

Calculation of 2023 Crude Average Carbon Intensity Value

<u>Posting:</u> Each year, pursuant to section 95489(b)(3) of the Low Carbon Fuel Standard (LCFS) Regulation,¹ CARB posts the Annual Crude Average carbon intensity calculation at the CARB-LCFS website for public comment. Written comments shall be accepted for 15 calendar days following the date on which the analysis was posted. Only comments related to potential factual or methodological errors in the posted Annual Crude Average carbon intensity value may be considered. CARB will evaluate the comments received and may request in writing additional information or clarification from the commenters. Commenters shall have 10 days to respond to these requests. After evaluating the comments² and updating the calculation accordingly, CARB is posting the final Annual Crude Average carbon intensity value.

<u>Calculation of 2021, 2022, and 2023 Annual Crude Average Carbon Intensity Values:</u> Table 1 shows California crude volumes and Annual Crude Average carbon intensity values for 2021, 2022, and 2023.³ Table 2 shows the sources of crude oil supplied to California refineries during 2023 and the carbon intensity values assigned to each source.⁴ All crude oil produced in and offshore of California during 2023 was assumed to be refined in California. The volume contributions for Californiaproduced crudes are based on oil production data obtained from the California Department of Conservation.⁵ The volume contributions for California federal offshore crudes are based on oil production data obtained from the Bureau of Safety and Environmental Enforcement.⁶ The volume contributions of imported crudes are based on oil supply data submitted by refineries as part of annual LCFS reporting. The annual crude average carbon intensity values are a volume-weighted average of the carbon intensities for the crudes supplied in a given year.

¹ The LCFS regulation is published at California Code of Regulations (CCR), title 17, sections 95480-95503. Subsequent section references are to CCR title 17.

² Comment Log for Comments on Crude Oil analysis for LCFS (accessed on November 29, 2024)

³ Carbon intensity values and volumes for 2021 and 2022 are from the <u>2021 Annual Crude CI final</u> (ca.gov) and <u>2022 Annual Crude CI final (ca.gov)</u>, respectively.

⁴ Crude carbon intensity values are from Table 9 of the LCFS regulation <u>Low Carbon Fuel Standard</u>. These carbon intensity values are based on oil field data from the year 2015.

⁵ California Department of Conservation, <u>WellSTAR Data Dashboard (ca.gov)</u> (accessed on November 28, 2024).

⁶ Bureau of Safety and Environmental Enforcement website <u>BSEE Pacific Production</u> (accessed on December 15, 2024).

Table 1. Crude Volumes and Annual Crude Average Carbon Intensity Values

| Year | 2021 | 2022 | 2023 |
|----------------------------|-------------|-------------|-------------|
| CI (gCO ₂ e/MJ) | 12.80 | 12.71 | 12.51 |
| Volume (bbl) | 518,262,620 | 519,754,097 | 532,457,677 |

Calculation of California Baseline Crude Average Carbon Intensity:

CI_{BaselineCrudeAve} is the California Baseline Crude Average carbon intensity value, in gCO₂e/MJ, attributed to the production and transport of the crude oil supplied as petroleum feedstock to California refineries during the baseline calendar year, 2010, and is calculated by the following formula for the 2023 compliance period:

 $CI_{BaselineCrudeAve} = 11.78$

<u>Calculation of Three-Year California Crude Average Carbon Intensity:</u> $CI_{2023CrudeAve}$ is the Three-year California Crude Average carbon intensity value, in gCO₂e/MJ, attributed to the production and transport of the crude oil supplied as petroleum feedstock to California refineries during the most recent three calendar years (2021, 2022 and 2023), and is calculated by the following formula:

$$CI_{2023CrudeAve} = \frac{[12.80 \times 518,262,620 + 12.71 \times 519,754,097 + 12.51 \times 532,457,677]}{[518,262,620 + 519,754,097 + 532,457,677]}$$

 $CI_{2023CrudeAve} = 12.67$

<u>Summary</u>: The Three-year California Crude Average carbon intensity of 12.67 gCO₂e/MJ is greater than the California Baseline Crude Average carbon intensity of 11.78 gCO₂e/MJ plus 0.10 gCO₂e/MJ. Therefore, pursuant to sections 95489(a) and (b) of the LCFS regulation, incremental deficits of 0.89 × E^{XD} × C for CARBOB or diesel will be added to each affected regulated party's compliance obligation for the annual compliance period of 2025, where E^{XD} is the amount of fuel energy, in MJ, from CARBOB or diesel, as defined in section 95489(a), and $C = 1.0 \times 10^{-6} \frac{MT}{g CO2 e}$.

| Country/State | Crude Name | CI (g/MJ) | 2023 Volume (bbl) |
