacy

The LCFS is a powerful tool for incentivizing the adoption of low carbon technologies to support the technologies called for in the 2022 Scoping Plan. Because the Scoping Plan calls for the adoption of new zero emission technologies, the LCFS regulatory framework must allow for some flexibility in response to changing market conditions and needs. As such, CalETC respectfully requests that the final regulation allow the Executive Officer to make modifications to the electricity provisions of the LCFS, including the ability to add tools other than rebates or new technologies (such as financing assistance) to the statewide Clean Fuel Reward program if requested by the Clean Fuel Reward Steering Committee. CalETC also respectfully requests that such exception requests from the Executive Officer be handled expeditiously, and staff be adequately resourced to handle these exceptions.

(8) CalETC requests implementation assistance on the Credit Clearance Market (CCM)

CalETC's members include large EDUs who will be impacted by the CCM. We respectfully ask for a guidance document (or, if appropriate, a user guide or FAQ) on the mechanics of the CCM. For example, what do deficit/credit holders functionally do once a CCM / Advanced Crediting phase is declared? Also, given the proposed increase from ten million to thirty million credits in the CCM, we request further discussion regarding possible practical issues down the road if only a small number of EDUs are trying to transact such a large volume in a mandatory compressed timeframe.

III. CalETC largely supports the proposed order

CalETC applauds CARB's efforts to amend this important and complicated regulation. In particular, CalETC supports the following provisions of the proposed order:

(1) CalETC supports the continued allocation of base residential charging credits to the electric distribution utilities (EDUs) which fund important statewide and individual utility programs

CalETC strongly supports the continued allocation of the residential base credits generated by electricity used to fuel electric vehicles to the electric utilities. This is appropriate and leads to the most efficient, equitable, and market-stimulating distribution of the proceeds.

1. *The utilities are subject to extensive regulatory oversight, ensuring that the proceeds are spent in a manner that aligns with the state's goals.*

The electric utilities are subject to extensive reporting and compliance requirements, ensuring that the distribution of LCFS proceeds is open and transparent. Furthermore, the utilities have a duty to serve all customers, including populations that have been slower to adopt EVs including those residing in disadvantaged communities (DAC), low-income renters and multi-unit dwellings (MUD). Residents of DACs and MUDs are utility customers, and as such the utilities are incentivized to assist those customers in transitioning to electric transportation. The electric utilities can use the proceeds gained from base residential credits to establish holdback programs that enable charging at MUDs, for renters, and in equity communities. Similarly, utilities can leverage credits generated across the entire customer base to fund programs incentivizing adoption in DACs and low-income communities. Utilities are the only entity able to use credits generated from residential light-duty EV charging to support heavy-duty or off-road vehicle electrification, an increasingly urgent issue in decreasing the transportation sector's air pollution and greenhouse gas emissions.

California's electric utilities are uniquely positioned to support and enable additional load from electric vehicles because electric vehicle load is flexible and when used off peak makes more efficient use of the electric system which puts downward pressure on electric rates for all other customers. Because of this, California's electric utilities are the only entities that have the primary goal of ensuring accessible infrastructure and affordable electricity, making them uniquely positioned to receive and manage base residential credits.

2. *The electric utilities have been a long-time partner in the state's decarbonization efforts and are by definition located in California.*

Unlike other entities, the electric distribution utilities (EDUs) must always be located locally, within California, to provide a critical and essential service. The size of utilities varies dramatically, with the larger utilities having the staff and resources necessary to work cohesively with the other EDUs to efficiently run statewide programs. Some examples of efforts to collectively enable market transformation include programs in energy efficiency, renewable energy and most recently, the California Clean Fuel Reward. The utilities are equipped to handle the very large-scale proceeds generated by the LCFS. They are experienced, efficient administrators and have a long history of designing large-scale, stable successful programs and have shown they can quickly implement statewide and individual utility programs.

Additionally, all Californians have an electric utility provider and are used to working with their utility to support their energy needs. This name recognition and familiarity is necessary for getting reluctant customers to adopt new technologies. Finally, the electric utilities have provided service to their customers for decades and will continue to serve their territories for

many decades to come, providing the stability needed to positively contribute to the wholesale market transformation required by the switch to electrified transportation.

3. *Electric utilities are able to implement programs that address the needs of all aspects of electric vehicle adoption and at the scale needed to support CARB's scoping plan.*

Unlike other important players in the electric vehicle industry, electric utilities can administer programs involving all aspects of the transportation electrification ecosystem. The utilities can provide rebates for chargers, rates designed to incentivize adoption, vehicle incentives, grid upgrades to support increased beneficial electrification, and have decades of experience implementing programs targeted to benefit lower-income and disadvantaged customers. Having the ability to address all aspects of electric vehicle adoption allows for flexibility in how the money is spent. Furthermore, a properly designed program can afford the utilities the ability to act quickly and to adjust program design when external factors change. This is increasingly important as state, local and federal funding sources and tax breaks tend to shift over time.

Electric utilities also provide service to all electric vehicle segments and classes. The utilities serve light, medium- and heavy-duty vehicles, individually owned vehicles, last-mile vehicles, and fleets. With the increase of electrification, upgrades to the electric grid will be necessary. Utilities will need information about the location of all electric vehicles so that they can adequately upgrade the grid and provide vehicle/grid integration services. Finally, serving all vehicle classes allows the electric utilities to provide programs for both the light-duty and medium-and-heavy-duty sectors. This allows the utilities to utilize the funding from the sectors that are first to electrify (light-duty) to incentivize and support the sectors that are harder to electrify (e.g., medium-and-heavy-duty).

Allowing the utilities to receive the residential base credits also supports individual utility programs which are necessary for meeting local needs and hard-to-reach markets such as medium- and heavy-duty EVs, off-road EVs and infrastructure for renters (homes, apartments, etc.) that are identified in the Scoping Plan, Advanced Clean Cars, and Advance Clean Fleets. Individual utility programs can be nimble and respond to the complex, ever-changing incentive landscape for EV and infrastructure incentives.

4. *Keeping the current structure prevents a complicated system where both utilities and non-utilities receive base residential credits.*

The current structure supports large-scale, statewide programs linked to the State's equity and climate goals. Diluting the credits coming to utilities makes both individual utility and large-scale statewide programs very difficult to implement and harder for CARB to regulate. Also, the current structure enables and funds active utility involvement, especially for small POUs, and encourages more small EDUs to join LCFS and create custom programs to support their customers. The current LCFS is a well-crafted system that allows site-hosts, automakers, charging providers and utilities to all receive LCFS credits.

CalETC also supports the proposed provision requiring entities “generating credits from electricity to use all credit proceeds to further transportation electrification efforts in California and include in their annual compliance report an itemized summary of efforts and costs associated with meeting this requirement.” Ensuring that all the proceeds from the electricity LCFS credits are put back into programs and projects that incentivize the adoption of transportation electrification is essential to effectuating the goals of CARB’s Scoping Plan.

(2) CalETC supports staff’s proposal for EDUs to spend more of their LCFS proceeds on holdback programs

Under the proposed order § 95483(c)(1)(A)(2), the required contribution to CCFR and remaining allocation to holdback programs would be changed as follows:

EDU Category	Holdback Allocation (%)	
	Proposed	Previous
Large Investor-owned Utilities	50	33
Large Publicly Owned Utilities	75	55
Medium Investor-Owned Utilities	75	75
Medium Publicly Owned Utilities	90	75
Small Publicly Owned Utilities and Small Investor-owned Utilities	100	98

CalETC strongly supports these changes, with the exception discussed above regarding San Diego Gas and Electric. Funding from base residential credits for holdback programs and CCFR are directly linked. With the proposed regulation increasing holdback funding percentages, the percentages allocated to the CCFR will decrease. This change is appropriate because the proposed CCFR is for the much smaller market of medium- and heavy-EVs vs. the larger light-duty market in the current CCFR.¹¹ Similarly, removing very small EDUs from contributing to the CCFR is appropriate because a two percent contribution is not meaningful and results in administrative inefficiencies for both the CCFR Program Administrator and the very small EDUs.

(3) CalETC supports the proposed shift in the California Clean Fuel Reward (CCFR) from being a reduction in the purchase or lease price of new light-duty electric vehicles (EVs) to being a reduction in the purchase or lease prices of new electric medium- and heavy-duty EVs

CalETC supports CARB’s proposed amendments that will transition the statewide Clean Fuel Reward program from an incentive for all new passenger EVs to one that will support the adoption of electric MDHD vehicles in the coming decade. We also agree that the new Clean Fuel Reward

¹¹ The California Energy Commission anticipates that the adoption of medium- and heavy-duty vehicles as follows: 27,000 by 2025, 155,000 by 2030 and 377,000 by 2035. See Assembly Bill 2127 Second Electric Vehicle Charging Infrastructure Assessment Revised Staff Report.

should be in line with the needs of CARB's Scoping plan - and primarily benefiting equity communities - and believe the new proposal¹² achieves this goal. However, as the Clean Fuel Reward Program Administrator (SCE) has commented, minor updates to the vehicle eligibility in the proposed amendments are needed to ensure that that new Clean Fuel Reward program can effectively implement CARB's ambitious plans for the commercial vehicle sector.

For example, in *Appendix E: Purpose and Rationale of Proposed Amendments for the Low Carbon Fuel Standard Requirements*, CARB Staff states that the "Clean Fuel Reward will change from a universal new light-duty EV rebate to be focused on new and used rebates for medium- and heavy-duty trucks." However, the proposed amendments define the Clean Fuel Reward as applying only to new vehicles. CalETC believes that "used" was accidentally omitted from the proposed amendments and has provided recommended language that includes used vehicles in Appendix B to this letter.

Additionally, CalETC is concerned that definitions for medium-or-heavy duty vehicle in the proposed amendments do not necessarily align with CARB's stated intentions. Defining these solely by weight class, as the current proposed amendments do, means that the Clean Fuel Reward program may be required to provide incentives for all vehicles that have a GVWR greater than or equal to 8,501, which includes many passenger vehicles such as the Rivian line of products, the extended range Ford F-150 Lightning, the electric Chevrolet Silverado, and the electric Hummer to name a few. Based on CARB Staff's published rationale, CalETC believes these vehicles should be incentivized by the Clean Fuel Reward only if they are purchased for use as commercial vehicles. CalETC agrees with the Program Administrator's proposal that the definition of Clean Fuel Reward be updated to specify that it is for commercial vehicles only, and the Regulation should also include a definition for commercial vehicle in the Definitions and Acronyms section for clarity and completeness. For consistency, CalETC proposes that the LCFS Regulation adopt the same definition for commercial vehicles utilized by the Hybrid and Zero-Emissions Truck and Bus Voucher Incentive Project (HVIP). Both these definitions are included in Appendix B to this letter, and CalETC believes that these minor modification to the proposed amendments will empower the new Clean Fuel Reward program to be a vital tool in the state's efforts to decarbonize heavy-duty trucking.

¹² "Clean Fuel Reward" is a statewide program established by EDUs to provide a reduction in price on new light-duty EV purchases or leases for new medium- or heavy-duty electric vehicles that are not subject to the High Priority and Federal Fleets requirements as specified in, title 13, California Code of Regulations, section 2015(a)(1) in California.

CalETC appreciates the opportunity to provide comments on this important regulation. If you have any questions, please do not hesitate to contact me at any time.

Best,

Subject	LCFS Credits Affecting Light Duty Hydrogen Stations

Comment

104.1

I am merely a fuel cell EV owner and, unfortunately, the technicalities of the LCFS rules are over my head. However, I do understand that the current regulations are the cause of the high prices at the light duty hydrogen stations as well as the pause/stoppage in the construction of new stations.

I have been one of the lucky few FCEV drivers over the past 6-1/2 years who have been able to ride the ups and downs of the hydrogen infrastructure. There were slow improvements and expansion being made, but it wasn't until the price of hydrogen increased did the sales of FCEVs start to drop as well as the stoppage of station construction. I am now very concerned that without changes to the LCFS regulations the expansion and improvements made since 2015 will all be for naught and light duty hydrogen stations will not survive.

Please do not throw away all the work of the past 10+ years. Please do not emphasize heavy duty stations over light duty stations as both are important. Please do not let bio-diesel or any other renewable carbon producing fuels overthrow the future of a truly clean fuel that is hydrogen.

Regards,
Bruce Hata

Comments on Proposed Low Carbon Fuel Standard Amendments

Dear California Air Resources Board (CARB) Low Carbon Fuel Standard Program Staff:

Thank you for the opportunity to provide comments in response to the proposed amendments to the Low Carbon Fuel Standard.

As background, Oberon is an innovative California company founded in San Diego 13 years ago with a focus on decarbonizing the global LPG/propane industry while laying the foundation for renewable hydrogen. We are accomplishing this today by producing renewable dimethyl ether (DME) at our Brawley, California production facility. Oberon's rDME® brand fuel can be made from various in-state waste streams (*e.g.*, dairy manure biogas, waste water treatment biogas), which can enable smaller, often stranded, biogas suppliers to participate in the LCFS program and produce low carbon DME.¹ Oberon's rDME fuel can reduce the carbon footprint of transportation when used as a: 1) blending agent with Liquid Petroleum Gas (LPG)/propane; 2) hydrogen carrier to power the growing fuel-cell electric vehicle and stationary source market; and 3) diesel substitute. This range of creative applications that clean fuels, such as DME, can support is underscored in the 2022 Scoping Plan Update—DME along with other clean alternatives to petroleum are a key part of the solution for the state to reach its legislatively-mandated greenhouse gas reduction targets.

Responses to Draft Amendments

Oberon supports the proposed amendment package and appreciates the significant efforts that have gone into developing these changes. In the 'Other Comments' section below we offer suggestions for further clarity where the proposed amendments may benefit from a more fulsome consideration of rapidly developing technology and commercial practices.

We also express our gratitude for your engagement and support for DME and we note with pleasure the inclusion of DME on *Table 4. Energy Densities and Conversion Factors for LCFS Fuels and Blendstocks*.

¹ The California Air Resources Board has estimated dairy biogas-based DME made by the Oberon process has a carbon intensity of -278. rDME® is a trademark of Oberon Fuels, Inc.

Other Comments

- **Carbon Intensity (CI) Benchmarks**

105.1 Oberon strongly supports the increased stringency to a 9% carbon intensity reduction in 2025 from the 5% originally proposed in the 45-day package. This adjustment reflects a necessary step toward more robust climate action. This single adjustment will translate into millions of additional tons of GHG emission reductions and act as a supportive market signal for new clean fuel projects that have been or are being constructed to bring more clean fuels to market.

105.2 Additionally, we commend CARB for the inclusion of the Auto Acceleration Mechanism as a forward-thinking measure to ensure the program's dynamism. The AAM is a necessary compliment to the CI target adjustment and as designed, will send a clear, supportive, and unambiguous market signal to continue investments in clean fuels by tightening the program in the event overperformance occurs. Adoption and implementation of this mechanism will ensure that potential emission reductions are not left on the table and will help California reach its climate goals faster if triggered.

- **Avoided Methane Crediting**

105.3 Oberon strongly supports the inclusion of avoided methane crediting in the proposed changes. Avoided methane emissions are a critical part of science-based life cycle assessments, and their inclusion in CI scores is consistent with internationally recognized standards of carbon accounting. While we understand CARB's intention is to better align the proposed end dates for avoided emission pathways with its mobile source regulations focused on transitioning to electric vehicles, we are concerned about CARB's proposed limitation on the number of crediting periods for avoided methane emissions projects, reducing it from three to two consecutive 10-year periods for pathways breaking ground before January 1, 2030. This change negatively impacts these projects, particularly those that are already in development or near completion that were funded with the expectation they would be eligible for up to three 10-year crediting periods. The reduced crediting period could undermine the financial viability of these initiatives, which rely heavily on LCFS credits to justify the significant investments required. We urge CARB to reconsider this reduction, as it may inadvertently discourage the development of methane mitigation projects that are crucial to achieving California's climate goals. Instead, maintaining the original structure of three crediting periods for these projects would provide the necessary support to ensure the long term viability of these projects and their continued contribution to reducing greenhouse gas emissions.

- **Sustainability Requirements – Biomass for a Feedstock or Process Fuel**

105.4 We appreciate CARB's commitment to ensuring that forestry biomass projects are conducted in an environmentally responsible manner, contributing to both forest health

and the state's climate objectives. As industry continues to advance in this area, we believe it is essential to consider the progress made in sustainable forestry practices over recent decades, which has laid a strong foundation for the responsible utilization of forestry biomass.

The proposed definitions notably narrow the scope of feedstock material availability by excluding industrial lands, which remain undefined, and limiting the sources of material to those derived solely from fuel reduction or restoration projects. These terms, "fuel reduction" and "restoration projects," are themselves undefined, further complicating their application. By excluding other silvicultural treatments, the proposed language unnecessarily restricts the types of forest management practices that can contribute to low carbon fuel production. The added restrictions provide no incremental benefits, particularly in light of the new sustainability provisions CARB is proposing.

Section 95488.9(g), originally designed to ensure the sustainability of crop-based fuels, has been expanded to cover a wider range of waste biomass. While these requirements are suitable for purpose-grown crops, they are not applicable to agricultural or forest residues, where the feedstock is a waste product and fuel producers have no control over crop growing practices. Applying the same standards to agricultural or forest residues as to purpose-grown crops could hinder the production of fuels from these residues. The proposed rules could also restrict the use of previously approved waste feedstocks for process heat in biofuel production unless they can be proven to originate from certified sustainable operations.

- **Book-and-Claim – RNG Deliverability**

105.5

We recognize and appreciate CARB's efforts to enhance the integrity and accuracy of the proposed RNG deliverability requirements, consistent with RPS eligibility rules. While we support the intent behind these changes, we have concerns regarding the potential impact on investment in RNG projects under the proposed framework for *Book-and-Claim Accounting for Pipeline-Injected Biomethane Used as a Transportation Fuel or to Produce Hydrogen*. Particularly, the language concerning "if the Executive Officer approves a gas system map by July 1, 2026", as this proposal introduces a level of uncertainty that poses challenges for stakeholders considering investments in RNG projects. The lack of clarity on which pipelines will meet the new criteria until the map is finalized creates a precarious environment for project developers and investors, who require certainty and predictability to commit substantial resources.

This uncertainty could inadvertently disincentivize investment in RNG projects, as stakeholders may be reluctant to move forward without a clear understanding of directional flow-based deliverability requirements. Such ambiguity could stall progress in expanding RNG production, which is essential for meeting California's ambitious climate goals. We highly encourage CARB to provide more immediate and transparent guidelines coupled with a transparent public process to provide investors the confidence

needed to continue supporting RNG development in the state. We look forward to discussing these provisions with CARB staff in the coming year and highly encourage CARB to conduct a full and transparent public process to inform any gas maps the Executive Officer may consider.

- **Renewable Hydrogen Proposed Definition**

105.6

The 15-day changes propose an updated definition to “Renewable Hydrogen”. We specifically wish to comment on the language in item (2) which identifies “steam methane reforming of biomethane or other renewable hydrocarbons” as a qualifying process. While we support the explicit inclusion of “other renewable hydrocarbons”, we believe that this definition should also include renewable oxygenates, such as renewable DME, which serve the same function and purpose as renewable hydrocarbons in the production of renewable hydrogen via steam reforming. To better reflect the versatility of renewable feedstocks used in renewable hydrogen production, we recommend that CARB amend the language to include renewable oxygenates. For example, the phrase could be revised to “steam methane reforming of biomethane or other renewable hydrocarbons or oxygenates” or “steam methane reforming of biomethane, renewable hydrocarbons, or renewable oxygenates”. This change would ensure that the definition accurately reflects the range of renewable sources that can be used with steam reforming technologies to maximize renewable hydrogen production, while promoting technology neutrality and innovation in hydrogen production technologies.

- **Credit True-up**

105.7

Oberon strongly supports CARB’s proposal to expand the LCFS credit true-up provisions to include periods using temporary pathway CIs after annual verification. This is a highly positive change, particularly for projects that operate with conservative, temporary CI scores. By allowing these projects to reconcile their credits based on verified CI data, this helps to protect the financial viability of low carbon fuel projects by allowing them to recover lost value that might otherwise be forfeited due to conservative early reporting. Moreover, it promotes greater accuracy and transparency in the program, ensuring that stakeholders are rewarded based on their true environmental performance. This adjustment ultimately strengthens the LCFS program by fostering a more accurate and equitable system. We commend CARB for recognizing the importance of this adjustment and for taking steps to support the integrity and financial viability of renewable fuel projects. The proposal also includes true-up provisions that adjust credits based on verified operational CIs relative to certified CIs, applying a penalty of four times the spread for shortfalls. However, the justification for this 4X multiplier is unclear, as a smaller multiplier, such as 2X, would still effectively discourage overconfidence in CI analysis.

- **Stakeholder Engagement – Source Specific Feedstocks**

105.8

While we sincerely appreciate the efforts CARB has made in developing the proposed changes, we are concerned about the inclusion of several items in the proposed changes that were not previously discussed or evaluated with stakeholders. Specifically, CARB failed to hold a workshop to address the complexities associated with forest biomass during this rulemaking process. This significant change to eligible forest biomass was included in the 15-Day Changes (i.e., §95488.8(g)(1)(A)(3) and §95488.9(g)) without the benefit of stakeholder engagement, in stark contrast to CARB's long-standing transparent approach when considering amendments to the LCFS as well as other regulations.

To maintain the integrity of the rulemaking process and ensure that final regulations are both effective and equitable, we strongly urge a review of these changes with a focus on promoting environmentally sustainable practices in the management of industrial forests. Limiting source-specified forest biomass feedstock to "non-industrial forestlands" could inhibit the use of these materials from a fate of productive use as a renewable feedstock, where the alternative is destruction or disposal. Waste and residues from industrial forestlands play a critical role in providing the reliable long-term supply agreements necessary for biofuel project success.

Proper review to allow for the necessary scrutiny and input that these proposed items deserve will ensure the final rule is based on robust data and stakeholder consensus. It is imperative that stakeholders have the opportunity to thoroughly review and provide feedback on such changes, particularly those that could have significant implications. As noted above, transparency and stakeholder engagement have always been cornerstones of California's environmental policy success, and it is critical that this process upholds those values to sustain the credibility and effectiveness of which the program is built upon and globally regarded for.

Recommendations for Future Action

Oberon encourages CARB to ensure there continues to be a market for low-CI liquid and gaseous fuels as they are an important decarbonization tool, especially in sectors that are hard to decarbonize. Oberon recommends that CARB send a clear policy signal that biofuels (e.g., biomethane, renewable propane, renewable DME) are necessary and effective decarbonization strategies in these other sectors (e.g., residential, commercial, industrial) and are fundamental to the state meeting its ambitious GHG reduction targets.

As the state transitions out of combustion in the transportation space gaseous and liquid fuels will continue to support the industrial, commercial, and residential sectors with escalating pressure to drive down GHG emissions. One approach for doing so is stronger signals and incentives for the production and use of low-CI fuels in those sectors.

Expanding the LCFS or creating a LCFS-like structure to help facilitate decarbonization of other gasoline-, diesel-, fossil natural gas-, and propane-fueled applications in residential, commercial, and industrial markets is an opportunity that merits attention. Doing so would reward investments and use of cleaner fuels by these legacy sectors that are not anticipated to be electrified for many decades. In the last year new domestic and international policies have been established to apply the LCFS approach beyond transportation fuels such as Vermont's Clean Heat Standard, the Canadian Clean Fuel Regulation, and the EU ETS II which cover both transportation and non-transportation fuel. Policy expansion, as signaled in the Initial Statement of Reasons for the proposed LCFS amendments, will support additional reductions in greenhouse gas emissions by further accelerating the market development of low carbon fuels such as renewable DME.

Thank you for your time and consideration. Please do not hesitate to contact me at cristin.reno@oberonfuels.com with any questions.

Sincerely,

A handwritten signature in black ink, appearing to read "Cristin Reno", written in a cursive style.

Oberon Fuels

August 27th, 2024

Matt Botill
Chief, Industrial Strategies Division
California Air Resources Board
1001 I Street, Sacramento, CA 95814

Mr. Botill and CARB Staff,

I am writing to you on behalf of Generate Capital, PBC ("Generate") regarding the latest proposals for amendments to the Low Carbon Fuel Standard ("LCFS"). As a leading sustainable infrastructure company based in San Francisco, Generate is dedicated to building, owning, operating, and financing infrastructure solutions that address critical needs across clean energy, transportation, water, waste, agriculture, and smart cities. Since our founding in 2014, we have partnered with technology- and project developers to deliver sustainable resources to over 2,000 customers, including companies, communities, school districts, and universities.

We greatly appreciate the California Air Resources Board's ongoing efforts to refine and strengthen the LCFS program. Your openness to stakeholder feedback and your commitment to creating a robust and impactful policy framework have been instrumental in maintaining California's status as a leader in climate policy. CARB's stewardship of this program – which has stimulated billions of dollars of private capital and which has decarbonized California's transportation sector faster and to a greater extent than was considered possible – is a credit to the hard and too-often-underappreciated work of CARB staff and leadership.

We acknowledge the complexity and challenges associated with the LCFS rulemaking process and would like to offer our perspective on the latest proposed changes. In the following sections of this letter, we outline our support for specific aspects of the proposal while highlighting areas where we believe further adjustments could better serve California's long-term climate goals and foster continued investment in low-carbon infrastructure.

Thank you once again for your diligent work on these critical issues and for considering our comments as part of your decision-making process. We would be happy to discuss the views included in this letter and other aspects of the LCFS program with CARB staff over the coming weeks as the rulemaking process reaches its conclusion.

Sincerely,

A handwritten signature in cursive script that reads 'Asher Goldman'.

Asher Goldman
Vice President
Generate Capital

Support for the Increase to the 2025 CI Reduction Target

106.1 We strongly support CARB's proposal to increase the 2025 carbon intensity reduction target by 9%. This adjustment is a crucial step toward restoring balance in the LCFS market, which has faced challenges due to oversupply and low credit prices. By setting a more stringent CI reduction target, CARB is sending a clear signal to the market that it remains committed to driving meaningful reductions in carbon emissions. This move is likely to invigorate investment in low-carbon technologies, ensuring that California continues to lead in the fight against climate change.

While the 9% reduction is a positive and much-needed step, we believe it represents the minimum necessary to achieve market equilibrium and will not undo the growth in the credit bank seen over the last several years. A larger step-down should be considered to address the large reserve of supply in the credit bank. The credit bank is more than three times larger than it was 3 years ago, and we anticipate that 2024 data will show further acceleration to the bank's growth. By increasing the step-down to 10% or 11%, CARB could more effectively reduce the excess credit supply and provide a stronger foundation for future investments in sustainable infrastructure.

Concerns Regarding Proposed Changes to Renewable Natural Gas Treatment

106.2 *Avoided Methane Crediting:* The proposed changes to the treatment of Renewable Natural Gas ("RNG") present significant challenges that could undermine both economic and environmental goals. Specifically, the proposal to remove a full crediting period from existing RNG assets is deeply concerning. These investments were made under the assumption of a stable and predictable regulatory framework, and retroactively altering this framework risks creating substantial uncertainty for investors. Such changes would lead to project disruptions, as well as diminished trust in CARB's commitment to maintaining consistent policy guidelines. This uncertainty extends beyond RNG projects and would negatively impact other areas where CARB is attempting to motivate investment. This includes electric vehicle charging infrastructure where the economic proposition is heavily dependent on the investors' trust that CARB will not change the rules in the future.

While the proposal to limit avoided methane crediting is most concerning for existing assets, the rule would also result in substantial negative outcomes by limiting the development of new assets. CARB has been highly effective in motivating private actors to prevent methane emissions. By limiting avoided methane crediting to a shorter period of time, CARB will be kneecapping one of the most powerful tools it has to limit the emissions of short-lived climate pollutants in support of SB1383. At the very least, this shortened crediting period should be conditional on California implementing policy in support of alternative end markets for RNG (e.g. hard to decarbonize sectors like glass and steel manufacturing) to ensure there is not a stark increase in methane emissions if these assets were to lose their economic incentive to continue operating and as a result be forced to shutter.

106.3 *Deliverability:* In the August 12 guidance, CARB staff proposed to add a condition for out-of-state gas to be injected into a pipeline with "majority directional flow" towards California. The first issue is that the proposed requirement fails to consider the operational realities of the American natural gas distribution system. The system is designed around a balancing mechanism rather

than a point-to-point delivery model – that is, the entire system is similar to the existing book-and-claim accounting mechanism. By mandating physical deliverability of RNG, CARB would be treating fossil natural gas – which is currently and would continue to be book-and-claimed into California – preferentially to low-carbon natural gas.

Second, this change would stifle investment into methane abatement solutions. Given the uncertainty that the proposal would create, with a lack of regulatory clarity until at least 2026 on which (if any) projects would meet the conditions of this proposal, investment into all RNG projects would slow or stop. If CARB is serious about hitting the proposed long-term CI reduction targets or abating meaningful volumes of short-lived climate pollutants, a cessation of new RNG projects is not a viable solution.

Lastly, the proposal would not serve any actual environmentally beneficial purpose. Not only is there no GHG emission benefit when requiring physical delivery of RNG compared to using a book-and-claim mechanism, there is likely to be an increase in emissions resulting from a delivery mandate as (needlessly) moving molecules around requires energy input. What the LCFS program solves for is a reduction in carbon emissions from fuels; by determining which projects are “in” and which are “out” based on a factor which has no relationship to lifecycle carbon emissions, CARB deviates meaningfully from the intent of the LCFS program.

The proposed deliverability requirement would increase costs and complexity without delivering corresponding environmental benefits, ultimately discouraging investment in low-carbon fuel projects. We believe that a more nuanced understanding of the natural gas distribution system is necessary to create policies that truly advance California’s climate goals.

We recommend that CARB reconsider these changes. The two proposals discussed do not aid CARB in the goal to decarbonize transportation, but instead serve only to add complexity and friction to the system. Instead, we suggest that CARB focus on policies that provide stability and predictability for investors and developers to be able to deploy much needed infrastructure. By ensuring that existing assets are treated consistently and that new requirements are aligned with the realities of the energy market, CARB can foster continued investment into effective, proven climate solutions at scale.

Concerns Regarding the Definitional Change for “Food Scraps”

We would like to address the definitional change included in the current rulemaking regarding “Food Scraps.” As proposed, the definition effectively removes credit for processing organic waste that comes directly from food manufacturers. This waste stream typically consists of off-spec products or excess supply that needs to be disposed of in a sustainable manner. While the ideal solution would be to re-purpose this material—such as by converting it into animal feed—this is often not feasible due to various logistical and regulatory challenges.

When direct alternative uses are not possible, the next best sustainable option is to divert this organic waste away from landfills to compost and anaerobic digestion facilities. The proposal from August 12, however, appears to exclude this type of waste from qualifying as “Food Scraps,” potentially discouraging its beneficial use in energy production and nutrient recycling. This exclusion runs counter to the principles of waste reduction and sustainable resource management that underpin California’s broader environmental goals, such as those articulated

in SB1383. If implemented as proposed, the narrow definition for “Food Scraps” would make meeting the requirements of SB1383 even more challenging than they are already proving to be.

We recommend that CARB adjust the definition of “Food Scraps” to include food waste from food manufacturers that cannot be beneficially reused for human or animal consumption. By doing so, CARB can ensure that all feasible routes for sustainably processing organic waste are supported under the LCFS, thereby promoting a more comprehensive approach to waste management and further reducing the environmental impact of California’s critical food production sector.

Impact of Removing Fossil Jet Fuel as a Deficit Generator

106.5 The decision to remove fossil jet fuel as a deficit generator within the LCFS program is a major concern, as it puts a significant source of transportation emissions outside of this program and would fail to force polluters to account for the cost of those emissions. Fossil jet fuel was expected to generate tens of millions of deficits over the next 20 years, playing a critical role in incentivizing the adoption of sustainable aviation fuels (SAFs) and other low-carbon alternatives. By removing this fuel class from the deficit generation framework, CARB would weaken the economic incentives for the aviation industry to transition to cleaner fuels, thus slowing progress toward the state’s broader climate goals.

The rationale behind this decision appears to overlook the importance of LCFS in pricing carbon emissions effectively. In the documentation published on August 12, CARB stated “[p]ublic commenters noted that the original proposal did not guarantee that airlines would procure and use alternative jet fuel”. The LCFS program’s strength lies in its ability to internalize the cost of carbon emissions, making high-carbon fuels less competitive and low-carbon alternatives more. We only have to look at the last five years of the diesel pool to see this in action: a low-CI diesel mandate or a cap on fossil diesel would not have resulted in nearly as much fossil diesel reduction as the price signals from the LCFS program effectuated by incentivizing the private sector to invest in new production capacity for fossil diesel alternatives. By removing fossil jet fuel as a deficit generator, CARB risks diluting this crucial price signal – both through the elimination of the cost on fossil jet fuel use and through the reduced benefit to SAF as a result of a lower LCFS price – which would hinder the adoption of SAF and delay the decarbonization of the aviation sector.

We strongly urge CARB to reconsider this decision and to explore ways in which the LCFS program can continue to drive emissions reductions in the aviation sector. A more integrated approach, where the LCFS framework works alongside an aviation sector GHG reduction mandate, would provide the strongest incentives for the industry to reduce its carbon footprint.

Recommendation for the 2030 CI Reduction Target

106.6 Given the substantial increases to the credit bank over the last 3 years, the removal of fossil jet fuel as a deficit generator, and the impact of other regulatory measures such as Advanced Clean Cars II, Advanced Clean Fleets, and Advanced Clean Trucks, we believe that the currently proposed 2030 CI reduction target of 30% is insufficient both as a matter of ensuring a stable market and to ensure California meets its climate goals. The latest market performance data

suggests that the LCFS program is on track to exceed the 30% CI reduction target well before 2030, which would result in unnecessary market volatility and could trigger the Auto Acceleration Mechanism (AAM). To avoid this outcome, we recommend extending the 2030 CI reduction target to 35%, a level that would better align with the state's decarbonization objectives and the realities of the LCFS market.

As the LCFS program continues to evolve, it is important that CARB sets targets that are both ambitious and achievable, ensuring that the program remains a driving force for decarbonization in California's transportation sector. We have recently experienced the outcome of setting the targets too low, which has resulted in diminished capital investment into climate solutions for the last several years. With the consequences of climate change more apparent today than ever before, California cannot afford the cost of any more avoidable delays.

SUBMITTED ELECTRONICALLY AT: www.arb.ca.gov/applications/public-comments?utm_medium=email&utm_source=govdelivery

Re: Notice of Public Availability of Modified Text and Availability of Additional Documents and Information for the Proposed Low Carbon Fuel Standard Amendments

To Chair Randolph, Honorable Members of the California Air Resources Board (“CARB”), and Staff,

Rivian Automotive, LLC, (“Rivian”) appreciates the opportunity to submit 15-day comments in **strong support** of the modified text released on August 12th as part of the proposed Low Carbon Fuel Standard (“LCFS”) amendments. The LCFS is a proven emissions reduction policy and a powerful enabler of transportation electrification. As an EV manufacturer and charging provider, we strongly support the policy primarily because of what it offers our customers, our business, and our industry as we work to achieve scale and profitability. To date, the policy has generated more than a billion dollars in value in support of transportation electrification and this figure is poised to grow significantly in the coming years. These are dollars that can be leveraged by the private sector and would otherwise not exist to support the state’s EV transition. This is why the future of the regulation, as determined by this rulemaking, is so important.

Rivian strongly supports several key aspects of the latest modifications. We recommend finalizing this package to strengthen the 2025 carbon intensity target, make valuable changes to the regulation’s infrastructure crediting provisions, and introduce an encouraging new opportunity for EV manufacturers to share in residential base credit generation. Our comments below elaborate on our support for these specific aspects of the newly modified regulation, while also suggesting minor improvements or additional changes that could be made in the interest of clarity and maximizing impact. We also reintroduce a few additional changes that the modified text does not effectuate but that merit continued discussion.

About Rivian

Founded in 2009, Rivian is an independent U.S. company headquartered in California. With over 16,000 employees across the globe, Rivian's mission is to Keep the World Adventurous Forever. Rivian's focus is the design, development, manufacture, and distribution of all-electric adventure vehicles, specifically pickups, sport utility vehicles ("SUVs"), and commercial vans. Key to the success of our mission, these vehicles will displace some of the most polluting conventional vehicles on the road today.

Rivian brought the first modern electric pickup to market in 2021 when we launched the R1T from our manufacturing facility in Normal, Illinois, followed shortly thereafter by the R1S SUV and the EDV commercial van for Amazon. The R1T and R1S provide all-electric options in segments where added utility is a necessity. The R1T has an EPA-certified range of up to 410 miles. The R1S is certified at up to 400 miles. The truck also features 11,000lbs of towing capacity, while the R1S is a seven-passenger full-sized SUV. Both are well-equipped for off-roading in a range of climates. Separately, our Class 2b commercial vans eliminate tailpipe emissions from last-mile delivery. Rivian is committed to producing 100,000 vans for our launch customer, Amazon, with more than 15,000 already in service in 800+ U.S. cities. The van is now also available for purchase by other fleet customers beyond Amazon and is eligible for HVIP support. Beyond our vehicle lineup, Rivian is also building a network of DC fast chargers across the country known as the Rivian Adventure Network ("RAN"). Fifteen RAN sites are up and running in California alone.

To Continue the LCFS' Success, Rivian Strongly Supports Key Changes Proposed in the Modified Text

The LCFS is a keystone regulation in California's portfolio of climate policies. As the 2022 Scoping Plan stated, the LCFS "is the primary mechanism for transforming California's transportation fuel pool" in service of the state's climate goals.¹ Indeed, as an electric vehicle manufacturer and charging provider, the LCFS is a priority for Rivian precisely because of the role it plays in speeding the transition toward renewable fuels in the transportation and electricity sector.

¹ CARB, *2022 Scoping Plan for Achieving Carbon Neutrality*, 190.

The LCFS has been tremendously successful, so much so that changes have become urgently necessary to ensure that the policy keeps pace with the progress made by industry toward a low-carbon transportation future. To that end, Rivian has actively participated in CARB workshops and the rulemaking process to amend and update the LCFS. We greatly appreciate the staff's commitment to this process and the time they have dedicated to this proposal and stakeholder engagement.

Rivian welcomes the modified text and this additional opportunity to provide comment. We strongly support key changes proposed by the amended language and urge CARB to finalize these changes at its hearing in November.

Finalize the Newly Proposed 2025 Carbon Intensity Benchmark

Short-term conditions in the LCFS credit market are a top concern for businesses like ours that earn credits under the program. Rivian has consistently supported a one-time stepdown in the 2025 carbon intensity ("CI") benchmark to course-correct the credit market, which currently suffers from a glut of credits stemming from a sustained period of overcompliance.

As of Q1 2024, the cumulative credit bank stood at approximately 26 million metric tons ("MT"). Moreover, the bank has grown extremely quickly over the past two years.² Based on the trend since the start of 2020, we estimate that the bank could total approximately 35 million MT by the end of 2024, immediately preceding the earliest opportunity for regulatory amendments to take effect.

We appreciate the staff's efforts to address this overcompliance with a one-time stepdown. Rivian provided extended feedback on the magnitude of the stepdown after both the ISOR and the April workshop, arguing that the previously proposed adjustments to the CI curve were not sufficient to rebalance the market.

Rivian welcomes the progress made in the newly modified amendments, which now call for a 9-percentage point stepdown in 2025. This is a big step forward and we are grateful to the staff for proposing this. Importantly, the initial market reaction to the proposal was positive. **We respectfully urge the Board to implement this change as a necessary step toward rebalancing the LCFS program and credit market.**

² California Air Resources Board, *LCFS Data Dashboard*, available at www.arb.ca.gov/resources/documents/lcfs-data-dashboard.

107.2

At the same time, we encourage the staff and the Board to continue weighing the benefits of a stepdown that is yet larger. While we welcome the 9-percentage point adjustment, the reality is that the credit bank continues to grow quickly. We find that the market could accommodate even more significant action than what has been proposed—accounting for the possibility that current modeling underestimates potential credit generation—and set the program up for success in the coming years.

We appreciate concerns about the potential risks of a larger stepdown, namely the possibility of ‘over-obligating’ industry and creating the conditions for an excessive runup in compliance costs. However, the policy’s existing cost containment provisions adequately safeguard the market and broader public, preventing runaway increases in credit prices. In our view, there are far greater risks attached to an overly conservative adjustment to the CI benchmark curve that fails to fully rebalance the credit-to-deficit ratio, including chilled investment in EV charging networks and slower growth in EV sales.

107.3

Finalize the Proposed Changes to Residential Base Credits

Rivian finds the proposed amendments to base credit generation very encouraging, reflecting fresh thinking about this critical aspect of the LCFS. Clean fuels policies are intended to be market-based systems that create incentive structures for private sector investments by the providers and users of clean transportation fuels. In the light-duty vehicle sector, the two most important market participants are vehicle manufacturers and their customers. Consistent with the core principles of the LCFS, we have long argued that the policy should encourage the participation of these market actors and reward them for making investments in EVs that displace as much fossil fuel use as possible.

To that end, **Rivian applauds the newly proposed amendments that would—subject to certain conditions and the Executive Officer’s approval—allow for EV manufacturers to share in base credit generation.** The proposed rules represent a valuable evolution of the LCFS’ residential credit pathway, positioning the policy to play an even more meaningful role in the growth of California’s EV market at a pivotal moment. In fact, we believe the proposal promises at least two key benefits.

1. Allowing automakers to earn a share of base credits establishes an incentive for automakers to go above and beyond minimum sales requirements. This is important for achieving climate and air quality goals on an accelerated timeline while also positioning the state to achieve its longer-term EV sales targets as the market grows into the mainstream.

2. Vehicle manufacturers enjoy close relationships with their customers and are the best positioned entities to effectively and efficiently pass through credit value in the form of market-enhancing investments. By establishing a 'menu' of investment options, the proposal establishes important flexibility in this regard while establishing clear guardrails around credit revenue spending. Whether in the form of consumer rebates, charging infrastructure investments, new spending on marketing, or other approved projects, EV makers like Rivian stand ready to reliably and impactfully invest base credit revenue for the benefit of our customers and the EV market.

For these reasons, **we strongly support the proposed modifications and urge the Board to approve these provisions at the November hearing.**

Should market conditions trigger these provisions, Rivian would look forward to engagement with the Executive Officer and the staff—as well as more formal agency guidance—to inform implementation. Among other things, we would encourage a focus on stability and predictability in the base credit allocation. We support leaving that allocation to the Executive Officer's discretion, but to best aid industry in making investment with credit revenue, CARB should provide automakers with as much notice as possible of base credit allocations and make adjustments on a reasonable and consistent timeline—not more than annually, in our view—and on a predictable basis.

CARB could take other steps now to prepare for a smooth implementation of these provisions. To be consistent with existing practice and to avoid the need for reregistration of vehicles by market participants, **we recommend that the regulation specify that an OEM or their designee may register with the Executive Officer** to generate the allowed share of base credits.

Fast Charging Infrastructure ("FCI") Pathway Rules are Much Improved

Rivian welcomes the changes made to the provisions governing the FCI pathway. We find that establishing a *light- and medium-duty* ("LMD") FCI pathway is reasonable and appropriate given the similarities in charging behavior and need across those classes, while other changes in the modified text helpfully streamline and simplify the eligibility criteria for LMD FCI sites. Specifically, we welcome the following changes:

- Increasing the per-site power limit from 1 MW to 2.5 MW;
- Removing the geographic limits;

- Matching the credit life for the FCI and hydrogen refueling infrastructure (“HRI”) programs at 10 years (fair regulatory treatment of electricity and hydrogen remains an important principle, more on which below); and,
- Allowing stations installed after 2022 to apply.

Perhaps most importantly, the staff restored the cap to 2.5 percent of prior quarter deficits—a significant improvement over the prior proposal that will avoid undercutting the FCI pathway’s effectiveness.

Combined, these modifications meaningfully improve prospects for participation by EV charging providers, which is key for accelerating the expansion of charging networks into every corner of the state. We look forward to leveraging the FCI pathway to expand the footprint of RAN into high-need regions across California and therefore **urge the Board to finalize the proposed LMD FCI provisions.**

107.5

To strengthen the FCI pathway yet further and to ensure fair treatment across both the FCI and HRI pathways, **we also recommend that the final language be amended to allow FCI credit generators to claim capacity-based credits at zero CI if the site’s charging activity is matched with renewable energy.** Under the regulation, the CI used for HRI crediting is equal to the companywide average CI for dispensed hydrogen in the quarter “or 0 g/MJ, whichever is greater.”³ But the CI used for FCI crediting is “the California average grid” CI with no option to generate credits at zero CI like that available to HRI claimants.⁴ If charging network providers are sourcing renewable energy to power their sites, the regulation should permit them to earn capacity-based credits at zero CI, just as in the HRI pathway. This will only enhance the impact of the LCFS on clean grid buildout. We respectfully encourage the staff and Board to consider this modification.

³ 17 C.C.R. §95486.2(a)(5).

⁴ 17 C.C.R. §95486.2(b)(5).

Rivian Encourages Continued Deliberation on Other Topics

Third-Party Verification Requirements for Certain Electricity Credit Pathways Remain a Concern

The Initial Statement of Reasons (“ISOR”) proposed to introduce third-party verification requirements for an expanded list of electricity credit pathways. The latest package of modified text does not appear to have changed these requirements. Therefore, as currently proposed, electricity credit generators would require third-party verification of credit claims associated with non-residential charging and metered residential charging, despite the significant compliance burden this poses without commensurate benefits in return.

We urge CARB to reconsider the proposals and establish pragmatic requirements that account for real-world implementation concerns.

107.6

- **Third-party verification of non-residential charging by desktop review should suffice.** Existing regulations govern EV charger accuracy and practical considerations call into question the feasibility of comprehensive site visitation to fuel supply equipment. If site visitation remains a priority for CARB, we recommend at least reducing the site visit burden using a reasonable sampling approach and/or authorizing third-party verifiers to exercise discretion in determining when a site visit to a specific location is warranted. The latter approach would align with a recent proposal by Oregon DEQ for its Clean Fuel Program.⁵
- **Metered residential charging should be entirely exempt from site visit requirements.** Site visits to many thousands of residential locations would be highly impractical, raise privacy concerns, and incur significant costs that would significantly erode the economics of the incremental credit pathway. The implications of potentially disincentivizing automaker generation of incremental credits include relatively more carbon-intense EV charging, diminished market pressure to accelerate the development of renewable electricity generation, and the potential loss of the best available data on residential EV charging, which CARB now uses to establish base

⁵ Oregon Department of Environmental Quality, *Oregon Clean Fuels Program 2024 Rulemaking: Rulemaking Advisory Committee Meeting #2* (Meeting Slides), August 14, 2024, slide 17, available at www.oregon.gov/deq/rulemaking/pages/cfp2024.aspx.

credit volumes. CARB can achieve this with a small modification to the final regulatory language in §95500(c)(1)(E)(1) to state (new text in italics),

“EV Charging except as specified under 95491(d)(3)(A) *and 95491(d)(3)(B).*”

This would exempt both metered and non-metered residential charging from third-party verification.

Updates to the Light-Duty (“LD”) EER and Geofencing Radius Still Merit Consideration

Rivian has previously raised the need to implement technical adjustments to the LD EV EER and geofencing radius used to identify eligible telematics-recorded charging activity. Unfortunately, the latest package of modified text does not include any discussion of potential changes to these aspects of the LCFS.

We acknowledge that updating the EER would represent a relatively substantial change at this stage in the rulemaking process. Nonetheless, we want to take this opportunity to reiterate a summary of our findings in this regard and encourage continued deliberation on this important aspect of the regulation. If the staff consider proposing further modifications to the regulatory text before the hearing, we recommend an update to the EER be included.

At the same time, we believe it is not yet too late to update the geofencing radius, which CARB specifies through guidance. While relatively minor in administrative complexity, a change to agency guidance in this respect would be significant in its real-world impact on credit generators.

- **Revise the LD EER.** The current value of 3.4 stems from a determination originally made by CARB in the 2011 rulemaking—and is thus now more than a decade old.⁶ Continuing to use an outdated EER systematically undervalues the real-world displacement of fossil fuels achieved by EVs, and the true role EVs play in decarbonizing the transportation fuel pool in support of the LCFS’ objectives. Examples of more appropriate EER values exist. For instance:

⁶ California Air Resources Board, *Appendix A: Proposed Regulation Order*, October 26, 2011, available at www.arb.ca.gov/sites/default/files/barcu/regact/2011/lcfs2011/lcfsappa.pdf.

- A National Renewable Energy Laboratory analysis of the U.S. passenger vehicle fleet found an EER of 4.4.⁷
- Canada's clean fuels regulation specifies an EER of 4.1 for LD vehicles.⁸
- Rivian compared the R1S to comparable three-row internal combustion engine ("ICE") SUVs and estimated an EER of 4.05.⁹

We encourage CARB to take this opportunity to calculate a revised EER.

- **Update the Geofencing Radius.** To avoid double-counting, CARB currently requires that vehicle charging sessions recorded using telematics that occur within 220m of a non-residential charging station be excluded from reporting for residential incremental credits.¹⁰ As the density of public charging networks continues to increase, a 220m geofencing radius risks excluding a growing share of incremental charging claims. Moreover, contemporary GPS accuracy, usually accurate to within 2 meters, means that such a generous radius is no longer necessary nor justifiable.¹¹ Rivian recommends that CARB amend the geofencing radius as part of this rulemaking. At a minimum, we suggest aligning with the 110m radius established by Washington's Clean Fuel Standard guidance but encourage CARB to consider an even smaller figure.¹²

Conclusion

Rivian greatly appreciates the hard work of staff in developing the modified text for the proposed LCFS amendments. We welcome and applaud key changes in the latest round of proposals and respectfully urge the Board to finalize them at its November hearing. Rivian is particularly supportive of the proposed base credit generation opportunity for automakers. This is an important evolution of the LCFS' residential charging provisions that we believe is not just consistent with the policy's foundational principles but also potentially a significant catalyst for accelerated growth in California's EV market. **The LCFS has been very successful. The proposed rulemaking will ensure that success continues.**

At the same time, we encourage the staff and Board members to continue reflecting on the burdens credit generators will incur under the proposed requirements for third-party verification of certain electricity credit claims. We do not believe third-party verification as proposed is appropriate or necessary in these contexts and that CARB's objectives can be met through other means, including desktop verification procedures and reasonable sampling. We also believe there is still an opportunity to update the geofencing radius used for certain electricity credit claims and, if further regulatory amendments are proposed, to revisit the outdated LD EV EER.

Please do not hesitate to reach out with any questions about our comments. We look forward to strongly supporting the proposed amendments at the November hearing.

Sincerely,

Tom Van Heeke

Re: Proposed Amendments to the Low Carbon Fuel Standard Regulation

Dear Chair Randolph and Honorable Board Members:

This letter is submitted on behalf of Los Angeles Department of Water and Power, Pacific Gas and Electric Company, Sacramento Municipal Utility District, San Diego Gas & Electric Company, Southern California Edison Company, Burbank Water and Power, Pasadena Water and Power, and the Northern California Power Agency ("the CA Utilities"). We appreciate this opportunity to comment on the Proposed Low Carbon Fuel Standard Amendments ("15-day changes").

108.1 The CA Utilities are also members of the California Electric Transportation Coalition ("CalETC") and support the positions taken in the CalETC Board Letter that was submitted on August 27, 2024. The CA Utilities urge CARB to adopt all the recommendations outlined in the CalETC Board Letter. In addition, these comments focus on a key issue not addressed therein pertaining to the potential assignment of base credits to Original Equipment Manufacturers ("OEMs" or "automakers"). To summarize, the CA Utilities urge CARB to resolve these critical issues to ensure that the final regulation is clear and efficacious:

- 108.2 ➤ Establish that individual and aggregate utility holdback credits will not be reduced if the Executive Officer redirects credits from the Clean Fuel Reward ("CFR") program to OEMs.
- 108.3 ➤ Establish a one-time deadline of March 15, 2025, for the Executive Officer's determination whether to reallocate base credits to the OEMs and clarify that utility contributions to the CFR would cease.
- Ensure Board oversight of the Executive Officer's discretion to reallocate base credits to the OEMs.

These issues are discussed further below, accompanied by proposed redline changes to the relevant sections of the 15-day changes in Appendix A and the CalETC Board Letter in Appendix B.

I. Discussion

The CA Utilities support many provisions in the Proposed Regulation Order, as discussed in comments filed through CalETC in February 2024. However, the CA Utilities share significant concerns about the newly proposed option for the Executive Officer to assign base credits to OEMs. The CA Utilities also remain concerned about the omission of key clarifications and revisions to the 45-day proposed amendments necessary to ensure effective implementation, as detailed in the CalETC Board letter in Appendix A.

108.2 cont

Reallocating the base residential credits away from the utilities – the fuel providers that are required to spend at least half of their funds on equity projects – to the non-fuel supplying automakers that will use the funds to incentivize the purchase of new cars, is a significant departure from both CARB’s and the state’s equity goals. The proposal in the 15-day changes to provide the option for allocation of electric distribution utility (“EDU” or “utility”) base residential credits to the automakers is contrary to the intent and purpose of the LCFS and sets a concerning precedent. The entire premise of the LCFS is that clean fuel providers earn credits for the production and supply of low-carbon fuels, and high-carbon fuel providers must purchase credits to offset the carbon-emitting fuels from which they profit at the cost of all Californians, especially those in disadvantaged communities. By allocating credits to the automakers – entities that are not fuel providers – CARB is directly undermining the premise of the regulation. Siphoning credits earned by a clean fuel provider such as utilities disincentivizes low-carbon fuel suppliers from further investing in low carbon fuel technologies, infrastructure, and programs.

The CA Utilities are particularly concerned that throughout the robust, deliberative, and multi-year regulatory process, this concept has neither previously been introduced nor vetted. We urge CARB to reconsider the potential consequences of such a drastic change before adopting this language. However, if CARB does go forward, specific changes must be made to the 15-day changes to maintain the integrity of the LCFS program and ensure that the utilities will be able to effectively administer programs funded by LCFS proceeds, as discussed below.

1) CARB Should Establish that Individual and Aggregate Utility Holdback Credits Will Not Be Reduced if the Executive Officer Redirects Credits from the Statewide Clean Fuel Reward Program to the OEMs

The Draft Order provides that, “If the Executive Officer directs base credits to eligible OEMs, the requirements of section 95483(c)(1)(A)2. do not apply.”¹ Put simply, the requirements for EDU contributions to the CFR do not apply. However, those requirements include a table specifying the EDUs’ contribution towards the statewide program:

¹ Draft Order, at section 95483(c)(1)(B).

EDU Category	% Contribution
Large Investor-owned Utilities	50%
Large Publicly-owned and Medium Investor-owned Utilities	25%
Medium Publicly-owned Utilities	10%
Small Publicly-owned Utilities and Small Investor-owned Utilities	0%

The requirements provide a level of clarity regarding proportionality that is absent from the carveout for OEMs. There is no mention of how base credits would be redirected from the EDUs to support the OEM allocation. For example, according to the table above, small publicly owned utilities and small investor-owned utilities have 0% contribution to the statewide program. Without additional clarity on the contribution process, there is concern that CARB will take 45% from each EDU's base credits to support the OEMs effectively reducing the holdback credits available to many utilities.

The determination of individual EDU allocations is based on section 95486.1(c)(1)(A), or the ratio of non-metered residential EVs assigned to an EDU over total number of non-metered residential EVs. Under the proposed 15-day changes, if the total base credit equals 100 million metric tons ("MMT"), OEMs will get 45 MMT, and EDUs will get the remaining 55 MMT. For example, if large POU's make up approximately 10% of the base credits they would receive 5.5 MMT for holdback. In contrast, under the 45-Day proposal, large POU's would contribute 25% to CFR and keep 75% or 7.5 MMT for holdback.

This scenario would significantly affect EDUs. For example, a medium-sized utility like Burbank would expect to receive 25% fewer credits, even though their contribution to the CFR program would cease. This would make it difficult, if not impossible, for some EDUs to conduct their holdback and equity holdback programs. Because all of Burbank's TE programs and infrastructure projects are funded by LCFS proceeds, a reduction in the credits could result in:

- Fewer investments in TE customer programs and public TE infrastructure projects.
- An impact on electric rates, if ratepayer funds need to be used to partially fund the TE programs and projects.

Similarly, SMUD, as a large POU, would expect to contribute 25% of its base credits to the CFR and retain 75% for holdback under the proposed regulation. However, if 45% of SMUD's base credits were reassigned to OEMs, the holdback percentage would drop to 55%. Like many POU's, SMUD's transportation electrification programs are primarily supported through LCFS credit revenues. Such a reduction would, for example, challenge already stressed budgets and jeopardize SMUD's ability to maintain transportation electrification programs, expand EV charging infrastructure, increase electric mobility investments in low-income and equity communities, and avoid or limit rate impacts from distribution grid upgrades to support long-term growth in EV charging.

This problem is even more exaggerated for small POUs such as the City of Ukiah, the City of Lompoc and the City of Lodi. Under current regulation, small POUs are not required to remit any percentage of their credit proceeds to the CFR and if the regulation is adopted as written, they will receive 45% fewer credits.

Therefore, CARB should (1) establish in the regulation that individual and aggregate utility holdback credits will not be reduced as a result of this directive, and (2) clarify in the regulation that in redirecting credits to the OEMs, the Executive Officer would allocate only that portion of the credits dedicated for CFR according to the table in section 95483(c)(1)(A)(2), but not to exceed 45% of the total base credits. The CA Utilities propose such clarifications in Appendix A.

2) The Regulation Should Establish a Deadline of March 15, 2025, for the Executive Officer's Discretion to Reallocate Base Credits to the OEMs and Clarify that EDU Contributions to CFR Would Cease

Should the final order allow the Executive Officer the discretion to allocate base credits to OEMs, a shot clock is necessary to provide certainty and transparency regarding the Executive Officer's decision and the impact on the CFR program. It must be clear in the regulation that this potential allocation is a one-time option that must be executed by March 15, 2025. If it is not executed by March 15, 2025, this option expires. This deadline is necessary for the utilities to develop and implement the proposed statewide eMDHD CFR program without the looming possibility that some unknown percentage of funds may be redirected at any future time via a nontransparent and arbitrary process. In addition, the CFR Governance Agreement requires medium and large EDUs to transfer credit proceeds to the CFR program by March 31. In addition, if this provision is enacted CARB must clarify no further contributions to the Clean Fuel Reward program shall be made, and the administrator of the Clean Fuel Reward program shall implement the windup procedures set forth in the statewide program Governance Agreement.

Requiring the Executive Officer's decision by March 15 will ensure that the EDUs have enough time to initiate a timely transfer of credit proceeds to the CFR program, if needed. To remedy this situation, the CA Utilities request that CARB modify §95483(c)(1)(B) as shown in Appendix A.

3) The Regulation Should Ensure Board Oversight of the Executive Officer's Discretion to Reallocate Base Credits to the OEMs

Reallocating the base residential credits away from the utilities – the fuel providers that are required to spend at least half of their funds on equity projects – to the non-fuel supplying automakers that will use the funds to incentivize the purchase of new cars, is a huge departure from both CARB's and the state's equity goals. As such, checks and balances are needed in the form of ongoing Board oversight. There is precedent for Board oversight of program implementation in the current regulation under §95483(c)(1)(A)(2) regarding the utilities' implementation of the CFR program:

The Executive Officer will review the implementation of any Clean Fuel Reward program, including the actual credit value contribution of each utility to the program, and present a report to the Board by January 1, 2027, with recommendations for further increasing utility contributions to the Clean Fuel Reward program.

Given that the EDUs' implementation of the CFR could essentially be replaced via an OEM allocation of base credits, then so too should the CARB Board have oversight here. Specifically, the final order should require the Executive Officer to review the implementation of any OEM program and present a report to the Board annually, beginning January 1, 2027, with recommendations for continuing or decreasing allocations to the OEMs. To remedy this situation, the EDUs request that CARB modify §95483(c)(1)(B) as shown in Appendix A.

II. Conclusion

The CA Utilities appreciate the opportunity to provide comments on this important regulation. Due to the severity of the changes proposed by CARB in the 15-day changes and the criticality of having clarity on these changes to effectively administer the eMDHD CFR and utility holdback programs, the utilities request that CARB staff address each of these issues in detail in the next round of 15-day changes.

Respectfully,

The CA Utilities

Appendix A
Proposed Revisions to Draft Order

Proposed text deletions are in bold and strikethrough (~~**abcd**~~)

Proposed text additions are in bold and underlined (**abcd**)

Appendix A

Proposed Revisions

The CA Utilities propose the following modifications to the Draft Order (additions in underline and deletions in ~~strikeout~~ format; numeration follows that of the Draft Order):

Section 95483(c)(1)

- A. *Base Credits to EDUs.* The EDU or its designee is the credit generator for base credits for the portion of residential EV charging assigned to that EDU by the Executive Officer, except for any portion of base credits that the Executive Officer assigns to OEMs pursuant to section 95483(c)(1)(B). ~~If the Executive Officer assigns a portion of base credits to OEMs pursuant to section 95483(c)(1)(B), the EDUs are assigned the remaining base credits.~~ The EDU may authorize a third party to sell the EDU's credits. The EDU or its designee must meet the requirements set forth in paragraphs 1. through 5. below, and 95491(e)(5).
- B. *Base Credits to OEMs.* No later than March 15, 2025, ~~the~~ the Executive Officer may reallocate some or all of the EDUs' credits that would have otherwise been allocated to the Clean Fuel Rewards contributions, not to exceed ~~direct up to~~ 45% of base credits, to eligible OEMs, if the share of new zero emission vehicle sales for model year 2024 zero emission vehicles certified under California Code of Regulations, title 13, section 1962.2 is less than 30 percent. If the Executive Officer directs base credits to eligible OEMs, the following provisions apply:
- i. Each EDU's base credits shall be reduced by no more than the percent contribution for the applicable EDU category as specified in section 95483 (c)(1)(A)2.
 - ii. ~~The~~ The requirements of section 95483(c)(1)(A)2 ~~do not~~ shall no longer apply.
 - iii. No further contributions to the Clean Fuel Reward program shall be made, and the administrator of the Clean Fuel Reward program shall implement the windup procedures set forth in the statewide program Governance Agreement.
 - iv. The OEM is the credit generator for base credits for the portion of residential EV charging assigned to that OEM by the Executive Officer pursuant to 95486.1(c)(1)(A).
 - v. The OEM must meet the requirements set forth in paragraphs 1. through 3. below, and 95491(e)(5).
- C. *OEM Eligibility.* The OEM must identify itself to the Executive Officer as eligible to generate base credits. The Executive Officer may revoke the eligibility of an OEM to generate base credits if it fails to sell base credits and spend the proceeds within three years of base credit issuance. An OEM must submit any request to change base credit generation eligibility status for base credit generation by the end of the first month of the prior quarter.
- D. *Reporting Requirements.* The Executive Officer shall review the implementation of any OEM program and present a report to the Board annually, beginning January 1, 2027, with recommendations for continuing or decreasing allocations to the OEMs. Documentation of adherence to the following restrictions must be included in the annual report submitted pursuant to section 95491(e)(5)(A).

Appendix B
CalETC Board Letter

August 27, 2024

Sacramento, CA 95812

Re: Proposed 15-day Change Amendments to the Low Carbon Fuel Standard Regulation

Submitted to <https://ww2.arb.ca.gov/applications/public-comments>

Dear Chair Randolph and Honorable Board Members:

CalETC appreciates this opportunity to SUPPORT the Low Carbon Fuel Standard (LCFS) regulation and provide feedback for CARB Board member consideration. As discussed in detail below, CalETC largely supports the proposed draft regulation order ("draft order") August 12, 2024, version ("15-day changes"). However, we are urging CARB to make critical modifications to the regulation in order ensure that the utilities will be able to effectively administer the programs funded by LCFS proceeds. Attached to this letter is our February 20 letter which we are resubmitting as Appendix B and slightly changed recommended amendments in Appendix A. The changes we request are critical to ensuring the success of the LCFS program. Below we also provide additional justification for the recommendations in our February 20 letter.

CalETC is a non-profit association committed to the successful introduction and large-scale deployment of all forms of electric transportation including plug-in electric vehicles of all weight classes, transit buses, port electrification, off-road electric vehicles and equipment, and rail. Our board of directors includes Los Angeles Department of Water and Power, Pacific Gas and Electric, Sacramento Municipal Utility District, San Diego Gas and Electric, Southern California Edison, Northern California Power Agency, and the Southern California Public Power Authority. Our membership also includes major automakers, manufacturers of zero-emission trucks and buses, developers and operators of charging stations and other industry leaders supporting transportation electrification. CalETC supports and advocates for the transition to a zero-emission transportation future to spur economic growth, fuel diversity and energy independence, ensure clean air, and combat climate change. This letter is submitted on behalf of the CalETC board of directors and covers issues specific to the utility interests in LCFS. Also see our joint letter with the EV Charging Association for our comments on the non-utility provisions in the 15-day change package.

Over the past few years, the CalETC board has worked closely with the CARB LCFS staff to provide suggested amendments to the LCFS regulations. We appreciate the tremendous effort and accessibility of CARB staff during the extensive public process regarding this regulation.

Additional rationale for our February 20 letter recommendations:

1. **Requesting a clearer list of eligible Holdback Programs.** The current list of proposed holdback projects is confusing. Utilities and their regulators need this list to be as clear as possible to help remove any ambiguity for staff and decisionmakers at CARB, CPUC, and Publicly Owned Utilities (POU). The Appendix to our February 20 letter provides our recommended amendments and detailed justification (See Appendices A and B to this letter). These recommendations also consider the needs of the dozens of medium and small EDUs in California that are at a very different stage of EV program implementation than the large EDUs. These recommended edits are necessary to make the project review and approval process simpler and to help the utilities implement equity projects:

Having one list instead of the current two lists improves clarity and allows for the implementation of more equity projects such as vehicle grid integration projects for low-income individuals and others who meet the equity definition.

Allowing eMHDVs anywhere in California to clearly count as equity is necessary as the current language is open to interpretation. Improving clarity here will allow projects supporting eMHDVs (e.g., grid side upgrades, panel upgrades, the eMHDV Clean Fuel Reward etc.) to count as equity. See Appendices A and B for more on this topic.

Requiring large IOUs¹ to utilize their holdback credit revenues to fund a minimum of three program options is necessary as there are increasingly diversified needs in transportation electrification over large service areas. Including this requirement to fund a minimum of three program options will help ensure that the large IOUs consider these diverse needs and will prevent a situation in which the large IOUs are compelled to spend all of their holdback funds on one program. The list of holdback expenditures is appropriately lengthy, in part, to meet the diverse and varied needs of priority communities and address equity. For example, the holdback list allows spending on light-, medium- and heavy duty EVs and off road EVs too. Proceeds also can be spent on projects for chargers, vehicle-grid integration, grid side upgrades, ridesharing, transit, EV rebates, micromobility, reskilling and workforce development and others. All of these are important projects. Requiring spending on at least three programs will ensure programmatic diversity and equity. CalETC proposes to limit this requirement to only the large IOUs as the other EDUs may not have enough funds to do three programs, especially with low credit prices. See Appendix A for recommended edits.

The project list should preserve a narrowly focused project category for direct multilingual education, and outreach serving equity communities. The preservation of this category is not intended to include general marketing or advertising. It is only intended to allow for multilingual education and outreach to equity communities for specific projects. The 15-day changes allow this for automaker programs, but not the EDU holdback programs. Deleting

¹ Under the proposed definitions, this would only include SCE and PG&E.

the multilingual education and outreach project category in the regulation will hurt efforts by many EDUs to reach hard-to-serve markets who speak little or no English, many of whom are low-income individuals. See Appendix A for recommended edits.

The project list should explicitly allow for upgrades to electric panels, which are prerequisites to transportation electrification for many customers living in older buildings that have not had recent updates. Upgrades to panels can have other benefits but are primarily to enable transportation electrification. Naming this clearly in the regulation will also help develop equity projects to serve low-income individuals with panel upgrades. See Appendix A for recommended edits.

For simplicity and clarity, *the project list should be consolidated under the recommended projects for electric mobility solutions* as there are two list items that appear to overlap regarding mobility alternatives. See Appendix A for recommended edits.

The list of agencies that may be consulted in the creation of workforce development projects should be expanded to include other pertinent entities, such as California Community Colleges, community-based organizations, and POU Governing Boards.

CalETC thanks CARB Staff for harmonizing the definitions of equity communities and individuals in the proposed amendments with those detailed in AB 841 and CPUC Decision D.20-12-027. However, the language requires a slight modification. AB 841 defines this as "a community located on lands belonging to a federally recognized California Indian tribe, " and *the proposed order should align with AB 841 in order to ensure simplicity*. Note the proposed amendments include term "state and federally recognized" instead of the AB 841 language.

"Off Road Vehicle" should be defined in LCFS for clarity because it is not obvious that vessels, aircraft, and other transportation or mobile sources qualify under that term. Off-road vehicle projects are needed in many areas including construction sites, factories, warehouses, seaports, railyards, airports and farms. Adding a definition will improve the clarity of the holdback program's list of eligible projects. See Appendix A for recommended edits.

2. **Requesting an increased cap on administrative costs for utility Holdback Programs and statewide Clean Fuel Rewards.** While we appreciate that CARB increased the administrative costs for electric distribution utility (EDU) holdback programs to seven percent, we do not support this change, and request 1) that the seven percent administrative cost cap for utility holdback programs be raised to ten percent and 2) the five percent administrative cost cap for the electric medium-and heavy duty vehicle Clean Fuel Reward be raised to ten percent. We note this recommendation is a simpler solution than the recommendations from our previous letter (see Appendix B):
 - a. As we explain in Appendix B, administrative cost caps are a complex issue. And this issue has not been workshopped. Given the complexity, we recommend maintaining

the current 10 percent administration cost cap on holdback programs and statewide Clean Fuel Reward. It is important to note that the CPUC has decades of experience in regulating billions of dollars in energy efficiency program portfolios and their requirements on administrative costs, marketing, education and outreach costs, and related costs are both thoughtful and strict. They require a ten percent administrative cost cap for energy efficiency programs which is appropriate for CARB's regulation of LCFS programs too. Additionally, as the EDU's LCFS programs grow in size and amount spent, we expect many projects will be added, and many additional partners (community-based, equity-oriented organizations) will be engaged. In that scenario, the EDUs may require a cap of more than 10 percent for holdback programs. Regarding examples on why a 10 percent administrative cost cap is needed for utility holdback programs please see August 27 letters to CARB from individual utilities. Also, the February 20 letter to CARB from CalETC ([Appendix B](#)) provides additional justification, and [Appendix A](#) in this letter on this topic is slightly different than our proposed amendments in our February 20 letter.

- b. The proposed statewide Clean Fuel Reward for electric medium and heavy duty EVs (eMHDVs) is a new program that should not be hampered by a five percent administrative cost cap especially since this market is complex with many submarkets and types of customers that will be hard to reach with rewards. We note that CARB's concerns about administrative costs were addressed when the CPUC authorized the utilities to implement the Clean Fuel Reward in 2019, finding that "a 10% cap of administrative funds is generally within the range of spending for other customer programs the utilities implement," and ordered SCE in Resolution E-5015 to "administer no more than 10% of the total Clean Fuel Reward program budget on administrative and marketing, education, & outreach spending, which must include all administrative spending related to the Clean Fuel Rewards program." The CPUC found that including ME&O in the 10% cap was reasonable for a program of this size; the potential scale of the Clean Fuel Reward is no larger today than it was in 2019, and the same rationale should apply today. In addition, the utilities should not have a lower cap (i.e., five percent) for this program than the automakers (i.e., seven percent) for a similar program for light duty EVs. An additional rationale for our recommendation is in [Appendix B](#).
3. **Clarifying that Publicly Owned Utilities must spend 50% of holdback funds on equity projects, consistent with the intent in the 45-day package.** Appendix E in the 45-day LCFS proposed order gives the rationale for 50%, and we understand that 50% allocation was CARB's intent. This change is necessary to eliminate the inconsistency. Moreover, maintaining a 50% equity spending requirement is appropriate for POUs, as further detailed in [Appendix B](#) to this letter.

4. **Update the EDU definition based on 2022 sales data, clarifying that San Diego Gas & Electric Company is a “medium-sized” utility under the regulation for all the reasons listed in [Appendix B](#).** Appendix E in the 45-day LCFS proposed order gives the rationale for San Diego Gas & Electric Company (SDG&E) as a medium-sized EDU, and we understand that was CARB’s intent. In general, CARB should use GWh definitions consistent with the 2022 EDU annual sales data in the California Energy Commission’s 2023 Integrated Energy Policy Report’s Planning Forecast. This report makes clear that SDG&E is a medium-sized utility with a similar volume of sales as the Los Angeles Department of Water and Power. We recommend small POUs be defined as having less than 5,000 GWh annual sales. See proposed amendments in [Appendix A](#).
5. **Exempt holdback programs administered by EDUs with less than 2000 GWhs of annual sales from a cap on administrative costs, or make them subject to a higher cap, such as 20%.** While small EDUs can design and implement programs specifically tailored to their community needs, administrative costs for these EDUs may naturally result in a higher percentage of costs due to the small scale of programs and the utility’s limited staff resources, particularly if the definition of administrative costs is expanded. We do not support the alternative solution of having a process where small EDUs would seek an exemption (EO approval) due to the cost and time burden. Small EDUs have very different LCFS program needs due to their very small size and lack of budget and staff.
6. **Make edits to the regulation that will assist smaller utilities, potentially allowing them to participate in LCFS.** See the rationale for our proposal in [Appendix B](#) and proposed amendment in [Appendix A](#). Our proposal would support approximately twenty small rural utilities who cover about one percent of California to opt-into LCFS.
7. **Modifying the utility reporting requirements to better track deployment of funds to impacted communities, align with the reporting framework required by the California Public Utilities Commission (CPUC), and simplify reporting for smaller utilities.** See the rationale for our proposal in [Appendix B](#) and proposed amendment in [Appendix A](#). CARB and the CPUC currently measure equity in very different ways, and our proposal would harmonize with how this is done by the two agencies. In addition, our proposal benefits the POUs with a simpler, more practical way to report compliance with the LCFS equity provisions.

CalETC appreciates the opportunity to provide comments on this important regulation. If you have any questions, please do not hesitate to contact me at any time.

Best,

Appendix A (note: slightly different than CalETC's February 20th letter)

New or updated Defined Terms to be added to the Regulation's Definitions and Acronyms

~~[New term] "EDU Program Administrative Costs" are all costs associated with implementing LCFS-funded programs incurred by an EDU to pay for its staff, 3rd party implementers, non-incentive implementation costs (rebates processing, application verification, etc.) websites, application portals, and other direct program costs required to operate the program. EDU Program Administrative Costs do not include marketing, education and outreach costs.~~

[Updated term] "Clean Fuel Reward" is a statewide program established by EDUs to provide a reduction in price ~~on new light duty EV purchases or leases~~ for new and/or used commercial medium- or heavy-duty electric vehicles that are not subject to the High Priority and Federal Fleets requirements as specified in, title 13, California Code of Regulations, section 2015(a)(1) in California. The Clean Fuel Reward is funded exclusively through LCFS proceeds generated by EDUs from electricity fuel.

[New term] "Commercial vehicle" for the purposes of this program means any vehicle used by a business, public or governmental agency, or non-profit to carry people, property, or hazardous materials.²

~~"Rural Area" means a census tract with at least 75 percent of its population identified as rural non urban by the latest US Census data.~~

[New term] "Off road vehicle" is a piece of equipment that is moved over distances in order to transport goods or people from one physical location to another and is not primarily operated on roads established for automotive transport (e.g. fields, waterways, construction sites, airports, airways, etc.).

Recommendations for edits to the holdback program

5. *Restrictions on the Use of Holdback Credits.* Documentation of adherence to the following restrictions must be included in the annual report submitted pursuant to section 95491(e)(5)(A).
 - a. *Holdback Credit Equity Projects.* Effective January 1, 2022~~5~~, at least 75 percent in year one, 40 percent in year two, and 50 percent in subsequent years of holdback credit ~~proceeds~~ annual spending for large and medium investor owned EDUs and 50 percent of holdback credit annual spending for all other EDUs must be used to support transportation electrification for underserved individuals and

² HVIP FY22-23 Implementation Manual, Definitions, page 52 [HVIP-FY22-23-Implementation-Manual.pdf \(californiahvip.org\)](https://californiahvip.org)

communities. Any project from sections 95483(c)(5)(a)(i), (viii), or (xi) shall be considered a holdback credit equity project; all other projects described in this paragraph may be considered holdback credit equity projects provided they are for the primary benefit of or primarily serving disadvantaged communities and/or low-income communities and/or rural areas or low-income individuals eligible under California Alternative Rates for Energy (CARE) or Family Electric Rate Assistance Program (FERA) or the definition of low-income in Health and Safety code section 50093 or the definition of low-income established by a POU's governing body or a community in which at least 75 percent of public school students in the project area are eligible to receive free or reduced-price meals under the National School Lunch Program, or a community located on lands belonging to a ~~state and~~ federally recognizes California Indian tribe.

If an EDU fails to spend the required percentage on equity projects in a calendar year, the shortfall of spending, in dollars, will be added to their total equity spending requirement for the following year.

~~a.~~

~~b.~~ EDUs must use their holdback credits to implement additional projects that further transportation electrification efforts in California. Project costs may include incentives; infrastructure installation; administration; marketing, education, and outreach (ME&O); evaluation; and other cost categories as needed. Equity projects as defined in this paragraph must be selected from the options of projects listed in i-x below. Non-equity projects may be selected from the options on this list, or any alternative provided the EDU meets the requirements of 95491(e)(5) without further CARB approval. The large investor-owned utilities must implement at least three different holdback projects. Equity holdback project options are listed below: ~~These projects may include:~~

- ~~i.~~ Electrification and battery swap programs for school or transit buses.
- ~~ii.i.~~ Electrification of drayage trucks as well as other medium-, heavy-duty, or off-road vehicles including school and transit buses.
- ~~iii.ii.~~ Investment in public EV charging infrastructure and EV charging infrastructure in multi-family residences.
- ~~iv.iii.~~ Investment in electric mobility solutions, such as EV sharing and ride hailing programs.

- ~~v.~~ Multilingual marketing, education, and outreach designed to increase awareness and adoption of EVs and clean mobility options and including information about: the environmental, economic, and health benefits of EV transportation; basic maintenance and charging of EVs; electric rates designed to encourage EV use; and local, state, and federal incentives available for purchase of EVs.
- vi. *[Revised Subsection v. renumber as iii]* ~~community education events located within communities listed in 95483(c)(1)(A) designed to increase awareness and adoption of EVs and clean mobility options, and outreach in coordination with community-based organizations, including but not limited to neighborhood canvassing, community listening sessions, and needs assessments, focused in communities listed in 95483(c)(1)(A), to inform the development of projects and programs tailored to community needs. including information about: the environmental, economic, and health benefits of EV transportation; basic maintenance and charging of EVs; electric rates designed to encourage EV use; and local, state, and federal incentives available for purchase of EVs. Education and outreach do not include general marketing or advertising campaigns.~~
- vii.
- ~~viii.~~ ~~iv.~~ Additional rebates and incentives ~~for low-income individuals~~ beyond existing local, federal and State rebates and incentives ~~including the Clean Fuel Reward~~ for: purchasing or leasing new or previously owned EVs; installing EV charging infrastructure in residences, including panel and service upgrades; ~~promoting use of public transit and other clean mobility solutions~~; and offsetting costs for residential or nonresidential EV charging.
- v. Investing in, or promoting the Promoting use of, and additional incentives for use of public transit and other clean mobility solutions, via charging equipment or infrastructure for the following categories such as:

- I. EV sharing and ride hailing programs,
- II. Electrification of public transit and school buses, including battery swap programs, and
- III. Use or ownership of neighborhood electric vehicles, eBikes, eScooters, eMotorcycles, and other micromobility solutions.
- IV. Charging equipment or infrastructure for any of the above.
- vi. Re-skilling and workforce development for transportation electrification and electric vehicle infrastructure applications, developed in coordination with the California Workforce Development Board, ~~or~~ local workforce development agencies, a community-based organization, a California Community College, or a workforce strategy adopted by the Board of a POU.
- vii. Investments in grid-side distribution infrastructure necessary for ~~medium and heavy duty~~ EV charging.
- viii. Transportation Electrification projects that are identified in, or consistent with, a Community Emission Reduction Plan created in response to AB 617.
- ix. Support for vehicle-grid integration with projects such as:
 - I. Encouraging the optimization of EV charging through education in the following areas: peak demand, rate pricing, grid emergencies, potential power shutoffs, infrastructure deferral, renewable integration, and/or other signals and grid needs to provide grid and customer benefits.
 - II. Providing program incentives to encourage driver participation in monitored/managed charging, demand response, or vehicle-to-

load / vehicle-to- grid applications.

III. Supporting the deployment and installation of bidirectional charging equipment.

IV. Other innovative approaches to promoting and managing EV charging and discharging provide benefits to customers and the grid.

X. Hardware and software that decrease the cost of or avoid updates to infrastructure, including load management software or outlet splitting.

~~vii.~~xi. Alternatively, EDUs, in coordination with local environmental justice advocates, local community-based organizations, and local municipalities, may develop and implement other projects that promote transportation electrification in disadvantaged and/or low-income communities and/or rural areas or for low-income individuals. These alternative projects are subject to approval by the Executive Officer. Applications submitted to the Executive Officer must include, and will be evaluated for approval based on, a complete description of the project, demonstration that the project promotes transportation electrification in disadvantaged and/or low-income communities and/or rural areas or provides increased access to electric transportation for low-income individuals, and evidence that the project was developed in coordination with local environmental justice advocates, local community-based organizations, and local municipalities.

b. ~~*Additional Reporting Requirements for Holdback Credit Equity Projects.*~~ As part of annual reporting required pursuant to section 95491(d)(3)(A)5., EDUs must include a discussion on how their portfolio of holdback credit equity projects is consistent with the findings and recommendations of the SB 350 Low Income Barriers Study, Part B report prepared by CARB (rev. Feb. 2018), incorporated herein. This discussion must include, as applicable, a description of how the projects:

support increased access to clean transportation and mobility options; consider, and to the extent feasible, either complement or build upon existing CARB, other State, or local incentive projects to diversify and maximize benefits from statewide investments; demonstrate partnership and support from local community based organizations; and meet community identified clean transportation needs.

~~b. Other Holdback Projects. Holdback projects that are not specified in subsection 95483(c)(1)(A)6.a. must follow the requirements specified in 95491(e)(5). Below are examples of pre-approved uses for these other holdback credit proceeds:~~

~~i. Investments in grid side distribution infrastructure necessary for EV charging.~~

~~ii. Support for vehicle grid integration with projects such as:~~

~~I. Encouraging the optimization of EV charging through education in the following areas: peak demand, rate pricing, grid emergencies, potential power shutoffs, infrastructure deferral, renewable integration, and/or other signals and grid needs to provide grid and customer benefits.~~

~~II. Providing program incentives to encourage driver participation in monitored/managed charging, demand response, or vehicle to load /vehicle to grid applications.~~

~~III. Supporting the deployment and installation of bidirectional charging equipment.~~

~~IV. Other innovative approaches to promoting and managing EV charging and discharging that provides benefits to customers and the grid.~~

~~iii. Hardware and software that decrease the cost of or avoid updates to infrastructure, including load management software or outlet splitting.~~

b. Administrative Costs of Holdback Credit Equity Projects. With the exception of EDUs with annual sales of less than 2000 GWh, EDU Program administrative costs to support the ~~development and~~ implementation of holdback credit equity projects excluding start-up costs (those costs associated with setting up the program and incurred prior to issuing incentives), must not exceed 10.7 percent of total spending on holdback credit equity projects annually unless the EDU contracts with a community-based organization, and the exceedance is approved in advance by the Executive Officer. The request for administrative cost exceedance for a calendar year must be submitted by September 30th of the prior year. The request must include, and will be evaluated for approval based on, a complete description of the equity projects planned by the EDU, an estimate of total administrative costs relative to total spending on the projects, and evidence that the community-based organization is a non-profit organization focused on serving disadvantaged and/or low-income groups.

Within 30 days of receiving a request for higher administrative costs, the Executive Officer will inform the EDU of its decision in writing. If the request is rejected the Executive Officer will provide a rationale for the decision. If the rejection is due to insufficient information, the EDU may resubmit the request after addressing the deficiencies identified in the Executive Officer decision.

Recommended amendments on administrative cost

§95483(c)(1)(A)(4) Combined Administrative and marketing, education and outreach costs, excluding start-up costs (those costs associated with setting up the program and incurred prior to issuing rewards), to support any Clean Fuel Reward program funded by LCFS credit proceeds may not exceed 5.10 percent of LCFS credit proceeds contributed to the Clean Fuel Reward program annually, unless approved in advance by the Executive Officer.

§95483(c)(1)(A)(4)(a) A request to exceed 5.10 percent administrative and marketing education and outreach costs must be submitted by the administrator of the Clean Fuel Reward program to the Executive Officer by September 30 of the prior year.

Recommended edits to the definition of “Electrical Distribution Utility.”

§95481. Definitions and Acronyms

“Electrical Distribution Utility” means an entity that owns or operates an electrical distribution system, including:

- (1) a public utility as defined in the Public Utilities Code section 216 (referred to as an Investor-Owned Utility, or IOU); or
- A. “Large Investor-owned Utility” means an IOU with annual load served equal to or more than 10,000 25,000 Gigawatt-hours (GWh) in 2017 2022;
- B. “Medium Investor-owned Utility” means an IOU with annual load served of less than 10,000 25,000 GWh and equal to or more than 700 15,000 GWh in 2017 2022;

- C. “Small Investor-owned Utility” means an IOU with annual load served equal to or less than ~~700~~ 15,000 GWh in ~~2017~~ 2022.

or

- (2) a local publicly owned electric utility (POU) as defined in Public Utilities Code section 224.3;

- A. “Large Publicly owned Utility” means a California POU with annual load served equal to or more than ~~10,000~~ 15,000 Gigawatt-hours (GWh) in ~~2017~~ 2022;
- B. “Medium Publicly owned Utility” means a California POU with annual load served of less than ~~10,000~~ 15,000 GWh and equal to or more than 7005,000 GWh in ~~2017~~ 2022;
- C. “Small Publicly owned Utility” means a California POU with annual load served of less than ~~700~~ 5,000 GWh in ~~2017~~ 2022. Or
- D. (C) an Electrical Cooperative (COOP) as defined in Public Utilities Code section 2776

Recommended amendments for a new Small EDU program

[New provision – exact location TBD] §95483(c)(1)(A) XXXX Proceeds from non-opt-in EDU base credits that were allocated to the Large EDUs beginning with the deposit of Q2 2019 credits through the deposit of Q2 2024 credits and the transferred to the Clean Fuel Reward program pursuant to section 95483 (c)(1)(A) may be transferred by the Clean Fuel Reward Program Administrator to small EDUs opted in to the LCFS program by March 31, 2025. Any base credit proceeds reallocated in this manner must be spent by the recipient small EDU in accordance with sections 95491 (e)(5) and 95483 (c)(1)(A). The Executive Officer must approve the Clean Fuel Reward Program Administrator’s plan for distribution of previously unallocated base credit proceeds prior to any transfers.

Appendix B- CalETC Board's February 2024 Letter

February 20, 2024

Honorable Chair Liane Randolph and Honorable Board Members California Air Resources Board
1001 I Street
P.O. Box 2815
Sacramento, CA 95812

Re: Proposed Amendments to the Low Carbon Fuel Standard Regulation

Submitted to <https://ww2.arb.ca.gov/applications/public-comments>

Dear Chair Randolph and Honorable Board Members:

CalETC appreciates this opportunity to SUPPORT the Low Carbon Fuel Standard (LCFS) regulation and provide feedback for CARB Board member consideration. As discussed in detail below, CalETC largely supports the proposed draft regulation order ("draft order"), however, we are urging CARB to make some modifications to ensure that the utilities will be able to effectively administer the programs funded by LCFS proceeds. These changes are critical to ensuring the success of the LCFS program.

CalETC is a non-profit association committed to the successful introduction and large-scale deployment of all forms of electric transportation including plug-in electric vehicles of all weight classes, transit buses, port electrification, off-road electric vehicles and equipment, and rail. Our board of directors includes Los Angeles Department of Water and Power, Pacific Gas and Electric, Sacramento Municipal Utility District, San Diego Gas and Electric, Southern California Edison, Northern California Power Agency, and the Southern California Public Power Authority. Our membership also includes major automakers, manufacturers of zero-emission trucks and buses, developers and operators of charging stations and other industry leaders supporting transportation electrification. CalETC supports and advocates for the transition to a zero-emission transportation future to spur economic growth, fuel diversity and energy independence, ensure clean air, and combat climate change. This letter is submitted on behalf of the CalETC board of directors and covers issues specific to the utility interests in LCFS.

Over the past few years, the CalETC board has worked closely with the CARB LCFS staff to provide suggested amendments to the LCFS regulations. We appreciate the tremendous effort and accessibility of CARB staff during the extensive public process regarding this regulation.

I. Executive Summary of CalETC Utility Comments

CalETC requests specific changes to the draft order to ensure that the utilities will be able to effectively administer programs funded by LCFS proceeds. These changes include: (1) ensuring that the cap on administrative costs for both holdback programs and the statewide California Clean Fuel Reward (CCFR) program is clearly defined and set at a reasonable amount; (2) simplifying and clarifying the language in the proposed regulation pertaining to utility “holdback” (holdback) programs; (3) clarifying that Publicly Owned Utilities must spend 50% of holdback funds on equity projects, as opposed to 75%; (4) clarifying that San Diego Gas and Electric is a “medium-sized” utility under the regulation; (5) making edits to the regulation that will assist smaller utilities, potentially allowing them to participate in LCFS; (6) modifying the utility reporting requirements to better track deployment of funds to impacted communities, align with the reporting framework required by the California Public Utilities Commission (CPUC), and simplify reporting for smaller utilities; (7) requesting that the regulation allow the Executive Officer to approve certain modifications to the CCFR that can improve program responsiveness and efficacy; and (8) requesting implementation assistance on the Credit Clearance Market (CCM). All of these modifications are discussed in Section II, below.

CalETC supports many provisions in the draft order including, but not limited to: (1) the current program design with utilities generating the “base” LCFS residential credits; (2) the provision of more credits to the utility holdback programs; and (3) the establishment of a statewide medium-and-heavy-duty electric vehicle rebate program for new and used vehicles. A detailed description of the rationale behind CalETC’s support positions is included in Section III, below.

II. CalETC Requests the Following Important Changes to the Draft Order

CalETC respectfully requests that the following changes be made to the Draft Order:

(1) CalETC opposes the proposed 5% cap on administrative costs for both holdback programs and the statewide California Clean Fuel Reward and recommends that the cap remain at 10%

Based on how utilities currently track and report program administrative costs, the reduction of allowable administrative costs for utility holdback programs from 10% to 5% in the proposed amendments will make it extremely difficult, if not impossible, to administer these programs. Given their focus on addressing the most underserved individuals and communities, utility holdback programs are necessarily more expensive to operate than broad, unrestricted incentive programs given higher levels of customer support and additional expenses like income verification needed to ensure the funding is reaching the people that most need it. Additionally, smaller utilities may only be able to implement a portfolio of small programs that will never benefit from the economies of scale that larger programs achieve. While there is an option in the Regulation that allows the utilities to exceed the administrative cost caps with advanced approval from the Executive Officer, this is likely to create administrative challenges for CARB and utility staff if each utility must make a request each year that they expect to exceed the proposed 5% cap.

CalETC acknowledges, however, that there may be differences in how CARB Staff and the electrical distribution utilities (EDUs) interpret “administrative costs” as this is not a defined term in the Regulation. While CARB Guidance 20-03 does provide some insight into what might be considered administrative costs, it appears to be inclusive only of the utility’s administrative staff costs (salary, benefits, training, travel, etc.) and does not mention other program-specific costs that have typically been reported as “administrative costs” in past and current utility LCFS programs to CARB and the CPUC . These include critical program activities such as third-party administrative costs, rebate processing fees, applicant and income verification costs, website licenses and fees, and other direct, but non-incentive, program costs. It has been customary for the IOUs to report all these additional costs as “administrative costs” to both CARB and the CPUC in their annual LCFS reports based on the history of discussion in various CPUC Decisions and their experience with other customer programs.³

So, while it may be possible to implement utility Holdback programs with a 5% administrative cost cap under the narrow definition considered in Guidance 20-03, CalETC recommends that, with the exception of small EDUs that have annual electricity sales of less than 2000 GWh, the cap on equity holdback administrative costs should revert to 10% as allowed in the current Regulation, and that the definition should be expanded to include all associated program administrative costs, with the exception of start-up costs and education and outreach costs. Start-up costs, defined as set-up costs that occur before any incentives can be paid, are already excluded from the CCFR. Because costs before program launch are almost 100% administrative, it is nearly impossible to meet any administrative cap in the year a program is being set up. For small EDUs, CalETC proposes that they are not subject to a cap on administrative costs. To this end, CalETC has proposed a definition of EDU Program Administrative Costs in Appendix B that should be included in the Definitions and Acronyms section of the Regulation.

For small EDUs, CalETC proposes that they are not subject to a cap on administrative costs, or are subject to a higher cap, such as 20%. While Small EDUs are able to design and implement programs specifically tailored to their community needs, administrative costs for these EDUs may naturally result in a higher percentage of costs due to the small scale of programs and the utility’s limited staff resources, particularly if the definition of administrative costs is expanded. The 2000 GWh exemption makes sense as a natural break in utility sizes when looking at 2022 CEC data on total electricity sales. While there is a process for EO approval of administrative costs exceeding 10%, the process would place yet another administrative burden on small EDUs to go through the process annually and require additional LCFS Staff time. Furthermore, the process requires a contract with a community-based organization, which is limiting. Many small EDU equity projects incorporate partnerships and collaboration with a CBO without a formal contract.

To further illustrate how other program operating costs are different than the definition of administrative costs in Guidance 20-03, consider the investor-owned utilities (IOUs) energy efficiency program portfolios, which have administered billions of dollars of incentive funds

³ See D.14-12-083, D.20-12-027, and CPUC Resolution E-5015.

throughout the state with oversight from the CPUC, are operated under guidelines established in the Energy Efficiency Policy Manual⁴. As shown in the Table below, Appendix C of the Energy Efficiency Policy Manual lists the cost caps (hard requirements) and targets that the CPUC established for the operations of these programs.

Appendix C Table: Energy Efficiency Policy Manual APPENDIX C Cost Category Caps

Budget Categories	Cap	Target
Utility program administrative costs	10%	
Third-party / Gov't partnership administrative costs		10%
Marketing & outreach costs		6%
Direct implementation non-incentive (DINI) costs		20%
Evaluation, measurement & verification (EM&V) costs	4%	

In addition to being separate from ME&O costs, administrative costs, as defined in the Energy Efficiency Policy Manual, explicitly exclude third party implementer fees, and also exclude direct implementation non-incentive (DINI) costs (which include activities such as software licenses, rebate processing, contractor training, etc.). CalETC's request to expand the definition of administrative costs to include things such as third-party implementer costs and DINI costs while imposing a cap of 10% is more conservative than the requirements of the Energy Efficiency Policy Manual while still allowing the utilities the budgets needed to effectively operate their LCFS-funded programs.

CalETC has confirmed with CARB staff that ME&O costs for holdback are not included as part of administrative costs in any LCFS guidance document. In addition, as noted above, the CPUC does not include ME&O as part of administrative costs for other programs, including current LCFS programs. We recommend that ME&O should be excluded from administrative costs in the new LCFS regulation to reduce uncertainty and improve clarity. See Appendix B for our proposed amendments.

With this expanded definition of administrative costs, CalETC also recommends that the allowable cost cap for the statewide Clean Fuel Reward, which currently includes ME&O costs, be reverted to 10% from the 5% that is in the proposed regulation. While CARB Staff have expressed reasonable concerns that the potential size of the Clean Fuel Reward could allow for very large administrative and ME&O budgets, it should be noted that these same concerns were addressed when the CPUC authorized the utilities to implement the Clean Fuel Reward in 2019, finding that "a 10% cap of administrative funds is generally within the range of spending for other customer programs the utilities implement," and ordered SCE in Resolution E-5015 to "administer no more than 10% of the total Clean Fuel Reward program budget on administrative and marketing, education, & outreach spending, which must include all administrative spending related to the Clean Fuel Rewards program." The CPUC found that including ME&O in the 10% cap was reasonable for a program of this size; the potential scale of the Clean Fuel Reward is no larger today than it was in

⁴ Version 6 located at [6442465683-ee-policy-manual-revised-march-20-2020-b.pdf \(ca.gov\)](https://www.cpuc.ca.gov/6442465683-ee-policy-manual-revised-march-20-2020-b.pdf)

2019, and the same rationale should apply today. Further, we do not believe that either the Clean Fuel Reward or holdback programs will grow so large in the near term that the administrative costs will be too large. CARB will be doing another LCFS rulemaking in a few years and should closely monitor administrative costs and address if there is a problem.

Therefore, the proposed amendment's 5% cap should be rejected, and instead should revert to 1) the 10% allowable administrative costs for utility equity holdback programs, excluding startup costs and ME&O, as this is currently accepted by both CARB and the CPUC, 2) the 10% cap on allowable combined administrative and ME&O costs for the Clean Fuel Reward programs, as authorized in the current version of the LCFS Regulation and concurrent CPUC Resolutions, and 3) a more expansive definition of administrative costs that explicitly excludes ME&O should be added to the regulation. CalETC has provided recommended language for the relevant sections of the Regulation in Appendix B that implement these recommendations. Additional details on administrative costs should continue to be in an updated guidance document.

(2) CalETC recommends simplifying and clarifying the language in the proposed regulation pertaining to utility holdback programs

CalETC supports the staff's efforts to develop a recommended list in the proposed regulation of activities for holdback projects to make it easier for all stakeholders (e.g., the CPUC, CARB Staff, municipal utility governing boards, and utility program developers) to have a clear understanding of how CARB intends utility LCFS Holdback funds to be used. While we appreciate that many new project types have been included in the proposed amendments at the recommendation of CalETC and its members, several updates to the Holdback project list in the proposed amendments are needed for the sake of simplicity and to provide clarity on what is or is not considered a holdback equity project while also providing consistency of interpretation through the regulation itself.

The proposed amendments contain two lists: one which CARB Staff has indicated must be used for equity projects and another which are "good ideas" for non-equity projects. However, this makes it unclear if a utility could implement a project on the "equity" list – such as deploying charging stations at a multifamily property – as part of its non-equity project spending, and it also implies that a project on the "good ideas" list – such as optimized EV charging – could not be considered as counting towards a utility's equity spending requirements even if that project was directly reducing the energy bill of a low-income customer. Further uncertainty exists around the incentivization of medium- and heavy-duty (MDHD) vehicles: should projects supporting MDHD electrification only be considered equity projects if the vehicles are domiciled, or fueling located in, impacted communities, or always be considered equity projects since the pollutants from these vehicles disproportionately impact equity communities (i.e., disadvantaged rural, tribal and low-income communities) regardless of where they are domiciled or fueled?

CalETC recommends that the two lists be consolidated into one and that project spending be considered towards the utilities' equity allocation compliance requirements if it benefits the communities and individuals defined in the equity holdback section. To ensure that the utilities are only deploying projects that CARB supports for equity communities and individuals, CalETC

recommends that the single project list must be used for equity projects and may be used for non-equity projects in addition to other non-equity projects that further transportation electrification in California as defined by 95491(e)(5). This approach is more straightforward, minimizes opportunity for conflicting interpretations, and provides certainty on expectations around CARB's priorities while still allowing flexibility for utilities to propose non-equity programs that are best suited to their specific service areas and customers. CalETC also recommends that any project that furthers the deployment of electric MDHD vehicles be considered as an equity project, as the electrification of trucking almost always benefits low-income individuals and disadvantaged communities with criteria pollutant and GHG reductions even when the primary charging / ownership location is outside of the disadvantaged community, low-income community, tribal area, or rural area (See CalETC's comments on the definition of rural in bullet 8 below).

Additionally, CalETC recommends several smaller changes to the proposed regulation below with proposed amendments in Appendix B:

1. The regulation should include a requirement for large IOUs (SCE and PG&E in CalETC's comments below) to utilize their holdback credit revenues to fund a minimum of three program options as there are increasingly diversified needs in transportation electrification over large service areas. Including this requirement to fund a minimum of three program options will help ensure that the large IOUs consider the diverse needs of their customers and are not compelled by stakeholders to focus on a single project.
2. While we agree with the proposed regulation's deletion of broad-based ME&O (e.g., television and radio), the regulation, rather than Guidance Document 20-03, should clearly allow ME&O for specific projects.
3. The project list should explicitly allow for upgrades to electric panels, which are prerequisites to transportation electrification for many customers living in older buildings that have not had recent updates. Upgrades to panels can have other benefits but are primarily to enable transportation electrification.
4. For simplicity and clarity, the project list should be consolidated on the recommended projects for electric mobility solutions as there are two list items that appear to overlap regarding mobility alternatives.
5. The project list should preserve a narrowly focused project category for direct multilingual education and outreach serving equity communities. The preservation of this category is not intended to include general marketing or advertising. It is only intended to allow for multilingual education and outreach to equity communities.
6. The list of agencies that may be consulted in the creation of workforce development projects should be expanded to include other pertinent entities, such as California Community Colleges, community-based organizations, and publicly-owned utilities (POUs) Governing Boards.
7. CalETC thanks CARB Staff for harmonizing the definitions of equity communities and individuals in the proposed amendments with those detailed in AB 841 and CPUC Decision D.20-12-027. However, the language requires a slight modification. AB 841 defines this as

"a community located on lands belonging to a federally recognized California Indian tribe."⁵ The proposed amendments include "state and federally recognized".

8. The definition of "rural" needs to be updated as the U.S. Census Bureau no longer reports rural percentages for census tract population. The Census Bureau now defines rural as "all population, housing, and territory not included within an urban area."⁶
9. "Off Road Vehicle" should be defined for clarity because it is not obvious that vessels, aircraft, and other transportation qualify under that term. CalETC has provided recommended edits to this section of the proposed amendments in Appendix B to this letter.

(3) CalETC requests clarification that POUs must spend 50% of holdback funds on equity projects, as opposed to 75%

CalETC notes a discrepancy between the proposed LCFS requiring 75% of holdback funds for equity projects compared to Appendix E "Purpose and Rationale for Low Carbon Fuel Standards Amendments," which calls for 50% for POUs. We recommend that POUs have a 50% requirement for equity holdback. We understand there are almost 30 POUs that have opted into LCFS and potentially another fifteen could opt in. The POUs are very diverse and represent specific and limited territories within the State, with a wide variety of populations, EV densities, rural/urban splits, percentages of DACs and community needs. POUs are also uniquely in tune with local needs. Designing and implementing effective transportation electrification programs for low-income, rural and/or disadvantaged communities can be challenging, and the uptake and timing of projects is difficult to predict. In addition, there will be natural fluctuations in program spending year-to-year, and an annual requirement of 50% allows for better planning to maximize the impact of equity spending. In addition, we recommend the 50% equity requirement for the three small IOUs (instead of the 75% in the proposed LCFS). These small IOUs are not opted into LCFS, and a 75% equity holdback requirement creates practical challenges at start up that make it difficult for them to opt-in to LCFS.

(4) CalETC requests clarification that San Diego Gas and Electric is a "medium-sized" utility under the regulation

CalETC notes that the regulatory package has conflicting information regarding the size of San Diego Gas and Electric (SDG&E) and its requirements under CCFR and holdback programs. Specifically, in *Appendix E: Purpose and Rationale of Proposed Amendments for the Low Carbon Fuel Standard Requirements*, CARB staff states, "San Diego Gas & Electric is re-defined to have a comparable contribution to the statewide program to similarly sized public utilities." However, this change is not in the proposed regulation. In discussion with CARB staff, we understand that they intend to categorize SDG&E as the same size as Los Angeles Department of Water and

⁵ Bill Text: CA AB841 | 2019-2020 | Regular Session | Amended | LegiScan at 1601.(e)(5)

⁶ See <https://www.census.gov/programs-surveys/geography/guidance/geo-areas/urban-rural.html>

Power based on their similar total 2022 electricity sales (annual GWh). CalETC supports these two utilities having the same contribution to the CCFR in the final LCFS, as their size is very similar, and SDG&E is substantially smaller than the two large IOUs. This change will allow SDG&E to have more meaningful holdback programs.

CalETC may have further comments on the definition of EDUs based on annual GWhs in the future, as we understand that staff plans to propose amendments to these definitions (e.g., improved data, new thresholds for large, medium, and small EDUs) in an upcoming 15-day comment period.

(5) CalETC requests edits to the regulation that will assist smaller utilities, potentially allowing them to participate in LCFS

CalETC requests the LCFS include a program to encourage small EDUs who have not opted-into LCFS to do so and expand programs by small EDUs who have recently opted in. There are over 50 EDUs in California, and we understand from staff that about thirty have opted in to LCFS. Our proposal would support approximately twenty small rural utilities who cover about one percent of California.

We propose that the LCFS have new regulatory language that allows the CCFR Steering Committee to work with the Executive Officer to design one-time grants to incent the small, mostly rural EDUs that have not yet opt into the LCFS to opt-in and also to provide additional funding to EDUs that have recently opted in. The goal of the program would be to have almost all California utilities participate in the LCFS and provide holdback programs to provide better coverage in underserved areas.

Specifically, we request funding for our recommended program to come from funds that non-opt in EDUs have been providing to the CCFR since 2020 per Section 95486.1 (c) (1) (A) paragraph 2.⁷ Our informal survey of these small EDUs found that they often only have a handful or a few hundred EVs which is not enough to justify a program. Under our proposal, a start-up grant would be enough for a small EDU to start or expand a basic program to help their customers and CARB would provide approvals and oversight to the CCFR Steering Committee and Program Administrator. Our recommended amendment is in Appendix B.

(6) CalETC requests the regulation modify the utility reporting requirements to better track deployment of funds to impacted communities, align with the reporting framework required by CPUC, and simplify reporting for smaller utilities

CalETC appreciates the areas where CARB Staff have made efforts to harmonize the regulatory and reporting requirements of the LCFS Regulations with other regulatory bodies, such as the CPUC. One such area was increasing the equity allocation requirement of utility Holdback

⁷ All base credits for any EDU that is not eligible to receive base credits pursuant to this provision will be allocated to the Clean Fuel Reward program pursuant to section 95486.1(c)(1)(A) paragraph 2.

programs for the Large IOUs from 50% to 75%. Yet, while increasing the equity requirement to 75% appears to align with the CPUC's requirements in D.20-12-027, CARB and the CPUC currently measure this metric in very different ways. CARB counts percent of proceeds earned in a calendar year, which was clarified by guidance document 20-03 to include percent of proceeds either spent or encumbered (i.e., budgeted or set aside) to an equity program. The CPUC, however, counts spending that occurs during the calendar year, regardless of when the credits were earned. This is subtle but, as a result, the IOUs are often reporting entirely different data to demonstrate compliance to each agency in their annual reports⁸.

Tracking compliance against the percentage of annual proceeds creates many operational difficulties. For example, if the combination of on-road EV charging and credit prices-- both of which are beyond the utilities' control -- evolve over a year such that a utility generates double the proceeds it expected to generate, then a utility may be faced with two options to maintain compliance based on percent of annual proceeds: double the spending of its in-market programs or encumber those funds, without actually spending them, in some combination of those programs. The first may not be practical as it is difficult to increase operational capacity of a program in real time; the second achieves compliance but it does not necessarily allow the utility to assess where it should best allocate its holdback funds in the coming calendar year as they will have been encumbered to a specific program for the sake of compliance.

Tracking on how LCFS proceeds are actually returned to Californians, is a more effective metric to track how LCFS dollars actually flow to benefit underserved communities over time and is consistent with the metric used by the CPUC to ensure compliance⁹. However, in recognition that the balance between equity and non-equity spending may necessarily vary in a given year, the regulation should specify that any "underspend" in annual equity spending will carry over to the next calendar year(s) in the form of increased equity spending requirements.¹⁰ The recommended language has been provided in Appendix B as part of the updates to the holdback program section.

Compliance based on spend, when coupled with the rollover of any "underspending" on equity in a given year, also helps smaller utilities, by providing an option, to save up holdback proceeds for several years to accumulate a large enough bank to implement a program without "pre-deciding" how to allocate their funds into a program until they are ready to spend them, in addition to the option of saving up for large equity spending projects through the rollover provision. Further, compliance based on spend makes it easier to account for the reality of utility programs, which often have both equity and non-equity recipients, as the utilities can simply report how much of the annual spend went to each type of recipient in a calendar year, rather than managing set asides in intra-program budgets.

⁸ See Decision D.14-12-083 Ordering Paragraph 4, requiring reporting on annual expenditures.

⁹ Decision D.20-12-027 Ordering Paragraph 1

¹⁰ For example, if a large IOU spent \$10 million in one year, \$7.5 million of that would be required for equity. However, if only \$7 million was spent on equity (70%), the \$500,000 underspend would be added to the following year's compliance such that they would need to spend 75% plus \$500,000.

Therefore, CalETC recommends that the utility holdback project equity allocation requirements be updated to percent of annual spend rather than percent of annual proceeds. Further, CalETC proposes that if a utility underspends on equity projects in a given year, the amount that it underspends will be carried forward to the next year. This aligns the LCFS Regulation's requirements with the obligations that the CPUC has already placed on the IOUs, improves tracking of how LCFS funding is actually being deployed into impacted communities, and simplifies accounting for CARB, CPUC, and utility staff. CalETC has proposed language that would implement these recommendations in Appendix B to this letter as part of its other recommendations for updates to the holdback section.

(7) CalETC requests that the regulation allows the Executive Officer to approve certain modifications to the CCFR that can improve program responsiveness and efficacy

The LCFS is a powerful tool for incentivizing the adoption of low carbon technologies to support the technologies called for in the 2022 Scoping Plan. Because the Scoping Plan calls for the adoption of new zero emission technologies, the LCFS regulatory framework must allow for some flexibility in response to changing market conditions and needs. As such, CalETC respectfully requests that the final regulation allow the Executive Officer to make modifications to the electricity provisions of the LCFS, including the ability to add tools other than rebates or new technologies (such as financing assistance) to the statewide Clean Fuel Reward program if requested by the Clean Fuel Reward Steering Committee. CalETC also respectfully requests that such exception requests from the Executive Officer be handled expeditiously, and staff be adequately resourced to handle these exceptions.

(8) CalETC requests implementation assistance on the Credit Clearance Market (CCM)

CalETC's members include large EDUs who will be impacted by the CCM. We respectfully ask for a guidance document (or, if appropriate, a user guide or FAQ) on the mechanics of the CCM. For example, what do deficit/credit holders functionally do once a CCM / Advanced Crediting phase is declared? Also, given the proposed increase from ten million to thirty million credits in the CCM, we request further discussion regarding possible practical issues down the road if only a small number of EDUs are trying to transact such a large volume in a mandatory compressed timeframe.

III. CalETC largely supports the proposed order

CalETC applauds CARB's efforts to amend this important and complicated regulation. In particular, CalETC supports the following provisions of the proposed order:

(1) CalETC supports the continued allocation of base residential charging credits to the electric distribution utilities (EDUs) which fund important statewide and individual utility programs

CalETC strongly supports the continued allocation of the residential base credits generated by electricity used to fuel electric vehicles to the electric utilities. This is appropriate and leads to the most efficient, equitable, and market-stimulating distribution of the proceeds.

1. *The utilities are subject to extensive regulatory oversight, ensuring that the proceeds are spent in a manner that aligns with the state's goals.*

The electric utilities are subject to extensive reporting and compliance requirements, ensuring that the distribution of LCFS proceeds is open and transparent. Furthermore, the utilities have a duty to serve all customers, including populations that have been slower to adopt EVs including those residing in disadvantaged communities (DAC), low-income renters and multi-unit dwellings (MUD). Residents of DACs and MUDs are utility customers, and as such the utilities are incentivized to assist those customers in transitioning to electric transportation. The electric utilities can use the proceeds gained from base residential credits to establish holdback programs that enable charging at MUDs, for renters, and in equity communities. Similarly, utilities can leverage credits generated across the entire customer base to fund programs incentivizing adoption in DACs and low-income communities. Utilities are the only entity able to use credits generated from residential light-duty EV charging to support heavy-duty or off-road vehicle electrification, an increasingly urgent issue in decreasing the transportation sector's air pollution and greenhouse gas emissions.

California's electric utilities are uniquely positioned to support and enable additional load from electric vehicles because electric vehicle load is flexible and when used off peak makes more efficient use of the electric system which puts downward pressure on electric rates for all other customers. Because of this, California's electric utilities are the only entities that have the primary goal of ensuring accessible infrastructure and affordable electricity, making them uniquely positioned to receive and manage base residential credits.

2. *The electric utilities have been a long-time partner in the state's decarbonization efforts and are by definition located in California.*

Unlike other entities, the electric distribution utilities (EDUs) must always be located locally, within California, to provide a critical and essential service. The size of utilities varies dramatically, with the larger utilities having the staff and resources necessary to work cohesively with the other EDUs to efficiently run statewide programs. Some examples of efforts to collectively enable market transformation include programs in energy efficiency, renewable energy and most recently, the California Clean Fuel Reward. The utilities are equipped to handle the very large-scale proceeds generated by the LCFS. They are experienced, efficient administrators and have a long history of designing large-scale, stable successful programs and have shown they can quickly implement statewide and individual utility programs.

Additionally, all Californians have an electric utility provider and are used to working with their utility to support their energy needs. This name recognition and familiarity is necessary for getting reluctant customers to adopt new technologies. Finally, the electric utilities have provided service to their customers for decades and will continue to serve their territories for

many decades to come, providing the stability needed to positively contribute to the wholesale market transformation required by the switch to electrified transportation.

3. *Electric utilities are able to implement programs that address the needs of all aspects of electric vehicle adoption and at the scale needed to support CARB's scoping plan.*

Unlike other important players in the electric vehicle industry, electric utilities can administer programs involving all aspects of the transportation electrification ecosystem. The utilities can provide rebates for chargers, rates designed to incentivize adoption, vehicle incentives, grid upgrades to support increased beneficial electrification, and have decades of experience implementing programs targeted to benefit lower-income and disadvantaged customers. Having the ability to address all aspects of electric vehicle adoption allows for flexibility in how the money is spent. Furthermore, a properly designed program can afford the utilities the ability to act quickly and to adjust program design when external factors change. This is increasingly important as state, local and federal funding sources and tax breaks tend to shift over time.

Electric utilities also provide service to all electric vehicle segments and classes. The utilities serve light, medium- and heavy-duty vehicles, individually owned vehicles, last-mile vehicles, and fleets. With the increase of electrification, upgrades to the electric grid will be necessary. Utilities will need information about the location of all electric vehicles so that they can adequately upgrade the grid and provide vehicle/grid integration services. Finally, serving all vehicle classes allows the electric utilities to provide programs for both the light-duty and medium-and-heavy-duty sectors. This allows the utilities to utilize the funding from the sectors that are first to electrify (light-duty) to incentivize and support the sectors that are harder to electrify (e.g., medium-and-heavy-duty).

Allowing the utilities to receive the residential base credits also supports individual utility programs which are necessary for meeting local needs and hard-to-reach markets such as medium- and heavy-duty EVs, off-road EVs and infrastructure for renters (homes, apartments, etc.) that are identified in the Scoping Plan, Advanced Clean Cars, and Advance Clean Fleets. Individual utility programs can be nimble and respond to the complex, ever-changing incentive landscape for EV and infrastructure incentives.

4. *Keeping the current structure prevents a complicated system where both utilities and non-utilities receive base residential credits.*

The current structure supports large-scale, statewide programs linked to the State's equity and climate goals. Diluting the credits coming to utilities makes both individual utility and large-scale statewide programs very difficult to implement and harder for CARB to regulate. Also, the current structure enables and funds active utility involvement, especially for small POUs, and encourages more small EDUs to join LCFS and create custom programs to support their customers. The current LCFS is a well-crafted system that allows site-hosts, automakers, charging providers and utilities to all receive LCFS credits.

CalETC also supports the proposed provision requiring entities “generating credits from electricity to use all credit proceeds to further transportation electrification efforts in California and include in their annual compliance report an itemized summary of efforts and costs associated with meeting this requirement.” Ensuring that all the proceeds from the electricity LCFS credits are put back into programs and projects that incentivize the adoption of transportation electrification is essential to effectuating the goals of CARB’s Scoping Plan.

(2) CalETC supports staff’s proposal for EDUs to spend more of their LCFS proceeds on holdback programs

Under the proposed order § 95483(c)(1)(A)(2), the required contribution to CCFR and remaining allocation to holdback programs would be changed as follows:

EDU Category	Holdback Allocation (%)	
	Proposed	Previous
Large Investor-owned Utilities	50	33
Large Publicly Owned Utilities	75	55
Medium Investor-Owned Utilities	75	75
Medium Publicly Owned Utilities	90	75
Small Publicly Owned Utilities and Small Investor-owned Utilities	100	98

CalETC strongly supports these changes, with the exception discussed above regarding San Diego Gas and Electric. Funding from base residential credits for holdback programs and CCFR are directly linked. With the proposed regulation increasing holdback funding percentages, the percentages allocated to the CCFR will decrease. This change is appropriate because the proposed CCFR is for the much smaller market of medium- and heavy-EVs vs. the larger light-duty market in the current CCFR.¹¹ Similarly, removing very small EDUs from contributing to the CCFR is appropriate because a two percent contribution is not meaningful and results in administrative inefficiencies for both the CCFR Program Administrator and the very small EDUs.

(3) CalETC supports the proposed shift in the California Clean Fuel Reward (CCFR) from being a reduction in the purchase or lease price of new light-duty electric vehicles (EVs) to being a reduction in the purchase or lease prices of new electric medium- and heavy-duty EVs

CalETC supports CARB’s proposed amendments that will transition the statewide Clean Fuel Reward program from an incentive for all new passenger EVs to one that will support the adoption of electric MDHD vehicles in the coming decade. We also agree that the new Clean Fuel Reward

¹¹ The California Energy Commission anticipates that the adoption of medium- and heavy-duty vehicles as follows: 27,000 by 2025, 155,000 by 2030 and 377,000 by 2035. See Assembly Bill 2127 Second Electric Vehicle Charging Infrastructure Assessment Revised Staff Report.

should be in line with the needs of CARB's Scoping plan - and primarily benefiting equity communities - and believe the new proposal¹² achieves this goal. However, as the Clean Fuel Reward Program Administrator (SCE) has commented, minor updates to the vehicle eligibility in the proposed amendments are needed to ensure that that new Clean Fuel Reward program can effectively implement CARB's ambitious plans for the commercial vehicle sector.

For example, in *Appendix E: Purpose and Rationale of Proposed Amendments for the Low Carbon Fuel Standard Requirements*, CARB Staff states that the "Clean Fuel Reward will change from a universal new light-duty EV rebate to be focused on new and used rebates for medium- and heavy-duty trucks." However, the proposed amendments define the Clean Fuel Reward as applying only to new vehicles. CalETC believes that "used" was accidentally omitted from the proposed amendments and has provided recommended language that includes used vehicles in Appendix B to this letter.

Additionally, CalETC is concerned that definitions for medium-or-heavy duty vehicle in the proposed amendments do not necessarily align with CARB's stated intentions. Defining these solely by weight class, as the current proposed amendments do, means that the Clean Fuel Reward program may be required to provide incentives for all vehicles that have a GVWR greater than or equal to 8,501, which includes many passenger vehicles such as the Rivian line of products, the extended range Ford F-150 Lightning, the electric Chevrolet Silverado, and the electric Hummer to name a few. Based on CARB Staff's published rationale, CalETC believes these vehicles should be incentivized by the Clean Fuel Reward only if they are purchased for use as commercial vehicles. CalETC agrees with the Program Administrator's proposal that the definition of Clean Fuel Reward be updated to specify that it is for commercial vehicles only, and the Regulation should also include a definition for commercial vehicle in the Definitions and Acronyms section for clarity and completeness. For consistency, CalETC proposes that the LCFS Regulation adopt the same definition for commercial vehicles utilized by the Hybrid and Zero-Emissions Truck and Bus Voucher Incentive Project (HVIP). Both these definitions are included in Appendix B to this letter, and CalETC believes that these minor modification to the proposed amendments will empower the new Clean Fuel Reward program to be a vital tool in the state's efforts to decarbonize heavy-duty trucking.

¹² "Clean Fuel Reward" is a statewide program established by EDUs to provide a reduction in price on new light-duty EV purchases or leases for new medium- or heavy-duty electric vehicles that are not subject to the High Priority and Federal Fleets requirements as specified in, title 13, California Code of Regulations, section 2015(a)(1) in California.

CalETC appreciates the opportunity to provide comments on this important regulation. If you have any questions, please do not hesitate to contact me at any time.

Best,

August 27, 2024

The Honorable Liane M. Randolph, Chair
California Air Resources Board
1001 I Street
Sacramento, CA 95814

RE: 2024 Low Carbon Fuel Standard Amendments

Dear Chair Randolph:

The undersigned members of the Low Carbon Fuels Coalition's Climate Smart Agriculture Advisory Committee appreciate the opportunity to provide comments regarding the 2024 amendments to the Low Carbon Fuel Standard (LCFS). We strongly support the increased focus by the California Air Resources Board (CARB) on ensuring that the fuels used in the LCFS program are produced in the most sustainable manner. We are strong advocates for rigorous lifecycle accounting (LCA) methods that precisely quantify the lifecycle emissions from biofuels and that recognize and incentivize lower carbon feedstocks. From a LCA perspective, "corn is not just corn." To the contrary, corn and other crops can be grown on soil using a wide variety of techniques and inputs that substantially impact real-world carbon intensity (CI). We encourage the Board to direct staff to dedicate time and resources to analyze the lifecycle issues pertaining to crop-based feedstocks and report back to the Governing Board. This focused research, analysis, and reporting by CARB staff will enable and inform potential expansions to the LCFS regulations to include field-based practices, the recognition of soil organic carbon, and the harnessing of other CI-reducing techniques and technologies with the next update to the LCFS regulations.

The supporters of this letter represent a range of fuels, feedstocks, and technologies including agriculture trade associations, crop input companies, developers of LCFS credits, and other low-carbon fuel industry participants. This diverse group is united in its interest to provide high-quality fuels to the California transportation market with the lowest environmental footprint. This includes practices that encourage producers to reduce nitrous oxide and methane emissions and increase the carbon sequestered in the soil.

In 2018, the Intergovernmental Panel on Climate Change (IPCC) published a Special Report on the impacts of a 1.5°C global warming above pre-industrial levels. This report found that achieving global carbon neutrality by mid-century is critical to avoiding the most catastrophic impacts of climate change.¹ Moreover, the IPCC Sixth Assessment identified land-based emissions mitigation as "the only [sector] in

¹ IPCC, 2018: Summary for Policymakers. In: Global Warming of 1.5°C. An IPCC Special Report on the impacts of global warming of 1.5°C above pre-industrial levels and related global greenhouse gas emission pathways, in the context of strengthening the global response to the threat of climate change, sustainable development, and efforts to eradicate poverty [Masson-Delmotte, V., P. Zhai, H.-O. Pörtner, D. Roberts, J. Skea, P.R. Shukla, A. Pirani, W. Moufouma-Okia, C. Péan, R. Pidcock, S. Connors, J.B.R. Matthews, Y. Chen, X. Zhou, M.I. Gomis, E. Lonnoy, T. Maycock, M. Tignor, and T. Waterfield (eds.)]. Cambridge University Press, Cambridge, UK and New York, NY, USA, pp. 3-24, doi:10.1017/9781009157940.001.

which large-scale carbon dioxide removal may currently and short term be possible” and that it is “crucial to limit climate change and its impacts.”² The latest science finds that it is increasingly likely that the 1.5°C target will be exceeded³ and that large-scale greenhouse gas (GHG) reductions are critical to meeting the target.⁴

The recent modifications proposed by CARB to the LCFS regulations (the “15-Day Changes”) add stringency and oversight to the LCFS program and have the potential to facilitate more precise and accurate CI analysis. Unfortunately, certain aspects of the 15-Day Changes leverage this precision only to the detriment of biofuel CI scores rather than authorizing the adjustment of CI scores favorably or unfavorably depending on real-world performance. We encourage CARB to continue to embrace the fundamental LCFS principles of technology-neutrality and science-based performance measurement rather than introducing CI bias into the LCFS program structure.

In this final stage of the LCFS rulemaking, CARB has the opportunity to refine the 15-Day Changes so that the LCFS program will disincentivize less-sustainable biofuels and incentivize more-sustainable biofuels. Such an approach has the potential to expand and enhance the global sustainable fuels market and minimize the risk of unintended consequences at a time when the rapid phase down of petroleum-based fuels is an environmental imperative that has been codified into California law.

Already a leader in the response to climate change, CARB’s 2022 Scoping Plan Update details sector-by-sector roadmaps for California to achieve carbon neutrality by 2045 or earlier. One critical roadmap is for the aviation sector, where the scenario includes a transition of 20% of aviation fuel demand to zero-emission technologies by 2045 and sustainable aviation fuel (SAF) for the rest.⁵

109.1

The agriculture sector can play a significant role in helping California meet the goal of generating SAF. Practices including optimizing fertilizer application, reducing tillage, using enhanced-efficiency fertilizers, double-cropping and planting cover crops have the potential to reduce the CI of fuels by more than 40 g CO₂e/MJ.⁶ These practices are not limited to their GHG benefits; they provide “additional ecosystem service benefits, including watershed protection, increased biodiversity, and improved soil health and fertility.”⁷

⁶ Liu, X. et. al. (2020) Shifting agricultural practices to produce sustainable, low carbon intensity feedstocks for biofuel production. *Environ. Res. Lett.* <https://doi.org/10.1088/1748-9326/ab794e>

⁷ *ibid.*

There is significant opportunity to increase the adoption of these practices on U.S. farmland. A recent study found that no-till or strip-till is practiced on only 30% of cropland.⁸ Furthermore, these practices are not always maintained by farmers. While no-till practices were adopted on almost 8 million acres between 2012 and 2017, farmers on more than 5 million acres discontinued no-till during the same period for a net gain of only 3 million acres.⁹ Another practice that can reduce GHG emissions, the planting and cultivation of cover crops, has an even lower adoption rate than no-till. Unfortunately, only 5.1% of the approximately 300 million cropland acres planted cover crops in 2017.¹⁰ The LCFS program has the potential to provide a strong and long-term incentive for farmers to implement no-till, cover crops, double-cropping and other similar practices.

CARB is also proposing that all crop-based feedstock used for LCFS fuel pathways must obtain third-party sustainability certification by January 1, 2028, under an approved certification system. These certification systems “must consider environmental, social, and economic criteria,” an expansive list that is likely to place a significant financial burden and obligations on farmers that elect to continue to supply feedstocks for biofuels production. Given the broadness of these requirements and the significant additional administrative burden this will impose on farmers and the producers who buy from them, we urge CARB staff to clarify the specific environment, social and governance (“ESG”) criteria that these certifications are meant to address in the context of crop-based feedstocks and to seek further stakeholder feedback on development of these criteria after this rulemaking. This requirement is consistent with the verification of land use under the EU Renewable Energy Directive (RED). Under international polices such as RED, CORSIA, and RenovaBio, fuel producers are required to collect farm level data and are thus able to benefit from improved farming practices. CARB should also provide a 3-year grace period for any certification system that it plans to suspend or remove, to give stakeholders sufficient time to get certified under a different certification system.

Additionally, sustainability certifications that address these ESG criteria will often also include a rigorous GHG accounting for feedstock CI calculation. For example, both the Roundtable for Sustainable Biomaterials (RSB) and the International Sustainability & Carbon Certification (ISCC) are existing sustainability certification systems that may meet the requirements outlined in Section 95488.9(g); both systems have already developed GHG methodologies for feedstock CI calculation.^{11,12} If CARB requires farms to go through the rigorous process of third-party sustainability certification, then we respectfully request that CARB also consider accepting a feedstock CI score that is calculated and verified in accordance with certification system standards. This would provide a mechanism to compensate farmers adopting climate smart practices for the additional work of certification. Specifically, we ask the Board to

direct staff to evaluate existing GHG calculation methodologies and develop guidance around feedstock CI calculation.

109.3

We are asking the Board to direct staff to investigate how the agriculture sector can be optimized to produce low-carbon biofuels to meet the state's SAF goal. Specifically, we are requesting the Board to prioritize policy discussions and the associated technical analysis related to low-carbon feedstocks for the production of SAF. This technical analysis should include a thorough lifecycle analysis to determine the extent to which supplies of sustainable biofuels produced from various feedstocks can be expanded while not converting additional land to agricultural uses. This technical analysis should be informed by the other primary LCA methodologies including Argonne GREET. To ensure the timely analysis of this information, we request that the Board direct staff to report back to the Board by the end of 2025 on the results of lifecycle analysis and progress toward developing policies to encourage the production of SAF.

For the foreseeable future, liquid fuels will be required to power the majority of airflight thus necessitating a rapid expansion in the supply of SAF. In order to create demand for the fuels with the lowest actual CI possible, ARB needs to account for and incentivize field-based practices. Fortunately, the benefits of these sustainable agricultural practices go beyond their GHG savings, positively impacting our water, ecosystems, and soils.

CARB has been an international leader in developing and implementing programs to reduce GHG emissions across the California economy and the inclusion of climate smart agricultural practices will continue the State's leadership throughout the country. We thank CARB for this opportunity to offer these comments and look forward to continued collaboration to implement policies and strategies that further reduce emissions from the transportation sector.

Sincerely,

August 27, 2024

Re: Comments on Modifications to the Proposed Low Carbon Fuel Standard Amendments Issued August 12, 2024

Dear Ms. Sahota,

The Renewable Fuels Association (RFA) appreciates the opportunity to comment on the modifications to the proposed Low Carbon Fuels Standard (LCFS) amendments released on August 12, 2024. The RFA is the leading trade association for America's ethanol industry. Our mission is to drive growth in sustainable renewable fuels and bioproducts for a better future.

RFA has commented extensively over the last two years during the California Air Resources Board's (CARB) process of modifying and updating the LCFS program. The comments here are responsive to the August 12 proposal and should be considered in conjunction with our other comment letters. In particular, we are attaching to this letter the comments we submitted regarding the April 10, 2024, LCFS workshop in order to ensure that they are part of the formal record.

110.1 **Approval of E15 Is Necessary to Meet the Proposed Increase in Compliance Stringency at the Lowest Practical Cost to California Consumers**

In our last comment letter, RFA supported an increase to a 9% one-time step-down in the compliance curve, contingent on a commitment from CARB to begin the regulatory process to approve E15. While the modifications to the proposed LCFS amendments do include the 9% step-down, a schedule for a rulemaking to approve E15 has not been released.

As RFA has pointed out multiple times, limiting ethanol to a 10% blend not only locks in a 90% petroleum dependence in the gasoline market with myriad negative environmental and public health consequences, but it also severely limits needed credit generation in the gasoline pool. The proposed caps on soybean and canola oil-derived biomass-based diesel (BBD) are likely to slow the generation of excess LCFS credits in

the diesel pool that have been used to cover ever-increasing cumulative net LCFS deficits in the gasoline pool. E15 is a critical near-term strategy for decarbonizing liquid fuels, which will continue to dominate transportation in California for years, if not decades, to come.

From a consumer perspective, E15 offers a unique opportunity to lower the cost of gasoline while cutting emissions of greenhouse gases and criteria pollutants. California drivers could save \$0.20 per gallon if the state allowed gas stations to sell E15 fuel, according to a new study authored by David Zilberman, PhD, a distinguished professor in the Agricultural and Resources Economics Department at the University of California, Berkeley, and Scott Kaplan, PhD, assistant professor in the Economics Department at the U.S. Naval Academy.¹ The study found that the potential savings for California consumers could reach \$2.7 billion annually and that “low-income commuters may stand to gain the most from a transition towards E15,” given their propensity to have longer commutes and less fuel-efficient vehicles.

California is the only state in the U.S. that has not approved E15. The state’s failure to approve the use of E15 essentially amounts to a gas price hike at a time when hard-working Californians can least afford it.

SB 32, which extended the goals of California’s groundbreaking AB 32 legislation, is clear in the mandate for CARB to adopt rules and regulations to “achieve the maximum technologically feasible and cost-effective greenhouse gas emissions reductions.” Expeditiously approving E15 use in California is consistent with that directive and necessary for CARB to comply with state clean-air policies, bringing significant environmental, health, and cost benefits to California citizens.

110.2 **The Primary Rationale for Introducing Biomass Sustainability Requirements in the LCFS Amendments No Longer Exists**

During public workshops held in 2022 and 2023 regarding potential changes to the LCFS, CARB openly considered whether any measures should be taken in response to the growth in the use of crop-based feedstocks for BBD. In the workshop on July 7, 2022, staff noted that CARB had received feedback in which it was “[r]ecommended that CARB set an upper limit on biofuel volumes from lipid-based feedstocks.”² For CARB’s February 22, 2023, workshop, the staff presentation contained three slides showing increases in BBD and related crop-based feedstock usage and then asked, “Are there regulatory mechanisms staff should consider?”³

Rather than imposing a lipid “cap,” CARB established feedstock sustainability requirements in the proposed LCFS amendments issued in December 2023. In the Crop-Based Biofuels Sustainability Criteria section of its Initial Statement of Reasons,

¹ <https://d35t1syewk4d42.cloudfront.net/file/2823/Impact%20of%20Introducing%20E15%20in%20California%207-9-24.pdf>

² https://ww2.arb.ca.gov/sites/default/files/2022-07/LCFSWorkshop_Presentation.pdf

³ https://ww2.arb.ca.gov/sites/default/files/classic/fuels/lcfs/lcfs_meetings/LCFSpresentation_02222023.pdf

CARB explained, “To reduce the risk that rapid expansion of biofuel production and biofuel feedstock demand could result in deforestation or adverse land use change, CARB staff are proposing additional guardrails on the use of crop-based feedstocks for biofuel production.”⁴

However, in the 15-day changes to the proposed amendments issued on August 12, 2024, CARB reversed course and capped the generation of credits for BBD from “virgin soybean oil and canola oil” at 20% of annual BBD volumes on a company-wide basis. Yet, CARB did not remove the sustainability requirements, even though they were intended to accomplish the same objective. Instead, CARB doubled down by making the requirements more onerous.

Certification Under the Proposed Sustainability Requirements Is Unnecessary for U.S.-Produced Ethanol

As discussed at length in the attached comments RFA submitted in response to the CARB workshop that was held on April 10, 2024, the risk that U.S. ethanol production will result in adverse outcomes of concern to CARB is essentially nonexistent.

As noted above, the proposed sustainability requirements were intended to reduce the risk associated with a “*rapid expansion* of biofuel production and biofuel feedstock demand.” (Emphasis added.) However, fuel ethanol production has receded since 2018, and the market for ethanol in U.S. road transportation is mature. Moreover, total U.S. cropland has been declining for decades, and the entire increase in U.S. corn production since 2007 has come from rising yields (and switching acreage from other crops), not expanding crop area.

This was implicitly acknowledged by CARB. In the Crop-Based Biofuels Sustainability section of the staff presentation to the April workshop, which was held four months after the proposed amendments were issued, all six of the charts focused on BBD and related feedstocks, especially soybean oil. In the Topics for Discussion slide in that section, the first three bullets addressed BBD and related feedstocks. Notably, however, CARB asked, “Should E15 be considered to help reduce retail gasoline costs?” This indicates that the same concerns did not extend to ethanol.

The Latest Version of the Sustainability Requirements Is Unjustifiably Onerous and Likely Unworkable, Which Could Have Ramifications for the State’s Fuel Supply

The sustainability requirements are scheduled to be phased in over time. Starting in 2026, biofuel producers “must maintain attestations ... and geographical shapefiles or coordinates of plot boundaries (farm, plantation or forest) that are managed to produce the biomass with the annual fuel pathway report.”⁵ However, even this initial phase will be difficult for some ethanol producers and unworkable for others.

⁴ <https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2024/lcfs2024/isor.pdf>

⁵ https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2024/lcfs2024/15day_atta-1.pdf

For those ethanol producers that predominantly originate corn and sorghum directly from farmers, a typical facility will buy grain from hundreds of growers. And, for those producers that purchase a significant share of their feedstock from grain elevators, the complications of complying with the requirements would be compounded.

Not all farmers will want to share their shapefiles/coordinates with ethanol producers or elevators, and land sales and shifts in rentals from year to year would make it challenging to ensure that all records are up to date. Often, elevators and the grain-purchasing areas of ethanol plants are sparsely staffed and have basic computer systems, and elevators operate on razor-thin margins, making it unattractive to incur additional costs that do not come with associated revenues.

Additionally, an officer of each ethanol company will be required to sign an attestation *under penalty of perjury* that “the biomass used to produce [the fuel] is sourced from land that was cleared or cultivated prior to January 1, 2008, and actively managed or fallow, and non-forested since January 1, 2008. Biomass has not been sourced from land that is protected by international or national law or by the relevant competent authority for nature protection purposes.” He or she must “further certify that geographical shapefiles or coordinates of plot boundaries (farm, plantation or forest) accurately represent the source of biomass used under this fuel pathway.”

However, ethanol facility employees will not have firsthand knowledge of the land history and field dimensions of farms where the feedstock was produced, and they will likely be extremely reluctant or unwilling to sign such an attestation. This requirement is unlike the one for specified source feedstocks (e.g., waste fats, oils, and greases), where suppliers, who are directly responsible for and knowledgeable about the origin and handling of the materials, are required to provide the attestations.

Starting in 2028, biofuel producers are required to meet chain-of-custody requirements similar to those for specified source feedstocks, including feedstock transfer documents. In the case of corn, a highly efficient elevator system, in which grain from numerous origins is commingled, has evolved over decades if not longer. For an ethanol plant that sources a significant share of its grain from one or more elevators (i.e., an elevator is the “first gathering point”), having to “show shipments of feedstock type and quantity directly from point of origin to the fuel production facility” is not workable, at least without receiving a premium for ethanol that would offset the cost of setting up and operating an identity-preservation system. Using a mass-balance approach would at least be theoretically possible, but “material balance or energy balance systems that control and record the assignment of input characteristics to output quantities at relevant points along the feedstock supply chain between the point of origin and the fuel production facility” are not currently in place.

However, some farmers and elevators would not want to go through the extra effort associated with the 2026 and 2028 requirements and would instead sell their grain into other market channels (e.g., for livestock feeding or exports) rather than ethanol. As

discussed in RFA's comments on the April 2024 workshop, if California moves ahead with any feedstock certification program, there should be a provision to designate all U.S.-produced ethanol as already in compliance, so long as aggregate cropland area does not expand beyond a 2007 baseline. This would be consistent with the EPA's approach under the federal Renewable Fuel Standard.

The final set of sustainability requirements to be implemented in 2031 would be extremely onerous for ethanol facilities' purchases of feedstock directly from farmers and completely unworkable for purchases through grain elevators. While the objective underlying the requirement that feedstock "be produced according to best environmental management practices" might be commendable, the four sustainability areas that are addressed (biodiversity, soil quality, "contamination" from fertilizers and other inputs, and water quality) are all-encompassing for farm operations yet barely defined in the CARB proposal.

In 2023, 1.34 billion gallons of corn- and fiber-based ethanol were used in California toward the LCFS.⁶ This represented 8.6% of the ethanol produced in the U.S. During the 2023/24 crop-marketing year, USDA estimates that 35.5% of the U.S. corn crop will be used for ethanol and coproducts.⁷ This means that the equivalent of 3.0% of the U.S. corn crop is used to produce ethanol consumed in California. Given the Advanced Clean Cars II program, it is likely that less ethanol will be consumed in California in 2031—especially if it remains the only state not to allow sales of E15 blends—while corn yields will continue to increase. As a result, on the present trajectory, well under 3% of the U.S. corn crop will be used to provide ethanol to California in 2031.

As a result, a large majority of farmers would have the option not to incur the additional effort and cost of complying with the California sustainability requirements. They are supplying commodity corn that is not receiving a premium, so why would they choose to sell it at a lower profit with a higher administrative burden? They could simply sell it into livestock feeding or export channels—or even to ethanol plants that are not shipping to California.

The same applies to grain elevators. They typically buy from local farmers or from smaller elevators and then commingle the corn that they receive. They do not necessarily know in advance which farms they will originate/handle corn from—and if they buy from a feeder elevator, they might never know. Elevators would suddenly be in the position of having to stipulate in advance to farmers the production practices that must be followed, in addition to undertaking the additional recordkeeping. Again, they are supplying commodity corn that is not receiving a premium, so why would they choose to sell it at a lower profit with a higher administrative burden?

The situation would be exponentially more difficult in a drought year. An ethanol plant in a drought area can have to buy substantial quantities of corn from a distant elevator, rather than purchasing from local farmers and elevators with which they usually do

⁶ <https://ww2.arb.ca.gov/resources/documents/low-carbon-fuel-standard-reporting-tool-quarterly-summaries>

⁷ <https://www.usda.gov/oce/commodity/wasde/wasde0824.pdf>

business. The shift in suppliers is unexpected, so there is no ability to retroactively have the distant elevator inform growers in the area that they will need to meet California's environmental requirements that season.

All of this could cause some ethanol producers to have great difficulty complying with the sustainability criteria in 2028 and 2031—or they could simply not want to incur the potential exposure associated with noncompliance and particularly with signing the attestation. Therefore, they might decide not to sell ethanol to California. From the state's perspective, this could cause volume constraints and price increases in the gasoline pool at a time when California is already concerned about how to avoid problems in the liquid fuel supply during the transition to ZEVs.⁸

If the state is going to consider sustainability criteria, it would be far more reasonable for those to be implemented as part of a program that allows greenhouse gas-reducing feedstock production practices to be recognized in determining the carbon intensity (CI) of the resulting biofuels—after an extensive process of consultation with industry. This would provide an opportunity for a premium to be received for feedstock that would at least offset the additional cost and effort incurred by farmers, elevators, and biofuels producers. It is worth noting that at the federal level the Inflation Reduction Act provided billions of dollars to incentivize farmers to undertake climate-smart agriculture practices, rather than simply mandating that they follow such practices, in order to dramatically kickstart adoption where it was not already occurring.⁹

The New Language Regarding Land Use Change Is Unclear and Potentially Problematic

In the proposed amendments, a column labeled 2015 Region of Analysis was added to Table 6, Land Use Change Values for Use in CI Determination. Ostensibly, this was done to assist in the determination of a land use change (LUC) “value appropriate to use for a region/feedstock/fuel combination not currently listed” in the table.

However, CARB also added the following language about LUC as section 95488.3(d)(2):

The Executive Officer may determine that no value in Table 6 is conservatively representative of a particular region/feedstock/fuel combination and assign a more conservative LUC value. Such determination must be based on the best available empirical data, including but not limited to satellite-based remote sensing data for land cover monitoring, crop yields, and emission factors from the AEZ-EF model or carbon stock datasets. For feedstocks not listed in Table 6, the Executive Officer may determine and assign an appropriate LUC value based on empirical land cover data, crop yields, and emission factors.

⁸ <https://www.spglobal.com/commodityinsights/en/market-insights/latest-news/oil/081624-californias-governor-looks-to-regulate-gasoline-price-shocks-during-the-energy-transition-period>

⁹ <https://www.usda.gov/media/press-releases/2024/08/16/fact-sheet-celebrating-two-years-inflation-reduction-act>

The first sentence in the section is open-ended, and only the last sentence refers to a factor (limited to feedstock) that is not listed in Table 6. In order to ensure that this provision cannot be interpreted more broadly, CARB should add language at the beginning of section 95488.3(d)(2) specifying that it only applies to region/feedstock/fuel combinations not listed in Table 6.

It is also notable that the section appears to allow new discretion for the Executive Officer of CARB to unilaterally increase LUC factors but not decrease them. RFA and many other stakeholders have documented how the existing LUC factors for corn ethanol are overstated and should be revised downward.

RFA and others have also provided analysis demonstrating that modern farming practices are capable of significantly decreasing feedstock CI. The federal government is recognizing these benefits in the regulatory framework for tax credits under the Inflation Reduction Act, and CARB should finally move forward with similar recognition under the LCFS.

Thank you for the opportunity to submit these comments. RFA looks forward to working with CARB board members and staff to strengthen and extend the successful LCFS program.

Sincerely,

A handwritten signature in black ink, appearing to read "Scott Richman", with a stylized flourish at the end.

Scott Richman

Ms. Rajinder Sahota
Deputy Executive Officer – Climate Change and Research
California Air Resources Board
1001 I St
Sacramento, CA 95814

Re: Comments on April 10, 2024 LCFS Workshop

Dear Ms. Sahota,

The Renewable Fuels Association (RFA) appreciates the opportunity to comment on the Low Carbon Fuel Standard (LCFS) workshop held on April 10, 2024. The RFA is the leading trade association for America's ethanol industry. Our mission is to drive growth in sustainable renewable fuels and bioproducts for a better future.

The RFA supports the LCFS and looks forward to continued engagement in this process to strengthen and extend the program beyond 2030. The RFA is also working around the country in collaboration with other stakeholders to develop and implement clean fuel programs in other states.

The RFA has commented extensively over the last two years during the California Air Resources Board's (CARB) process of modifying and updating the LCFS program. The comments here are responsive to the latest workshop and should be considered in conjunction with our other comment letters.

The one-time step-down should be increased to nine percent, contingent on a commitment from CARB to begin the regulatory process to approve E15.

Overcompliance with the LCFS has accelerated and is stifling the innovation necessary for California to meet its climate goal of carbon neutrality by 2045. At the end of 2023, the credit bank was approaching 24 million metric tons, and it has been growing steadily every quarter for the last two years.

The significant imbalance between credits and deficits has chilled the credit market, with credit pricing this month dropping to the lowest levels since July 2015. Delays in finalizing the modifications to the LCFS program are adding to the market uncertainty. Consequently, the long-term market signals necessary for new investments in low-carbon technologies are lacking, undermining the future success of the program.

The 45-day rulemaking package for the LCFS included a five percent step-down. The April 10th workshop showed modelling for both a seven and nine percent step-down. A strong one-time step-down in the compliance curve of nine percent, combined with the proposed Auto Acceleration Mechanism, would be the most effective and immediate measure CARB can implement to send the appropriate investment signals and restore confidence in the long-term viability of the LCFS program.

Approval of E15 in California would further reduce carbon emissions, support a more stringent LCFS compliance curve, lower criteria pollutant emissions, and reduce consumer fuel costs.

The RFA has been actively working with CARB over the last five years on the process for E15 approval. California is now the only state in the country that does not allow the use of E15 as a legal fuel. The Multi-Media Evaluation required by regulation to certify new fuels in California is complete and is awaiting final approval by the Environmental Policy Council.

E15 certification is the single most effective measure CARB can adopt in the transportation sector to immediately and significantly reduce GHG emissions further, while at the same time reducing criteria pollutant emissions and consumer costs. If all gasoline sold in California today were E15 instead of E10, the state would see an additional decrease in GHG emissions of approximately 2 million metric tons per year.

On the cost side, the wholesale price of ethanol in California typically trades at a significant discount to CARBOB, the fuel with which ethanol is blended to make finished California gasoline (Figure 1). In recent months, prices for ethanol sold in California have consistently been \$1 per gallon below the price of CARBOB.

This cost-effective strategy for significant GHG reductions supports a more significant step-down in the LCFS compliance curve while displacing more petroleum and improving public health through lower tailpipe and toxics emissions.

The RFA has been advocating since the beginning of the current LCFS rulemaking for E15 to be a part of this round of program modifications. We appreciate that CARB is now asking for comments on E15 in connection with the April 10th workshop, but since E15 was not part of the 45-rulemaking package we are urging CARB to expeditiously begin a separate rulemaking process to approve E15.

As part of the final LCFS rulemaking, we encourage CARB to include a staff recommendation or a Board resolution to immediately initiate an expedited rulemaking to approve E15 in California. Given the myriad environmental and economic benefits of E15, as well as the time value of near-term carbon reductions, the time to approve E15 in the state is now.

Figure 1: Los Angeles Gasoline Blendstock (CARBOB) vs. Ethanol Prices

Sources: OPIS (ethanol), U.S. Energy Information Administration (CARBOB)

U.S.-produced ethanol already meets the objectives of the proposed sustainability provisions and should not be subject to further certification.

In the Initial Statement of Reasons for the proposed LCFS amendments, CARB provides its rationale for introducing crop-based biofuels sustainability criteria: “To reduce the risk that *rapid expansion* of biofuel production and biofuel feedstock demand could *result in deforestation or adverse land use change*, CARB staff are proposing additional guardrails on the use of crop-based feedstocks for biofuel production.”¹ However, U.S. fuel ethanol production has declined since peaking in 2018, and federal government forecasts do not reflect “rapid expansion,” but rather flat or declining volumes, depending on the timeframe. As a result, there is no risk of associated deforestation or land use change related to U.S. ethanol production.

After reaching 16.1 billion gallons (bg) in 2018, ethanol production slipped to 15.8 bg in 2019 and then fell sharply to 13.9 bg in 2020 as a result of the pandemic, according to the U.S. Energy Information Administration (EIA) (Figure 2). Volumes have recovered somewhat over the last few years, but output was only 15.6 bg in 2023. Moreover, according to EIA’s May 2024 *Short-Term Energy Outlook*, production is forecast to be 15.8 bg in both 2024 and 2025, remaining below the 2017 and 2018 levels. The compound annual growth rate from 2010 to 2025 will have been just 1.2%.

¹ <https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2024/lcfs2024/isor.pdf> (emphasis added)

Figure 2: U.S. Fuel Ethanol Production

Source: EIA

The number of vehicle miles traveled in the U.S. has followed a similar pattern over the last five years. Increasing sales of electric vehicles (EVs) and improving fuel economy for vehicles with internal combustion engines have also weighed on ethanol consumption. Trends toward reduced commuting (as people are working from home at least part of the week), higher fuel economy, and expanded EV sales are expected to continue in the future.

Beyond market developments, adoption of EVs will be explicitly or implicitly required by policies adopted over the last couple of years. In November 2022, California adopted the Advanced Clean Cars II (ACC II) program, which will require EVs to account for 35% of new passenger car, truck, and sport-utility vehicle sales starting with model year 2026, ramping up to 100% by model year 2035. A number of other states have adopted all or part of California's vehicle regulations under Section 177 of the Clean Air Act, and as a result ACC II is expected to apply to approximately one-third of U.S. light-duty vehicle (LDV) sales starting in 2027.

Moreover, in March 2024, EPA released its final Multi-Pollutant Emissions Standards for Model Years 2027 and Later Light-Duty and Medium-Duty Vehicles, more commonly referred to as the "tailpipe emissions standards." In conjunction with the release, the Agency stated, "EPA projects that from MYs 2030-2032 manufacturers may choose to produce battery electric vehicles (BEVs) for about 30 percent to 56 percent of new light-duty vehicle sales."² Plug-in hybrid electric vehicles (PHEVs) would account for part of

² <https://www.epa.gov/system/files/documents/2024-03/420f24016.pdf>

the remaining sales. Under EPA’s “central case” technology pathway, the share of U.S. LDV sales represented by plug-in EVs would exceed the share that would result only from adoption of ACC II by California and Section 177 states.

In a Regulatory Impact Analysis, EPA estimated the impact that the standards would have on liquid-fuel consumption. Based largely on that analysis, RFA estimates that if the average ethanol content of finished gasoline were to remain at the 2023 level of 10.39%, the annual impact on U.S. ethanol consumption would be 300 million gallons (mg) in 2030 and more than 700 mg in 2032 (Figure 3). Given that adoption of E15 is expected to continue expanding in the interim, the impact is likely to be even greater. If all finished gasoline sold in the U.S. were E15 in 2032, 1 billion fewer gallons of ethanol will be consumed than would be the case without the rule.

Figure 3: Annual Reduction in Ethanol Consumption Under EPA 2027-2032 Tailpipe Standards

Source: RFA analysis of EPA Final Regulatory Impact Analysis (Table 4-13)

Note: Assumes 98% of liquid fuel for light- and medium-duty vehicles is gasoline, based on Department of Transportation data

For land use change to actually occur, production of a certain biofuel, and the associated consumption of feedstock, must increase more rapidly than gains in feedstock production efficiency (i.e., crop yield). Models used to estimate emissions resulting from land use change typically assume that demand for a particular biofuel outpaces the agriculture sector’s capacity to provide the requisite feedstock on existing cropland. This has not occurred in the real world, and projections looking forward show this will not occur in the future.

As noted in a recent paper written by leading researchers involved in the lifecycle analysis of biofuels, “Unfortunately, land-use changes are not directly observable or measurable. Economic models have been used to estimate land-use changes.”³

Models are typically run separately for a certain biofuel volume trajectory and for a counterfactual scenario (e.g., without a policy change), and then the results are compared. Alternatively, models can be run to show the impact of a biofuel volume “shock” of a specific size. For example, in the Model Comparison Exercise that EPA conducted in conjunction with issuing the 2023-2025 volume obligations under the Renewable Fuel Standard (RFS), it introduced a corn ethanol shock and a soybean oil biodiesel shock, each of which involved an additional billion gallons of domestic consumption per year.⁴ However, as discussed above, U.S. ethanol volumes are not expected to grow materially in the near term, and usage as a road transportation fuel is expected to decrease in the medium term. That is, there is no upward “shock” to be modeled to estimate expected land use change.

In introducing its proposed sustainability requirements, CARB stated, “Crop-based and forestry-based feedstocks must not be sourced on land that was forested after January 1, 2008.”⁵

Importantly, the entire increase in U.S. corn production since 2007 has come as a result of rising yields (and switching with other crops), not expanding acreage. The U.S. harvested a record corn crop in 2023; however, if yields had stayed the same as in 2007, corn production would not have increased at all (Figure 4).

U.S. corn yields have exhibited a strong upward trend during recent decades. Yields have increased by nearly 1.9 bushels per acre annually since the mid-1990s (Figure 5). This has been the result of substantial investments in seed technology, combined with the adoption of improved agronomic practices.

In the future, if ethanol production is steady or declines, fewer acres will be needed to grow corn to be used as feedstock for ethanol because more corn is being produced per acre. Additionally, approximately 15 pounds of distillers dried grains, a high-quality animal feed ingredient, is produced from each bushel processed for ethanol, along with nearly one pound of distillers corn oil, which is used as a low-carbon-intensity feedstock for biomass-based diesel or as a feed ingredient. Together, nearly one-third of the corn that is used by ethanol biorefineries is returned to the market in the form of coproducts.

Note: Dashed line represents actual harvested acreage multiplied by 2007 yield

Figure 5: U.S. Average Corn Yield

Source: USDA-NASS (historical production), RFA (analysis)

Putting corn acreage dynamics into a broader context, total U.S. cropland has fallen steadily for decades, as has been documented in previous RFA comments.⁶ More specifically, cropland has declined since the beginning of 2008, the date after which CARB’s proposed sustainability criteria are intended to ensure that previously forested land is not used to grow feedstocks for the LCFS program. This decline in cropland was confirmed by the 2022 Census of Agriculture released in February, which showed that the amount of cropland in the U.S. fell by an additional 14 million acres, or 4%, since the prior Census in 2017 (Figure 6).

Figure 6: Composition of U.S. Cropland

Source: USDA Census of Agriculture

The Energy Independence and Security Act of 2007 (EISA), in which the RFS was expanded and allocated among several categories of biofuels, specified that the “renewable biomass” used to produce those biofuels must be “harvested from agricultural land cleared or cultivated at any time prior to the [December 19, 2007] enactment of this sentence that is either actively managed or fallow, and nonforested.”⁷ Thus, the RFS already accomplishes at a national level the objective that CARB has elaborated for its proposed sustainability criteria.

To implement this provision of EISA, EPA adopted an aggregate compliance approach. In its final rule for the revised RFS, EPA stated:

⁶ See particularly RFA comments dated August 8, 2022 and February 20, 2024

⁷ <https://www.congress.gov/110/plaws/publ140/PLAW-110publ140.pdf>

EPA has determined that an aggregate compliance approach is appropriate for certain types of renewable biomass, namely planted crops and crop residue from the United States.

Under the aggregate compliance approach, EPA is determining for this rule the total amount of “existing agricultural land” in the U.S. ... at the enactment date of EISA, which is 402 million acres. EPA will monitor total agricultural land annually to determine if national agricultural land acreage increases above this 2007 national aggregate baseline. Feedstocks derived from planted crops and crop residues will be considered to be consistent with the definition of renewable biomass and renewable fuel producers using these feedstocks will not be required to maintain specific renewable biomass records ... unless and until EPA determines that the 2007 national aggregate baseline is exceeded.⁸

To ensure compliance, EPA tracks U.S. agricultural land area annually using USDA data.⁹ Its estimate of the number of acres of agricultural land is consistent with the Census of Agriculture’s estimate of total cropland, and the two series have exhibited similar downward trends since 2007. EPA estimates that there has been a 17-million-acre reduction in U.S. agricultural land area between 2007 and 2022 (Figure 7).

Figure 7: EPA Assessment of U.S. Agricultural Land Area

Source: EPA

Note: No estimates were issued for 2008, 2009, or 2020

⁸ <https://www.govinfo.gov/content/pkg/FR-2010-03-26/pdf/2010-3851.pdf>

⁹ Note that EPA’s definition of agricultural land includes Conservation Reserve Program acreage

A similar compliance approach was recently adopted by Environment and Climate Change Canada (ECCC) for ethanol produced from U.S.-grown feedstock. As noted by USDA, “On November 9, 2023, ECCC publicly announced that it approved the U.S. application for legislative recognition which demonstrates that U.S. feedstock is in compliance with the land use and biodiversity (LUB) criteria under the Clean Fuel Regulation (CFR). ... Without legislative recognition, individual farmers or states would have had to prove their own compliance, as of January 1, 2024.”¹⁰

If California moves ahead with any feedstock certification program, there should be a provision comparable to those in the RFS and CFR to designate all U.S.-produced ethanol as in compliance with the program, so long as aggregate cropland acreage does not expand beyond a 2007 baseline.¹¹ This is justified by both the steady decline in U.S. cropland and the lack of growth reflected in federal government forecasts/analyses of future ethanol volumes, as detailed above.

It is recognized that two developments have the potential to result in growth in domestic ethanol consumption beyond these levels: the adoption of E15 and the emergence of sustainable aviation fuels (SAF). However, E15 currently accounts for a small share of U.S. finished gasoline consumption, and growth will take time, although a combination of compelling economics (including the value of LCFS credits) and compatible infrastructure would be expected to result in somewhat more rapid adoption in California if the fuel blend is approved for sale there.¹² Still, the adoption of E15 in the U.S. and specifically in California is not expected to result in significant growth in overall ethanol consumption and is more likely to result in keeping long-term ethanol consumption at or near current levels.

Regarding SAF, current production of alcohol-to-jet fuel is very small, and it will take years and large capital expenditures for the industry to be built out.¹³ Additionally, tax credits available for SAF under the Inflation Reduction Act of 2022 are scheduled to expire at end of 2027. As a result, forecasts of future SAF volumes are highly speculative.

In summary, the proposed LCFS sustainability criteria are not currently justified for ethanol. If future growth of the industry is stronger than reflected in current federal government forecasts, CARB would have sufficient time to revisit the potential introduction of requirements designed to achieve the purpose of the criteria.

Comments on Proposed Low Carbon Fuel Standard Amendments—15-day changes

Dear Mr. Botill:

Thank you for the opportunity to provide comments in response to the Low Carbon Fuel Standard (LCFS) proposed 15-day changes. We appreciate CARB engaging stakeholders' input on a variety of forward-looking concepts for the future of the LCFS. Taking decisive action to bolster the LCFS market will help ensure the long-term viability of the program and the accomplishment of the state's carbon reduction objectives. SkyNRG Americas ("SkyNRG") is pleased to be able to provide comments on several areas of the 15-day change proposal.

SkyNRG has been engaged in enabling sustainable aviation fuel (SAF) as a solution to decarbonize aviation since 2010. Starting in 2019 we initiated the construction of new dedicated SAF production facilities to support the aviation industry's 2050 net-zero commitments with new SAF capacity globally. Critically, SAF is one of the few cost-effective and scalable tools for decarbonizing aviation in the near-to medium-term. As such, SAF is one of few viable solutions for California to mitigate aviation emissions in the foreseeable future.

For our SAF project development efforts in the US, SkyNRG will be among the first producers of SAF and renewable diesel (RD) at-scale sourced from cellulosic feedstocks such as biomethane or renewable natural gas (RNG). SkyNRG's SAF production process is anticipated to use RNG sourced from a variety of sources and secured from common carrier pipelines on a mass balance accounting basis similar to producers of other clean fuels such as compressed natural gas (CNG), or liquid natural gas (LNG) do currently in California. Importantly, SAF produced from RNG also doesn't compete with food-based crops or create indirect land use challenges.

As other industries and transportation sectors decarbonize utilizing electrons and other low carbon fuel sources, aviation as a proportion of California's total greenhouse gas footprint will continue to increase through 2035 and beyond. The aviation sector is one of the most difficult industries to decarbonize (or electrify) due to unique operational and safety requirements that necessitate liquid energy-dense fuels, highlighting the critical role of low-carbon liquid fuels such as SAF for the future of the sector.

SAF is an essential contributor to achieving Governor Newsom's goal of 20% clean fuels for the aviation sector by 2030.¹ However, delaying supportive low carbon policies that enable SAF in the LCFS now will jeopardize the industry's ability to scale SAF production in the timeframe needed to meet the Governor's goal in the future. SAF production facilities can take five to seven years to move from

¹ [Governor Newsom Calls for Bold Actions to Move Faster Toward Climate Goals | Governor of California](#) calling for 20% SAF target.

development to operation; consequently, construction of new projects (or expansions of existing facilities) must begin now to enable these solutions to be available by 2030.

SkyNRG submits the following comments related to the fossil jet fuel exemption, support for increased program ambition for 2025 and beyond, caution against changes to the avoided methane emissions crediting, flexibility around the mass balance accounting and deliverability of RNG for the production of SAF and the cap on biomass-based biodiesel from virgin soy and canola.

Support for maintaining the removal of “Fossil Jet Fuel” from LCFS exemption for intrastate use

SkyNRG sees sustainable aviation fuel as one of the few near-term, readily available solutions to addressing both carbon dioxide (CO₂) and non-CO₂ emissions from aviation. For this reason, we were disappointed by the most recent proposal to maintain the LCFS fossil jet fuel exemption.

Achieving California’s ambitious goals for the aviation sector will require addressing the structural disincentives for SAF embedded in the status quo. While SAF is eligible to receive credits under the LCFS,² the lack of deficits on the fossil jet fuel side decreases the value of SAF as a replacement relative to renewable diesel, which replaces an obligated and therefore more costly fossil fuel. This structural disparity, illustrated by multiple third-party analyses, strongly and systematically incentivizes clean fuel producers to make renewable diesel rather than SAF.³ The result: in 2023, 2 billion gallons of renewable diesel were registered by the program but only 23 million gallons of SAF.⁴ It remains unclear what differences exist between aviation and on-road fuels that justify continuation of uneven supportive policies.

For most low-carbon alternative fuels, production remains more expensive than the incumbent fossil alternative. Fundamentally, not obligating traditional fossil fuels ensures that they remain inexpensive relative to low carbon alternatives. Rational fuel users will choose the less expensive option, and even fuel users who want to advance low carbon options will be undercut. This puts a strong chilling effect on the rate of adoption of opt-in fuels.

To ensure that CARB’s current proposal does not exacerbate structural disincentives to SAF under the LCFS program, we suggest a modest step that would remove the applicability of the Auto Acceleration Mechanism (AAM) to the table of annual jet fuel benchmarks. The AAM applied to the gasoline and diesel benchmarks can act to control the credit supply by both reducing credit generation for alternative fuels and increasing deficits for fossil fuels. However, without any obligations on fossil jet fuel, the AAM would only undercut support for SAF without creating any corresponding demand.

In conjunction, we propose that CARB set the jet fuel benchmarks at a level and on a schedule that recognizes that SAF is an emerging, less mature market that has not benefited from higher fossil

² We applaud CARB’s harmonization of the annual CI standards for diesel and jet fuel following the 2018 Rulemaking. This preserves credit generation opportunities for SAF and reduces some of the structural differences that would otherwise disincentivize SAF production compared to diesel, though significant disincentives remain.

³ See Bay Area Air Quality Management District (BAAQMD), Sustainable Aviation Fuel: Greenhouse Gas Reductions from Bay Area Commercial Aircraft. October 2020. Page 56 available at <https://www.baaqmd.gov/news-and-events/page-resources/2020-news/121120-saf-report>. See also <https://stillwaterassociates.com/saf-in-the-ira-era-how-do-the-incentives-stack-up/>.

⁴ CARB Data Dashboard available at <https://ww2.arb.ca.gov/resources/documents/lcfs-data-dashboard>

benchmarks and years of credit generation since program inception in 2010. In the early years of the LCFS program, CARB set small CI reduction targets for gasoline and diesel and modest annual increases to allow the industry (both fossil and alternative) time to complete their investments and ramp up production. CARB can evaluate the jet fuel benchmarks and set them in such a way that supports SAF as an emerging fuel and addresses airline industry concerns about the transition towards increasing low-carbon fuel use. This could include freezing the jet fuel benchmarks, resetting the 2030 jet fuel benchmark targets to their pre-amendment level of 20%, or decoupling the annual increases of the jet fuel benchmarks from those of gasoline or diesel. Notably, British Columbia has adopted a similar approach under their recent LCFS amendments, providing both a higher benchmark and a less aggressive compliance curve for aviation fuels, preserving credit generation opportunities for the emerging SAF industry.

- 111.3 Further study of the local air quality conditions surrounding California's major airports and the benefit of SAF use to these communities is also recommended. This presents an opportunity for collaboration with the aviation sector and airport workers to support the accelerated uptake of currently available solutions like SAF to help mitigate both health and climate impacts in the near- and long-term.

After virtually attending the April workshop, we were moved by the testimony and diverse perspectives of airport workers, as represented by the Service Employees International Union (SEIU) and their support for clean fuels such as SAF. While air travel remains crucial in our society, we encourage CARB staff to develop policy that drives uptake of SAF that contributes to protecting the health and safety of these workers and airport communities. Fully addressing aviation's impacts requires a committed approach to reducing CO₂ and non-CO₂ emissions from aviation and there is a growing body of data that SAF offers this in both cases.⁵

Support for increased program ambition for 2025 and beyond

- 111.3 We strongly support CARB's proposal to change the carbon intensity reduction target for 2025 to 9%. Since its implementation over a decade ago, the LCFS has proven highly successful in both encouraging market investment in low carbon fuels and lowering emissions in the transportation fuel sector. To help ensure a healthy LCFS credit market that can keep pace with these investments, we strongly support CARB's plans to strengthen the existing emission targets for 2030 and beyond. Therefore, we encourage CARB to adopt the 9% near-term stepdown presented during the April workshop, thereby recognizing the carbon intensity (CI) reduction successes of the program over the previous years. This better aligns with the findings of the consulting firm ICF, which suggests an optimal stepdown range of 10.5% to 11.5% for 2025 and targeting a credit bank size equivalent to two quarters worth of deficits. By making appropriate adjustments, CARB can reflect the strong market supply scenario, thereby fostering the development of additional solutions to further drive down the state's emissions with SAF.

- 111.4 Additionally, we believe a 2030 target of 30% can be achieved as noted in the ICF analysis and that the Auto Acceleration Mechanism should be able to trigger earlier. As a member of the Coalition for

⁵ <https://www.dlr.de/en/vt/research-transfer/fag/fag-sustainable-aviation-fuels>

https://www.who.int/health-topics/cardiovascular-diseases#tab=tab_1

Renewable Natural Gas (RNG Coalition), we support their positions on these two topics in their comments on the 15-day amendments.

Further Study on Changes to Avoided Methane Emissions Credits is Necessary

We are very disappointed to see the 15-Day Package treatment of avoided methane crediting continues to lack connection to any long-run strategy that would ensure continued methane abatement. It is unwise and risky to impose an arbitrary phase-out of avoided methane crediting without a detailed plan for developing a supporting replacement policy. The treatment of avoided methane continues to create significant project uncertainty and increases the potential for stranded assets—an issue correctly cited by CARB during prior workshops as a key outcome to be avoided.⁶

CARB should continue to encourage the capture and productive repurposing of methane emissions from organic waste streams processed through anaerobic digestion, regardless of the source of the waste stream or when this waste is produced. To this end, and as noted in previous comments, SkyNRG encourages CARB to avoid making changes that limit opportunities to include avoided emissions in CI calculations.

If CARB truly wants methane abatement from sources such as agricultural wastes to continue, and for new sources of RNG activity such as organic waste diversion from the municipal waste stream to develop, they must reconvince the clean fuel investment community that RNG will remain a viable and important contributor to the LCFS framework. Therefore, we believe that this warrants further study from CARB to avoid any unnecessary consequences as currently proposed since methane sources will continue to increase in the future.

As SkyNRG continues to build out SAF production capacity in the US, the company will continue to explore a wide range of RNG feedstock opportunities from organic waste streams, including food waste, yard and landscaping waste, industrial and wastewater sludge, and a variety of animal wastes in the coming decades. Many untapped waste streams are novel as it relates to LCFS pathways, but nonetheless can readily be converted to transportation fuels through technologies that are commercially proven and readily suitable for producing low carbon fuels from RNG pathways.

The GHG emission reductions resulting from CNG fleets being the default for many medium- and heavy-duty applications are attributed, in part, to the incentives of the LCFS and has resulted in improved air quality for constituents. SAF is at a similar crossroads. By allowing for avoided methane crediting for RNG as a feedstock, CARB has the potential to see SAF become the default fuel for aviation, much like the transition in the CNG fleet space. RNG has continued potential to reduce GHG emissions in California, and recognizing its potential as a feedstock is essential to the continued success of the program.

We encourage CARB to study the success of Europe's Renewable Energy Directive (RED), which has long recognized the avoided methane benefits when assessing the lifecycle CI of various RNG pathways. The RNG to SAF pathway presents a unique opportunity to scale-up low carbon fuels in the aviation sector to align with the Governor's recently stated goal for SAF by 2030.

⁶ See CARB's Presentation at the February 22, 2023, LCFS Workshop, slide 31.

https://ww2.arb.ca.gov/sites/default/files/classic/fuels/lcfs/lcfs_meetings/LCFSpresentation_02222023.pdf

111.6 Expanding Not Limiting Mass Balance Accounting of RNG including to SAF and RD

As stated in previous comments to CARB, expanding opportunities for RNG to be used as an input for additional transportation fuels such as SAF and RD will be critical to achieving more stringent targets. Existing LCFS regulations incentivize the use of RNG in renewable CNG and LNG applications by offering the flexibility of mass balance accounting of RNG injected into pipeline systems connected, sometimes at great distance, to downstream production or dispensing locations (sometimes referred to as “book-and-claim”). This is a highly effective way to rapidly decarbonize transportation fuels, and we encourage this to be expanded to SAF and RD as it has been applied to other transportation fuel end uses like CNG, and LNG. Under the current LCFS regulations, SkyNRG (and others) would be unable to participate in the expansion of the program because there are no provisions allowing mass balance accounting for offsite RNG utilized as feedstock to produce SAF and RD.

The U.S. RNG industry has evolved with existing regulatory programs at both the federal and state levels that reasonably recognize that most sources of RNG do not justify co-location of fuel production facilities. To accommodate this challenge, mass balance accounting is an indispensable ingredient to incentivizing the development of RNG resources and unlocking their emission reduction potential to materially reduce emissions.

The U.S. Environmental Protection Agency (EPA) has recognized the potential for RNG as a feedstock in the production of renewable fuels. In its 2023 rulemaking, the EPA established a regulatory framework allowing the use of RNG as a “biointermediate,” paving the way for producers like SkyNRG to make renewable, low carbon fuels like SAF and RD from products derived from RNG under mass balance accounting (once finalized). Critically, the EPA’s regime leverages indirect accounting of pipeline injection and offtake at separate points consistent with LCFS mass balance accounting procedures. In CARB’s ISOR for the proposed rule change, the need to align with federal support for SAF proliferation is specifically highlighted as a guiding principle of the rule change.

The LCFS program has long been compatible with federal incentives, including the Renewable Fuel Standard (RFS) and numerous tax credits. The creation of additional federal incentives through the Inflation Reduction Act (IRA) and Infrastructure Investment and Jobs Act (IIJA) only increases the opportunity for the LCFS program to align with and leverage federal investments to accelerate decarbonization. While the SAF market is growing, these incentives are greatly needed and have outsized impacts in supporting the industry’s maturation. CARB should ensure that the LCFS program aligns with the treatment of SAF feedstocks under the RFS to avoid creating a bifurcated RNG market. Further, given the intention to align and coordinate LCFS programs in California, Oregon and Washington and further accelerate the uptake of SAF, we also encourage CARB to consider Washington state’s approach to enabling book and claim/mass balance accounting for RNG to SAF.

We implore CARB to expand eligibility for mass balance accounting of all sources of RNG as feedstock to produce transportation fuels like SAF and RD. Doing so will create new opportunities to utilize RNG to make low, or even negative, CI transportation fuels that are suitable for sectors that are hard to decarbonize in California, directly contributing to Governor Newsom’s ambitious goals for expanded production and use of low carbon, renewable aviation fuels. With appropriate oversight (including the verification and validation procedures CARB already requires), we believe that any compliance risks can be effectively managed as they are today for CNG, LNG, and hydrogen production. By recognizing the potential of RNG as an SAF and RD feedstock, CARB acknowledges its material value to a maturing

industry and instills confidence in investment communities to continue to invest in the energy transition of this sector. Limiting mass balance accounting eligibility for RNG feedstocks is a critical issue that may significantly negate California's ability to benefit from the next generation of low carbon fuels.

111.7

Deliverability language creates a barrier to imports and should not be adopted in the LCFS

CARB's 15-Day package proposed changes to RNG deliverability requirements which remain problematic for RNG development. This fundamentally reduces investment certainty and delays investment in RNG projects and thus slows critical near-term methane reductions.

We are discouraged that CARB introduced deliverability requirements for RNG that restrict the ability to utilize this low carbon feedstock, rather than expanding its applicability. Geographic and deliverability limitations would almost certainly stifle investment in RNG resources and reduce opportunities for the state to achieve its LCFS-specific climate goals.

It is unclear how directional flow data from 2020 to 2023 should hold any relevance to long-run delivery patterns for RNG. Assuming California (and hopefully other states) are serious about cutting fossil demand and increasing renewable gas supply at the rate called for in the Scoping Plan, the gas system would fundamentally change, from a system that is driven heavily by fossil gas flows to one driven by renewable gas flows.

Given that California clearly benefits from broad North American and global energy markets for other types of energy—and the recent trend toward significant increases of the in-state supply of RNG,⁷ with in-state production increasing from 6.74 in 2021 to 18.23% of LCFS supply in 2023—we question why CARB would propose eliminating any imported RNG eligibility from any portion of the North American gas system.

111.8

Support for the cap on credit generation for biomass-based diesel produced from virgin soybean oil and canola oil

SkyNRG supports CARB's proposal to limit the credit generation potential of biomass-based diesel produced from virgin soybean oil and canola oil to 20 percent of annual biomass-based diesel reported on a company-wide basis. We agree that this proposal will help avoid sending a long-term signal for virgin soy or canola oil to serve California demand. Furthermore, we believe that CARB should continue to focus on shifting demand to advanced feedstocks that can bypass the issues that first generation biofuel feedstocks face. Given that science-based research has shown that food-based biofuels are linked to emissions from deforestation and other indirect land-use change (ILUC), this shift is particularly important.⁸ We are however concerned about the addition of alcohol to hydrocarbons to the list as a potential Tier 2 eligible drop-in fuel. This could potentially open up a loophole enabling corn ethanol-

⁷ <https://ww2.arb.ca.gov/resources/documents/lcfs-data-dashboard>

⁸ Tyler J. Lark, Nathan P. Hendricks, Aaron Smith, Nicholas Pates, Seth A. Spawn-Lee, Matthew Bougie, Eric G. Booth, Christopher J. Kucharik, and Holly K. Gibbs, "Environmental Outcomes of the US Renewable Fuel Standard," Proceedings of the National Academy of Sciences 119, no. 9 (March 1, 2022). <https://doi.org/10.1073/pnas.2101084119>

based SAF which could skirt the cap on biomass-based diesel. For this reason, we would urge careful consideration of this addition.

Thank you for the opportunity to comment on the proposed changes to the LCFS. SkyNRG applauds California's leadership and CARB staff for taking action to drive innovation and growth of low carbon fuel technologies. Through careful consideration of the impact of these rule change to a developing industry, we believe SAF can help take the LCFS to new heights.

Sincerely,

Honorable Chair Liane Randolph and Honorable Board Members
Low Carbon Fuel Standard Program
California Air Resources Board
1001 I St., Sacramento, CA 95814

Sent via email to LCFSworkshop@arb.ca.gov

Re: 15-Day Changes to Proposed Low Carbon Fuel Standard Amendments

Chair Randolph and Members of the Board:

EVgo appreciates the opportunity to comment on the California Air Resources Board's 15-Day Changes to the proposed Low Carbon Fuel Standard (LCFS) amendments. The LCFS remains a cornerstone of California's transportation electrification efforts and EVgo commends CARB's efforts to update the regulation to better reflect the state's zero-emission vehicle (ZEV) and climate policy goals.

In particular, the proposal to modify the 2025 carbon intensity (CI) target from a 5% stepdown to a 9% stepdown is one of the most essential measures CARB can take to address sustained overcompliance in the program and send a near-term signal for further low carbon fuels investment in support of CARB's foundational ZEV regulations – including Advanced Clean Cars II.¹ EVgo also appreciates the proposed modifications to the light-duty fast charging infrastructure (FCI) provisions of the regulation, including the proposal to preserve the existing pool of available FCI credits at 2.5% of prior quarter deficits and other modifications that streamline FCI credit generation opportunities. Direct current fast charging remains an essential component of the state's strategy to support widespread EV adoption – particularly in communities without access to home charging – and the continuity of FCI provisions in the LCFS will support critical operations and maintenance activities that bolster the reliability and accessibility of California's public charging network.

¹ EVgo notes that a more stringent 2025 CI target would further magnify the benefits associated with a 9% CI stepdown.

To further support goals of the LCFS and CARB's broader ZEV adoption goals, EVgo respectfully requests that CARB consider the following minor amendments:

112.1

1. Clarify that electricity dispensed for EV charging should be verified by desktop review and remove requirements for site visits to EV charging stations in §95501(b)(3) to recognize that EV charging networks' fuel transaction data is housed on electronic charging management platforms and not individual EV charging stations; and
2. Enable the Automatic Acceleration Mechanism (AAM) to trigger in 2026 based on 2025 data.

1. **Clarify that electricity dispensed for EV charging should be verified by desktop review and remove requirements for site visits to EV charging stations in §95501(b)(3) to recognize that EV charging networks' fuel transaction data is housed on electronic charging management platforms and not individual EV charging stations**

EVgo recognizes the importance of ensuring alignment between the quantity of electricity dispensed by EV charging stations and the quantity of electricity reported to CARB by entities generating LCFS credits from EV charging. To this end, EVgo maintains that the best way to verify the accuracy of reported fuel from EV charging stations is through data checks and reviews of electronic records as identified in §95501(b)(5). Site visits may be appropriate for verification of large liquid fuel production facilities, but they are not suited to EV charging networks for several reasons:

112.2

- **EV charging networks' fuel transaction data is housed on electronic charging management platforms, not at individual EV charging stations.** Third-party verifiers cannot readily obtain cumulative fuel transaction data from visiting individual EV charging stations because EV chargers, unlike liquid fuel production facilities, are unmanned and do not feature data management systems on-site. Instead, third-party verifiers can complete electronic reviews of data management systems that collect fuel transaction data from across EV charging networks that are then used to generate fuel transaction reports that are submitted to CARB. This approach can provide material time and cost savings while providing third-party verifiers with the information needed to carry out a comprehensive assessment of an entity's compliance with LCFS reporting requirements.
- **EV charger metrological accuracy is already regulated by California Department of Food and Agriculture Division of Measurement Standards (DMS).**

112.2 Cont.

Many stakeholders have noted throughout the rulemaking process that DMS has already established a regulatory framework (the California Type Evaluation Program) that governs the testing and approval of EV chargers in California with EV charger accuracy requirements that are at least as stringent as those in § 95491.2 of the LCFS regulation.² Given the comprehensive lab and field-testing requirements that EV chargers are already subject to per DMS regulations, it is redundant for CARB to require additional site visits to assess the metrological accuracy of thousands of individual EV chargers participating in the LCFS.

- **EV charging networks are large and widespread.** Whereas third-party verifiers may feasibly carry out annual site visits to a limited number of large liquid fuel production facilities, it is costly and time-intensive for verifiers to conduct annual site visits for thousands of EV charging facilities located in diverse areas across the state.

112.3

Instead of taking a one-size-fits-all approach to a diverse suite of low carbon fuels, EVgo strongly recommends that CARB remove the requirement for site visits to EV charging stations participating in the LCFS and modify the regulations in a manner that allows third-party verifiers to complete verification services remotely, as fuel transaction data is housed on electronic charging management platforms – not at individual EV charging stations. This approach is better situated to provide third-party verifiers with the data needed to conduct in-depth verification.

2. Enable the Automatic Acceleration Mechanism (AAM) to trigger in 2026 based on 2025 data.

112.4

EVgo strongly supports the inclusion of the AAM in the LCFS and maintains that CARB can further support the ambition of California's decarbonization goals by allowing the AAM to be triggered in 2026 with a potential earliest effective date in 2027 (as opposed to the currently proposed 2027 trigger year and effective date in 2028). While CARB's proposed 9% CI stepdown in 2025 could potentially forestall the need for the AAM in 2026, the AAM acts as an important near-term hedge against sustained overcompliance at a time when the credit bank has reached unprecedented levels. Allowing the AAM to trigger in 2026 would ensure that the AAM can effectively achieve its express purpose of accelerating the stringency of the LCFS if certain market conditions are met.

² [View Document - California Code of Regulations \(westlaw.com\)](#)

To conclude, EVgo appreciates CARB's efforts to update the LCFS in line with California's transportation decarbonization goals and respectfully requests that CARB adopt the minor modifications described in these comments to ensure that the LCFS continues to support continued EV charging deployment in California. With these amendments, EVgo looks forward to supporting the passage and implementation of the proposed LCFS regulation.

California Air Resources Board
1001 I Street Sacramento, CA 95814

RE: Proposed 15-Day Modifications to Proposed Regulation Order

Dear California Air Resources Board,

Advanced Biofuels Canada is the Canadian national trade association for advanced biofuels and renewable synthetic fuels. ABFC members produce a portfolio of liquid low-carbon fuels (including alternative jet fuels), sustainable feedstocks, and intermediary products. Our members operate over 10 billion gallons of low carbon fuel production capacity globally and are significant suppliers to renewable and low carbon fuel regulations in Canada, the US, and worldwide. Many of our members have operations in both the United States and Canada.

Regarding the Proposed Low Carbon Fuel Standard Amendments:

- 113.1 **Additional consultation requested** - The concepts included Modifications to Section 95482. *Fuels Subject to Regulation* item #4 (specifically the 20% limit of annual biomass-based diesel from virgin soybean and canola oil) have not been publicly presented or reviewed in any detail during CARB public workshops. The LCFS policy structure pioneered in California is regarded as a science-based and technology-neutral regulation; establishing feedstock limitations, without due consultation, goes against this science-based approach. Proposals of this magnitude and impact merit additional consultation and stakeholder engagement prior to finalization and enactment.
- 113.2 **As written, the 20% limit will result in stranded assets and introduces significant regulatory risk to project developers** - The proposed approach of limiting pathway holders to supply only 20% of annual biomass-based diesel reported on a company-wide basis with crop-based biofuels (soy & canola) will directly impair businesses that have invested in production facilities to supply low carbon biofuels to the California LCFS market. There are significant questions on application and implementation (e.g., will the limitation apply to rapeseed, winter canola, spring canola [?]; what is the process by which a feedstock would be considered for being subject to this 20% limit [?]; will the application and amount of the limit be reviewed with any established frequency [?], etc.).

113.1 cont

The specific identification of virgin canola and soybean oil pathways as being subject to the 20% limit should be further substantiated by Staff - Analysis of the compliance data from Q1 2021 – Q1 2024 indicates that canola and soybean-based BD and RD have provided 8.2% of liquid biofuel credits and 10.7% of BD and RD credits. Other feedstock pathways for BD and RD (corn oil, tallow, UCO) provide 64% of all liquid fuel credits and 84% of BD and RD credits. It merits further explanation and supporting rationale for why virgin vegetable oils (soybean, canola) should be limited when other feedstock are not considered for limitation. Proceeding with feedstock limitations without sufficient consultation will hinder the advancement of alternative agricultural feedstocks for biofuel production lest they be similarly proposed for limitation without sufficient consultation. Additionally, the proposed limit will impair investments in agricultural innovation via Climate Smart Agriculture practices (e.g., yield enhancement, reduced inputs – fertilizer, pesticide, water use, etc., use of cover crops, use of low till/no till practices).

113.3

Potential for increased petroleum diesel usage under the 20% limit: California's LCFS demonstrates the extent to which low carbon fuels can achieve significant diesel emissions reductions in a relatively short time frame. If enacted, the proposed 20% limits would lead to backsliding in low carbon fuel use in diesel and impair the ability of the LCFS to achieve near-term GHG reductions. This is especially critical given the uncertainty around ZEV penetration in the MHDV fleet. Limiting the available amount of verified low carbon distillate fuels useable by the MHDV fleet will jeopardize the significant progress achieved in this 'hard to decarbonize' sector.

113.4

Support of compliance targets and curve smoothing - Re: *Modifications to Section 95484. Annual Carbon Intensity Benchmarks*. ABFC supports the increased stringency of the LCFS (from 5% to 9%) in the 2025 compliance year and a smoothed trajectory towards the 2030 target of 30% reduction.

113.5

Staff should consider an adjustment of the LCFS to re-focus the regulation on reducing the CI of liquid fuels supplied in California and remove ZEV from credit creation once an established penetration threshold is achieved. As ZEV use expands, the credits available in the compliance market will remove the signal for ongoing and increasing decarbonization in gasoline and diesel fuels. Staff should consider whether the LCFS is best utilized to ensure that remaining Internal Combustion Engines have the highest use of low carbon liquid fuels possible.

113.6 **The inclusion of sustainability criteria in the California LCFS make it among the most appropriate jurisdictions in which agriculture-derived biofuels can be responsibly increased to achieve strengthened GHG reduction targets** - Analysis by the International Energy Agency (IEA) in their recent study (July 2024) ‘Carbon Accounting for Sustainable Biofuels’ firmly states that biofuels from agricultural crops defined as ‘corn, sugarcane, canola/rapeseed, palm oil and other crops’ need to expand to achieve Net Zero Emissions by 2050 scenario:

Figure 1.3 Biofuel production by feedstock: Current, main case, Announced Pledges Scenario and Net Zero Emissions by 2050 Scenario, 2023-2030

IEA. CC BY 4.0.

Notes: APS = Announced Pledges Scenario. NZE = Net Zero Emissions by 2050 Scenario. “Conventional crops” refers to corn, sugarcane, soybeans, canola/rapeseed, palm oil and other crops. “Residue oils” refers to used cooking oil, animal fats, palm oil mill effluent and other residue oils. “New technologies and practices” refers to biofuel production from (lignocellulosic) agricultural and forestry residues, municipal solid waste and oil seeds grown on marginal land through intercropping, double-cropping and other approaches that do not otherwise compete with food and feed production.

Sources: IEA (2024), [Oil 2024: Analysis and Forecast to 2030](#); IEA (2023), [World Energy Outlook 2023](#).

(Source: <https://www.iea.org/reports/carbon-accounting-for-sustainable-biofuels>, page 14)

The LCFS’s inclusion of sustainability criteria, along with the Renewable Biomass provisions in the US RFS, ensure that irresponsible feedstocks are not utilized for credit creation.

113.7 **US and Canadian trade should be maintained and enhanced through regulatory cross compliance for sustainability certification between the LCFS and Canada’s Clean Fuel Regulations (CFR) - ABFC**

recommends that CARB maintain open markets between Canada and the US on crops, fuels, and biofuels by aligning regulations and recognition of existing compliance and administrative measures. Specifically, CARB can recognize the verified adherence to the Canadian Clean Fuel Regulations' Land Use and Biodiversity Criteria¹ as achieving the requirements of the LCFS section 95488.9 (g).

113.8 A revised approach to jet fuel is warranted - The demonstrated effectiveness of the LCFS in reducing gasoline and diesel emissions should be harnessed to reduce aviation emissions. ABFC suggests that CARB re-consider its exemption for intrastate jet fuel and consult on a revised approach (whether within the current LCFS or via a new regulation) where all jet fuel sold in California is subject to both a minimum volume blend requirement of alternative jet fuel as well as a carbon intensity reduction requirement. This revised approach would address the issue identified that '*aviation fuel suppliers who would generate deficits under the initial proposal could simply acquire credits to meet that compliance obligation*'.² We note that this approach has been implemented in the British Columbia Low Carbon Fuel Standard as of January 2024.³

CARB's actions to address jet fuel emissions will be impactful on other subnational jurisdictions: ABFC suggests that California expand its ambition towards jet fuel and align with the approach enacted in British Columbia that (1) obligates all jet fuel sold under the regulation, (2) prescribes minimum volumetric AJF use requirements, and (3) prescribes carbon intensity (CI) reduction requirements for jet fuel.

British Columbia's updated LCFS statute:

- Was approved on December 11, 2023, and enacted on January 1, 2024.
- Requires 1% AJF by volume in 2028, 2% in 2029, 3% in 2030.
- Requires a 2% CI reduction from a fossil jet baseline of 88.83 gCO₂e/MJ in 2026, 4% in 2027, 6% in 2028, 8% in 2029, and 10% in 2030.

BC's CI reduction requirements for jet fuel are lower than that of gasoline and diesel fuels. Gasoline has a 5% renewable content requirement and a 30% CI reduction requirement by 2030 (below 2010 levels);

¹Land use and biodiversity guidance: <https://www.canada.ca/en/environment-climate-change/services/managing-pollution/energy-production/fuel-regulations/clean-fuel-regulations/compliance/guidance-land-use-biodiversity.html>

² As stated in the Notice of Public Availability of Modified Text and Availability of Additional Documents and/or Information.

³ British Columbia LCFS: https://www.bclaws.gov.bc.ca/civix/document/id/complete/statreg/282_2023

diesel has a 4% renewable content requirement and is subject to the same 30% CI reduction requirement by 2030. (We note that the CI reduction requirements for any fuel can be met by overcompliance in other fuel types though there must be a volumetric minimum supply of alternative jet fuel.

Thank you for this opportunity to provide comments.

Yours truly,

Advanced Biofuels Canada

RE: Comments On 15-Day Changes to the Low Carbon Fuel Standard Proposed Regulation Order

Remora values the chance to share input on the 15-day changes to the Low Carbon Fuel Standard (LCFS) Proposed Regulation Order. We are eager to collaborate with CARB, its State agency partners, and all stakeholders to contribute innovative climate solutions with broad-reaching benefits in California and beyond. We submit these comments in support of a more stringent LCFS program and the swift inclusion of Mobile Carbon Capture Technologies within that program.

About Remora & Mobile Carbon Capture Technology

[Remora](#) designs and manufactures an **innovative engine exhaust technology that captures carbon dioxide (CO₂) directly from hard-to-decarbonize mobile sources**, including Class 8 heavy-duty trucks (semi-trucks), line-haul locomotives, and cargo ships. Using Remora's mobile carbon capture and storage (MCCS) technology, exhaust is diverted to a carbon capture unit, which captures CO₂ emissions, before the exhaust is released into the atmosphere. The captured CO₂ is compressed, stored onboard, and then offloaded at designated sites that are co-located at refueling or cargo-loading infrastructure sites. All captured CO₂ can be safely and permanently disposed of via underground sequestration or utilized within other products and industries.

Mobile carbon capture technologies are uniquely poised to provide major decarbonization benefits while also supporting critical air quality benefits, particularly in heavily impacted communities.

Remora Supports a Strong LCFS

California's transportation sector is the State's largest source of both greenhouse gas emissions (GHG) and air pollution, accounting for more than half of statewide GHG emissions.¹ Rapidly driving down these emissions is a critical element of California's strategy to achieve carbon neutrality. As described in the 2022 Scoping Plan Update, the transition to zero-emission technology will take time as internal combustion vehicles will remain on the roads and in service in California for decades to come. The modeling for the Scoping Plan indicates that even in 2045, significant volumes of liquid fuels, including fossil fuels, are likely to remain in California's transportation fuel mix.² Solutions that can significantly reduce—and even fully eliminate—greenhouse gas emissions from California's transportation sector will be key.

Remora supports CARB's near-term increase in carbon intensity (CI) stringency to a 9% CI reduction in 2025, which is included in the 15-day changes. CARB should also consider that the increased step down should be advanced through the stringency curve to guarantee stronger reduction targets year after year through 2030. Both of these changes will support the program's efforts to maximize emission reductions and drive California towards its climate goals.

The LCFS Can Be More Effective By Positioning it To Incorporate Mobile Carbon Capture Technologies

Given the scale and scope of the challenge to meet California's GHG reduction targets, the State cannot afford to limit any approaches that can contribute to this effort. As CARB works to refine LCFS, Remora urges CARB to ensure that it optimally positions California to reap the benefits that innovative and proven technologies like MCCS can provide.

Swiftly incorporating additional technologies into the existing CCS Protocol within the LCFS Regulation will recognize the role CCS can play in decarbonizing the production of transportation fuels and will be key in meeting California's climate goals.

By incorporating MCCS into the LCFS, California can work towards even more ambitious transportation decarbonization targets, which will provide climate, air quality, and public health benefits to Californians.

¹ See Draft 2022 Scoping Plan Update, pg. 147.

² See Draft 2022 Scoping Plan Update, pg. 153.

Remora appreciates the opportunity to submit comments, and we look forward to continuing to work with you and all stakeholders in California on this critically important effort.

Sincerely,

Re: Proposed 15-Day Changes to the Proposed Regulation Order

Dear Chair Randolph and Members of the California Air Resources Board,

On behalf of the Iowa Biodiesel Board, thank you for the opportunity to comment on the proposed 15-day changes (15-Day Changes) to the Low Carbon Fuel Standard (LCFS) program. The Iowa Biodiesel Board represents the biodiesel industry in Iowa, from the farmers who grow the feedstock, to production, through distribution to end users. Founded by the Iowa Soybean Association, IBB operates an independent organization and board, working to promote the commercial and economic success of biodiesel in Iowa.

115.1

Our position is that the proposed amendments introduced by CARB to significantly limit vegetable oil feedstocks and set onerous requirements for soybean oil are short-sighted and counterproductive to CARB's goal of decarbonizing the fuel supply. Rather than further embracing biodiesel – a solution that is here today and already contributing greatly to cleaning up the California fuel supply – it appears to us that CARB will penalize biodiesel while waiting for future technology to take hold.

Without scientific justification, these proposed vegetable oil caps and additional sustainability requirements threaten to reverse the progress California has made in emissions reductions and destabilize the economics of renewable fuels nationwide. This is harmful to Iowa and other states with strong biodiesel production and a thriving farm economy. Unlike petroleum, this proposal would penalize the many producers and farmers who have dedicated their livelihoods to a cleaner, more sustainable energy supply. This is likely to have many unintended consequences, such as a halting investment in renewable fuels and other innovations.

It is important to remember that soybeans are grown primarily for their meal, which goes into the animal feed supply. Curbing demand for the lower-value soybean oil has an unintended effect of raising the price of protein for the food supply.

This proposal calls into question the integrity of the LCFS, and whether it is something the renewable fuels industry can count on, or if it is capricious and can be easily blown off course by unpredictable winds.

CARB's 15-Day Changes to revise the LCFS was quite surprising, as the final package diverged significantly from what was included in the Initial Statement of Reasons (ISOR) and the April 10 public workshop. Of top concern for biodiesel producers and farmers across our state and the rest of the nation is a proposal that would in effect cap the use of soybean oil and canola oil as feedstocks for biofuels at 20 percent by company.

Placing an artificial limit on the market, combined with the inclusion of sustainability guardrails, as proposed will fail to reduce emissions and will only increase costs. Iowa biodiesel producers and farmers remain frustrated that CARB insists on using data and methods that are over two decades old to set carbon intensity (CI) scores for soy, while refusing to consider new economic data and failing to consider the potential indirect emission impacts their expanding preference for waste is having.

115.2 IBB opposes the proposed discretionary authority provided to the Executive Officer to stop accepting new pathways for biomass-based diesel. In addition to discriminating against the lipid-based fuel platform, we are concerned this could have unintended impacts for non-lipid pathways which could produce biomass-based diesel as a co-product. We are 115.3 also concerned that the aggressive step-down of CI benchmarks, which partially result from the removal the proposed regulation of fossil jet fuel, combined with other changes, will reward importers of waste feedstocks while penalizing farmers across Iowa and the broader United States.

As CARB seeks to finalize updates to the LCFS program in the coming months, we strongly encourage the agency to ensure these updates are based on science as required by AB-32. The determination to make such drastic changes to previous CARB proposals so late in the game was shocking to the soybean and biofuels industries. For CARB to move from arguing that, based on the modeling, a vegetable oil feedstock cap was detrimental to the goals of the LCFS at the April public workshop, to now recommending a wildly stringent cap on those feedstocks without data or science, is quite difficult to comprehend. CARB's own April 10th analysis showed that a feedstock cap would increase greenhouse gas (GHG) emissions in California, which is contrary to requirements in AB-32.

The Impact of a Vegetable Oil Feedstock Cap

Iowa is the nation's leading biodiesel producer. The state's operating biodiesel plants produce about 350 million gallons of fuel per year. According to a [study](#) by ABF Economics, the biodiesel industry:

- Accounts for more than \$850 million of Iowa GDP
- Supports nearly 5,700 fulltime-equivalent jobs in all sectors of the Iowa economy
- Accounts for about \$410 million of household income for Iowans

In 2023, the Iowa biodiesel industry spent \$1.8 billion on raw materials, other inputs, goods, and services. The largest share of this spending is for fats and oils used as the raw

material to make biodiesel. The 2 billion pounds of soybean oil used to produce biodiesel in Iowa were the equivalent of the oil from nearly 178 million bushels of soybeans, more than 30 percent of Iowa's soybean crop. Iowa's biodiesel industry used an additional 600 million pounds of other feedstocks including distiller's corn oil (a co-product of corn dry mill ethanol production), canola oil, animal fats, and domestic used cooking oil (UCO).

115.1 cont

The inclusion of a virgin vegetable oil feedstock cap in the 15-Day Changes was alarming to producers, farmers and the entire biofuels value chain, as reflected in market activity. You may understand our surprise based on the April 10 workshop in which CARB noted that liquid fuels would continue to be needed in the transportation sector in California for at least the next decade. In that same workshop, CARB also argued that the imposition of a virgin vegetable oil feedstock cap would increase the utilization of petroleum diesel in the transportation sector. In the staff's own presentation on April 10, staff noted that nearly eighty percent of vehicles on the road in California to still use combustion engines by 2030. Further, they noted that such a stringent cap on virgin vegetable oils may result in 2.8 billion gallons of fossil diesel utilization in 2030, versus 1.9 billion gallons using a scenario that does not impose the cap proposed by the Environmental Justice Advisory Committee.

In a full reversal of staff's prior analysis, which is only four months ago, staff is now essentially recommending to the board that more fossil diesel be sold into the market in 2030. This recommendation appears to not only go against the goals of AB-32, but also science. This recommendation seems to flatly disagree with the Intergovernmental Panel on Climate Change, which notes in its sixth assessment report that using existing low carbon technologies is a crucial component to avoiding catastrophic temperature increases, stating that "biodiesel and renewable diesel fuels...could offer important near-term reductions" for several technologies, including buses, rail, and long-haul trucking.¹

In our current interpretation, the cap may lock out of the market producers of the lowest cost, lowest carbon intensity soybean oil-based biofuel (soy methyl esters). Most soy methyl esters are produced at biodiesel plants adjacent to soybean processing plants. Often, the companies which own operate these soybean processing are not involved in the procurement and processing of non-crop-based oils, such as UCO and tallow. They exclusively make biofuels out of soy oil or canola oil. The current language limits crediting of soy and canola to 20 percent of reported gallons. This leaves integrated agriprocessing/biofuel producers two choices: 1) exit the market entirely, or 2) be denied a government benefit on 80 percent of their fuel. If this is the current interpretation of the proposed provision, it would significantly and arbitrarily disadvantage the sustainable oilseed biodiesel community.

¹ Jaramillo, P., S. Kahn Ribeiro, P. Newman, S. Dhar, O.E. Diemuodeke, T. Kajino, D.S. Lee, S.B. Nugroho, X. Ou, A. Hammer Strømman, J. Whitehead, 2022: Transport. In IPCC, 2022: Climate Change 2022: Mitigation of Climate Change. Contribution of Working Group III to the Sixth Assessment Report of the Intergovernmental Panel on Climate Change. https://report.ipcc.ch/ar6wg3/pdf/IPCC_AR6_WGIII_FinalDraft_Chapter10.pdf

We echo the concern of the American Soybean Association and Clean Fuels Alliance America that new requirement appears to contradict the statutory guidance laid out in AB-32 to minimize costs.

Sustainability Guardrails

115.4

The IBB was surprised to find that not only was a feedstock cap in the 15-Day Changes, but the sustainability guardrails were also retained. The cap, sustainability guardrails and Indirect Land Use Change score all additively, and redundantly, address land use change. This has the equivalent effect of giving soy and canola a much higher CI score increasing the compliance cost associated with delivering the product, despite the lack of direct evidence.

Broadly we are concerned that the requirement proposed by CARB is unneeded given the longstanding, excessively high ILUC figure (relative to more recent modeling efforts). Furthermore, we are extremely disheartened that CARB has not followed the example of governments across North America, where farmers who submit data for compliance are also given the opportunity to be incentivized for conservation efforts. This additional cost without benefit contradicts language authorizing the LCFS. Section 38562 (b)(7) of AB-32 directs CARB to, “Minimize the administrative burden of implementing and complying with these regulations.” Adding supply chain traceability to a bulk delivery system adds significant administrative burden without changing the GHG emissions of the pathway.

115.5

CARB’s efforts could be improved and enhanced by outreach to U.S. Department of Agriculture (USDA) personnel who have engaged in activity regarding climate-smart farming practices. USDA recently closed a comment period on its Request for Information on Procedures for Quantification, Reporting, and Verification of Greenhouse Gas Emissions Associated with the Production of Domestic Agricultural Commodities Used as Biofuel Feedstocks. With the information received, USDA seeks to quantify and qualify the benefits of climate smart agriculture practices for biofuel programs at the state, national, and international level. Communication between CARB and USDA could be enlightening regarding ongoing agricultural sustainability practices.

Through the current sustainable aviation fuel (SAF) federal tax credit (40B), the CI of soy-based biofuels can improve through no-till and cover cropping on the field that the soybeans were produced. Other farming practices like low-till, nutrient management, enhanced efficiency fertilizers, buffers, wetland and grassland management, tree planting on working lands, planting for higher carbon sequestration, and soil amendments all can and should be accounted to assign a lower CI score to an agricultural feedstock. USDA already tracks all these practices through several of their managed conservation programs. In addition, there are a variety of other practices that scientifically lower the CI score of soybean feedstocks for biofuels, and USDA is actively working to develop mechanisms to account for those.

Given the work being undertaken by USDA and EPA as part of the implementation of the Inflation Reduction Act, IBB urges CARB to reconsider its proposed sustainability requirements to allow soybean growers the opportunity to participate in the California biofuels market through innovative and climate smart agriculture practices.

Outdated Scoring

For the last several years, state soybean associations, national associations, and biofuel producers have urged CARB to consider updating its scoring methodology for crop-based biofuels. CARB has refused to even consider the request.

We remain deeply concerned that without a comprehensive update to the Global Trade Analysis Project model for biofuels (GTAP-BIO) that CARB utilizes, soy-based feedstocks will be phased out of the LCFS even without the additional limitations being proposed in the 15-Day Changes. Current data indicates a much lower CI score for soybeans, as growers continue to improve soil practices, limit water use, lower on-farm emissions and more. On the one hand, CARB is recommending stringent sustainability guardrails for U.S. soy, but on the other hand is still on track to likely phase-out soy-based biofuels from credit generation by approximately 2035 or sooner.

CARB has indicated plans to update all major models for lifecycle emissions calculations except for GTAP-BIO in the updated LCFS rulemaking. The soy industry has made vast improvements in sustainability and efficiency over the past two decades, with even greater improvement goals ahead. At the same time, CARB continues to rely on a 2014 model that uses data from 2004. The ILUC score accounts for half or more of the CI score for soy-based biofuels. CARB's current modeling assigns soy biomass-based diesel with an ILUC impact of 29.1g CO₂e/MJ whereas updated results from the model used to calculate ILUC scores indicate a value of between 9 and 10 gCO₂e/MJ for soybeans². The recently released 40BSAF-GREET 2024 model has an ILUC score of 12.2 for soy-based sustainable aviation fuel in federal programs.

The benefits of the LCFS can only be achieved if CI values are accurately captured. If land use change concerns are large enough to justify sustainability guardrails and capping virgin vegetable oil feedstocks, then the modeling should also be updated to reflect current land use change data.

115.2 cont **Entities Eligible to Apply for Fuel Pathways**

We are concerned about CARB's 15-Day Changes to give the Executive Officer discretion to stop accepting new pathways for biomass-based diesel starting in 2031. We do not understand what provision of AB-32 statute is served, or justifies, this arbitrary and highly

² Taheripour, F., Karmai, O., and Sajedinia, E. (2023). *Biodiesel Induced Land Use Changes: An Assessment Using GTAP-BIO 2014 Data Base*. Purdue University

selective change. CARB must under statute minimize costs and maximize GHG reductions. It is unclear how this is served by rejecting new pathways. In fact, the requirements of current law are met by allowing the most available pathways. If these pathways cannot achieve cost-effective GHG savings, they will not be utilized by the market in the LCFS. In essence, an increase in pathways can only serve to improve GHG benefits in California. Singling out a single fuel for prejudicial treatment is baffling given the goals of the LCFS and the authority that establishes it. Executive Order S-01-07 establishing the LCFS specifically cites diversity of fuels as a motivation for the program, and this proposal contradicts one of the stated purposes of the program. In addition, this provision if implemented could also significantly disadvantage other biofuel production processes which may produce biomass-based diesel as a co-product, for example in system where SAF is a main product.

Conclusion

The IBB is encouraged by the continued successes of programs that support the development of cleaner, low-carbon fuels. However, it is critical that CARB finalizes updates in a way that does not arbitrarily exclude agricultural feedstocks through policies that are not science-based and run afoul of CARB's mandate, including capping vegetable oil feedstocks and applying onerous sustainability guardrails that add cost without rewarding farming practices that lower CI.

CARB's 15-Day Changes, released in August 2024, is deeply concerning. CARB has singled out soybean and canola oil for adverse, prejudicial treatment. No scientific evidence is ever given for this treatment. In fact, CARB has refused to update the science as required by law for these feedstocks. This alone calls into question the integrity of a performance-based LCFS. On top of this, CARB is now proposing feedstock caps, traceability requirements and authority to reject applications for these fuels produced from them. Again, CARB has not shown any scientific justification. In fact, the LCFS is already over penalizing soy for any land use change requirements.

Biodiesel producers and farmers across Iowa remain eager to continue working with CARB to support the role of agriculture in diversifying the fuel supply while reducing GHGs and increasing clean air in California and beyond. We appreciate the opportunity to comment and look forward to collaborating with CARB and other relevant stakeholders on implementation of policies that expand the use of soy-based biofuels and market opportunities for soybean farmers.

Sincerely,

Grant Kimberley
Executive Director
Iowa Biodiesel Board

27 August 2024

Chair Randolph and Members of the Board
California Air Resources Board (CARB)
1001 I Street
Sacramento, CA 95814

Subject: Mercedes-Benz High Power Charging (MB HPC) response to the August 12, 2024 Notice of Public Availability of Modified Text and 15-day changes as stated in the Summary of Proposed Modifications

Dear Chair Randolph and Members of the Board,

Mercedes-Benz High-Power Charging (MB HPC) supports the California Air Resources Board's (CARB) ongoing efforts to update the Low Carbon Fuel Standard (LCFS) regulations. The LCFS program is a key policy in attracting private investment in the state, particularly when it comes to high-power direct current fast charging (DCFC) stations. Our vision to invest hundreds of millions of dollars in California and to build out the I-5 corridor in the coming years factored in California's flexible and innovative policies, particularly the LCFS.

The LCFS is a key policy driving investment in the state, and we support CARB's efforts to refresh and utilize this program to reach the goals of the state's Scoping Plan. CARB's steady hand administering this policy over the years has maintained the policy's efficacy.

We are largely supportive of CARB's Proposed Modifications. However, we have concerns about the new definition for Public Light- and Medium-Duty (LMD) Charging Site under the Fast Charging Infrastructure (FCI) pathway contained in the 15-day package. The proposed LMD-FCI program, as currently defined, could hamper innovation and station deployment. With minor edits, the definition can be modified to incentivize more DCFC across the state while encouraging continued innovation.

Overview of MB HPC

MB HPC, a joint venture between subsidiaries of Mercedes-Benz Group AG (Mercedes-Benz) and MN8 Energy LLC (MN8), has made an initial investment of \$1 billion for the first phase of building a public DCFC charging network to elevate the electric vehicle (EV) charging experience across North America. Leveraging Mercedes-Benz' over 130-years of engineering excellence and leadership in delivering exceptional customer experiences, and MN8's extensive expertise as a renewable energy infrastructure developer and owner-operator, MB HPC will set a new standard for quality, safety, and innovation in the charging industry. To do so, we are extending the Mercedes-Benz brand promise to all EV drivers, regardless of vehicle brand. Our convenient, fast, and reliable network is designed to fit seamlessly into drivers' everyday lives. Powered by 100% clean energy, our goal is to promote the shift to sustainable, emission-free mobility.

Comments

- 116.1 CARB's proposal to increase the annual carbon intensity (CI) reduction benchmark in 2025 from 5% to 9% will drive further investment into the state as California continues to exceed its clean fuel goals. We
- 116.2 conceptually support CARB's proposal to develop a new FCI pathway for LMD charging sites. The proposed LMD-FCI program, if designed with innovation in mind, will expand the deployment of DCFC infrastructure in California, which is necessary for California to meet its transportation carbon emission reduction goals.

What do we mean by Innovation?

MB HPC was founded with the goal of developing products and solutions that address the pain points drivers have experienced using the first generation of EV chargers. MB HPC takes a measured approach to product innovations, testing new solutions within the ecosystem of Mercedes-Benz drivers. Once proven these innovations are released across the network to all drivers with the aim of setting a new standard for public charging. Simply put, this standard will be defined by charging infrastructure that reliably works and is complemented by delightful experiences that allow the act of charging to fade into the background, as exemplified by our recent announcement to electrify the I-5 by building at Starbucks sites throughout the corridor.

One of the first products developed within the Mercedes-Benz ecosystem to optimize the charging experience is an intelligent queuing feature that allows drivers to reserve a charger fifteen minutes prior to the vehicle's expected arrival at the charger, helping to address the prevalent concern EV drivers have with congestion at public charging stations. According to a recent survey of current and prospective EV owners, "80 percent of survey respondents who are considering an EV as their next car believe that the current availability is insufficient; another 15 percent are satisfied with it but worry that the future network will not be robust enough to meet surging demand."¹

By routing vehicles to stations with available chargers and away from those without availability, intelligent queuing is a critical measure to deliver the reliable driver experience necessary so that EV adoption is not hindered. Other Charge Point Operators (CPOs) are implementing congestion management methods that seek to address this concern, such as idle fees, dynamic pricing, and vehicle state of charge (SOC) limits. The intelligent queueing feature offers an alternative way of reducing congestion, without raising prices or limiting the length of charging sessions for drivers. We expect this feature to not only result in a better charging experience for drivers, but also, to increase utilization by routing demand to available supply. We believe that product innovation is critical in these still nascent years in the charging industry, and caution CARB against implementing a policy that would discourage it.

¹ [Exploring consumer sentiment on electric-vehicle charging](#)

116.2 cont **Recommended Changes to the Public LMD-FCI Charging Site Definition Proposed in the 15-day package:**

We respectfully request that CARB amend the 15-day package to incorporate changes to the Section 94581 Definitions and Acronyms. Our proposed changes are as follow:

“Public LMD-FCI Charging Site” means an EV fast charging site that can be restricted to light- and medium-duty EVs and that is available to the public for at least 12 continuous hours each day, including the time interval between 9 a.m. and 5 p.m.
~~Chargers at the site must not be reservable during public hours.~~

~~Chargers at the site may be reserved during public hours and still qualify as public if no more than 75% of EVSE at a charging station are reservable, rounding down to the nearest integer [2].“~~

This definition will avoid discouraging experimentation with innovative features such as intelligent queueing, which we believe will improve the charging experience and increase utilization of equipment and would otherwise be penalized under CARB’s Proposed Modifications. If not adopted, the current proposal would lead to a situation where stations deploying innovative queueing systems receive only half of the FCI funding of other, “public” stations – this would discourage this type of innovation and result in less deployment of DCFC infrastructure in California.

California’s continued leadership in clean transportation is important to ensure that operators of EVSE are able to innovate around features and products, and best serve both the current and next generation of EV drivers. Limiting opportunities to participate in the LCFS program for DCFC projects because a portion of the chargers are not first come, first served hurts the economics of these projects and discourages what we believe could be a valuable innovation for the industry and future drivers.

Summary

The LCFS is a critical tool in CARB’s toolkit to meet the timelines laid out in the Scoping Plan. While we urge CARB to adopt our changes to the 15-day package, we support CARB’s strengthening of the LCFS by increasing the short-term CI reduction benchmark and establishing the LMD-FCI pathway.

Through this suite of changes, we believe that the LCFS program will continue to meaningfully incentivize CPOs to invest in California, helping the state to meet its infrastructure goals, while also encouraging continued innovation in the charging space, which will support the much-needed levelling-up of the charging experience.

We commend CARB for putting in the time and effort to develop this proposal and its continued steady hand with the highly impactful LCFS program, and we appreciate the opportunity to provide meaningful feedback on the program.

Sincerely,

Andrew Cornelia

Deputy Executive Officer for Climate Change & Research

California Air Resources Board

1001 I Street

Sacramento, CA 95814

RE: World Energy's Comments on the 15-Day Proposed Amendments to the Low Carbon Fuel Standard

Dear Ms. Sahota and CARB Staff,

World Energy appreciates the opportunity to provide comments on the 15-Day Proposed Amendments to the Low Carbon Fuel Standard (LCFS). We would like to thank CARB staff for their continued efforts throughout this extensive process to consider stakeholder feedback. Of the utmost importance, World Energy urges the finalization of this rulemaking at the November 8th Board meeting to ensure the proposed amendments will have the greatest impact in driving additional decarbonization in California's transportation sector. It is also important for CARB to provide meaningful modifications to the 15-Day Proposed Amendments in order for our company to realize the low carbon opportunities that are envisioned by CARB.

World Energy is one of the largest and longest-serving advanced clean energy suppliers in North America. We were the world's first producer of sustainable aviation fuel (SAF) and remain leaders in the field of renewable fuels. Our facility in Paramount, CA is in the final stages of conversion from a petroleum refinery to a 100% renewable fuels bio-refinery. When completed, World Energy's Paramount facility is projected to increase production capacity to approximately 350 million gallons of low carbon fuels per year.

We have made significant investments in continuously reducing the carbon intensity (CI) of our fuels and producing very-low carbon fuels for the California market and will continue to do so as lower carbon reduction technologies are created and implemented over next 20 to 30 years. Already, we have fuel pathways providing up to an 85% reduction in CI, which are near the lowest commercial scale CI fuels in the marketplace. Our fuels have helped the LCFS program meet and exceed its targets, and our Paramount plant is a premiere example of the clean energy future. World Energy continues our commitment to reduce transportation emissions including investing \$4 billion in scaled manufacturing and new technologies to achieve our goal of supplying 1 billion gallons of sustainable aviation fuel annually by 2030.

World Energy would like to share the following comments and concerns for consideration in response to the 15-Day Proposed Amendments shared on August 12:

2025 CI Benchmark

We are encouraged by the proposed nine percent change in stringency for the 2025 CI benchmark as proposed in §95484(d) through (f). Given the accumulation of credits in the credit bank, this is a necessary threshold to begin to better balance the market and send a stronger investment signal in 2025 and beyond. Together with the auto acceleration mechanism, these updates to the LCFS will help maximize transportation decarbonization. We encourage these proposed amendments to be advanced to the CARB Board.

Proposed Addition of §95482(i): Biomass-Based Diesel from Virgin Soybean and Canola Oil

118.1

World Energy has significant concerns with the proposed addition of §95482(i) pertaining to the phase out of biomass-based diesel from virgin soybean and canola oil. Both the principle and the details of the proposal give us pause. Although World Energy prides itself on primarily sourcing waste oils, this restriction will cause significant indirect impacts on us and feedstock supply constraints across the industry.

On principle, we remain unconvinced that these feedstock limits are necessary, and are concerned that CARB is for the first time disqualifying credit generation from a feedstock with a certified low carbon intensity score. The evidence from the marketplace demonstrates that CI scores already act as a restriction to the use of virgin seed oils. While soybean and canola oil comprised over 50%¹ of feedstock for biofuels across the country in 2023, in California these feedstocks represented only 19.5% of the market.² The market driver and reason for the regional difference is the CI score, indicating that the

¹ Energy Information Administration Monthly Biofuels Capacity and Feedstocks Update Report, Tables 2b and 2c for calendar year 2023

² CARB LCFS Data Dashboard, Figure 6.

118.1
Cont. LCFS framework is functioning as intended to incentivize the lowest carbon approaches to transportation decarbonization, and crowd out higher carbon alternatives.

It is particularly concerning to us that this significant change to our industry is proposed in a 15-day comment package so close to the regulatory update being completed. The unprecedented suggestion to disqualify credit generation from a category of fuels that currently qualify for credits is likely to send chilling signals to other investors in the marketplace writ large. The investment community will view the last-minute, sudden change in the program as an indication of regulatory instability, which could increase risk calculation and discourage investment in other feedstocks, fuels, or technologies within the LCFS.

Therefore, our **top recommendation is to remove the draft feedstock limitation from the staff proposal**. As originally intended, the CI scores are working as a natural limitation, while still providing some market flexibility during unforeseen events.

118.2 If CARB is determined to pursue this concerning provision, we urge CARB to utilize a universal start date in 2030 paired with a phased approach. The necessary components of this revision include:

1. **A universal start date** that does not pick winners and losers, allowing some in the industry to utilize virgin oil feedstocks for several years beyond the rest of the industry.

We are very concerned with the 2028 start date for only certain entities. In separating which entities are subject to the regulation immediately versus in 2028, CARB arbitrarily chooses winners and losers by allowing some entities to have additional time to adjust to the change. This breaks with precedent in the LCFS and gives a marketplace advantage to some fuel producers based on a very finite snapshot of the past – in this case, the 2023 feedstock selections.

2. **A 2030 start** to the limit that will still send a strong signal to the market that alternative feedstocks are of upmost value but provides time for the industry to adjust and for companies like World Energy to avoid significant feedstock price spikes. This would also ease concerns from the investment community across the LCFS. Moreover, a later start date will be more consistent with the slow and steady approach typically taken in regulatory implementation.

The respective 2025 and 2028 start dates across the industry do not provide sufficient time for the feedstock market to react. Consider that in order to

118.2 Cont. plant new, alternative sustainable non-food crops (e.g., camelina and covercrops such as carinata or pennycress) and have yields of any meaningful volumes, farmers will require at least 4-5 growing cycles. The regulatory implementation must reflect this timeline, at a minimum. The planning cycle for farmers, together with the years it takes for seed and farm practice development to supply an updated feedstock offering to the market cannot meet the proposed short timeline. This has the potential to unleash significant feedstock shortages and price spikes.

Already, CARB has recognized that existing credit generation opportunities should have ample advanced notice, as reflected in the staff proposal to cease crediting avoided methane emissions after 2040. Both the marketplace and investors need this lead time for investment confidence and regulatory stability. As users of the lowest carbon feedstocks, World Energy has signed letters of intent with most (if not all) low carbon feedstock developers, trying to spur their development into the commercial marketplace. The simple truth is that these new crops take a long time to develop. Five years of advanced notice is the absolute minimum the industry requires to adjust and develop alternatives.

118.3 3. A **phased approach** that starts higher than 20 percent and ratchets down until 2035 or 2040. This would provide the market flexibility to weather unforeseen economic events, while CARB's CI values continue to function as intended.

The existing flexibility in feedstocks has proven crucial recently, when supply chains were severely impacted during COVID. California needs a long-term decarbonization strategy that can weather black swan events like COVID. Completely eliminating fossil fuel from our transportation cannot be accomplished if we are creating plans that only work during strong, predictable economic years.

118.4 Furthermore, when it comes to soybean and canola oil and agriculture across the United States, one size does not fit all. Already, farmers are creating more options and greater flexibility to use practices that reduce feedstock and CI. Moreover, the biofuels market remains constantly evolving. Innovation is advancing at an unprecedented rate on feedstock diversification, crop development, and farming practices to reduce GHGs. This is why we encourage CARB to enable as much adaptability and flexibility in its framework as is practicable and embrace a performance-based approach in its analysis, focusing on outcomes rather than prescriptive and exclusionary lists of acceptable feedstocks.

Proposed Addition of §95488(d): No New Fuel Pathways if ZEVs or NZEVs Exceed 132,000

118.5

We are also concerned with the proposal in §95488(d) regarding the Executive Officer's ability to deny new fuel pathway applications for biomass-based diesel if the number of Class 3 to 8 zero-emission vehicles (ZEV) or near-zero emission vehicles (NZEV) reported in California exceeds 132,000 vehicles. While World Energy agrees this may make sense for ZEVs, we ask CARB to reconsider this provision for NZEVs. Particularly, NZEVs will still use combustion fuels and eliminating the option for new fuel pathways may reduce the opportunities to include new biomass-based diesel fuel pathways with lower CI. As such, the restriction could inadvertently prolong the use of petroleum over switching to lower carbon fuels. As long as NZEVs are in use, the LCFS should incentivize new fuel pathways to ensure the lowest possible CI fuels are available to fuel NZEVs.

Sustainability Related Considerations

The current proposed language for biomass-based feedstock requires environmental management practices that are not relevant to waste based oils. World Energy suggests adding a stipulation that the requirements pertain to cultivated rather than waste diversion/repurposing end uses.

118.6

Regarding Approved Certification Systems, it is possible that several of the requirements may not be included in the operating procedures for the standards bodies (e.g., certification system requiring auditing bodies to maintain professional liability insurance). We recommend that CARB consider including formal consultation with the candidate "certification system" operators that includes both analysis and the potential for adoption of new CARB provisions. It is unclear whether CARB is envisioning a California based certification (e.g., ISCC-CARB, RSB-CARB fuel certification), or whether the assessment will determine if recognizing an external regulatory system as sufficient (e.g., CARB recognizes ISCC-Plus or RSB-Global as complying). Clarification on these points would be helpful.

Unresolved Issues for Imminent Consideration

World Energy is glad to see CARB is reaching the final stages of this LCFS rulemaking. However, we want to highlight some important topics that we have mentioned in our previous comments that have not been addressed in this rulemaking. We would like to encourage staff to turn their attention to these topics as soon as possible at the conclusion of this rulemaking.

- 118.7
1. Low Carbon Power Crediting: CARB should update its low carbon power sourcing provisions – already afforded to the ZEV market – for renewable fuel production. Utilization of lower carbon power, both as an industrial power source and to create hydrogen, should be rewarded in the California marketplace. To adequately encourage SAF production, CARB should align its accounting for and crediting of electricity emissions with that of the federal government’s 40B guidance.
 2. Book and Claim for Hydrogen: Furthering the issue above, to spur the growth of lower carbon hydrogen in California, industrial use of low carbon hydrogen should be credited, so long as the eventual product is used in the transportation market. CARB is narrowly dictating end uses of low carbon energy sources when cleaner hydrogen should be credited within the transportation market, whether used to produce SAF or sent directly into a FCEV.
- 118.8
3. Farm Side Crediting and Soil Organic Carbon: We also recommend CARB evaluate the potential benefits of adding farm side crediting to the LCFS during the next rulemaking. As farmers consider opportunities to implement agricultural climate solutions, such as soil organic carbon sequestration, including farm side crediting in the LCFS can incentivize and reward improved agricultural practices. Reducing emissions associated with feedstock production at the farm level will result in overall lower carbon intensities of the LCFS fuel pool.
- 118.9
4. Marine Fuels: We encourage CARB to consider adding ocean-going and marine vessels to the LCFS. Ocean-going and marine vessels are hard-to-decarbonize and incentivizing lower CI fuels will be a crucial near-term solution to move the vessels towards lower carbon emissions. Adding ocean-going and marine vessels to the LCFS can motivate investments and open the market to lower CI fuels which can support the decarbonization of these vessels.

World Energy values CARB staff’s work to finalize this LCFS rulemaking. We hope our concerns will be considered and incorporated before the rulemaking package is finalized and approved by the CARB Board. We are hopeful that the final package will be adopted on November 8th and implemented on schedule in January 2025 to send the appropriate market signals and ensure the continued success of the LCFS.

Sincerely,

World Energy Net Zero Services,

Scott Lewis, President

RE: Charm Comments on the On 15-Day Changes to the Low Carbon Fuel Standard Proposed Regulation Order

Charm Industrial (Charm) appreciates the opportunity to submit comments to the California Air Resources Board (CARB) on the 15-day changes to the Low Carbon Fuel Standard (LCFS) Proposed Regulation Order. Charm is a California-based company working in support of state efforts to rapidly drive down greenhouse gas emissions (GHGs) on the path to carbon neutrality. Our innovative negative emissions technology can play a key role in these efforts. We look forward to continuing to work with CARB, its state agency partners, and all stakeholders to deliver innovative climate solutions that will provide benefits in California and beyond.

About Our Technology

Charm has developed a proven carbon dioxide removal technology that has already removed thousands of tons of carbon from the atmosphere. Our innovative approach converts biomass residues into a carbon-rich liquid that is safely and permanently stored underground. Agricultural waste and highly combustible forest residues that would otherwise burn or be left to rot, emitting GHGs into the atmosphere, are instead transformed into a carbon benefit. In addition to the vital climate benefits that negative emissions technologies like bio-oil sequestration provide, our approach delivers critically needed air quality, wildfire resilience, and economic benefits in parts of California that most need them, like the Sierras and the Central Valley.

Charm Supports The CARB's Near-term Increase In Carbon Intensity (CI) Stringency

California must build on and accelerate actions to rapidly cut GHGs. These actions must include a robust policy and regulatory framework that will take advantage of the significant benefits that innovative carbon removal and sequestration technologies can deliver while still prioritizing direct emissions reductions.

Charm supports CARB's near-term increase in carbon intensity (CI) stringency to a 9% CI reduction in 2025 in its 15-Day Changes. However, to ensure that the program is moving towards maximizing emission reductions to help achieve California's GHG reduction goals, the increased step down should be advanced through the stringency curve to guarantee stronger reduction targets year after year through 2030.

CARB Can Strengthen The LCFS by Ensuring That Additional Technologies Are Quickly Incorporated Into The Existing Regulatory Framework for Carbon Removal.

119.1

Stronger benefits from the LCFS program could be realized if CARB swiftly establishes pathways within the current regulatory framework for additional carbon removal technologies. Charm can help support the success of an ambitious LCFS program through its proven carbon dioxide removal technology as one part of a suite of innovative technologies that California will need to meet its climate goals. The kinds of solutions that Charm has developed can also play a key role in supporting California's biomass and forest waste management goals, wildfire and forest resilience actions, and air quality goals. As a California-based company, we are invested in helping the state continue to be a climate leader by putting in place policies that pave the way for innovative technologies and solutions to support climate action. Policies that support emerging carbon-negative technologies will ensure continued investment, job creation, and economic growth for California.

Consistent with the necessary and ambitious goals for carbon removal technology detailed in the 2022 Scoping Plan, CARB can strengthen the LCFS by, as expeditiously as possible, ensuring that as new carbon dioxide removal and sequestration technologies emerge, they can be quickly incorporated into the existing regulatory framework.

Conclusion

Charm is fully committed to helping California meet its climate goals. California needs a host of strategies to decarbonize virtually every economic sector in the state to achieve carbon neutrality. While we support ongoing efforts to secure direct emission reductions wherever possible, it is clear that innovative carbon removal and sequestration technologies are also going to be needed for California to reach its climate goals, including carbon neutrality by 2045.

Our company was founded to develop and bring technological solutions to the collective effort needed to turn the tide against climate change rapidly. We look forward to continuing to work with CARB on this challenge.

Sincerely,

Nora Cohen Brown

Head of Market Development and Policy

Re: DVO, Inc. Comments on Low Carbon Fuel Standard 15-Day Amendments

Dear Mr. Botill:

DVO, Inc is a U.S.-based provider of anaerobic digesters designed to effectively and efficiently digest a variety of organic materials to produce either biomethane or renewable electric power. With over 150 digester vessels installed worldwide (majority in North America), DVO is the largest single provider of anaerobic digesters in this industry.

Our industry position is most often that of a vendor to developers and/or project owners. As such, we have a broad and direct overview of the anaerobic digester industry throughout North America. Projects involving DVO's digesters on methane capture projects most often require significant long term investment – either from private individuals, developers, lending institutions or investors.

In recent years, we have seen and experienced what we would describe as an erosion of the effectiveness of the LCFS program. This has resulted in a meaningful drop off in project development and investment. We look forward to CARB instituting improvements that will result in increased methane capture and diversion into beneficial uses as renewable energy.

Toward the goal of increasing methane capture and program effectiveness, we thank CARB and CARB staff for the opportunity to provide the following comments on the LCFS 15-day amendments:

- 120.1a • **Near Term CI Ambition:** We support an increased near-term ambition from the proposed 9% to something greater, such as 11% proposed by other stakeholders. This course-correction should help boil off the current credit bank surplus and the resulting economic consequences.
- 120.1 • **Credit True Up:** DVO supports the proposed language to include a full credit true-up including the temporary period once verification is complete.

- 120.2
- **Step Down in Avoided Methane Crediting from Three Periods to Two:** We do not support the proposed step down in the total number of crediting periods for avoided methane emissions for some subset of projects breaking ground before January 1, 2030, from three to two. This would be an extremely problematic change as it would reduce project lifetimes and create significant headwinds for investment decisions. In addition, lacking further economic incentive support, at the end of only a second avoided methane crediting period, many projects run the risk of abandonment as it may no longer be cost-effective to continue operations. We believe the avoided methane crediting periods should be at least three.
- 120.3
- **Deliverability Language:** We find very troubling the proposed language limiting delivery of out-of-state RNG to pipelines with >50% directional flow into California. The direction of pipeline flows are not controlled or controllable by RNG project owners. Pipeline operators make their own decisions about directionality of products they carry. The current book and claim approach has helped incentivize RNG projects in the U.S. We strongly believe the proposed directional deliverability language by CARB in the 15-day proposed language will further disincentivize investment in these critical RNG projects.
 - **Accessibility to Non-Colocated Renewable Power:** To help further incentivize development in the renewable power industry, we urge CARB to remove the co-located power generation requirement and allow greater and more diverse sources of green power to help produce RNG.

We appreciate CARB's consideration of our views and concerns and look forward to a more robust and reliable LCFS program to support the interests of all stakeholders

Sincerely,

Stephen Dvorak, PE
President & Co-Founder

Subject: Ford Comments on the Proposed Low Carbon Fuel Standard Amendments

Dear Chair Randolph and Members of the Board,

Ford Motor Company (“Ford”) hereby submits our comments on the California Air Resources Board’s (“CARB”) Proposed 15-Day Changes to the Proposed Amendments to the Low Carbon Fuel Standard (“LCFS”). We appreciate the opportunity to comment as well as CARB’s time and consideration.

Ford supports the proposed changes to direct up to 45 percent of the base credits generated by light-duty electric vehicle residential charging to the automakers producing those vehicles, which is outlined in the comments submitted by the Alliance for Automotive Innovation as well. Automakers are uniquely positioned and motivated to effectively invest revenue from the LCFS program to advance the electrification of transportation. In California, automakers face the strictest emissions requirements in the world, and a primary limiting factor on the adoption of electric vehicles is consumer concerns about costs and availability of charging infrastructure. With additional revenue from LCFS, automakers can help relieve these concerns, and doing so improves the financial performance of automakers’ electric vehicles.

With additional revenue, Ford could provide strategic support for residential charging—where most people charge most of the time—and for efforts to integrate electric vehicles into the grid and help ensure these vehicles reduce the grid’s carbon intensity while also reducing the cost of electricity for Californians. On this point, Ford supports the comments submitted by the Vehicle-Grid Integration Council (“VGIC”) and encourages CARB to include vehicle-grid integration (“VGI”) programs as an approved usage for both Base Credit revenue and Electric Distribution Utilities (“EDU”) holdback funds. Ford is currently participating in a small-scale pilot program with Sacramento Municipal Utility District to test VGI. With additional revenue, Ford would like to bring these types of VGI programs to additional customers in California in partnership with the California utilities, thus, helping further electric vehicle adoption by creating new value streams for electric vehicle customers and, at the same time, helping to

support the electric grid by administering VGI programs in coordination with utilities in order to meet the utility goals of increased resilience, infrastructure upgrade deferral, and increased renewable energy utilization.

121.1

To date, Ford has only reported residential charging for a small number of Ford drivers in California which has limited the ability to fully utilize the LCFS program's potential to invest and support the customer's EV transition. CARB's proposed amendments would improve Ford's ability to invest in electrification to support EV affordability for customers. Further, Ford requests that CARB consider the fact that Ford does not include a customer's vehicle in the LCFS Incremental Credit program unless and until that customer opts into the program. Ford participates in the Zero-Carbon Intensity pathway in order to offer our customers' the value of carbon free charging at home through the pathway with Renewable Energy Credit purchases, but this adds additional cost into the business case for Ford's participation in the LCFS. We take this approach to help ensure compliance with California privacy laws, and beat customer expectations, given that Ford may need to share with CARB the customer's vehicle identification number and location. As a result, Ford's participation has been limited to generating about 1,200 credits since it began participating in December 2021. This contributed to 3,457 MWh of renewable electricity from solar and wind energy projects via renewable energy credits. However, if all Ford vehicles were eligible to participate as part of the proposed Base Credit generation, we anticipate that Ford would generate almost six times that number of credits for calendar year 2025, equating to approximately 15-16 times the amount of carbon reduction for residential charging. Ford is eager to find ways to participate in the LCFS in a more substantial way while maintaining our high standards for customer privacy.

121.1

RE: Hyundai's Comments to the California Air Resources Board's Low Carbon Fuel Standard 15-Day Changes

Dear Chair Randolph:

Hyundai Motor North America ("Hyundai") appreciates the opportunity to comment on the California Air Resources Board's ("CARB") Low Carbon Fuel Standard's ("LCFS") 15-day changes that were published on August 12, 2024.

Hyundai offers a diverse line up of quality and affordable electric vehicles ("EV") which include battery, plug-in hybrid, hybrid, and fuel-cell electric (both light- and heavy-duty) vehicles. We are committed to innovative initiatives that propel forward the EV transition. For example, we are a proud member of IONNA¹, the joint venture of eight automakers to build out more than 30,000 chargers across the nation. As a key partner in the NorCAL ZERO demonstration project², we deployed 30 heavy-duty XCIENT fuel-cell trucks to support the world's most capable hydrogen refueling station in Oakland. Additionally, we seek to convert drivers to EVs by offering a hands-on experience with EVs through a low-commitment, "try-before-you-buy" subscription program, Evolve+³. We will continue to doggedly pursue innovative solutions to spur EV adoption among early majority buyers.

Hyundai recognizes CARB's hard work and dedication in revamping the LCFS regulation. We greatly appreciate the proposal for automakers to earn Base Credits for plug-in electric vehicles ("PEVs"). Automakers are best positioned to efficiently utilize proceeds to further advance the EV transition as automakers have the most at stake. Additionally, we support the 9% stringency increase in carbon intensity ("CI"), as well as the proposed automatic acceleration mechanism, in hopes these together will increase the LCFS credit prices.

¹ See ionna.com.

² See Press Release, Hyundai Newsroom, Hyundai Motor Spearheads U.S. Zero-Emission Freight Transportation with NorCAL ZERO Project Launch (March 5, 2024), <https://www.hyundai.news/eu/articles/press-releases/norcal-zero-project-launch.html>.

³ See Press Release, Hyundai Newsroom, [Hyundai Announces Evolve+ EV Subscription Program at the Chicago Auto Show](https://www.hyundai.news/eu/articles/press-releases/hyundai-announces-evolve-ev-subscription-program-at-the-chicago-auto-show) (February 9, 2023), <https://www.hyundai.news/eu/articles/press-releases/hyundai-announces-evolve-ev-subscription-program-at-the-chicago-auto-show>.

However, significant investments are still needed for CARB to meet its environmental goals. California is behind in charging infrastructure to support the quantity of PEVs (aka ZEVs) required by CARB's Advanced Clean Car II (ACC II) regulation⁴ and woefully behind in hydrogen infrastructure for both light-duty and heavy-duty applications⁵. For example, in Southern California, there are no performant heavy-duty stations publicly available. The existing three stations are not a viable option due to limited fuel and station reliability issues. Additionally, PEVs are facing headwinds in the market, resulting in a much slower adoption rate than anticipated. Therefore, significant incentives are needed to rebuild the momentum.

Below are specific requests that we kindly ask you to consider.

- 122.1 1. The existing monies that the utilities collected but did not allocate through the Clean Fuel Reward ("CFR") program should be divided among automakers who sold PEVs from the time the program expired, September 1, 2022 until the next iteration of LCFS is implemented next year. Unfortunately, the automakers experienced a lost opportunity during this timeframe that would have otherwise supported EV expansion investments.
- 122.2 2. The CFR program has been changed to be used only for medium- and heavy-duty vehicles. We request that proceeds from credits generated from light-duty vehicles be utilized for light-duty vehicles.
3. The proposal states that the light-duty fast charging infrastructure ("FCI") program sunsets at the end of 2030. We request that this program be extended to 2035 to align with CARB's ACC II requirement of 100% ZEV sales by 2035 model year.
- 122.3 4. We request that the final amendments allow hydrogen-powered fuel-cell electric vehicles ("FCEVs") to receive Base Credits or, at a minimum, Incremental Credits subject to the applicable requirements for PEVs. Like PEVs, these vehicles produce no tailpipe emissions and should receive the same benefits as PEVs.
- 122.4 5. We have strong concerns that hydrogen produced using fossil gas feedstock can no longer generate credits starting in 2031. The hydrogen industry is still in its infancy. By removing fossil gas as an allowed feedstock at such an early stage, it may undercut the market's development. While we understand that water electrolysis is the goal, without abundant

⁴ See [CA AB 2127](https://www.energy.ca.gov/publications/2024/assembly-bill-2127-second-electric-vehicle-charging-infrastructure-assessment) Second Electric Vehicle Charging Infrastructure Assessment (updated March 6, 2024), located at <https://www.energy.ca.gov/publications/2024/assembly-bill-2127-second-electric-vehicle-charging-infrastructure-assessment>. The assessment states that 1.01 million chargers are needed to support 7.1 million light-duty vehicles by 2030, and 2.11 million chargers to support 15.2 million light-duty vehicles in 2035 to meet California's zero-emission vehicle targets. As of August 26, 2024, the California Energy Commission website shows 105,012 total public and shared private chargers (<https://www.energy.ca.gov/data-reports/energy-almanac/zero-emission-vehicle-and-infrastructure-statistics-collection/electric>).

⁵ See [CARB Hydrogen Station Network Self-Sufficiency Analysis per Assembly Bill 8](https://www2.arb.ca.gov/sites/default/files/2021-10/hydrogen_self_sufficiency_report.pdf) (October 2021), located at https://www2.arb.ca.gov/sites/default/files/2021-10/hydrogen_self_sufficiency_report.pdf, p. 14 ("With respect to hydrogen, the EO tasks all State agencies to work with other organizations in the private and public sectors to support the development of 200 hydrogen stations by 2025."). Additionally, according to the Hydrogen Fuel Cell Partnership, there are a total of 55 hydrogen stations 18,729 FCEVs in California as of July 3, 2024. See Hydrogen Fuel Cell Partnership, [FCEV Sales, FCEB, & Hydrogen Station Data](https://h2fcp.org/by_the_numbers) (Numbers as of July 3, 2024), https://h2fcp.org/by_the_numbers.

122.4
Cont.

access to deionized water and more affordable green electricity – which will take considerable time to build out – hydrogen will not be cost-competitive. Meeting diesel Total Cost of Ownership is key to driving fleet adoption. We request that blended feedstock of bio and fossil gas be allowed in 2031 and beyond to generate credits until alternative technologies reach market readiness.

6. Though we are hopeful that the proposed CI standards will appropriately increase credit prices, we strongly encourage CARB to continue its dialogue with hydrogen refueling station operators. The current decline in LCFS credit values caused tremendous hardships on the operators, and this unfortunately resulted in a significant price increase at the pump. Appropriate LCFS credit values are imperative to maintain the affordability of hydrogen and ultimately drive FCEV adoption of all vehicle classes.

In closing, Hyundai appreciates CARB staff's efforts on these amendments. We also support the environmental goals that California's LCFS program strives to achieve. Hyundai is aligned with the comments submitted by the Alliance for Automotive Innovation. We are more than happy to discuss our comments further; please feel free to reach out to Gil Castillo at gcastillo@hmausa.com with any questions. Thank you.

Sincerely,

Olabisi Boyle
Senior Vice President, Product Planning & Mobility Strategy
Hyundai Motor North America

Re: Comments on the Additional Modifications to the Proposed
Amendments to the Low Carbon Fuel Standard

Dear Honorable Members of the California Air Resources Board:

This firm represents Leadership Counsel for Justice and Accountability (“Leadership Counsel”) in matters relating to the California Air Resources Board’s (“CARB”) Proposed Amendments to the Low Carbon Fuel Standard Regulation (“LCFS”). Central Valley Defenders of Clean Water & Air, Animal Legal Defense Fund, and Food & Water Watch have informed us that they also join in this letter. On February 20, 2024, we submitted comments demonstrating that CARB’s proposed amendments to the LCFS would greatly incentivize concentrated animal feeding operations (“factory farms”) to expand their herds and install anaerobic digesters, which will have devastating environmental impacts. These impacts were not adequately evaluated, or even acknowledged, in the Draft Environmental Impact Analysis (“DEIA”). The additional modifications to the proposed amendments published on August 12, 2024 do not eliminate, and would likely increase, the incentive for factory farms to expand their herds and install anaerobic digesters.

Leadership Counsel intends to provide more comprehensive comments on the inadequate Recirculated Draft Environmental Impact Analysis ahead of the September 30, 2024 public comment deadline. However, as discussed below, Leadership Counsel notes that the modifications do not address its concerns regarding the incentives for factory farms created by the LCFS.

Key Modifications to the Proposed Amendments

Strengthening the Carbon Intensity Benchmark

123.1 Currently, the LCFS includes a carbon intensity benchmark requiring a 20% reduction from the 2010 baseline by 2030. The proposed amendments, released in December 2023, strengthened the carbon intensity benchmark to a 30% reduction from the 2010 baseline by 2030, and established a new 90% carbon intensity reduction benchmark by 2045.¹ In our February 2024 comments, we pointed out that strengthening the carbon intensity would increase demand for LCFS credits, and thus increase the money eligible fuel producers, including factory farms, receive for LCFS credits. The additional modifications to the proposed amendments would further increase the required carbon intensity reduction in the first five years following adoption (2025, 2026, 2027, 2028, and 2029). Notably, the initial increase in stringency will be a 9% reduction from the 2010 baseline benchmark² in 2025 as compared to the 5% reduction included in the amendments published in December. Put differently, the recent amendments update the 2025 benchmark schedule to achieve a 22.75% CI reduction compared to the 13.75% CI reduction specified in the 2018 adopted regulation, and the 18.75% reduction specified in the December 2023 amendments. CARB explained this change is intended to increase the stringency to bring deficits and credits into balance.³ If adopted, this modification would provide even more financial benefits for eligible fuel producers, and thus increase the incentive factory farms have to expand their herds and install anaerobic digesters.

Avoided Methane Crediting

123.2 The proposed amendments published in December 2023 drew a bright line between factory farm fuel pathways certified before, and after, January 1, 2030, with respect to avoided methane crediting.⁴ Factory farm fuel pathways certified before January 1, 2030 would be eligible to be renewed for up to three consecutive 10-year crediting periods, whereas fuel pathways certified after January 1, 2030 would only be eligible to generate LCFS credits until 2045 at the latest. Leadership Counsel argued in our February 2024 comments that this proposed amendment would provide a significant

¹ CARB Staff Report: Initial Statement of Reasons, at 22-26 (December 19, 2023) (“ISOR”).

² CARB, Notice of Public Availability of Modified Text and Availability of Additional Documents and/or Information, at 5 (August 12, 2024) (Notice of Additional Modifications).

³ *Id.*

⁴ ISOR, at 31.

incentive for factory farms to expand their herds and/or install anaerobic digesters before December 31, 2029, to take advantage of maximum LCFS crediting. The additional modifications to the proposed amendments would limit the number of crediting periods for fuel pathways that are certified before January 1, 2030 to two, rather than three.⁵ However, even with this modification, factory farms would still be greatly incentivized to expand their herds and install digesters before December 31, 2029.

Biomethane Deliverability Requirements

123.3

Under the current LCFS Regulation, all factory farms across the nation can generally qualify for LCFS credits on the same basis as factory farms in California. The proposed amendments included new deliverability requirements that would limit the biomethane eligible for LCFS crediting to biomethane “carried through common carrier pipelines that physically flow within California or toward end use in California.”⁶ Leadership Counsel argued that these deliverability requirements would limit the supply of LCFS credits, thereby increasing the amount of money eligible fuel products would receive per credit, providing a substantial incentive for factory farm herd expansion and digester installation in California. Moreover, it would limit eligible fuel producers to those in California or providing fuel for California, thus providing a greater market share for California livestock operations. The additional modifications would add a condition that would move up the starting point for deliverability requirements under specified circumstances.⁷ Leadership Counsel anticipates this additional modification will only further incentivize the expansion of herds and installation of digesters in California.

Limitations on Fossil Hydrogen Favor Livestock Methane

123.4

The Notice of Additional Modifications states that “staff proposes to remove LCFS credit generation eligibility for hydrogen produced using fossil gas as a feedstock, effective January 1, 2031.”⁸ The text of the proposed amendment, however, provides that hydrogen produced using fossil gas as a feedstock will still be eligible after January 1, 2031, if “biomethane attributes are matched to the hydrogen production.”⁹ This change will require that fossil hydrogen producers that wish to generate credits through the LCFS to purchase the environmental attributes of biomethane. This methane laundering will

both expand the market and demand for livestock biomethane and send a signal to the market that the demand for livestock biomethane will increase. This change, too, will increase the value of livestock methane and will encourage the production of biomethane and with it the production and concentration of livestock manure.

Very truly yours,

SHUTE, MIHALY & WEINBERGER LLP

Submitted electronically.

RE: Proposed Low Carbon Fuel Standard Amendments – August 12, 2024

Dear Mr. Botill,

On behalf of the Canola Council of Canada (CCC) and Canadian Oilseed Processors Association (COPA) we welcome the opportunity to provide feedback on the *Proposed Low Carbon Fuel Standard Amendments (Proposed Amendments)* released August 12, 2024.

The CCC and COPA are non-profit industry associations that work collaboratively to help address issues impacting the canola value chain and oilseed processing sector in Canada.

124.1 The canola industry in Canada is extremely concerned with the California Air Resources Board's (CARB) proposal to cap canola and soybean oil's participation in the Low Carbon Fuel Standard (LCFS) program. The proposal appears to be arbitrary, discriminatory, and lacks scientific justification. As CARB's own data and analysis show¹², clean fuels derived from these vegetable oil feedstocks are making positive contributions to California's GHG emission goals and will play a critical role in supporting cost effective emission reductions from the transportation sector in the future.

Proceeding with a cap, coupled with proposals to phaseout biomass-based diesel pathways, and rigid certification requirements on already sustainable feedstocks like canola and soybeans from Canada and U.S., can be expected to stifle clean fuel investments, lead to more combustion of fossil diesel fuel, drive up fuel prices at the pump and lead to poorer air quality.

124.2 To avoid these unintended consequences, we strongly recommend CARB consider the following actions before finalizing amendments to the LCFS.

1. Reject any imposition of a cap on canola and soybean oil's participation in California's clean fuel market, consistent with CARB's own analysis that a cap on virgin vegetable oils is unwarranted.
2. Remove the proposal to give the Executive Officer discretion to stop accepting applications for new fuel pathways for biomass-based diesel, starting January 1, 2031. This provision is discriminatory and contradicts the overarching principle that LCFS programs be technology neutral.

¹ <https://ww2.arb.ca.gov/sites/default/files/2024-04/LCFS%20April%20Workshop%20Slides.pdf>

² <https://ww2.arb.ca.gov/sites/default/files/barcu/regact/2024/lcfs2024/isor.pdf>

- 124.3 3. Provide options and flexibility for sustainability certification. We agree that sustainability criteria are important to protect the integrity of any clean fuel program, but demonstrating compliance can be achieved on aggregate (in lieu of certification) if a jurisdiction can provide the necessary evidence to demonstrate there is no detrimental impact on land use change, including deforestation. This approach is consistent with existing biofuel programs, including the U.S. Renewable Fuel Standard and Canada's Clean Fuel Regulation, and has proven to address sustainability concerns while limiting regulatory burden on market participants.
- 124.4 4. Hold an additional public process, after the conclusion of this rulemaking, on these topics. Given the nature and magnitude of the unexpected changes that have been proposed, one can only conclude that there is a clear misunderstanding in the stakeholder community about the sustainability of canola and soy to fuel, therefore, it is vital for CARB to hold further consultations with stakeholders on these topics. This should be done outside of this rulemaking period to allow time for input from stakeholders, including leading academics and experts, on this topic area. Insufficient public process has occurred to-date to support such significant changes at this late date, but this can and should be remedied by appropriate public dialogue on a go-forward basis, in which we would willingly participate.

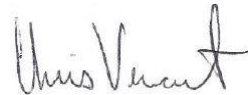

Our detailed feedback on *the Proposed Amendments* can be found in the attached Appendix

The CCC and COPA appreciate this opportunity to comment and look forward to an ongoing dialogue with CARB and other relevant stakeholders to enact changes to the LCFS that will address climate change while creating economic opportunities for those in the clean fuels value chain.

Sincerely,

Chris Davison
President and CEO
CCC

Chris Vervae
Executive Director
COPA

Appendix

I. Cap on Canola and Soybean Oil

While the intention behind CARB's Scoping Plan, and historical LCFS work appears to be to displace up to 100% of the State's current fossil diesel demand, the proposal to cap canola and soybean oils as feedstocks will likely have the opposite effect. Capping the use of these feedstocks will eliminate opportunities to displace fossil diesel and can be expected to increase fuel costs. Canola and soybean oils produced in Canada and U.S. are the most efficient, cost-effective and sustainably produced feedstocks on the market. Limiting their use will constrain the supply of renewable diesel. Renewable diesel and biodiesel are crucial components of California's efforts to reduce greenhouse gas emissions and transition to cleaner energy sources. Any arbitrary limitation on the use of these feedstocks will create a supply-demand imbalance, driving up the costs of renewable diesel production and, consequently, the price at the pump for consumers.

Furthermore, reaching CARB's goal to displace 100% of fossil diesel demand with the proposed feedstock constraints in place is unrealistic and impractical. The clean fuels industry is still developing, meaning access to all sustainably produced feedstock will be critical to meet the state's ambitious targets. By capping the use of canola and soybean oil, the proposal risks both existing and future investments made by clean fuel producers and feedstock providers alike. In turn, this will stall progress made to reduce carbon emissions by creating a bottleneck in clean fuel production. CARB's own analysis supports this assessment.

The CCC and COPA strongly support CARB's findings presented at the April 2024 workshop that renewable diesel and biodiesel have a positive impact on both consumers and the environment. CARB's "Staff Report: Initial Statement of Reasons" (ISOR) specifically modeled an alternative (Alternative 1) which "includes several policy mechanisms that have the effect of limiting the number of credits created from existing low-CI pathways" including "a limit on total credits from diesel fuels or sustainable aviation fuel produced from virgin oil feedstocks." The report's impacts are glaring – and each of them point to more fossil diesel use due to a cap on vegetable oil feedstocks:

- **Increased Fuel Costs:** Total costs of \$162 billion. "The main reason is that diesel fuel is a larger part of the fuel mixture and continues generating large amounts of in-state deficits through 2046. This is because renewable diesel produced from virgin oil feedstock is phased out...and more fossil diesel is needed to fuel the remaining vehicles with internal combustion engines."
- **18% more Greenhouse Gas Emissions, Increased Particulate Matter (PM2.5) and Nitrous Oxide Emissions (NOx) Emissions:** The baseline scenario reduces GHG emissions by 18 percent more than Alternative 1. "Alternative 1 increases NOx emissions by an additional 10,981 tons and increases PM2.5 emissions by 2,773 tons. Alternative 1 has more NOx and PM2.5 emissions than the proposed amendments because this scenario uses less renewable diesel than the proposed amendments."
- **Fewer Health Benefits:** "Alternative 1 has a valuation of health benefits at \$1.58 billion compared to the proposed amendments with a valuation of \$4.98 billion, a difference of \$3.4 billion less in health benefits. The lower avoided health impacts of Alternative 1 are primarily associated with increases in PM2.5 over the baseline due to lower utilization of renewable diesel." (emphasis added)

At the April Workshop, CARB Staff justifiably rejected Alternative 1, citing the fact that it "relies more heavily on fossil fuels...than the proposed amendments. As a result, [Alternative 1] does not achieve the same level of NOx and PM2.5 emissions reductions as the proposed amendments and potentially exacerbates existing air quality challenges in the State."

Additionally, the ISOR included an analysis, and the rejection of, another proposal which included a cap on vegetable oils set at 2020 levels. CARB found that “due to limitations on lipid biofuels and dairy biogas, the Comprehensive Environmental Justice Scenario results in higher volumes of fossil diesel being used than any of the other scenarios evaluated.” (emphasis added)

The proposal to cap canola and soybean oils as a means to achieve 100 % displacement of fossil diesel runs counter to all the evidence presented by CARB to-date that demonstrates a cap on virgin vegetable oil feedstocks will lead to greater fossil diesel demand, higher GHG emissions and higher costs.

Lastly, capping the use of canola and soybean oils will require California to rely on imported feedstocks originating from outside Canada or U.S., such as used cooking oil (UCO) from China. While free and open trade is an important market principle to uphold, it is harder to guarantee or be certain of the origin of UCO or other imported feedstocks, compared to those derived in North America. For example, there is some concern that some of the flood of UCO imports in the past year could include palm oil from southeast Asia, which is the subject of significant concerns due to the environmental profile of its production and concerns over deforestation. There is no deforestation in North America from canola and soybean production and any “indirect” impacts are already accounted for in the overly conservative life-cycle analysis and carbon intensity scores that have been developed for clean fuels from canola and soybeans.

II. Authority to phase out new Biomass-Based Diesel pathways

The proposed authority to phase out new BBD pathways in 2031 is also concerning and unwarranted. CARB has a stated goal to achieve 100 percent renewable diesel, and phasing out new pathways would be unnecessary – either because the market has already become saturated and new pathways would no longer be needed, or because the market has not yet achieved 100 percent saturation and additional fuel and feedstocks are required. The inclusion of this provision only serves to send a market signal that will limit both near and long-term supplies of feedstocks and fuel necessary to achieve the climate goals of the LCFS.

III. Sustainability Certification

Data that the canola industry and other stakeholders have shared with CARB over the past 12-24 months, clearly demonstrate that agriculture land in Canada and the U.S. is shrinking, yet crop output continues to grow. Figure 1 is an example of this trend, clearly indicating that crops grown and harvested in Canada do not contribute to deforestation or associated adverse land use impacts. Furthermore, growing more crops with less available land is a testament to the innovation of crop production, with farmers deploying enhanced plant genetics and applying sustainable growing practices.

We reiterate our position that CARB adopt an approach in the updated rule that would allow biofuels produced from crop-based feedstocks to comply with sustainability requirements on aggregate in lieu of certification. While we respect the importance of sustainability criteria in the development of low carbon fuel markets, the certification requirements proposed appear to be a ‘one size fits all’ approach, placing unnecessary obligations and burden on the supply chain from jurisdictions like the U.S. and Canada that have already demonstrated crop production has no adverse impact on land use, deforestation, or biodiversity. Indeed, both the U.S. Renewable Fuel Standard and Canada’s Clean Fuel Regulations already recognize crop production in U.S. and Canada as meeting sustainability requirements.

Figure 1.

Source: Statistics Canada

An aggregate approach to demonstrate compliance with sustainability requirements carries clear advantages for both CARB and market participants including:

1. It opens the door to a wider compliance option for CARB and allows for recognition of similar anti-deforestation efforts taken in partner jurisdictions (i.e. encourages efforts similar to U.S. and Canadian governments).
2. It encourages jurisdictions (not just individual entities) to demonstrate that their supply chains can and do meet sustainability criteria on key issues such as land clearance and deforestation.
3. Where sustainability equivalency can be demonstrated on aggregate across a jurisdiction, it will reduce the administrative burden and cost of feedstock supplies from those jurisdictions that are already fully meeting sustainability requirements under the rule.

Re: Comments to Proposed Low Carbon Fuel Standard Amendments (Amendments)

Dear Ms. Randolph:

Proteum Energy® (“Proteum”) thanks you for the opportunity to provide comments on the proposed modifications to the text of the Low Carbon Fuel Standard (LCFS) amendment issued August 12, 2024 (the “15-day Changes”). We commend the board and CARB staff (Staff) on their efforts to update the LCFS to support California’s greenhouse gas (GHG) emission reduction goals toward achieving carbon neutrality.

CARB’s 2022 Scoping Plan emphasizes the necessity of increasing the production of low carbon intensity (CI) hydrogen so that California can hit its decarbonization targets leading to carbon neutrality by 2045. To do so, it expressly “calls for accelerating the transition from combustion of fossil fuels to hydrogen.”

But the Scoping Plan also acknowledges the challenge of producing green hydrogen when it talks about the uncertainty surrounding “the availability of solar to support both electrification of existing sectors and the production of hydrogen through electrolysis” and the vast amount of additional solar capacity that electrolysis would require. As described below, Proteum’s technology can help California surmount this challenge by producing renewable low-CI hydrogen without reliance on electrolysis and the additional solar capacity required for such green hydrogen.

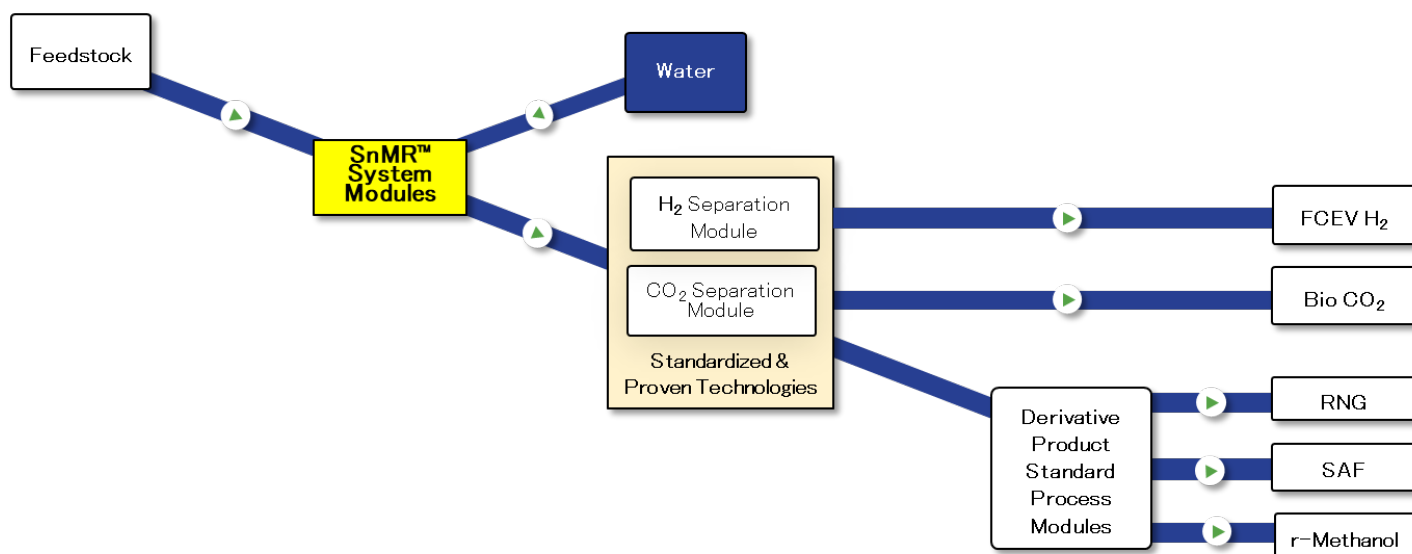

Indeed Proteum is a company that can help California accelerate GHG reductions by producing CI-negative transportation fuels. It is the producer of clean hydrogen and other ultralow-CI fuels for sale into the California transportation market using highly innovative proprietary technology, as described more fully below. As CARB has often made clear the transition to the electrification of heavy-duty trucking will be difficult and take many years due to the weight and range of batteries, as well as the long charging times. Hydrogen solves both of those problems, and we encourage the Amendments to do even more to encourage its production and use.

Proteum plans to produce low/negative carbon intensity fuels from renewable ethanol feedstock in California. Our technology, called Steam Non-Methane Reforming (SnMR™), reforms ethanol feedstock into clean hydrogen, renewable natural gas (RNG) and biogenic CO₂ for use to produce bio-methanol and sustainable aviation fuel (SAF). Our first two California projects will use California corn ethanol as their feedstocks, and both will employ CCS with CO₂ sequestered in California.

We have been developing our technology since 2014 and have been awarded 11 patents in the US and internationally, with an additional 21 patents pending. Proteum has successfully deployed our technology with Diamondback Energy and has a demonstration facility in Bryan Texas. Our production process does not require methane feedstock unlike steam methane reforming (SMR), nor does it utilize electrolysis. Our process uses less water and power than competing technologies, providing an ideal production process for California markets where water and power are constrained.

Utilizing available CCS, our SnMR™ technology platform can produce fuel cell grade hydrogen and bio-methanol with a negative carbon intensity (CI). Our Northern California project will be designed to produce 34 MT/day of carbon-negative fuel cell grade hydrogen, which will be liquified and delivered to FCEV refueling facilities in California, 450 MT/day of carbon-negative renewable methanol for marine bunkering fuel, and 3,100 MMBtu/day of renewable natural gas.

Below is a simple process flow diagram that illustrates the steps in Proteum's production process.

However, the viability of our California projects depends on the availability of LCFS credits.

Proteum believes that the spirit of the proposed Amendments furthers the State's GHG objectives, while certain terms could be enhanced to better support carbon abatement technologies to accelerate GHG reduction. We offer the following comments, which we believe will materially enhance the effectiveness of the Amendments.

Proteum supports many of the modifications proposed in the 15-Day Changes.

We support the 9% step-down in 2025 and the inclusion of AAM. However, we are disappointed that the first potential triggering of the AAM remains as in the 45-day package so that 2028 remains the first year for which the AAM can amend CI reduction targets. Instead we recommend that 2025's performance should be able to trigger the AAM. A 2025 data-year triggering would be able to impact CI targets in 2027. In short, the AAM should be allowed to trigger as early as needed to guard against the case where the step down is not sufficient to address the current oversupply,

126.1

particularly since CARB did not include a more aggressive step-down in 2025, as recommended by ICF and advocated for by many stakeholders in comments on the 45-day package.

We also applaud the adding of the term “captured CO₂” to the type of feedstocks that can be used to produce Alternative Jet Fuel. Proteum’s captured CO₂ can be used to produce AJF as well as negative-CI methanol marine fuel.

In addition to the foregoing, we request the following modifications to the 15-day Changes.

- 126.2 **The Amendments should encourage ethanol as a renewable feedstock to produce ultralow-CI transportation fuels.** An important benefit of using ethanol as a feedstock is that atmospheric CO₂ can be captured and permanently removed through Proteum’s SnMR™ process combined with CCS. Crops and the cellulosic resources used to produce ethanol capture CO₂ directly from the air which is liberated in Proteum’s SnMR™ process with production of renewable transportation fuels; when sequestered, this CO₂ is permanently removed from the atmosphere. This process is not only renewable but exceeds the carbon abatement benefits of other production processes like electrolytic hydrogen using renewable power. With the support of LCFS credits, it does so in a more economically feasible way than other abatement methods like direct air capture. Accordingly, the use of sustainable ethanol as a feedstock for hydrogen production for transportation fuels should be encouraged. In particular: (i) The definition of “Renewable Hydrogen” should *include hydrogen produced from ethanol feedstock*; (ii) The definition of “Biomethane” should *provide for biomethane produced from reformation of ethanol feedstock*; (iii) The definition of “Biomass” should *include all plant-based materials, including ethanol* to encourage Biomass reformation innovation; and (iv) *Reforming of ethanol* should be added to the list of suggested hydrogen production methods for drop-in fuels at § 95488.1(d)(4) and innovative production techniques at § 95488.1(d)(6).

To support innovation in the production of low-CI transportation fuel production, the term “renewable hydrocarbon” should be defined and *include renewable oxygenated hydrocarbons, including ethanol and other biomass sources, that meet the requirements of § 95488.9(g).*

- 126.3 **Sustainable farming practices should be acknowledged and encouraged.** Proteum endorses Staff’s proposal to assure that Biomass used to produce transportation fuels be sustainable. This concept can be developed further—and to a greater benefit—by allowing Biomass producers to *demonstrate and certify their sustainable farming practices* utilized to materially reduce CI using the Tier 2 fuel pathway certification process. Lumping leading edge sustainable Biomass producers into a pre-set CI disincentivizes them from making further investment and innovation to reduce GHG.

- 126.4 **Support for CCS.** Proteum encourages Staff to provide clear support for CCS in the production of renewable transportation fuels. The process of reforming ethanol and other Biomass feedstocks benefit greatly from the use of CCS, which enables Proteum to produce carbon-negative transportation fuels. Due to the expense and required economies of scale, the Amendments should not restrict CCS to facilities co-located with fuel production. The Amendments can incentivize CCS in renewable transportation fuel production separate and apart from questions about utilizing CCS solely when producing fossil-based fuels.

126.5

Addition to the definition of Alternative Jet Fuel.

Please add clarifying words to the definition of Alternative Jet Fuel as follows:

“Alternative Jet Fuel” means a drop-in fuel, made from non-petroleum sources, **including without limitation ethanol**, or captured CO₂, which can be blended into conventional jet fuel without the need to modify aircraft engines and existing fuel distribution infrastructure.

126.6

Additions to the Tier 1 Hydrogen Calculator and Instruction Manual.

In Section 2.1, Pathway Type, in Section 2, Pathway Inputs, on the Site-Specific Inputs tab of the proposed CA-GREET 4.0 Tier 1 Hydrogen Calculator, please add Steam Non-Methane Reforming as described above as a Pathway Input. In Section 2.3 of the same tab, please change the title to “SMR and Steam Non-Methane Reforming Feedstock” and add ethanol to the list of feedstocks.

Please make the corresponding changes in the accompanying Instruction Manual.

Despite CARBs diligent efforts, we fear that the Amendments, as proposed, will stifle the renewable and clean transportation industry in California. We urge CARB to revise and issue an additional 15-day proposal that will more fully encourage investments in clean hydrogen and other ultralow-CI renewable fuels to support its zero-emissions end use goals. We appreciate Staff’s work to develop the proposed rule and their commitment to improving the LCFS. We thank you for considering Proteum’s comments which we believe will advance the State’s GHG reduction goals.

Very truly yours,

PROTEUM ENERGY, LLC

SUBJECT: Low Carbon Fuel Standard 15-Day Changes

Dear CARB staff and Honorable Board Members,

Clean Transportation
Technologies and Solutions

www.calstart.org

CALSTART appreciates this latest iteration of the Low Carbon Fuel Standard (LCFS) amendments and applauds staff for their hard work and dedication to improve the LCFS program. The LCFS program is critical to the State's overall air quality, climate, and electrification strategy, as reflected by CARB's 2022 Scoping Plan, which lays out the path for attaining the State's carbon neutrality goals, and explicitly relies on the LCFS program to support electrification.

CALSTART and our Origins

CALSTART, headquartered in California, is a globally renowned 501(c)3 nonprofit organization dedicated to the advancement of zero-emission vehicle and infrastructure technology. With a global member consortium of almost 300 technology, government, industry, and community partners, CALSTART has worked for 30+ years to accelerate the commercialization and deployment of advanced technologies and solutions. Through policy development, incentive program administration, and first-of-its-kind deployment partnerships, CALSTART has designed and managed programs that drive the market for clean transportation technologies needed to achieve critical greenhouse gas and criteria pollutant emission reduction goals.

Comments on Proposed 15-Day Changes to the LCFS

CALSTART strongly supports the LCFS program and believes that the 15-day amendments are a huge step in the right direction in terms of improving programmatic elements to best support the transformation of the transportation sector, particularly for medium- and heavy-duty vehicles.

Capacity Credits and the HD-FCI Provisions

CALSTART appreciates staff's modifications to the HD-FCI and HD-HRI programs, which address many of the concerns that were raised by industry and advocates during the 45-day comment period and April 10 workshop. Specifically, we are thankful for the changes to the geographic limitations and the removal of FSE caps in favor of a limit on total power. These changes will help address grid constraints and support infrastructure buildout consistent with the State's overarching climate strategy and the Joint Office of Energy and Transportation's National Zero-Emission Freight Corridor Strategy.

127.1

While these revisions on the whole seem to greatly improve the HD-FCI program in order to support the State's ZEV deployment goals, there are some areas where clarification within CARB's Final Statement of Reasons are still needed:

OFFICES IN :

48 S. Chester Ave PASADENA, CA 91106 | 1607 Cole Blvd. LAKEWOOD, CO 80401 | 67 35th St. 5th floor Ste B508 BROOKLYN, NY 11232 |
2600 Tenth Street, Suite 407, BERKELEY, CA 94710 | 200 E. Big Beaver TROY, MI 48063 | 168 Smolian Circle, SANTA ROSA BEACH, FL 32459

127.1 Cont.

- Regarding the prohibition that a shared HD-FCI site cannot be reserved for one HDV fleet for more than 12 hours each day, we seek clarification on whether this restriction applies site-wide or on an individual FSE basis. It is our understanding that the 12-hour limitation is intended to be site-wide. If the restriction were to apply on a per-FSE basis, it could significantly impact the viability of the charging-as-a-service business model, which often relies on 24-hour reservation periods to support fleet operations effectively.
- It is our understanding that the distance requirement for shared HD-FCI sites, which has been extended to five miles from any ready or pending FHWA Alternative Fuel Corridor, is intended to mean as-the-crow-flies rather than as-the-truck-drives, but clarification would be greatly appreciated.

Increased Stringency

127.2

CALSTART appreciates staff's proposal to increase the Carbon Intensity (CI) stepdown from the initially proposed 5% to 9%. Increasing the stringency of the program translates into millions of additional tons of greenhouse gas emission reductions and strengthen the market in the process. While we are tremendously grateful to see this stepdown, we'd like to reiterate comments from our 45-day comment letter to encourage CARB to pull forward the effective date for triggering the Auto Acceleration Mechanism (AAM). The AAM should be based on 2025 data with the trigger assessment occurring in May 2026, and the AAM being applied in 2027 providing the applicable conditions are met, thus increasing the program stringency for 2027.

We are also pleased to see the introduction of a limit on credits for biomass-based diesel produced from virgin soybean oil and canola oil of up to 20 percent of annual biomass-based diesel reported on a company-wide basis— this is a step in the right direction. As California continues its progress toward carbon neutrality, it will continue to be important that the State's climate programs work synergistically together in order to achieve our ambitious goals and mandates. We commend staff for sending this important market signal and encourage staff and the Board to continue to think about how the LCFS program can best support the State's electrification objectives as the program continues into the future.

Conclusion

The LCFS program continues to be one of the best drivers to incentivize and promote investments in zero-emission infrastructure. It is a necessary program to ensure the reduction of carbon intensity in the transportation sector while accelerating the adoption of ZEVs. We appreciate all of CARB staff's work on this regulation to date, and the consideration of stakeholder feedback in this latest round of amendments.

Thank you for your time and consideration. Please feel free to reach out if there are any comments or questions.

Trisha Dello Iacono
Head of Policy
CALSTART

RE: Comments of Kaluza on the Proposed 15-Day Changes to the Proposed Amendments to the Low Carbon Fuel Standard

Dear Chair Randolph, Honorable Board Members, and California Air Resources Board Staff,

Kaluza appreciates the opportunity to provide comments on the California Air Resources Board's ("CARB") Proposed 15-Day Changes to the Proposed Amendments to the Low Carbon Fuel Standard ("LCFS"). We support the modifications being proposed by staff in these amendments, recognizing the vital role they play in strengthening the LCFS program and driving California towards the use of cleaner fuels and decarbonized transportation electrification.

Introduction

Kaluza is a fully cloud-native SaaS company that enables energy utilities to engage their customers in the clean energy transition. From revolutionizing billing to smart electric vehicle charging, Kaluza's technology is empowering some of the biggest energy suppliers to better serve millions of customers. Powered by Kaluza's meter-to-cash platform that automates the customer lifecycle from onboarding to billing and customer care, utilities can invest in innovating for tomorrow's customers and drive decarbonization with smart, low carbon technologies that not only reduce energy bills, but also lay the foundations for a more flexible energy system.

Kaluza's Flex software platform powers a range of market-leading managed charging programs, including the world's largest residential V2X pilot and a scaled managed charging program on behalf of the UK's third largest energy retailer that has grown from 200 EVs to 15,000 in less than a year.

Scaling its load management and smart charging solutions globally, Kaluza is working with a number of leading automotive companies. These collaborations are focused on developing cutting-edge direct-to-vehicle solutions able to intelligently manage the storage of green and affordable electricity across millions of EVs and reward customers,

without the need for separate smart charging hardware. Kaluza is proud to be a B Corp-certified business with US employees in California, Texas, New Jersey, and Washington DC in addition to global offices in London, Bristol, Edinburgh, Lisbon, and Melbourne.

Comments

Kaluza strongly supports utilizing utility holdback funding for all Vehicle-Grid Integration (VGI) projects and load management software outlined in section 95483(c)(1)(A)5b. Specifically, the inclusion of funding for investments in grid-side distribution infrastructure, support for vehicle-grid integration projects, and incentives to encourage driver participation in managed charging and vehicle-to-grid applications aligns with our mission to optimize energy systems for a sustainable future. These initiatives are critical to enhancing grid resilience, reducing costs for electricity ratepayers, and supporting the widespread adoption of electric vehicles (EVs) across California as well as moving towards a more customer centric energy system.

128.1 While Kaluza acknowledges the importance of focusing on medium- and heavy-duty vehicles as part of the broader decarbonization strategy, we believe that funding light-duty vehicle projects should remain a priority as well. To this end, we support the allocation of base credits to Original Equipment Manufacturers (OEMs) as a means to provide additional funding for the Zero-Emission Vehicle (ZEV) transition. By enabling OEMs to use these credits for projects such as installing EV charging infrastructure, subsidizing EV charging plans, and promoting VGI initiatives, California can ensure a comprehensive and balanced approach to transportation electrification.

128.2 As a certified B-Corp, Kaluza actively collaborates on projects that prioritize equity, frequently partnering with community-based organizations. We are seeing this equity-focused approach become increasingly common in utility programs and pilots across the U.S. These initiatives are crafted to ensure substantial participation from disadvantaged and low-income communities, proving that VGI and equity objectives can effectively align. We believe that residents in DAC areas are the ones who would benefit from VGI and clean air the most.

However, the current separation of equity projects from VGI initiatives in Sections 95483(c)(1)(A)5.a. and 95483(c)(1)(A)5.b. could unintentionally hinder the development of equity-focused VGI projects. We urge CARB to revise the language to combine the lists of required and pre-approved uses of holdback credits, clearly stating that VGI projects benefiting disadvantaged communities qualify for funding. Furthermore, the criteria for equity projects under the LCFS are currently too restrictive, limiting what

128.2
Cont.

Electric Distribution Utilities (EDUs) can accomplish. By broadening these criteria, a wider range of transportation electrification efforts that serve underserved communities could receive support, helping EDUs to design programs that better align with CPUC guidelines.

Conclusion

In summary, Kaluza endorses the proposed changes and urges the adoption of these amendments to enhance the effectiveness of the LCFS program. We believe that these adjustments will provide the necessary support to advance managed charging technologies, promote VGI projects, and ultimately contribute to California's ambitious clean energy and transportation objectives.

Thank you for considering our comments.

Re: SEIU-USWW Public Comments on Proposed Low Carbon Fuel Standard Amendments

Our Union & Member Communities

SEIU United Service Workers West (USWW) represents nearly 45,000 janitors, security officers, entertainment & stadium workers across California, including thousands of workers at LAX, SFO and other airports throughout the state. Our membership primarily consists of workers within low-wage industries, including aviation. Many of our members reside in communities near major airports and within their flight paths. For decades, these communities - largely Black and Brown - have endured exposure from an array of toxic pollutants produced by airport operations, adding on to the decades of environmental racism these cities and neighborhoods have faced from other sources.

SEIU USWW recognizes the detrimental health impacts on our membership and communities produced by commercial aviation's dependency on fossil fuel consumption. For years, we've fought to raise industry standards at the bargaining table, but more recently have been expanding our commitment to confronting the environmental racism and inequity that our members and their communities face as a result of this industry's continued and ever-expanding operations.

Worker & Communities Taking Action on Commercial Aviation in the LCFS

For all of these reasons, airport workers from across the state have stepped up and become involved in CARB's rulemaking for the Low Carbon Fuel Standard. In a space typically populated by industry lobbyists and business interests seeking to ensure that the program continues to work for them, hundreds of airport workers have made the trip from all over California to attend CARB meetings and workshops related to the LCFS. These members have been sharing their stories of the lived impact that the industry's emissions has had on them, their families and their communities. Our members have also been proud to stand in coalition with other frontline communities and environmental justice organizations voicing their longstanding concerns about the program.

Up to this point, CARB has appeared willing to finally take significant action to address commercial aviation's outsized and growing share of pollution, proposing an end to the exemption that conventional fossil jet fuel enjoys within the LCFS. That exemption saves the airlines an estimated \$110 to \$360 million each year on the cost of their fossil fuels¹ - a benefit in addition to the nearly \$300 million each year they save via a state sales & use tax carveout², as well as the \$23 million a year they save on jet fuel's exemption from excise taxes.³

CARB staff indicated in September of last year⁴ that their jet fuel proposal at the time was intended to cover fuel combusted in California airspace, regardless of whether or not it is from an intrastate flight or from California's portion of an interstate or international flight. Just a few months later, the proposal was scaled back significantly, limited to just fossil jet fuel used in intrastate flights.⁵

This was itself a disappointing and substantial change, as intrastate flights represent less than 6% of the overall emissions activity from aviation in California. In 2018, for instance, California's aviation sector

⁴ CA Air Resources Board, September 28, 2023 Board Meeting

⁵ Staff Report: Initial Statement of Reasons, CARB, 12/19/23

accounted for about 34 million metric tonnes of CO₂ emissions, just 2 million of which were the result of intrastate flights.

Airlines & CARB Falling Short on Even Short-Term Solutions in Sustainable Aviation

Despite the significant reduction in the scope of the proposal, we still viewed this as a great first step toward the necessary goal of finally reckoning with aviation's climate impact and the many harmful effects for workers and communities. This kind of movement was necessary and encouraging. It was also long overdue, as CARB's current approach to the industry - exemptions for the fossil fuels and LCFS credits for use of Sustainable Aviation Fuel (SAF) - has clearly not been working well enough to push aviation toward zero-emission technology or even toward significant uptake of SAF, which accounted for less than a quarter of one percent of global jet fuel use in 2023.⁶ As you know, SAF is intended to be a bridge fuel - a stopgap solution as zero emission technology develops to commercial scale in aviation. The short-term fix in aviation is itself decades away from significant adoption. This kind of outcome should surprise none of us when the industry's fossil fuels are allowed to remain exempt from the programs our state is using to achieve its climate goals. It is even less surprising when the airlines continue to enjoy hundreds of millions of dollars worth of tax breaks on those fossil fuels from our state. Returning to complete exemption in the LCFS for conventional fossil jet fuels is just more of the same approach that got us to this point.

Current Proposal Broadens CARB's Generously Hands Off Approach to Aviation

129.1 Restoring the conventional jet fuel exemption isn't the only break the industry is receiving in CARB's latest rulemaking updates. Limits on LCFS credits for biofuels derived from soybean and canola oil are added in the most recent proposal⁷, a restriction that does not appear to apply to Sustainable Aviation Fuel, which has been a credit-generating fuel in the LCFS for years. These guardrails are critical for SAF too, otherwise we risk trading one sustainability problem for another and subsidizing the industry for the privilege. Understand - this aspect of the proposal is already being described by at least one expert as having "nearly zero near-term impact."⁸ CARB is letting the airlines off the hook even for measures as modest and ineffectual as the 20% blend limit for those crop-based fuels, which speaks volumes about how much work there still is to be done.

Aviation's Growth & Missed Opportunities in California

129.2 Aviation is already a massive source of emissions in California, the full impact is just being excluded from the state's Greenhouse Gas Emissions Inventory.⁹ If all of the industry's exempted emissions were included in that inventory, commercial aviation would be the second largest emissions subcategory in the entire state, behind only the combined emissions from all on-road transportation in California.¹⁰ Based on 2019 data, this total would exceed California's entire inventory for all possible residential categories, all agriculture and forestry uses, and even exceed the sum of emissions caused by all electricity generation in the state. Not only is aviation being cut out of the meager solutions CARB is offering in this LCFS rulemaking, most of the industry's impact isn't even being acknowledged in any meaningful way in the state's own metrics.

⁹ GHG Inventory by Sector, California Air Resources Board, 2023

¹⁰ CARB, CA GHG Inventory for 2000-2020 - by Sector and Activity, 10/26/22

129.2
Cont.

The FAA forecasts that aviation activity in California will increase by at least two-thirds by 2044.¹¹ NO_x emissions from aircraft are expected to increase by 30% in that time in California - with aviation being the only transportation sector whose emissions are projected to increase in that time. (On-road is projected to decline by 88% in that same span.) This is a fossil fuel industry that is already a huge problem and yet also growing very quickly. We can't afford to continue taking such a hands-off approach with aviation.

Next Steps & Opportunities for Leadership

California is now on course to forfeit a significant opportunity to demonstrate leadership on one of the most impactful industries when it comes to climate change and air quality. As a state, we are very well positioned to take a leading role in the clean energy transition of commercial aviation. We can start to reverse some of the alarming impacts this industry's operations have had on airport workers and frontline airport communities - communities that are often Black & Brown and dealing with the consequences of decades of environmental racism. The status quo will not be enough. More subsidies to an already highly subsidized industry will not be enough.

CARB must do the following:

129.3

- Reinstatement of the proposal to end the LCFS exemption for conventional jet fuel - at a minimum for intrastate California flights.
 - CARB should also continue to plan for the eventual inclusion of California's share of interstate and international flights in the LCFS as a deficit generator as well.
- Include Sustainable Aviation Fuel in any LCFS proposals concerning the sustainability of feedstock used in biofuels, such as the limitations on LCFS credits for biomass-based diesel produced from soybean and canola oils.
- Continue to find ways to set strong sustainability criteria for SAF feedstock.

Intrastate fossil jet fuel being brought into the LCFS as a deficit generator was already an extraordinarily modest proposal - scaled back significantly from earlier versions of this proposal. That CARB has backslid even further in the face of industry lobbying and threats is a profound disappointment that we still have the time to undo. Now is the time for California to step into its role as a climate leader and put workers and communities ahead of polluters in the LCFS.

Sincerely,

David Huerta

Re: Comments on the August 12th 15-day Package

Submitted electronically: <https://ww2.arb.ca.gov//lispub/comm/bclist.php>

Dear Chair Randolph and members of the California Air Resources Board:

The Clean Fuels Alliance America (Clean Fuels)¹ and California Advanced Biofuels Alliance (CABA)² appreciate the opportunity to provide comments on the 15-day package (Package) that was published on August 12th, 2024. Clean Fuels and CABA have been longtime supporters of the state's overall climate and air quality improvement goals and have collaborated frequently with CARB staff toward achieving those goals. We have been strong partners with California in its long-term efforts to decarbonize its transportation sector, with its vast portfolio of policies, regulations and incentives that target high priority zero emission technologies and the hugely successful Low Carbon Fuel Standards – the hallmark policy that champions a market-based approach to decarbonizing transportation fuels by being science-driven, fuel-neutral, technology-agnostic, and performance-based. CARB set out a lofty goal to reduce GHG emissions and the members of Clean Fuels and CABA responded swiftly and overwhelmingly to that call...with innovation and investment throughout the supply chain.

¹ Clean Fuels Alliance America (Clean Fuels) is the U.S. trade association representing the entire biodiesel, renewable diesel, and sustainable aviation fuel supply chains including producers, feedstock suppliers, and fuel distributors serving the on- and off-road applications, rail, marine, and heating oil markets. Made from an increasingly diverse mix of resources such as recycled cooking oil, soybean oil, and animal fats, the clean fuels industry is a proven, integral part of America's clean energy future.

² California Advanced Biofuels Alliance is a not-for-profit trade association promoting the increased use and production of advanced biofuels in California. CABA represents biomass-based diesel (BMBD) feedstock suppliers, producers, distributors, retailers, and fleets on state and federal legislative and regulatory issues.
