Los Angeles	CA	90041	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026

These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/15/2026
Anaheim	CA	92806	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
Los Angeles	CA	90020	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
San Diego	CA	92106	Adopt clean air car standards	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026

Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/17/2026
Whittier	CA	90605	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Palmdale	CA	93551	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
El Sobrante	CA	94803	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
Berkeley	CA	94705	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
Jackson	CA	95642	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026

Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
Roseville	CA	95747	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Hayward	CA	94545	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026

These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
Carmel By The Sea	CA	93921	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026

Rohnert Park	CA	94928	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
San Diego	CA	92131	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026

Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026

Lancaster	CA	93534	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. Orange	CA	92867	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026

These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026

La Jolla	CA	92037	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Costa Mesa	CA	92627	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026

Los Angeles	CA	90056	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026

Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
Los Angeles	CA	90065	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. Watsonville	CA	95076	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026

These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
Lodi	CA	95240	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
Los Angeles	CA	90027	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
North Hills	CA	91343	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026

Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
Moorpark	CA	93021	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. Citrus Heights	CA	95610	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026

These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
Pico Rivera	CA	90660	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Albion	CA	95410	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
Mill Valley	CA	94941	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026

Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
San Mateo	CA	94401	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. Los Angeles	CA	90046	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026

These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
Pacifica	CA	94044	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Pacoima	CA	91331	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
Coloma	CA	95613	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026

Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
Livermore	CA	94551	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Venice	CA	90291	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026

These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
San Francisco	CA	94133	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/15/2026
San Francisco	CA	94103	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
Walnut Creek	CA	94595	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026

Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
Arbuckle	CA	95912	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Los Angeles	CA	90045	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026

These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
San Francisco	CA	94121	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
Daly City	CA	94015	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
Van Nuys	CA	91405	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026

Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
San Clemente	CA	92673	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Los Angeles	CA	90034	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026

These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
San Jose	CA	95125	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026

Redding	CA	96002	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
Nevada City	CA	95959	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/17/2026

Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026

Alameda	CA	94501	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. San Ramon	CA	94583	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026

These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026

San Pedro	CA	90731	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
Fair Oaks	CA	95628	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households.
