San Francisco	CA	94115	Please adopt car standards strong enough to meet California's clean air and climate targets	As a nurse and someone who cares deeply about climate change and its effects on plants, animals, and humans, I am writing to implore you to move forward with clean car standards that are as strong as possible - at least strong enough for all regions of California to meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. As you know, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Sacramento	CA	95833	Adopt car standards strong enough to meet California's clean air and climate targets	I live in one of the regions in California that suffer from the worst air quality in the country and it's THE CAPITAL OF THIS STATE!!!!! FOUR MAJOR FREEWAYS HERE SO THERE ARE MILLIONS OF VEHICLES EVERYDAY ON THEM!!!! THIS MUST CHANGE!!!! Also, thousands of drivers in Sacramento sit in their cars just idling their engines!!!! 30-40 minutes even, just running their engines, dumping pollution!! Seen them doing that even by schools, soccer games, and other places where children are!!! Since moving to Sacramento 2025 I've gotten more trouble breathing and head congested. STOP THEM IDLING THEIR ENGINES!!! Education I guess might help? AND DO WHAT YOU CAN TO GET SO MANY VEHICLES OFF THE ROADS!!! It's insane!!	7/14/2026
Novato	CA	94949	Adopt car standards strong enough to meet California's clean air and climate targets	Please know I appreciate your standing up to federal attacks on California's clean car standards. Our state's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Morro Bay	CA	93442	SUPPORT & Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. CA should be a leader in progressive decisions that better the health of its citizens and its precious resources-including wildlife, wild lands, air, and water. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Rancho Mirage	CA	92270	Car standards to meet California's clean air and climate targets	Thank you for standing up to mobster attacks on our clean car standards. California's leadership in cutting health harming auto pollution is more critical than ever. The California Air Resources Board should move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged and low-income households. Several regions suffer from the worst air quality in the country. If the Board doesn't adopt ambitious new standards, more people will suffer from asthma, cardiopulmonary disease, and premature death. We are also facing an unprecedented, escalating financial burden caused by pollution and the global warming crises. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea level rise. The health costs of illness, disease, and death exacerbated by global warming are staggering. These costs directly contribute to increasing inflation, and will get far worse without ambitious action to cut pollution. That's why the Board should phase out fossil fuel powered vehicles and significantly strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of no more than 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to 100% clean cars is underway and will deliver billions in savings, but needs to be sped up. Electric cars, or some type of clean car, save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion engine vehicles, totaling an estimated $90 billion in net savings. Strong clean car standards are a triple win for public health, affordability, and our environment. Please phase out of fossil fuel vehicles as quickly as possible and adopt even stronger standards.	7/14/2026
Fresno	CA	93722	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026

Vallejo	CA	94591	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I am someone who developed asthma while living in Houston several years. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. Carmel	CA	93923	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. (I know what it is like to see one suffer from COPD. My mother died from it at 61 years of age.) Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. (My home insurance used to be 1,300. Now it is 7500. And I am not insuring another building where I live because it adds another 1500.) The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Irvine	CA	92606	Adopt car standards strong enough to meet California's clean air and climate targets	Dear California Air Resources Board, Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same. Clean car rules (aka standards) would require automakers to clean up their fleets of passenger cars on a schedule that helps California meet its 2045 climate and clean air goals. Adopting ambitious rules in California will benefit the climate and help to protect human health. Please help Californians to breathe more easily: Urge the California Air Resources Board to adopt strong clean car rules for the state. Sincerely, Diane Langejans	7/15/2026
Rio Vista	CA	94571	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
Trabuco Canyon	CA	92678	CARB: Keep CA's Car Emission Stds High!	I grew up in the San Fernando Valley in the 60s and 70s. We had MANY days where you see the hills or breathe the air. It was awful. Thanks to the Clean Air Act and California's waivers, we're able to set higher standards for emissions and that has cleaned up our air to a point where it's hard to believe what we used to live in. Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
Hollister	CA	95023	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
Berkeley	CA	94703	Adopt strong car standards	As a California resident, I'm writing in favor of moving forward with stricter car standards in our state. This will reduce air pollution, save lives, and help California meets its climate targets. As an added bonus, it will be a thorn in the eye of the Trump administration, which, as I'm sure you already know, is rolling back federal emissions standards. If California has strong standards in place, this will benefit other states as well, since automakers will likely design their cars everywhere to meet California's standards. Thanks for taking the time to review this message.	7/13/2026
Los Angeles	CA	90045	Stronger vehicle emissions standards	I am writing to urge the California Air Resources Board to secure strong clean vehicle standards to keep California on track to meet its 2045 climate targets. The CARB must therefore strengthen its current proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. Vacaville	CA	95687	Set Car Standards to Meet CA Air & Climate Targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support strong clean air and climate standards in California! Our lives depend on it!	7/16/2026
Bellflower	CA	90706	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. Santa Cruz	CA	95060	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. Please fortify mitigation policies for GHGs and Toxic Air Contaminants. Require all new purchases of road vehicles (light, medium, heavy) to be BEV by 2029. Allow permits to be issued for electric mass transit, but not fossil-powered, by 2027. Sunset the LCFS on the same schedule because vehicles that are powered by a mix of biofuels and petrol have much higher lifecycle emissions than BEVs. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Joshua Tree	CA	92252	We need clean air and climate care!	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. We must ensure we keep strong clean air standards at a critical time of regulation rollbacks that will harm Californian's. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. I grew up in the 60's in Souther California's smoggiest area and have experienced the gains made. I also know we are losing the good air quality where I live in the mMojave Desert with the influx of population and development. I drive an electric car and know we must encourage improvements in charging but I absolutely love leaving gas behind. Until we develop more mass transit EVs must be supported. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/17/2026
Oxnard	CA	93035	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. As a native Californian, I support any legislation that improves our states air quality. I've owned an EV for 11 months and hope California will continue to expand the amount of charging stations available. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026

Rocklin	CA	95677	CA needs strong car standards	California has more cars than any other state, contributing to poor air quality in many places. That's why I sincerely appreciate your efforts in standing up to federal attacks on our state's clean car standards and why I encourage you to continue strengthening these standards to provide healthier air for everyone and meet our 2045 climate targets. Across the state, air pollution threatens people's health, particularly in disadvantaged communities and low-income households. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Globally, EVs are now outselling gas vehicles in several European nations, and almost half of China's new car sales last year were EV. Clean cars save lives AND money. Plus, stronger fuel standards help reduce our dependence on oil, particularly imported oil, and help protect consumers from the wild swings in gas prices that occur when global oil supply is threatened. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
Santa Ynez	CA	93460	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. We must continue to protect our environment from harmful emissions pollution instead of pandering to trump and his anti-environmental protection agenda. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
San Francisco	CA	94115	California's clean air and climate targets require strong auto emissions standards	First. I want to thank you for standing up for our state's clean car standards. Unfortunately, this administration's attacks on common sense regulations means that California's leadership in cutting health-harming auto pollution is more critical than ever. I am writing today to urge the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. As such, the board's initial proposal must be significantly strengthened. Several regions in California suffer from the worst air quality in the country. Moreover, bad air quality has a disproportionate impact on low income and minority communities, already suffering from increased rates of cancer, cardiopulmonary disease, and premature death. We are also facing unprecedented risks from wildfires and floods, with coastal communities like my home of San Francisco subject to increasing damages from sea level rise - all exacerbated by climate change that has resulted from our burning of fossil fuels. In addition to mandates for increased fuel efficiency and transition to clean energy vehicles, I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. We need to both reduce the burning of gas and diesel and reduce emissions in order to ensure a livable future for all Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. The majority of Californians like me support adopting strong car and truck efficiency and emissions standards. I again urge the board to strengthen its initial proposal and enact the strong emissions standards necessary to fulfill California's clean air and climate targets. Thank you for considering my views.	7/16/2026
El Cajon	CA	92019	Adopt car standards strong enough to meet California's clean air and climate targets	Please do the right thing for all of us. Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Petaluma	CA	94952	Adopt real car standards to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. When the fossil fuel industry has taken over the US Government with Donald Trump's collusion, when the world's climate is rocked by disruption due to burning oil products, we are all in real danger. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. IN fact, it would be better to return to the mandate to phase out internal combustion vehicles and replace them with all electric ones. China now produces and sells an all electric SUV that gets a 500 miles range (and more) for around $35,000. Why can't US manufacturers do that? Political cowardice, that's why. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same. Preferably by mandating the elimination of ICE vehicles and replacing them with EVs.	7/13/2026
Los Angeles	CA	90046	Adopt car standards strong enough to meet California's clean air and climate targets	I just purchased a new Prius hybrid as I want to do my part in cutting pollution. The climate is warming and we need to act fast! To that end, thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same. Our grandchildren are counting on you!	7/13/2026
Truckee	CA	96161	Adopt car standards that ensure California's clean air and climate targets are met	California's leadership in cutting auto pollution is more critical than ever. Thank you for standing up to federal attacks on our state's clean car standards. We must do more. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
San Jose	CA	95136	Adopt car standards strong enough to meet California's clean air and climate targets	Given the Trump regime's attacks on environmental regulations, it is more critical than ever that CARB significantly strengthen its initial proposal and adopt clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. Specifically, strengthen the proposed rule to require fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile starting for model year 2036. Several regions in California habitually suffer from the worst air quality in the country. If the board fails to adopt strong new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same. Please consider the health of our communities now and in future generations.	7/16/2026
Oakland	CA	94605	Adopt car standards strong enough to meet California's clean air and climate targets	I'm a professor of medical anthropology and public health at San Francisco State University, part of the California State University system. I've lived in California for almost 20 years. I live in East Oakland, a community that has long been impacted by air quality concerns. I'm writing to say thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. Please note: To do that, the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same. California often leads other states into making better choices for humans, animals, planet. Compared to the 1970s, 80s, and 90s when the bordering ranges, Mt Hamilton and Mt Umunhum, in the Santa Clara Valley where I live could not be seen through ugly thick haze all summer to the last 20 years. Summer days now share a cleaner horizon and these ranges are so beautiful. That is, I believe, the California Air Resources making those better choices for all of California. This planet is on a dangerous descent into uninhabitable conditions. Do not let this current administration have any sway into making choices for where I and millions of other Californians live and breathe. Thank you kindly Kathleen Kawakami Santa Clara County	7/14/2026
Los Angeles	CA	90034	Please read our message below: Adopt car standards strong enough to meet California's clean air and climate targets	Please uphold California's high standards. No one wants to choke in the freakish brown air that used to obstruct the view everywhere. It was a nightmare, now thankfully gone. DONT LET IT COME BACK! Our Family of five thanks you. Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams of CO2 per mile and 7 milligrams of NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions of dollars in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
Santa Rosa	CA	95404	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I urge the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same. Thank you for your attention to this important matter.	7/16/2026

Los Gatos	CA	95030	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
El Cerrito	CA	94530	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I am an electrical engineer and have commented on CEC standards, regulations and policies before, mostly on electrical energy issues. But, I also care about the effects on climate, pollution and health by transportation. I got rid of my very old gas powered vehicle with the Clean Cars for All program and replaced it with a battery electric vehicle using no fossil fuels and only clean renewable electricity from rooftop solar and battery backup on my home and supplemental 100% clean energy from my CCA, MCE. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. These measures are attainable and the benefits are tangible and especially in the area of health outcomes critical to health and safety for Californians especially in the most effected areas. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/15/2026
Sebastopol	CA	95472	Adopt car standards strong enough to meet California's clean air and climate targets	California always leads the way as a healthy example to the rest of our nation. Let's make sure to take the actions necessary so that all Californians can breath safe, healthy air and encourage the rest of the nation to do the same! Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. As a Californian I am proud of the measures our state has taken. Keep up the good work.	7/13/2026
Oakland	CA	94610	Adopt car standards strong enough to meet California's clean air and climate targets	As a teenager, I lived in Los Angeles in the early 1960s under a constant smog layer. I don't want my grandchildren to have to breathe polluted air, nor do I want the children who live in the poorest communities to be at a risk for asthma and other lung diseases. In 1967, Norman Mailer wrote a book entitled Why We Are in Vietnam. The first line is 'Smog is greed.' It has turned out to be true. Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
Mount Shasta	CA	96067	Urging you to Adopt strong car standards to meet CA's air and climate targets	It is important to me as a citizen of this great State for California to move forward with adequate clean car standards. As is well known, air pollution threatens people's health, and disadvantaged communities and low-income households especially suffer. Several regions in the state have some of the worst air quality in the country, and Californians suffer from asthma, cardiopulmonary disease, and premature death. I urge the CA Air Resource Board (CARB) to adopt ambitious new standards, so that the state will be on track to meet its 2045 climate targets, and so that all regions of California can meet clean air standards. Our state's leadership in cutting health-harming auto pollution is more critical than ever. To do that the board must significantly strengthen its initial proposal to require a 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile, as recommended by major environmental organizations. California's transition to clean cars will deliver billions in savings for Californians, and will help the affordability crisis. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 annually compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. If CARB will adopt strong standards or our state, it will keep our great State of California true to its commitment to an environment that benefits everyone.	7/13/2026
San Leandro	CA	94577	Adopt car standards for California's clean air	Thank you for rebuffing federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to create and enforce clean car standards that are strong enough to ensure all regions of California can meet clean air standards to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health. It is worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial effects of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get worse without ambitious action to cut climate pollution. That's why I strongly request that the board strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicle, totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and strongly request that the board do the same. Sincerely, Sharon Morris	7/14/2026
Santa Barbara	CA	93101	Please Adopt car emissions standards strong enough to meet California's clean air and climate targets	Keep CA a leader in clean air standards.Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. We need to do this for our state and to lead the way for our nation. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
Arcata	CA	95521	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same. Sincerely, Gabrielle Gopinath	7/13/2026
Santa Barbara	CA	93101	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same. Please murder RFK Junior.	7/13/2026
Novato	CA	94945	Fight Like Hell for Clean Air and a Livable Planet	You know the problem -- and you know the solution. Clean air and a safe planet are no longer a 'given' due to our ingrained and longstanding reliance on carbon fuel for industry and transportation. The Trump Administration is recklessly intent on ramping up this dependence, and I appreciate your opposition to federal attacks on our state's clean car standards and leadership in cutting auto pollution. As California Air Resources Board, it is essential that you act aggressively, and establish clean car standards strong enough to ensure our high standards prevail and the 2045 climate targets are met. But you - and I - must fight harder, and this will require that you greatly strengthening your initial proposal. Carbon fuel accelerated climate change is already ravaging our planet. We, along with other living things, are facing an existential crisis. I therefore urge you to amp up the Proposed Rule to a Model Year 2036 standard. I urge you to adopt strong clean car standards for our state, and continue to demonstrate leadership in the face of considerable pressure from Washington. In short, I'm asking you to fight like hell for all our sakes. Sincerely, Mary Jane Schramm	7/14/2026
Los Osos	CA	93402	Be ambitious and support CA's clean air and climate targets. Please adopt clean air and climate resilient car standards.	Thank you for standing up for California's clean car standards. California's leadership in addressing health-harming auto pollution is so important. The California Air Resources Board (CARB) can move forward with clean car standards. I would like to know that all regions of California can meet clean air standards. California has 2045 climate targets. I think CARB must be more ambitious and strengthen its initial proposal. When CARB adopts ambitious new standards, a set of clean car rules for 2030 and beyond, more Californian's health will improve because suffering from asthma, cardiopulmonary disease, and premature death will be lessened. The climate pollution is contributing to Californian's escalating financial burden. People have lost their homes to wildfires and to floods, home insurance prices are near impossible to pay. There is illness, disease, and death. These costs directly contribute to California's affordability dilemma and the situation will worsen without ambitious action to significantly reduce climate pollution. Dear CARB, please strengthen your proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. Electric cars can save drivers money. Compared to combustion-engine vehicles calculations suggest average fuel and maintenance savings of more than $7,500 when comparing combustion-engine vehicles to electric vehicles. An estimated $90 billion in net savings for Californians. Clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the California Air Resources Board to do the same.	7/14/2026
San Diego	CA	92104	Adopt car standards to improve California's air and meet climate targets	I grew up in Los Angeles, which had some of the worst air quality in the nation. I worried about what my daughter would experience, but thankfully the air quality in LA has somewhat improved. However with the Trump administration's role back of a host of environmental regulations, California's leadership in cutting health-harming auto pollution is more critical than ever. Thank you for standing up to federal attacks on our state's clean car standards. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. Other countries around the world could benefit from this rule and some are already per McKibben. Around the world, many economies are already acting to address the effects of greenhouse gases on health and the environment—a California transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
Sausalito	CA	94965	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. Every other state should be copying California. What is more important than clean air? Geez I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Petaluma	CA	94952	Please adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to please move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same. Thanks for taking the time to read this letter. Best, Craig A. Colton	7/16/2026
Oakland	CA	94605	Stand strong for car standards California's clean air and climate targets	We need your courage to stand up to attacks on our state's clean car standards. California must continue the work to cut hazardous auto pollution now and always. I urge you, the California Air Resources Board, to push bravely for clean car standards strong enough to ensure all of California can meet clean air standards and stay on track to meet its 2045 climate targets. And the you must go much further than your initial proposal in order to do that. Air pollution harms our health and is implicated in higher mortality and morbidity, especially in areas with more low income households. This is terrible. No child asks to be born to suffer in some of the worst worst air quality in the country. If you don't adopt ambitious new standards, more Californians will suffer and die. Californians are also suffering from escalating economic threats of climate crisis including wildfires, floods, sky high insurance prices, and drought. The real costs of illness, disease, and death made worse by climate change are unaffordable for many and will only get worse without strong action to cut climate pollution. I call on you to strengthen the proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. Do not weaken. Do not stand meekly by while we still have the ability to make a difference. We are already on our way to transition to clean vehicles. Electric cars save owners an average of more than $7500 on fuel and maintenance compared to gas vehicles. That's an estimated $90 billion in savings for Californians. We an do better. Strong clean car emission standards are a win-win-win for public health, affordability, and climate. I support in the strongest terms adopting much stronger standards in California and urge the board to do the same.	7/17/2026
San Francisco	CA	94122	Car standards to meet CA's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the CARB to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Escondido	CA	92029	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I agree, California must maintain and increase its' performance in reducing atmospheric pollution resulting from the use of fossil fueled vehicles. However, the state must look into reports of poor reliability concerning all electric vehicles, especially as failure of batteries reduces the attractiveness of these vehicles. I know battery technology is ever increasing however; I would like to see the state provide additional incentives to encourage scientists and manufactures to energize their efforts to improve battery reliability. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Los Angeles	CA	90034	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same. Thank you for your time.	7/14/2026
Riverside	CA	92501	California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026

The Sea Ranch	CA	95497	ADOPT auto standards strong enough to meet California's clean air and climate targets	The following represents my position in SUPPORT to strengthen CARB's proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
San Francisco	CA	94109	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. It is unfortunate that we are not being supported by our federal government in working to transition to cleaner vehicles, but California has been on the cutting edge of innovation before. Working to meet these new standards will help us to develop technology more rapidly, which will put us into an advantaged position when these standards become more widespread. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/15/2026
Berkeley	CA	94707	Control Health Costs - Adopt car standards strong enough to meet California's clean air and climate targets	As a physician with 3 decades of experience working in frontline communities I want to thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. I have seen the impacts of caring for children with asthma on parents who are frightened that they will lose their jobs due to missed work, terrified that their sick children will die, and frustrated that they can't afford to live somewhere with clean air that would help protect all of them from disease. Air pollution increases rates of depression, dementia, ADHD, and autism - all debilitating, chronic, and costly conditions. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
Vallejo	CA	94590	Strong car standards to meet CA's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026

Crockett	CA	94525	Adopt affordable car standards strong enough to meet California's clean air and climate targets	As someone who cares deeply about environmental health, I am in agreement with the scripted statement and request below. However, implementation involves multiple considerations, including affordability (without having to raise taxes), privacy, and choice. By privacy and choice, I am referring to the availability to have an affordable standard electric vehicle, similar to the older gas model vehicles, that is not spying on us. I am a law abiding citizen and I don't have anything to hide, but it is getting disgustingly invasive when 'smart' vehicles, appliances, phones, utilities, computers, wifi, and the list goes on, constantly gather information about us. What is all this data gathering used for and specifically who benefits from it? Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same. Clean cars NOW!!	7/13/2026
Sebastopol	CA	95472	Adopt car standards strong enough to meet California's clean air and climate targets	I truly appreciate CARB's refusal to submit to federal attacks on our state's clean car standards, while asking you to require additional clean car standards with enough enforcement mechanisms to ensure the whole state will meet the next round of clean air standards and its its 2045 climate targets. But more restrictive regulation is badly needed to protect lower income neighborhoods from physically damaging small particulate pollution, largely a consequence of outdated reliance on fossil fuels by agricultural and transportation sectors of our state. Stricter regulatory rules also are essential to reducing the losses to humans and wildlife from catastrophic wildfires and storm events that are directly caused by the cumulative impacts global warming from fossil fuel consumption. The proposal to strengthen Model Year 2036 standards to require fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile seems a rational and necessary next step to limiting the present and future harms from fossil fuel production and consumption.	7/14/2026
Laguna Beach	CA	92651	Adopt strong car standards to meet California's clean air and climate targets	I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/15/2026
Carmel	CA	93923	Please Enact Strong Car Emissions that Meet California's Clean Air and Climate Goals	I applaud the California Air Resources Board for pushing back on federal attacks on our state's clean car standards. California must continue to be the leader in reducing auto pollution. Please enact clean car standards strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. This would require the the board to significantly strengthen its initial proposal. I support the Center for Biological Diversity's proposal that the board strengthen its proposed rule to a 'Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile.' Strong clean car standards favor public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Orangevale	CA	95662	Adopt strong car standards to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Eureka	CA	95503	Meet California's clean air and climate targets	Thank you for standing up to federal attacks on California's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Rancho Palos Verdes	CA	90275	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
Ferndale	CA	95536	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same. Thank you for your consideration of these important issues.	7/16/2026
Ventura	CA	93003	Adopt car standards strong enough to meet California's clean air and climate targets	It's very important to me that we have clean air. It's bizarre that I even have to say that. It should be a given. As a resident of California, thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/17/2026
Oakland	CA	94619	Adopt strong Clean Car Rules	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. As an 81 year-old Californian, clean air is important to my health and well-being. I encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To accomplish that the Board must strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge CARB to do the same.	7/14/2026
Redwood City	CA	94061	Stop Corruption. Adopt Car Standards Strong Enough to Meet California's Clean Air and Climate Targets.	Enough corruption and empty rhetoric. Stop selling out the environment and the rest of us to your criminal oligarch donors. We are not disposable. No one is above the law. Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. As a citizen, a constituent, an atheist, and a science-based secular humanist values voter, I call on the California Air Resources Board to promptly enact clean car standards that are strong enough to ensure all regions of California can meet clean air standards and thereby ensure that the state at least meets its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it is worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board does not adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get worse without ambitious action to cut climate pollution. I accordingly call on the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles, totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and call on the board to do at least as much.	7/17/2026
Santa Rosa	CA	95404	Please adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
Alpine	CA	91901	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026

Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Benicia	CA	94510	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Oakland	CA	94602	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/15/2026

These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Hemet	CA	92543	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Palo Alto	CA	94301	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
Pleasant Hill	CA	94523	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026

Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
Mission Viejo	CA	92691	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. Healdsburg	CA	95448	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
Corning	CA	96021	Please adopt new car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
Santa Cruz	CA	95060	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/17/2026
Fresno	CA	93704	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Oakland	CA	94607	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/17/2026

Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Carlsbad	CA	92009	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. San Ramon	CA	94582	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026

These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/15/2026
Winterhaven	CA	92283	PLEASE Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
Eureka	CA	95503	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/17/2026
Santa Barbara	CA	93105	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026

Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Emeryville	CA	94608	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. Riverside	CA	92506	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026

These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
San Luis Obispo	CA	93401	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Huntington Beach	CA	92649	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
Berkeley	CA	94702	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026

Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/15/2026
Pasadena	CA	91107	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Monterey	CA	93940	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/17/2026

These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Santa Monica	CA	90403	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026

Alhambra	CA	91803	Adopt car standards strong enough to meet California's clean air and climate targets a	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Lake Elsinore	CA	92530	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026

Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026

Santa Barbara	CA	93109	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Vista	CA	92081	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026

These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/15/2026

Los Angeles	CA	90042	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026
Rancho Mirage	CA	92270	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026

Irvine	CA	92617	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026

If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
Santee	CA	92071	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Burlingame	CA	94010	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026

These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
San Anselmo	CA	94960	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
Rio Linda	CA	95673	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
Berkeley	CA	94707	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026

Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
Laguna Woods	CA	92637	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Castro Valley	CA	94552	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026

These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
Santa Monica	CA	90404	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/16/2026
Santa Rosa	CA	95404	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
Bakersfield	CA	93314	Adopt car standards strong enough to meet California's clean air and climate targets	Thank you for standing up to federal attacks on our state's clean car standards. California's leadership in cutting health-harming auto pollution is more critical than ever. I strongly encourage the California Air Resources Board to move forward with clean car standards that are strong enough to ensure all regions of California can meet clean air standards and keep the state on track to meet its 2045 climate targets. To do that the board must significantly strengthen its initial proposal. Across the state, air pollution threatens people's health, and it's worst in disadvantaged communities and low-income households. Several regions in California suffer from the worst air quality in the country. If the board doesn't adopt ambitious new standards, more Californians will suffer from asthma, cardiopulmonary disease, and premature death. Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/14/2026

Californians are also facing an unprecedented, escalating financial burden caused by the climate crisis. Tens of thousands of people have lost their homes to wildfires and floods, home insurance prices are skyrocketing, and so are the financial impacts of sea-level rise. The health costs of illness, disease, and death exacerbated by climate change are staggering. These costs directly contribute to California's affordability crisis and will get far worse without ambitious action to cut climate pollution. That's why I urge the board to strengthen its proposed rule to a Model Year 2036 standard requiring fleet averages of 40 grams CO2 per mile and 7 milligrams NOx + NMOG per mile. California's transition to clean cars is already underway and will deliver billions in savings for Californians. Electric cars save drivers money, with average fuel and maintenance savings of more than $7,500 compared to combustion-engine vehicles — totaling an estimated $90 billion in net savings for Californians. Strong clean car standards are a triple win for public health, affordability, and our climate. I support adopting strong standards in California and urge the board to do the same.	7/13/2026
