Section A. Introduction

California Climate Investments is a statewide initiative that puts billions of Cap-and-Trade dollars to work facilitating greenhouse gas (GHG) emission reductions; strengthening the economy; improving public health and the environment; and providing benefits to residents of disadvantaged communities, low-income communities, and low-income households, collectively referred to as “priority populations.” Where applicable and to the extent feasible, California Climate Investments must maximize economic, environmental, and public health co-benefits to the State.

The California Air Resources Board (CARB) is responsible for providing guidance on estimating the GHG emission reductions and co-benefits from projects receiving monies from the Greenhouse Gas Reduction Fund (GGRF). This guidance includes quantification methodologies, co-benefit assessment methodologies, and benefits calculator tools. CARB develops these methodologies and tools based on the project types eligible for funding by each administering agency, as reflected in the program expenditure records available at: www.arb.ca.gov/cci-expenditurerecords.

For CARB’s Woodsmoke Reduction Program, staff developed this Woodsmoke Reduction Quantification Methodology to provide guidance for estimating the GHG emission reductions and selected co-benefits of each proposed project. The Woodsmoke Reduction Program is administered by CARB in partnership with the California Air Pollution Control Officers Association (CAPCOA) and local air pollution control districts or air quality management districts (Districts). Participating Districts will help households replace uncertified wood stoves or inserts used as the primary source of heat with cleaner burning and more efficient home heating stoves. For the purposes of the program, a project is defined as the set of change-outs funded by the program within a participating District. This methodology uses calculations to estimate GHG emissions associated with the implementation of Woodsmoke Reduction projects.

The Woodsmoke Reduction Benefits Calculator Tool automates methods described in this document, provides a link to a step-by-step user guide with a project example, and outlines documentation requirements. Projects will report the total project GHG emission reductions and co-benefits estimated using the Woodsmoke Reduction Benefits Calculator Tool as well as the total project GHG emission reductions per dollar of GGRF funds requested. The Woodsmoke Reduction Benefits Calculator Tool is available for download at: http://www.arb.ca.gov/cci-resources.

Using many of the same inputs required to estimate GHG emission reductions, the Woodsmoke Reduction Benefits Calculator Tool estimates the following co-benefits and key variables from Woodsmoke Reduction projects: reductions in nitrogen oxides (NO\textsubscript{x}) (lbs) and reactive organic gases (ROG) (lbs), and energy and fuel cost savings. Key
variables are project characteristics that contribute to a project’s GHG emission reductions and signal an additional benefit (e.g., reductions in cord wood burned for the life of the stove, referred to as the quantification period). Additional co-benefits for which CARB assessment methodologies were not incorporated into the Woodsmoke Reduction Benefits Calculator Tool may also be applicable to the project. Applicants should consult the Woodsmoke Reduction guidelines, solicitation materials, and agreements to ensure they are meeting Woodsmoke Reduction requirements. All CARB co-benefit assessment methodologies are available at: www.arb.ca.gov/cci-cobenefits.

Methodology Development

CARB developed this Quantification Methodology consistent with the guiding principles of California Climate Investments, including ensuring transparency and accountability.1 CARB developed this Woodsmoke Reduction Quantification Methodology to be used to estimate the outcomes of proposed projects, inform project selection, and track results of funded projects. The implementing principles ensure that the methodology would:

- Apply at the project-level;
- Provide uniform methods to be applied statewide, and be accessible by all applicants;
- Use existing and proven methods;
- Use project-level data, where available and appropriate; and
- Result in GHG emission reduction estimates that are conservative and supported by empirical literature.

CARB assessed peer-reviewed literature and tools and consulted with experts, as needed, to determine methods appropriate for the Woodsmoke Reduction project types. The methods were developed to provide estimates that are as accurate as possible with data readily available at the project level.

In addition, the University of California, Berkeley, in collaboration with CARB, developed assessment methodologies for a variety of co-benefits such as providing cost savings, lessening the impacts and effects of climate change, and strengthening community engagement. As they become available, co-benefit assessment methodologies are posted at: www.arb.ca.gov/cci-cobenefits.

Tools

The Woodsmoke Reduction Benefits Calculator Tool relies on CARB-developed emission factors. CARB has established a single repository for emission factors used in CARB benefits calculator tools, referred to as the California Climate Investments

1 California Air Resources Board. www.arb.ca.gov/cci-fundingguidelines
Quantification Methodology Emission Factor Database (Database), available at: http://www.arb.ca.gov/cci-resources. The Database Documentation explains how emission factors used in CARB benefits calculator tools are developed and updated.

Applicants must use the Woodsmoke Reduction Benefits Calculator Tool to estimate the GHG emission reductions and co-benefits of the proposed project. The Woodsmoke Reduction Benefits Calculator Tool can be downloaded from: http://www.arb.ca.gov/cci-resources.

Updates

CARB staff periodically review each quantification methodology and benefits calculator tool to evaluate their effectiveness and update methodologies to make them more robust, user-friendly, and appropriate to the projects being quantified. CARB updated the Woodsmoke Reduction Quantification Methodology from the previous version\(^2\) to enhance the analysis and provide additional clarity. The changes include:

- The baseline methodology represented in this Quantification Methodology and accompanying calculator tool uses the average cord wood usage for existing fireplaces and uncertified woodstoves reported by air districts participating in the 2016-17 Pilot Woodsmoke Reduction Program and is detailed below in the section titled Stove-Specific Cord Wood Consumption and Heating Rates. This empirical data is used to better inform calculations for the 2018-19 quantification baseline methodology. The previous 2016-17 quantification methodology utilized the California average annual household heating energy consumption from the U.S. EIA 2009 Residential Energy Consumption Survey.
- Included certified pellet stoves or inserts and ductless mini-split heat pumps;
- Added new co-benefits to the output tab in the Benefits Calculator Tool

\(^2\) Greenhouse Gas Quantification Methodology for the California Air Resources Board Woodsmoke Reduction Program released September 29, 2017
Section B. Methods

The following section provides details on the methods supporting emission reductions in the Woodsmoke Reduction Benefits Calculator Tool.

Woodsmoke Reduction Project Change-Out Types

The Woodsmoke Reduction Program Guidelines identifies eligibility criteria including the types of old to new home heating stoves that can be funded for which there are methods to quantify GHG emission reductions. This quantification methodology matches those eligibility criteria and quantifies benefits based on the quantity of each type of change-out performed by a District. The different change-out types are:

- Replacing fireplaces with certified non-catalytic wood stoves or wood inserts;
- Replacing uncertified wood stoves or wood inserts with certified non-catalytic wood stoves or wood inserts;
- Replacing fireplaces with certified catalytic wood stoves or wood inserts;
- Replacing uncertified wood stoves or wood inserts with certified catalytic wood stoves or wood inserts;
- Replacing fireplaces with certified pellet stoves or pellet inserts;
- Replacing uncertified wood stoves or wood inserts with certified pellet stoves or pellet inserts;
- Replacing fireplaces with ductless mini-split heat pump;
- Replacing uncertified wood stoves or wood inserts with ductless mini-split heat pump;
- Replacing fireplaces with electric home heating stoves;
- Replacing uncertified wood stoves or wood inserts with electric home heating stoves;
- Replacing fireplaces with propane home heating stoves;
- Replacing uncertified wood stoves or wood inserts with propane home heating stoves;
- Replacing fireplaces with natural gas home heating stoves; and
- Replacing uncertified wood stoves or wood inserts with natural gas home heating stoves.

---

3 Residential Woodsmoke Reduction Program.  
https://www.arb.ca.gov/planning/sip/woodsmoke/reduction_program.htm
This methodology estimates the benefits of a project based on the quantities of each type of change-out performed. Districts will therefore need to estimate emission reductions both when awarded and implemented.

1. Awarded Funds: Upon being awarded funds by CAPCOA, Districts will estimate the expected project outcomes using the methods as described in this section.
2. Implemented Projects: When change-outs are performed, Districts will revise earlier estimates, again using the methods as described in this section.

General Approach

Methods used in the Woodsmoke Reduction Benefits Calculator Tool for estimating the GHG emission reductions and air pollutant emission co-benefits by activity type are provided in this section. The Database Documentation explains how emission factors used in CARB benefits calculator tools are developed and updated.

These methods account for the GHG emission reductions resulting from a home heating stove change-out from a fireplace, uncertified wood stove, or wood insert to a cleaner and more efficient home heating stove. In general, the GHG emission reductions are estimated in the Woodsmoke Reduction Benefits Calculator Tool using the approaches in Table 1. The Woodsmoke Reduction Benefits Calculator Tool also estimates air pollutant emission co-benefits and key variables using the same inputs used to estimate GHG emission reductions. This quantification methodology accounts for avoided GHG emissions from uncertified wood stoves, wood inserts, and fireplaces used as primary sources of heat and GHG emissions associated with the use of cleaner, more efficient heating stoves. In general, the GHG emission reductions are calculated using the following approach:

Table 1. General Approach to GHG Quantification

<table>
<thead>
<tr>
<th>GHG Emission Reductions from Change-Out</th>
</tr>
</thead>
<tbody>
<tr>
<td>GHG Emission Reductions = GHG Emissions of Uncertified Wood Stove, Wood Insert, or Fireplace – GHG Emissions of New Heating Stove</td>
</tr>
</tbody>
</table>

The total project GHG, black carbon, and particulate emission reductions per Woodsmoke Reduction Program GGRF dollar requested and per total GGRF dollar requested, as described below.

- **Total Project GHG Emission Reductions** is equal to the sum total of each of the GHG emission reductions by stove type and are automatically summed in the Woodsmoke Reduction GHG Calculator Tool.
- **Total Project GHG Emission Reductions per Dollar of Woodsmoke Reduction Program GGRF Funds Requested** is calculated as shown in Table 2.
Table 2. General Approach to Quantification by Project change-out

<table>
<thead>
<tr>
<th>Total Project GHG Emission Reductions per Dollar of Woodsmoke Reduction Program GGRF Funds Requested</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
</tr>
<tr>
<td><strong>Total Project GHG Emission Reductions in Metric Tons of CO$_2$e</strong></td>
</tr>
<tr>
<td><strong>Woodsmoke Reduction Program GGRF Funds Requested ($)</strong></td>
</tr>
</tbody>
</table>

Woodsmoke Reduction Program GGRF Funds Requested ($) for all projects is equal to the amount of GGRF dollars the District is requesting from the Woodsmoke Reduction Program. The Woodsmoke Reduction GHG Calculator Tool will provide the Total Project GHG Emission Reductions per Woodsmoke Reduction Program GGRF Dollar Requested.

Table 3. General Approach to Quantification by Project change-out

<table>
<thead>
<tr>
<th>Total Project GHG Emission Reductions per Dollar of GGRF</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
</tr>
<tr>
<td><strong>Total Project GHG Emission Reductions in Metric Tons of CO$_2$e</strong></td>
</tr>
<tr>
<td><strong>Total GGRF Funds Requested ($)</strong></td>
</tr>
</tbody>
</table>

The Total GGRF Funds Requested ($) for all project features is equal to the sum of GGRF dollars the District is requesting for the project from the Woodsmoke Reduction Program, all GGRF dollars from CARB or other agencies that have previously been awarded to the same project, and any GGRF dollars from agencies other than CARB that the District has or plans to apply for. For a list of GGRF funded programs, go to: [www.arb.ca.gov/cci-events](http://www.arb.ca.gov/cci-events). If no other GGRF funds are requested, this will be the same amount as the Woodsmoke Reduction Program GGRF Funds Requested. The Woodsmoke Reduction GHG Calculator Tool will provide the Total Project GHG Emission Reductions per GGRF Dollar Requested.
Emission Factors

A. Stove-Specific Cord Wood Consumption and Heating Rates

The Woodsmoke Reduction Program funds the replacement of uncertified, inefficient wood burning stoves with cleaner-burning, more efficient residential heating stoves. For the purposes of estimating emission reductions, this quantification methodology uses data reported by air districts participating in the 2016-17 Pilot Woodsmoke Reduction Program. Benefits accrue as a result of the difference in the efficiency of existing and replacement stoves and relative improvement in emission rates of GHGs, PM$_{2.5}$, and black carbon. The 2018-19 Woodsmoke Reduction Program includes the addition of co-benefits and key variables NOx and ROG.

1. Determine the average annual wood use reported by Air Districts participating in the 2016-17 Pilot Woodsmoke Reduction Program. For fireplaces, the average annual baseline is 1.8 cord wood fuel. For uncertified woodstoves, the average annual baseline is 2.8 cord wood fuel.
   a. As part of the Pilot Program, between January 1, 2018 and December 31, 2019, 445 fireplaces and 964 stoves were replaced throughout California.
   b. Pilot Program required that participants report on the amount of wood used annually in the existing device intended for replacement.
   c. Based on these data, the estimated average amount of wood used in fireplaces is 1.8 cords/year and 2.8 cords/year for uncertified woodstoves.
   d. Fireplaces are generally used as a source of heat in warmer climates like Santa Barbara, San Luis Obispo, Monterey, etc.

2. Determine each stove type efficiency of eligible existing and replacement stoves using:
   a. Efficiencies from Houk, J. and Tiegs, P. for fireplaces and propane or natural gas heating stoves.
   c. Efficiencies from U.S. EPA AP-42 for residential wood stoves.

   Efficiencies may vary from those used in Step 2 due to the broader stove categories used compared to the specific existing and replacement stoves eligible under the Program.

3. For existing wood burning fireplaces and uncertified wood stoves, calculate the annual energy use by factoring the average annual wood use as determined by step 1; multiplied by the heating value of wood (dry basis) and converted to tons for emissions calculations.

4. Calculate stove specific energy use using the annual energy use for existing stove type determined in step 3 above, factoring the efficiencies of the existing and replacement device.
5. For resultant emissions calculations, factoring fuel specific emission factors for wood fueled stoves and factoring fuel specific emission factors for non-wood stoves described in sections B and C below.
B. Electricity GHG Emission Factor

For the purposes of quantification methodologies for agencies administering California Climate Investments, CARB developed a California grid average electricity emission factor based on total in-state and imported electricity emissions (in MTCO$_2$e) divided by total consumption (in kWh) as calculated in Equation 1.

Statewide electricity emissions data were obtained from the most recent edition of CARB’s GHG Emission Inventory.\textsuperscript{4} The total in-state electricity generation is combined with the total imported electricity to determine the total emissions for grid electricity. The total electricity consumption data was derived by summing electricity generation and net imports obtained from California Energy Commission’s (CEC) California Energy Almanac.\textsuperscript{5}

\begin{equation}
\text{EF} = \frac{Electricity \ Emissions}{Electricity \ Consumption}
\end{equation}

\begin{tabular}{lll}
\textbf{Where,} & \textbf{Units} \\
\text{Electricity Emissions} & Total in-state electricity and imported electricity emissions & MTCO$_2$e \\
\text{Electricity Consumption} & Total California electricity generation and net imports & kWh
\end{tabular}

\textsuperscript{4} CARB California Greenhouse Gas Emissions Inventory – 2017 Edition
https://www.arb.ca.gov/cc/inventory/data/data.htm

\textsuperscript{5} CEC California Energy Almanac
http://www.energy.ca.gov/almanac/electricity_data/electricity_generation.html
C. Heating Fuel GHG Emission Factors

In the absence of a mechanism to verify that the wood burned in an applicant’s primary heating stove is waste material harvested pursuant to an approved timber management plan prepared in accordance with the Z’berg-Nejedly Forest Practice Act of 1973 or other locally or nationally approved plan and harvested for the purpose of forest fire fuel reduction or forest stand improvement, biogenic CO₂ is included in the calculation of GHG benefits for these stoves.

The Emission Factors for Greenhouse Gas Inventories uses the global warming potentials (GWP) from the IPCC Fourth Assessment Report. Gases are converted to MTCO₂e by multiplying by their GWP and converting the units appropriately.

<table>

E. PM$_{2.5}$ Emission Reductions from Change-Outs

The PM$_{2.5}$ emission reductions from the project are calculated as the difference between the baseline and project scenarios using Equation 3.

\[
PM_{2.5} = Q_{FNC} \times 1.239 + Q_{UNC} \times 2.285 + Q_{FC} \times 1.217 + Q_{UC} \times 2.028 + Q_{FPS} \times 1.243 + Q_{UP} \times 2.339 + Q_{FHP} \times 945 + Q_{UHP} \times 1.906 + (Q_{FE} + Q_{FP} + Q_{FG}) \times 819 + (Q_{UE} + Q_{UP} + Q_{UHG}) \times 1.652
\]

*Where,*

- $PM_{2.5}$ = PM$_{2.5}$ emission reductions from all project change-outs
- $Q_{FNC}$ = Quantity of fireplaces replaced with certified non-catalytic wood stoves or wood inserts
- $Q_{UNC}$ = Quantity of uncertified wood stoves or wood inserts replaced with certified non-catalytic wood stoves or wood inserts

### Equation 5: NOx Emission Reductions from Change-Outs (Continued)

- **-19** = NOx emission reduction from replacing an uncertified wood stove or wood insert with a certified pellet stove or pellet insert (lbs/change-out)
- **106** = NOx emission reduction from replacing a fireplace with a ductless mini-split heat pump (lbs/change-out)
- **158** = NOx emission reduction from replacing an uncertified wood stove or wood insert with a ductless mini-split heat pump (lbs/change-out)
- **92** = NOx emission reduction from replacing a fireplace with an electric home heating stove (lbs/change-out)
- **137** = NOx emission reduction from replacing an uncertified wood stove or wood insert with an electric home heating stove (lbs/change-out)
- **85** = NOx emission reduction from replacing a fireplace with a propane home heating stove (lbs/change-out)
- **57** = NOx emission reduction from replacing an uncertified wood stove or wood insert with a propane home heating stove (lbs/change-out)
- **88** = NOx emission reduction from replacing a fireplace with a natural gas home heating stove (lbs/change-out)
- **92** = NOx emission reduction from replacing an uncertified wood stove or wood insert with a natural gas home heating stove (lbs/change-out)
H. ROG Emission Reductions from Change-Outs

The ROG emission reductions from the project are calculated as the difference between the baseline and project scenarios using Equation 6.

**Equation 6: ROG Emission Reductions from Change-Outs**

\[
ROG = Q_{\text{FNC}} \times 979 + Q_{\text{UNC}} \times 3,749 + Q_{\text{PC}} \times 962 + Q_{\text{UC}} \times 3,543 + Q_{\text{FPS}} \times 1,048 + Q_{\text{UP}} \times 4,568 + Q_{\text{FHP}} \times 786 + Q_{\text{UHP}} \times 3,424 + Q_{\text{FPP}} \times 2,965 + Q_{\text{UP}} \times 2,965 + Q_{\text{FNG}} \times 681 + Q_{\text{UNG}} \times 2,965
\]

Where,

- **ROG** = ROG benefit from all project change-outs (lbs)
- **Q_{\text{FNC}}** = Quantity of fireplaces replaced with certified non-catalytic wood stoves or wood inserts (Change-outs)
- **Q_{\text{UNC}}** = Quantity of uncertified wood stoves or wood inserts replaced with certified non-catalytic wood stoves or wood inserts (Change-outs)
- **Q_{\text{PC}}** = Quantity of fireplaces replaced with certified catalytic wood stoves or wood inserts (Change-outs)
- **Q_{\text{UC}}** = Quantity of uncertified wood stoves or wood inserts replaced with certified catalytic wood stoves or wood inserts (Change-outs)
- **Q_{\text{FPS}}** = Quantity of fireplaces replaced with certified pellet stoves or pellet inserts (Change-outs)
- **Q_{\text{UP}}** = Quantity of uncertified wood stoves or wood inserts replaced with certified pellet stoves or pellet inserts (Change-outs)
- **Q_{\text{FHP}}** = Quantity of fireplaces replaced with ductless mini-split heat pump (Change-outs)
- **Q_{\text{UHP}}** = Quantity of uncertified wood stoves or wood inserts replaced with ductless mini-split heat pump (Change-outs)
- **Q_{\text{FE}}** = Quantity of fireplaces replaced with electric home heating stoves (Change-outs)
- **Q_{\text{UE}}** = Quantity of uncertified wood stoves or inserts replaced with electric home heating stoves (Change-outs)
- **Q_{\text{FP}}** = Quantity of fireplaces replaced with propane home heating stoves (Change-outs)
- **Q_{\text{UP}}** = Quantity of uncertified wood stoves or inserts replaced with propane home heating stoves (Change-outs)
- **Q_{\text{FNG}}** = Quantity of fireplaces replaced with natural gas home heating stoves (Change-outs)
- **Q_{\text{UNG}}** = Quantity of uncertified wood stoves or inserts replaced with natural gas home heating stoves (Change-outs)
- **979** = ROG emission reduction from replacing a fireplace with a certified non-catalytic wood stove or wood insert (lbs/change-out)
- **3,749** = ROG emission reduction from replacing an uncertified wood stove or wood insert with a certified non-catalytic wood stove or wood insert (lbs/change-out)
- **962** = ROG emission reduction from replacing a fireplace with a certified catalytic wood stove or wood insert (lbs/change-out)
- **3,543** = ROG emission reduction from replacing an uncertified wood stove or wood insert with a certified catalytic wood stove or wood insert (lbs/change-out)
- **1,048** = ROG emission reduction from replacing a fireplace with a certified pellet stove or pellet insert (lbs/change-out)
- **4,568** = ROG emission reduction from replacing an uncertified wood stove or wood insert with a certified pellet stove or pellet insert (lbs/change-out)
- **786** = ROG emission reduction from replacing a fireplace with a ductless mini-split heat pump (lbs/change-out)
- **3,424** = ROG emission reduction from replacing an uncertified wood stove or wood insert with a ductless mini-split heat pump (lbs/change-out)
