Huntington Beach	CA	92649	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026

These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Berkeley	CA	94703	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
Oakland	CA	94619	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/15/2026
Fairfield	CA	94534	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026

Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
San Mateo	CA	94404	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. San Luis Obispo	CA	93401	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026

These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Albany	CA	94706	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
Valley Center	CA	92082	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
La Mesa	CA	91941	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026

Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Oakland	CA	94602	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. Ukiah	CA	95482	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026

These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/15/2026
Castro Valley	CA	94546	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Huntington Beach	CA	92648	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Manhattan Beach	CA	90266	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026

Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Aromas	CA	95004	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Palo Alto	CA	94306	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026

These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
Fresno	CA	93722	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
San Francisco	CA	94109	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
Sebastopol	CA	95472	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026

Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
San Carlos	CA	94070	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Oakland	CA	94609	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026

These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
Capitola	CA	95010	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Seaside	CA	93955	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Palm Desert	CA	92211	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026

Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
San Marcos	CA	92078	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. Valley Springs	CA	95252	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026

These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Rohnert Park	CA	94928	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026

Crescent City	CA	95531	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Castro Valley	CA	94546	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026

Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026

Sierra Madre	CA	91024	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. San Diego	CA	92122	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026

These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026

Hayward	CA	94542	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians.
